IT IS not an impossible thing to put on an imposing pageant in the smallest community,' said Miss Era Betzner in the course of an interview. Miss Betzner has done this in almost every state in the Union. 'I find real histrionic talent where it is least suspected. The trouble does not lie in finding the live tools, but the accessories.

'By this I mean the spears, the crowns, the royal robes, the wands and all those other articles so essential in giving an air of reality to a performance.'

Miss Betzner, knowing the need of these communities, opened a Drama Service Bureau in New York City.

Requests for this service have been diversified in scope: The direction and production of pageants, plays, festivals and fairs; community celebrations planned and directed, special holiday programs for churches, schools, clubs and private homes, children's parties and entertainments, dances devised and taught for special occasions, costumes of all kinds designed and executed, stage settings and lighting effects planned, and so on.

Miss Betzner's first experience in drama service work began in a schoolroom in Atlanta, Georgia. Miss Betzner saw that little feet did less shuffling, there was less twisting of nervous little bodies, and the children showed better results in their lessons when the room was made attractive. She went a step further, doing an unprecedented thing in those days—she put on a children's play. A pageant by her pupils followed, attracting such attention to its spiritual value that she was chosen as one of the directors for a Shakespearean pageant, one of the most imposing pageants ever put on in the South.

Another great pageant which she directed was in honor of the opening of Eliza Lucas Hall, a home for young women in industry, in Charleston, South Carolina, in which five hundred sailors and one thousand girls participated. Wherever Miss Betzner went after that, she saw the need of gayer colors, more music, more recreation and a better understanding of the pageant.

MISS Betzner directed the pageant put on as a community feature to celebrate the 175th birthday of the city of Reading, Pennsylvania.

The celebration lasted a week, and the pageant was put on three nights. Perhaps one of the most interesting phases of this event was that rivalry in politics and differences in creed were forgotten. 'Any group,' was a comment heard on that occasion, 'will work together, but the real test of democracy is to play together.'

'We need more color,' concluded Miss Betzner, 'more music, more appreciation of play.'

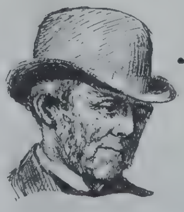
A Chinese LIVINGSTONE

As related by Charles Finger, the story of Huien-Tsaing who set out from China and traveled many thousands of miles to India to find a new religion is an epic of endeavor to which the only parallel is Livingstone's pioneer work in darkest Africa.

Where the Mother of LINCOLN Was Born

How the exact location of Nancy Hanks' first home was found to be in West Virginia although experts for years had believed that the site was elsewhere. Now a memorial may be built with assurance that it is on the right place.

By DR. WILLIAM E. BARTON



JULIAN HAWTHORNE *Tells of His* Boyhood Friend—OLIVER WENDELL HOLMES

Being intimate glimpses into the life of this American literary genius, with dramatic episodes such as even pure fiction seldom rivals.

CHATS WITH OFFICE CALLERS

In THE DEARBORN INDEPENDENT for May 21 there appeared an editorial in which there were comments on a statement regarding ***Smoking by Women,*** alleged to have been made by Dr. MacCracken, president of Vassar College. We questioned the statement and Dr. MacCracken now confirms our doubts. Here is his letter:

'The words attributed to me in the dispatch on which your editorial is based were put into my mouth by a group of reporters to whom I had refused an interview. The occasion was the annual session of the Kentucky Education Association and I had just delivered an address on "Education, the Foundation of Democracy." It was a serious address on which I had put much time and I was irritated at the conclusion of it to be confronted by several reporters who wanted my opinion on the question of whether women students should smoke or not. My irritation led me, perhaps unjustifiably, to protest against the triviality of such news methods. A few desultory remarks followed and the phrase "why shouldn't the women help?" was actually a question asked of me by a reporter to which I did not reply. The newspaper in Louisville, which published the original statement, has published my correction as have many other newspapers in the country. I would be greatly obliged to you if you would be good enough to do me the justice of inserting this correction in your paper.'

* * *

The ***Old-Fashioned Reader*** who had a habit of clipping things and copying choice passages, and carrying them in his vest pocket, produced this thing of uncommon beauty written by a Mr. Campbell:

Sadly, of Greece I thought; where sea, sky, sod,
  Rock, wood and hill, merged in one reverent plan,
Framed fanes untouched of mortar-line and rod;
  So had her builders bold the skill to scan
Earth's self for lines obsequious to their nod;
  And set their temples white with level base fair-shod,
Climax and keystone of the scene's whole span,
  Making all feel, who thereby trod,
The goodliest thing in Nature still was Man
  And Man's best thought his God.

* * *

The ***College President*** came into the office, threw his soft hat in the chair opposite, crossed his legs, twinkled his eyes, and said a number of things which undergraduates never hear, but which would give him an undying fame if he ever uttered them in chapel or on the campus. But one of the things he said was rather serious:

'Education costs more and more, and the next question is, Where is the money coming from? The more an education costs, the less proportion of the cost the students pay. What with endowments and subsidies, hardly any school is self-supporting. Even our big rich universities are giving their students, the sons of rich people, a large portion of their education free.

'This condition was so noticeable at Yale a little while back, that the authorities of Yale thought to remedy it. You know that when we think of Yale and the people who send their sons to Yale, we think of a pretty well-to-do class of American society. So the authorities of Yale sent out statements to the fathers of the students setting forth that the fees which were paid for the students were by such-and-such an amount less than the actual cost of the tuition, and that if any parent felt like making up the difference, that is, pay 100 cents for every dollar's worth of schooling, Yale would be very grateful. Out of hundreds thus appealed to, only three responded.'

* * *

The ***Westerner*** dropped in to make some remarks regarding one of our contributor's observations on the mustang. He resented the circumstance that this quadruped had been referred to as a 'wretched, spiritless animal,' and vigorously defended it from such designations.

'I have spent the last fifteen years in Montana, on more or less intimate terms with some of those "wretched, spiritless animals,"' began the Westerner, 'and my experience has been that they are neither "wretched" nor "spiritless."

'I have never attempted to describe the mustang, or "bronch" as he is termed on his native heath, but I have heard others describe him luridly, profanely, and at length, and I am here to say that "wretched" is far and away the mildest term that I have heard applied to the "bronch." After a séance or two with those "wretched, spiritless" animals, one feels the inadequacy of the English language to express a truly descriptive opinion of them.

'Away back in 1913 I worked one of them that was then thirty-two years old, gentle enough when hitched to the wagon, but we used to practise riding him to the house when it was time for "chuck." It was good exercise.

'I owned another, a thousand-pound mare, which I rode (when she was willing). She was a friendly animal and could be caught anywhere, but until she died, at the age of nineteen, I never got on her back with a settled conviction that I was going to stay there for any length of time. On another occasion I carried an arm in a sling for three weeks.

'There was another one that ranged within sight of my house last year, a saddle horse that was turned out because, although he was a good horse, whenever one got on him one had to be prepared to sit still or to "hang and rattle." I could multiply instances but it is unnecessary.

'If one doubts the spirit of the bronch, he need only converse with the riders who follow the rodeos to have his doubts set at rest.'

* * *

'What are they trying to do to football?' demanded the ***Loyal Townsman,*** who has never attended college but who hasn't missed a gridiron contest since the days of Eckersall and Heston. 'I don't mind this discussion about reforming the game, but surely it isn't necessary to go to extremes.

'For example, take the suggestions now being made to lighten the football influence. Those of President Hopkins, of Dartmouth, contained a number of excellent ideas—but did you read the response of the undergraduates? What I particularly object to is their desire to do away with artificial means for stimulating interest in contests; such as, the agile and colorful yell-leaders; the magnificent bandmasters; the pajama parades; the midnight bonfires; the serpentine; and all the other glorious frolics of the football season.

'Frankly, I don't mind doing away with the referee; or the goal-posts; or even the coaches. But let's not lose the fluttering pennants, the tuneful "Boola-Boolas." The spectacle is the thing we townsmen go to see; the day of the gladiatorial combat is past. And we should be consulted before the entire program is spoiled for us.'

* * *

'To find the favorite perfume of insects is now quite as important to the entomologist as it is to a young man at the time of ardent courtship to discover whether the all-important she prefers roses to violets,' observed the ***Naturalist.*** 'The hard-hearted entomologist, however, has destruction in mind. Working on the knowledge that sense of smell plays an important part in insect activity, he would enlist the insects in their own destruction. Once he discovers a smell for which insects will forsake food itself, the entomologist has found a siren to lure them into traps and subsequent death.

'Smells which are disagreeable and frequently irritating to human beings are the very ones that delight insects. This is the discovery of S. E. Crumb of the U. S. Bureau of Entomology's laboratory at Clarksville, Tennessee. They are usually odors never encountered in the insect's natural life. Thus bees will gather about the smell of formic acid and benzol chloride, velvet webworms about the odor of nitrobenzine, tobacco beetles about linseed oil, hornworm moths about amyl salicylate, and mosquitoes about chemicals which combine to form the odor of perspiration!

'The study of chemotropism, which is the scientific name for the attraction by chemicals, is a fairly new science, and experiments so far have only made a few scratches on this field which has enormous potentialities in insect control.

'The seventy-odd entomological laboratories over the country are nearly all working with chemotropism in some form. The laboratory at Clarksville deals primarily with the attraction of tobacco insects. Another laboratory which has met with success in the field of chemotropism is the one at Riverton, New Jersey, which has found that the Japanese beetle is very fond of the scent of geraniol. The cotton boll weevil and the European corn borer remain elusive, however. The laboratory at Tallulah, Louisiana, and the one at Arlington, Missouri, have not yet found a smell sufficiently attractive to these insects to lure them to death.'

Can Your Dog Reason?

(*Continued from page 5*)

may be intelligent enough to detect that which is spurious even in a caress.

Lloyd Morgan tells of two dogs, the larger of which had a bone. As long as the smaller dog thought the other one was near he let the bone alone. But when he heard the larger dog bark out of doors, he evidently decided he was safe and at once took the bone.

Shaler, in his *Domesticated Animals*, attributes to dogs the ability to recognize boundaries of their master's yard or even a farm.

'When a dog, even of militant quality, enters on a territory which he does not feel belongs to him, he is at once a different creature as compared to his condition when on his own land. He treads warily and will accept, without dispute, an order to take himself off.'

On the other hand, Shaler points out, much as a dog likes a warm bed, who ever heard an authenticated account of a dog that would take the initiative in providing himself with a good bed by hunting up rugs or other articles and making a bed of them? But Miss Viola Roseboro tells me she had a little dog that did that very thing. The proprietors of the Zenovia Kennels at Hartford, Pennsylvania, have given me the following:

A little Russian wolfhound bitch that has always lived in the house with us appeared, just before bedtime, to be in pain. We gave her simple remedies which quieted her somewhat, but she remained restless. I decided to stay downstairs that night and sleep on a couch near her as she was a great favorite. During the night she was uneasy, moving about constantly and coming crying to the side of my couch about every twenty minutes. By four o'clock in the morning neither of us had had one wink of sleep.

A bright idea struck me. I got the hot-water bottle, filled it, then gathered this little pet close to me on the couch and laid the water bottle against her abdomen, holding it in place with my arm around her body. She, as well as myself, must have gone to sleep almost instantly, for it was after six when I awoke and found that neither dog nor bottle had moved. She got down from the couch and went out of doors as lively as ever and remained that way all day. The water bottle lay on a small table unemptied and I forgot all about it. That night at bedtime this wolfhound went to bed as usual on a big straw pillow on the floor. In the morning I found her still asleep, but with the water bottle on the straw pillow beside her. I wondered at this and could hardly believe she remembered it had given her comfort the night before.

That night I laid the bottle on the table in the same place. The dog remained perfectly well all day and late in the afternoon I was out for several hours, leaving her entirely alone in the house. On my return I found the dog and the water bottle both on the pillow again. The table was about three yards from her bed, and during the years she has lived in our house, which is since her puppyhood, she had never before taken even a piece of food from the table. Can we say that this dog did not realize that there was something about that water bottle that made her feel mighty comfortable?

One author goes so far with beliefs in dog reasoning power that I can't force myself to accept the stories as dependable. I refer to the book, *Lola*, by Kindermann, translated from the German by Agnes Blake. In this is found an account of the achievements of the dog Rolf, that learned spelling, arithmetic, and could carry on an ordinary conversation. The book says: 'At length his alphabet came into being—he having, with the exception of one or two letters, put it together entirely by himself. It was constructed thus: I would ask him for instance, "Rolf, how many taps with your paw are you going to give me for *a*?" And he then gave me a number which I carefully noted down. To my inexpressible pleasure I found that Rolf never forgot the numbers he had given, though I, to this day, must have my notes at hand whenever Rolf wishes to tap out anything.'

The author of this passage adds: 'His own original remarks are delightful.' Most of the book is devoted to the Airedale terrier, Lola, that is reported as doing difficult problems in fractions, telling time, and showing considerably more thinking capacity than the average college president. Maybe so, maybe so, but I should want to know more about it before believing it.

Pen-and-ink impression by GERALD VAN DER HEYDEN

Dr. Alexander Graham Bell, inventor of the telephone, who was responsible for the early teaching of Helen Keller, tried for years to teach dogs to talk. But his efforts were futile.

Some years ago scientists were much interested in the astonishing feats of 'Don, the talking setter,' owned in Germany. He was supposed to have a speaking vocabulary of eight words, by which he could be induced to say when food was present and to answer when certain questions were asked. But an investigation showed that the questions had to be always in the same order to get the right responses, and even the dog's barking sounds required considerable imagination to be interpreted as words.

As another approach to this question of dogs' reasoning powers, L. T. Hobhouse, in England, made observations of dogs' ability to find their way about a new place. He says:

I carried a fox terrier in a box to a room on the first floor of my house and asked her master to call her from outside. After being let out from the box and going to the window, she appeared for a short time to be puzzled, but soon started off and went steadily out of the door, downstairs, out of the house door and around the corner to her master. Her total time was twenty-seven seconds. Apparently she was guided by what in a human being we should call common sense. Familiar with houses, staircases, rooms, and doors, she would understand that to reach her master she must get out of the room and out of the house. She would be familiar with the stairs as leading her to the ground floor. She would judge that, though leaving the house in the opposite direction, she would be able to get around to where her master stood.

None of the dogs which I have observed in this connection, with the exception of one puppy, showed any hesitation in endeavoring to get out of the house by however roundabout a way, if their master was outside, or to run around to some door which they had passed through before if he was inside. That is to say, full-grown dogs could use, in different degrees, their experience of houses as structures that have passages, doors, and staircases. On the other hand, they had considerable difficulty in locating a room from outside, particularly if it was upstairs.

This last isn't surprising. It is often difficult even for human beings to identify an upstairs room by the outside window.

I am reminded here of my dog Jimmie, who will leave choice food to play with a rubber ball. He knows that I usually keep a small ball behind a picture on a certain mantelpiece and when I ask him, 'Where's your ball?' or even if I only whisper the word 'ball,' he goes and stares up at that shelf. This has brought him to the natural inference that in all well-regulated houses rubber balls are kept on conveniently located mantelpieces. If I have him with me when calling at a friend's home, and mention his ball, he immediately hunts up a mantelpiece and stares at it.

Once he saw me put his ball on a shelf in a closet. The idea evidently occurred to him that perhaps the shelf ran clear through into the next room. He dashed about to have a look on the other side of the wall. In a moment he came back looking foolish—which seemed to me uncalled for, inasmuch as he had displayed intelligence in thinking that the shelf might go all the way through.

William McDougall, former professor of psychology in Harvard College, has conducted experiments to determine the intelligence of dogs. He suggests that 'what we need is not experiments which show how little intelligence an animal may display under favorable conditions, but rather experiments which show how much an animal may achieve in the way of intelligent adaptation of behavior under the most favorable conditions and after continued and varied training upon tasks of the same general nature.'

One of McDougall's experiments was with a 'lively sociable Airedale terrier who, up to middle age, had never been trained to tackle mechanical problems.' The material for the experiment was a wooden box with a lid hinged at one side, having a broad handle projecting from the hinged side. Pressure on this handle would open the lid. McDougall fed the dog by putting part of his biscuit in the box. The dog tried to obtain these pieces in the box and quickly discovered that he could open the box by shoving up the front edge of the lid with his nose. His master then shaved down the margin of the lid until the front edge could sink below the rim of the box and rest there upon a ledge.

The dog's first method was now of no value, but he pushed his nose so vigorously against the box as to overturn it. Thereafter the experimenter kept the box fastened to the floor. Finding now the second method futile, the dog scratched and bit and fussed all around the box until, after some minutes, he depressed the handle with his forepaw and so lifted the lid. Immediately he released the handle and rushed to the front of the box but the lid fell back into place. Soon he depressed the handle once more; this time he quickly inserted his nose under the lid before releasing the handle and so obtained the biscuit. With repetition he became more expert and quicker in this simple train of action.

His master then added a simple latch consisting of a slat of wood about eight inches long, loosely pivoted at its middle on the front corner of the box. This prevented the opening of the lid until the latch had been turned. At first, the dog was thwarted by this latch, but soon learned, in random fashion, to push the latch aside. He would usually begin by pressing his paw on the handle. If this did not raise the lid he would then run around to the latch and push it with his paw and then in turn press the handle. Sometimes he would not push the latch far enough; then he would return quickly and give it another push.

WHEN the dog learned to deal with both the handle and the latch, McDougall added the third obstacle, a board which, when set vertical, prevented the depressing of the latch and had to be pushed aside before the lid could be opened. The dog soon learned to deal with this also and would manipulate it along with the latch and handle with either his nose or paw.

Mr. McDougall describes another of this dog's achievements:

> Though this experiment was not observed under laboratory conditions, it was none the less highly significant. The dog would seek and find a piece of biscuit hidden in the room. After he had played this game many times, it was varied by taking the biscuit to other rooms; with very little experience of this more difficult task, he learned to sit listening intently in a room downstairs, while the biscuit was hidden in any one of a number of rooms upstairs. Then, when the hider returned and gave the signal, he would dash upstairs, and generally would quickly enter the right room and find the biscuit.
>
> The mechanist, of course, will say that he was guided by the scented trail; but the whole house, inhabited as it was by a large family, must have been saturated with a multitude of odors for him. What exactly his mental process was it is impossible to say; but it would, I think, be pedantic to deny that it involved an intelligent appreciation of the whole situation, to which an acquired knowledge of the house and of its various parts was essential—an appreciation and a knowledge analogous to our own.

Those who are inclined to exaggerate the dog's reasoning powers often say that the behavior of a dog in trying to get through an opening in a fence with a stick in his mouth shows that he is capable of real thinking, because, after a little experimenting he takes the stick by the end and drags it through instead of trying to get through with it crosswise in his mouth. The only objection to this argument is the strong probability that it is untrue. I have frequently watched dogs trying to get through a small opening while carrying a stick and never yet saw one that had enough sense to take the stick through endwise. Lloyd Morgan declares that in his experiment with a fourteen-month-old fox terrier, the dog seemed to be incapable of perceiving the nature of the difficulty and only imperfectly learned to overcome it after many ineffectual trials and failures.

Romanes tells of a dog annoyed at the sound of apples dropping on the floor in a loft overhead. When he was taken to the place and saw what caused the sound, he ceased to pay any more attention to it.

ANOTHER story collected by Romanes was of a dog that took his master's coat to a larder where meat was kept, presumably to compel the master, in seeking the coat, to visit the larder and be reminded to offer the dog a little refreshment.

A friend of mine in New York City told me of a dog belonging to friends of his who spent a summer in the Catskills. On their way back to their home in New York, the dog became separated from them in New Jersey. They gave him up as lost. The next day the dog appeared at their door. He had had to swim the river, or else had contrived to take the proper ferry, and then had to make his way across the perilous streets of the metropolis with all the countless distractions and conflicting sidewalk odors that might have baffled him.

The fact is that nothing is so distracting to a dog, no matter how much intelligence or how good a nose he has, as a great city. Old Badger has as keen a scent as any dog I have ever known, but once he became separated from me in a New York hotel, wandered into the street, and was completely bewildered. It was as if all his powers of observation, including that through his sense of smell, were numbed through fear. Even when I reached him and took hold of his collar, it was some minutes before I could make him recognize me.

The difficulty that most dogs have in trying to find their way about a city may be further complicated by the fact that instinct leads them to proceed in a straight line directly toward their destination. City streets, turning at right angles, make this impossible.

'She Told Me She Loved Me'

WALTZ QUADRILLE

DANCERS sing while executing the movements in the ballroom, on the playgrounds, at summer camps, or on the lawn.

Learn the words of the song first. Formation the same as any square dance.

THE SONG *or* CALLS

First couple down center, and there they divide . . . . *4 bars*

(First couple join nearest hand with partner, waltz forward, passing between the couple standing opposite.)

Lady goes right, and the gent goes left . *4 bars*

(The lady turns to the right, and gentleman to the left, each returning outside the set to original place.)

Honor your corner and don't be afraid . . *4 bars*

(All turn and bow to corner lady.)

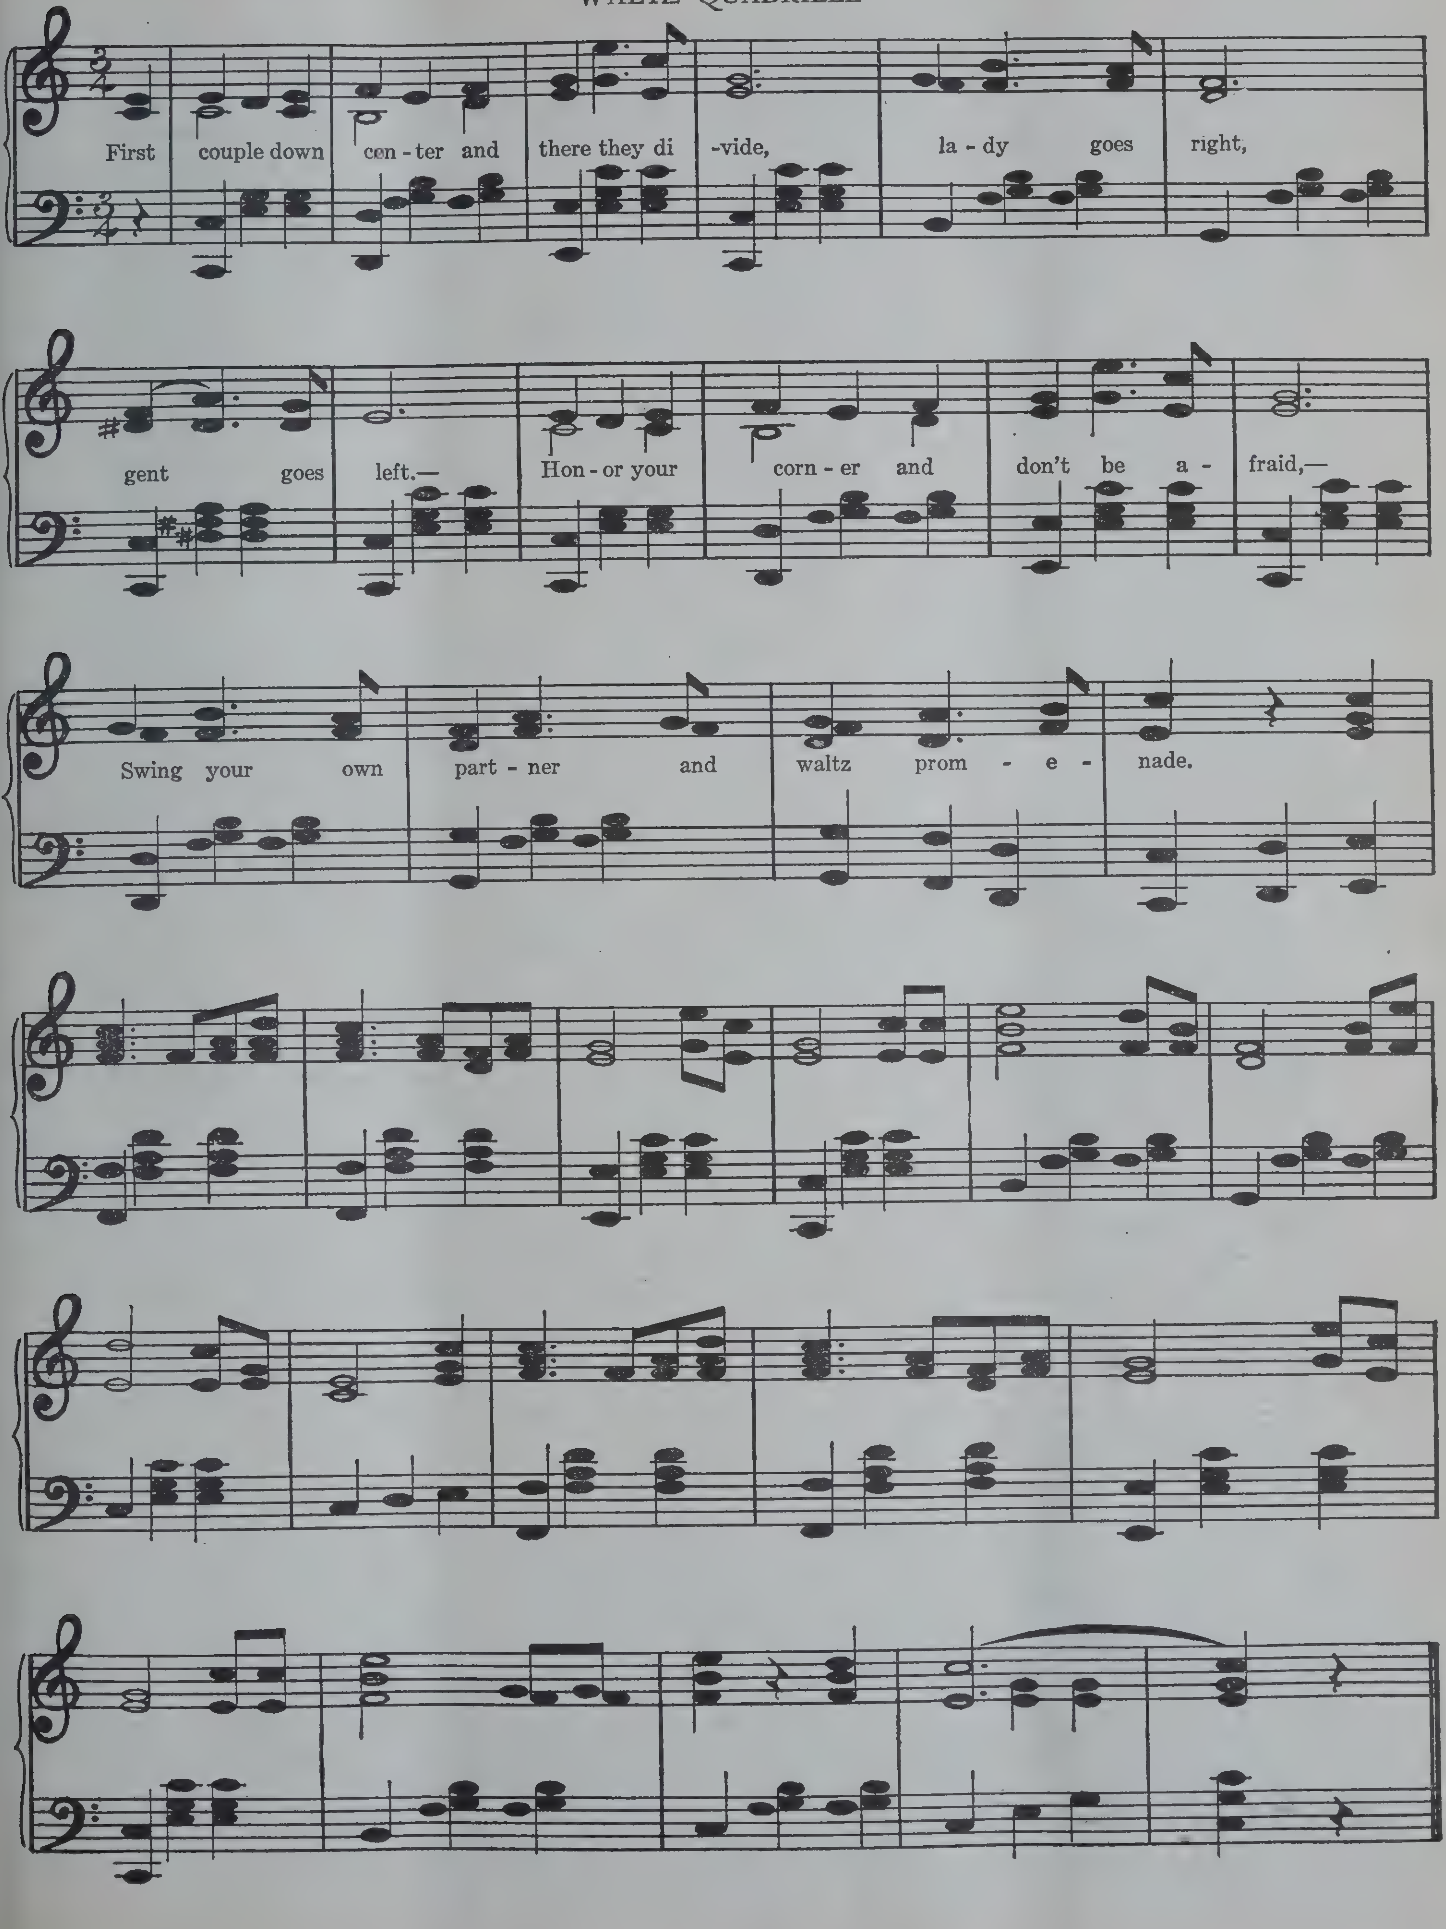
Swing your own partner and waltz promenade . . . *4 bars*

(All turn partners and waltz around the outside of the set while humming the next 16 bars of music.)

The next couple on the side then begin the movement. Four times in all. The last 16 bars may be omitted if instrumental music is not available.

She Told Me She Loved Me

WALTZ QUADRILLE



First couple down cen - ter and there they di -vide,
la - dy goes right,
gent goes left.—
Hon - or your corn - er and don't be a - fraid,—
Swing your own part - ner and waltz prom - e - nade.

CAN YOU TELL ME?

Question. What was the Meeker Massacre?

Answer. On September 29, 1879, the agency at White River, near the present town of Meeker, Rio Blanco County, Colorado, had been subjected to a brutal attack by a band of twenty or thirty Utes, led by Douglas, one of their chieftains. All the men were killed, most of the buildings burned, and the women carried into captivity. When General Merritt arrived at the agency on October 11, he discovered the mutilated bodies of the slain lying near the buildings and along the trail. Twelve men in all had been killed, including N. C. Meeker, agent. Douglas was compelled by Ouray, the head chieftain of the Utes, to surrender his captives in November.

* * *

Q. What is the Locarno Security Pact and what nations agreed to it?

A. At Locarno, Italy, on October 5, 1925, representatives of Great Britain, France, Italy, Belgium, Germany, Poland and Czecho-Slovakia, met for the purpose of insuring mutual security from war. As a result, the Rhine Security Pact was agreed to by Germany, Great Britain, France, Italy and Belgium. It binds the signatories to accept the existing frontiers established by the Versailles Treaty, and to the demilitarization of the Rhineland. Germany and France and Germany and Belgium mutually undertook not to attack each other, but to submit possible disputes to judicial decision, to arbitration by a permanent conciliation commission, or to decision by the Council of the League of Nations. A similar treaty of security and arbitration was negotiated between Germany and Czecho-Slovakia. These treaties, initiated at Locarno on October 16, 1925, signed in London on December 1, 1925, and subsequently ratified by the powers concerned, were to go into effect when Germany was admitted to the League of Nations.

* * *

Q. Where was Fort Kaskaskia located in Revolutionary times?

A. Fort Kaskaskia was situated in Illinois where the Kaskaskia River flows into the Mississippi, about halfway between the Ohio River and the Illinois River.

* * *

Q. Has the time expired for making applications for adjusted compensation?

A. All applications, whether by the veterans themselves or their dependents, must, in order to receive consideration, be made on or before January 1, 1928, except that, in the case of veterans who died during the six months immediately preceding that date, dependents may make application at any time within six months after the veteran's death.

* * *

Q. What was the treaty of 1916 with Haiti and why was it made?

A. The treaty between Haiti and the United States was proclaimed May 3, 1916. This instrument, modeled upon the American Domingo convention of 1907, was designed to secure political stability and economic development in Haitian affairs by a political and fiscal protectorate to remain in force for a period of twenty years. By its terms the president of Haiti appointed, on the nomination of the President of the United States:

(a) A receiver-general of customs to take charge of the custom houses.

(b) A financial adviser to be attached to the ministry of finance.

(c) American officers to organize and command a Haitian constabulary (gendarmerie) which was to replace the Haitian armed forces; such officers to be later succeeded by qualified Haitians.

(d) Engineers and doctors to supervise the public works department and public health services respectively.

Haiti agreed not to increase the public debt and not to modify the customs duties without the consent of the United States; the United States undertook to intervene when necessary for the preservation of Haitian independence and the maintenance of a stable and effective government.

* * *

Q. What were the military expenditures of the Army and Navy for the fiscal years 1913 and 1926?

A.

	1913	1926
War Department Military Establishment	$112,246,000	$271,260,000
Navy Department	134,092,000	312,743,000

For accurate comparison, the amounts for 1913 (prewar period) should be corrected for cost-of-living for the fiscal year 1926, by 176.4.

* * *

Q. By whom was the Erie Canal, which was finished in John Quincy Adam's administration, built and how much did it cost?

A. In 1816 Governor Tompkins of New York urged that the canal be built by the State of New York; on April 15 the legislature authorized the construction of the canal. On July 4, 1816, ground was broken at Rome and on October 26, 1825, the first canal boat, *Seneca Chief*, left Buffalo for New York. The cost of constructing the canal was $7,143,789.

* * *

Q. Please give me an account of Matthias Baldwin.

A. Matthias Baldwin, inventor and manufacturer, was born in Elizabethtown, New Jersey, December 10, 1795. He received a good common-school education, was apprenticed to a jeweler, later commencing to manufacture jewelry on his own account. He made constant improvements in the machinery and methods of his trade, inventing among other things a new process of gold plating now very generally employed. In 1825 he founded a partnership for the manufacture of bookbinding tools, machinery, and dies, to which was added the manufacture of cylinders for printing calicoes; he shortly afterward completed the great improvement of etching devices on the steel mills, which transferred them to the cylinder. A small stationary engine constructed by Mr. Baldwin in 1828 contained an original improvement in the method of imparting rotary motion, which proved the germ of the ponderous marine engines now in use. By degrees the manufacture of steam engines became the most important department of his business until in about ten years he was recognized as the foremost engine builder in the country. Encouraged by his success in reproducing a working model of a locomotive imported from England, he directed his attention to the building of better locomotives; the first locomotive from his shop was completed and tested in a grand public trial on November 23, 1832. His work in reality made possible the heavy freight traffic of the present day; and in other respects the science of railroading has been advanced by the inventions of his fertile brain. He died September 7, 1866.

* * *

Q. Please give me an account of the Sand Creek affair in Colorado.

A. On November 29, 1864, Colonel Chivington with a company of soldiers attacked the Cheyenne and Arapahoe Indians encamped upon Sand Creek, a tributary of the Arkansas. Chivington had given definite orders to his men to show no mercy. He took the Indians completely by surprise and many of them, thinking the soldiers had mistaken them for a war party, ran toward the troops with their hands raised in token of peace, but this was of no avail and they were shot down without consideration. Those who did fight were quickly slaughtered, as were the women and children. The soldiers scalped and mutilated the bodies in a manner unsurpassed by any bloodthirsty savage in the past. About two hundred of the warriors succeeded in escaping and were not apprehended. In January, 1865, Congress took heed of the wave of indignation which had spread over the land and ordered an investigation to be made of the massacre. The testimony showed that Black Kettle (chief of the Cheyennes) hoisted a white flag over his lodge when the troops were first seen and that it was disregarded by Chivington. On the other hand, it was proved that numerous scalps taken from the heads of white people were found in the lodges, some of them still fresh. Other articles of plunder which were recognized as having come from Americans were discovered.

* * *

Q. Will you please tell me how the nickname 'doughboy' originated?

A. The term, 'doughboys,' was apparently first used among the Federal soldiers about 1862, during the War of Secession, being suggested by the large globular brass buttons of the uniform, which had a fancied resemblance to dumplings or 'doughboys.' Another suggested derivation dates the word back to the Mexican Campaign of 1846-47, tracing its origin to the adobe huts in which the United States infantry were usually quartered.

BRIEFLY TOLD

IN HAWAII THE TERM 'motor cop' is not slang but is a name applied to the territorial police mounted on motorcycles.

THE LAND AT THE southern tip of Manhattan Island, including a park of some twenty-one acres, is known as The Battery, having taken its name from the Whiteside Battery. This battery, consisting of ninety-two cannon, was erected there in the closing years of the 17th Century.

THE GIANT OAKS OF Mur, near Loudeac, Brittany, which Corot never tired of sketching and painting, must fall beneath the woodman's ax as the logs have been sold to a timber merchant.

CANADA HAS 18¼ million horsepower at ordinary minimum stream flow (i. e. throughout the year), rising to more than 32 million for at least six months of the year.

AMBROSE HIEROMONACHUS PAMPERES published a poem in 1802 consisting of 160 pages, each line reading the same backward or forward as, 'Lewd did I live evil I did dwel,' and so on.

THE HISTORIC RIGHT of a dog to chase a cat was upheld in the Minnesota legislature when a bill permitting any person to kill a dog found chasing that person's 'domestic animals or poultry,' was changed to read 'livestock and poultry.'

EXPERIMENTS CONDUCTED by two German physiologists show that if cows and goats are given music with their milkings they will yield increased quantities of milk.

IN THE OPINION of dancing instructors, tall persons with poise and balance make the best dancers.

AIRSHIPS OPERATING between South American capitals and flying over the mountains for the accommodation of Caribbean Sea travelers charge fares according to weight.

RURAL AND STAR ROUTE mail carriers operating in any part of America are instructed to report all forest fires to the nearest warden.

A WELL DIGGER at Selsey, England, at a depth of twelve feet came upon 'running sand.' This was pumped out continuously for a week forming a flat mound eighteen inches high and twelve feet in diameter. In three days the sand was dry and a week later, it was densely covered with a crop of shepherd's-purse, a weed which was not plentiful in the garden surrounding the well.

THE NOISE OF TWO goldfish swimming in front of the microphone, amplified ten million times, sounded to the radio audience like the drumming of a horse's hoofs on a hard road; the beating of a man's heart sounded like the thump of a ship's engine; and the ticking of a watch, similar to the crashing of a compressed air drill.

W. L. HENLEY, of St. Joe, Arkansas, has been working on a device to protect the peach buds which are often started by the warm weather of February and killed by the freezes in March. He buries a cake of ice at the root of the tree thus chilling the ground and retarding the buds until after March.

WHEN THE EXPERIMENTAL FROGS from his laboratory, valued at $462, were stolen, Percy Viosca, Jr., was able to identify and reclaim his property by their voices. This was in New Orleans. The frogs were bullfrogs from the North.

ONLY ONE IN EVERY TWENTY-FIVE of the Parisian girls attending trade schools train to be stenographers or secretaries. They prefer dressmaking, millinery and similar 'women's work' to these 'dressed-up' jobs.

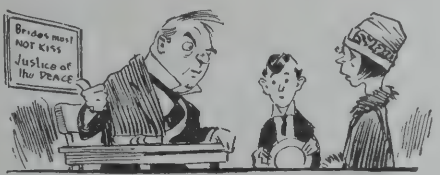
IT HAS BEEN ESTIMATED that there are 6,000,000 bridge players in the United States.

A VIOLINIST has discovered that when she plays certain high notes she experiences a severe toothache. On examining the tooth the dentist found it to be perfectly sound. It never aches except under the influence of the high notes of the violin.

FOR THE SAKE OF ECONOMY many couples in a workmen's quarter in Paris are married en masse. They assemble every Saturday, line up, and the principals and witnesses sign the register as they pass into the big 'wedding salon' of the city hall.

AFTER THE REIGN of Mary Tudor in England there was a decline in Roman Catholicism and fishermen began to suffer. Queen Elizabeth, to save the situation, passed the following decree: 'Eat fish every Wednesday or pay me £20.'

FAMOUS MEN have employed peculiar methods of recreation. Spinoza, world-famous philosopher, joined in the trivial conversation of the family with whom he lodged or provoked spiders to fight each other; Socrates played with the children; Balzac amused himself with a collection of crayon portraits; Dr. Samuel Johnson, by jumping over tables and chairs; and Dean Swift by running up and down the steps of the deanery.



Brides must NOT kiss Justice of the Peace

AS THE RESULT of an incident at a recent marriage performed by him, a justice of the peace in Missouri has posted the following sign in his office: 'Brides must not kiss the justice of the peace.'

THERE ARE MORE than two hundred separate and distinct forms of money in China.

A RESOLUTION was adopted at a conference of local education authorities in England and referred to a committee of teachers to introduce a course in laughter into the curriculum of the schools. The authorities believe the British to be too sober and sedate.

A FLOCK OF HENS has been provided to lay eggs so that chimpanzees brought from Africa by the Soviet government for the 'monkey farm' in the Caucasus may feel at home. In their native habitat chimpanzees steal and suck eggs.

AFTER QUEEN VICTORIA fell in love with her cousin, Prince Albert of Saxe-Coburg-Gotha, she realized that the task of proposing to a queen was a rather appalling one for a timid young man. She, therefore, proposed.

A PENNSYLVANIA GERMAN almanac, printed in Lancaster in 1779, claims the honor of having originated Washington's favorite title. The frontispiece presents a figure of Fame holding a trumpet and a medallic portrait, laureated and inscribed, 'Washington,' while from the trumpet proceed the words: 'Des Landes Vater'—'the Father of the Country.'

A COW OWNED by Miss Anna Penrose of Sydney, New South Wales, has had an artificial leg for the past six years. The animal has lived in perfect health and has been one of the best milkers of the herd.

THE METHODIST EPISCOPAL church at Sweetwater, Tennessee, has provided baby beds, rocking chairs, dolls and toys for the amusement of little folk while their parents attend services.

OUT OF THE 650 inhabitants of Lucas, Kansas, fifteen are octogenarians, ten men and five women. Five of the men are veterans of the Civil War. The combined ages of the fifteen aggregate 1,250 years.

THE FRENCH MINISTER of war has raised the official allowance of the army cats, whose duty it is to run rats and mice out of army storehouses, from four to ten centimes a day.

VALENTIN LE PAGE, a crippled Parisian chair mender, has lived for three years along the highway in a battered bathtub roofed with boards.

THE MENU OF THE LUMBER camp today includes fancy loin of pork, boiled ham, tongue, special sausage, fruits and puddings in contrast to the salt pork, corned beef, thick bacon, beans, flapjacks and fresh meat three times a day of twenty years ago.

FIVE THOUSAND DOLLARS was paid by Colgate University for one of the twenty-five dinosaur eggs found by the American Museum of Natural History in the Desert of Gobi, Mongolia. The egg is said to be 10,000,000 years old.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S Page this week discusses things that never grow old.

* * *

'The Cow's in the Corn,' a characteristic New England poem by Robert Frost, author of *North of Boston*, appears on page 2 of the cover. It is a story as well as a poem—for which Gerald Van der Heyden has furnished the art.

* * *

Vachel Lindsay, nationally known poet and writer, has caught the spirit of America in his story of the great Northwest, with its pioneers, Indians, covered wagons, mountain peaks and prairies. He goes into the inner life and history of this vast region and shows whence its great fascination comes. 'Sun Mountain is the most beautiful mountain in America,' he declares. (p. 1)

* * *

With 700,000 persons homeless, with scores drowned, with hundreds of thousands of animals dead and the property loss mounting high in the millions, the Mississippi River flood is easily the greatest cataclysm in the history of the nation. Here is an eyewitness account of the disaster by a member of the editorial staff of THE DEARBORN INDEPENDENT, the first of a short series which will give our readers first-hand information of the tragedy. (p. 3)

* * *

That dogs are guided by instinct is what people commonly believe, but Fred C. Kelly in the last of his series of dog articles thinks that they may also be directed by reason, and gives instances to show that they can reason things out in almost a human way. (p. 4)

* * *

Some people go through the world with their eyes shut; at least they only see things that are brought directly under their notice. This is especially true during a ramble in the country when bird and flower and bee are passed unheeded. But to the door of the city dweller there also come wild things in nature, insignificant in their way, but full of interest to observers. Robert Sparks Walker, southern naturalist and writer, is one of these observers. His story is full of subtle charm. (p. 6)

* * *

If you don't work you can't play and if you don't play you can't work. This sounds like still another version of a very old and trite saying. It is with the latter part of the sentence that H. G. Salsinger deals. He thinks that, in athletics at any rate, if you don't relax you can't win. This applies to everyday business as well. (p. 7)

* * *

Did you ever invite a number of people to your house and find that in the social circle they somehow fitted in rather badly, no matter how assiduously you strove to promote smoothness and harmony in order to make the evening a success? Lady Cynthia Asquith, from the abundance of her experience as a London society woman, writes entertainingly on this subject. Lady Cynthia handles social problems of this nature with piquancy and humor. (p. 8)

* * *

Another of the articles on Holland by that distinguished traveler and publicist Hilaire Belloc deals this week with The Hague, which, although the capital, is perhaps the most medieval of Dutch cities. The Hague Peace Tribunal—which did not stop the World War however—was for a time a familiar term which has since been lost in the League of Nations fiasco. Facsimiles of pencil sketches by Edmond Warre, an English artist of note, illustrate the article. (p. 12)

* * *

The art of the marionette man goes back many centuries. *Punch and Judy* is a tragedy that antedates *Hamlet*, and the funny little man with the big nose has appeared before innumerably greater audiences than the Prince of Denmark and is still delighting all ages and nationalities. All sorts of people are fond of the little men and little women of the marionette world, and Tony Sarg is the modern Gulliver in this stage-land of Lilliputians. Janet Mabie, whose articles on things quaint and curious are already familiar to our readers, tells us the story of this midget stock company, including its origin. (p. 14)

* * *

Hugh Walpole gives the second part of 'The Man Who Lost His Identity.' It forms a happy conclusion to an excellent story. (p. 16)

* * *

The Amazon Valley is a weird and wonderful region, much of it unexplored. C. R. Aschemeier, a traveler who spent some months in the Congo region of Africa, recently adventured into the valley and had some exciting experiences. (p. 19)

* * *

This week the singing dance is 'She Told Me She Loved Me.' These singing calls are infinitely useful in memorizing the various movements. (p. 29)

* * *

The front cover design, by Gerald Van der Heyden, represents a quaintly dressed couple catching an old-time train, a train which had an engine that burned wood. It brings back the period of carpetbags, crinolines, stovepipe hats and Paisley shawls.

REMARKS BY OUR READERS

Rochester, New York.

It is not sufficient to say I read THE DEARBORN INDEPENDENT because it is 'different': Its interesting articles are so wide in range, condensed, purposeful, instructive; its editorials fearlessly straightforward; its bits of philosophy a help to right thinking, a stimulus to right living; it has a mission and a place.

Preëminently, I have implicit faith in its integrity and would consider myself the loser did I neglect to read it.

JAY O. KARKER.

Toledo, Ohio.

We have learned to appreciate the magazine very much. Particularly is this true of Mr. Ford's page. Permit me to compliment you upon your many fine articles and the common sense expressed in the magazine.

W. H. YEASTING,
President,
The Commercial Savings Bank
and Trust Company.

Peoria, Illinois.

I have been reading your paper for some time and at last I have found something to object to. In your issue of April 30, in the descriptive matter under the cut of George L. Hathaway, you speak of a 'naval' orange tree. This would seem to imply that the orange tree was a seagoing shrub, which, I believe, is not a fact.

C. F. LAUREN.

The Rice Institute, Houston, Texas.

I should like to express my opinion, after taking over fifty-two copies of your magazine. The most important and suggestive point one receives on first taking up a copy is the variety of information—of interest particularly to the college boy or girl or to those who have had no such educational advantages. The current problems of politics, religion, schooling, et cetera, are well covered with the trend of events. Those subjects with which we are not familiar, such as anthropology, astronomy, literature and history, are well covered, and new interpretations are added. Thank goodness! you print novels very sparsely. All in all, there is something to please everybody—that is, the impossible has been accomplished.

JOHN H. WRIGHT.

Aetna, Kansas.

Although we take a number of high-class magazines, there is none that could take the place of yours.

There is much 'neglected truth' in it that is vital to the American citizen of today.

I get lots of 'kick' out of the criticisms. How some people do squirm when you step on their toes.

VERNON D. WELLS.

At the top of the world, in north Greenland, the Danish Ethnological Expedition found that the inhabitants leave their houses in spring and camp in sealskin tents such as the one here shown. So we find the familiar spring moving even in far north corners of the globe. Although the climate of Greenland is very cold, in the long summer day the warmth permits of vegetation in sheltered places, even in the most northern parts. Agriculture on a large scale, however, is out of the question, and the population lives by hunting and fishing, all else being imported.

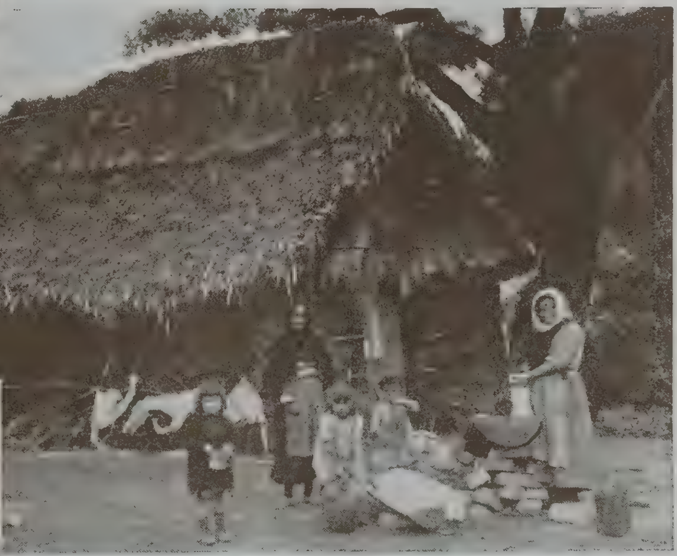
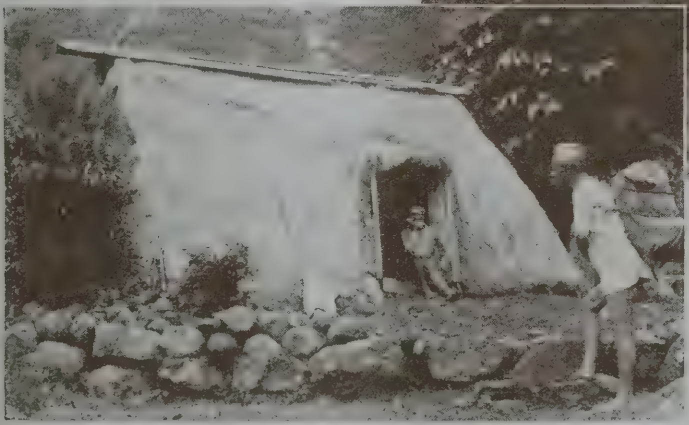
—Ewing Galloway Photo (J. C. Allen.)

America, too, in out-of-the-way country places, boasts rough-hewn log cabins such as this one, which has also the lean-to in the rear. Such houses remind us of the 'Old Kentucky Home' or the one in 'Old Virginny,' though this one happens to be in Indiana, near West Baden. It was built about 1861 and, as may be seen, is still in use.



—Publishers' Photo Service.

The very word, cork, derived through the Spanish corcha from the Latin cortex, meaning bark, indicates the source of much of that product, Spain. This primitive but well-made hut is that of a cork cutter in southern Spain. Cork is the outer layer of the bark of an evergreen species of oak which grows in the south of Europe and on the North African Coast. The bark is cut or 'stripped' first when the tree is 15 or 20 years old; after that, every eight or ten years, in July or August. The trees attain a height of about thirty feet and live to be 150 years old. The quality of the cork improves with each stripping, while the inner bark of the cork tree is a valuable tanning material.



Typical of the tropics, probably less skill or labor was required to construct this native grass hut in Tulele, South Sea Islands, than any abode here pictured.

ALL that the world needs for guidance of its life could be written on two pages of a child's copybook. 'A few strong instincts and a few plain rules' would set the world singing on its way, instead of tying it up in periodical blunders. Learning may need large space, thousands of volumes, vast experiment and failure and progress; but, strange to say, Wisdom carries very little such baggage.

PUFF-BALLS

Louis Untermeyer

'THIS patch,' they cried, 'will yield
No better crop than stone.'
And so they left the field
To mullein and the moon.

Its useless brook had dried,
Scorned even by the crow;
But when the mullein died
The moon began to plough.

He planted all his beams
Deep in a loamy ledge;
Then turned to simpler schemes
More suited to his age.

Still, careless of neglect,
The seeds remembered him.
They pushed; they stood erect:
First in a disc of flame,

Then, in their sturdy right,
A host of ragged suns,
And last, those balls of light
More delicate than the moon's.

And still they were ignored,
Waiting from dusk to day,
As though the moon deplored
His natural progeny,

Who, high above despair,
Strained to re-
join the moon
Sliding through
venturous air . . .

One morning
they were gone

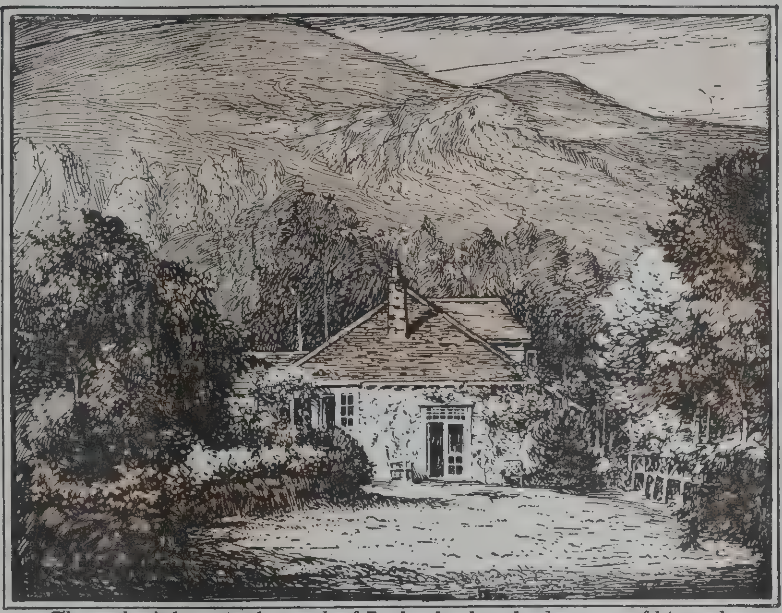
LITTLE ESSAYS *From a* NORTHERN COTTAGE

By HUGH WALPOLE



The author's home in the north of England, where he does most of his work.

On Coming HOME

Illustrated by GERALD VAN DER HEYDEN

SO MANY famous gentlemen from Horace downward (and I daresay Chinese and Egyptian wanderers long before Horace) have written about the joys of coming home that it is always an audacious proceeding for anyone in these latter days to attempt it. We know how Ulysses experiences it and Chaucer and Lady Macbeth and Uncle Toby and Emma Bovary and the hypersensitive hero of Monsieur Proust's endless novel and the lady in the cottage on the top of the hill who came home to find the beetles reigning on the kitchen floor and ordered two large cats immediately, she hating cats and swearing that she would never have any in the house.

My own homecoming has been a little different from any of these but then, of course, every returned wanderer feels that his homecoming is different. I will insist, however, that this recent homecoming of mine has been different from all my other homecomings and I don't know anyone anywhere who has had more homecomings than I have, it being my passion to consider any place where I have spent a night as home. And my habit is to take round with me on my travels a Chinese box in painted pigskin, and this box contains a necklace of amber beads, a Japanese ivory fisherman, a small water-color drawing of my own hills and a photograph of my cottage. The effect of this is that when I have been for five minutes in my hotel room, have laid my things on my dressing table, have gone out along the main street to survey the town and then half an hour later returned to my room again, that is a homecoming.

It is generally supposed that poor bachelors can have no home, they are pictured always as miserable persons living in uncomfortable apartments tyrannized over by a hostile servant, or if not that then at least over-cheerful uncles in houses filled with noisy and presumptuous children, houses that only want them for the things that they have in their pockets or for the games that their tortured brains are able to invent.

I suppose that it is true that no bachelor can have a home unless he has a passion for owning things; a married man may own nothing at all and live in an empty barn but his wife and children make, it is supposed, a sufficient home for him. During my recent journeys in America, how many eager gentlemen have I encountered in trains who were panting to return to their wives and children! They regarded me always with tender but rather scornful pity when they learned that I was a bachelor. 'Ah, then,' they would say, 'you have no home to come back to,' and they would smile proudly.

Indeed, I suppose that I must admit that I have hitherto cheated myself as to what homes really are. When I was a child I was for a long while alone in England pressed upon reluctant relations or buried as a mercenary bribe in the nests of poverty-stricken clergymen. And then when later on we did have homes in Durham and London they were not in sober strictness homes to me because my parents seemed always to be camping out, the furniture in the drawing-room and dining room appeared to be ready at a moment's notice to spring into another house; it had an expectant and restless air.

Afterward I had a real home in Cornwall, a cottage the size of a cigar box clinging to the cliff over a stormy little bay. This seemed to be a real home to me but I never owned it; it was owned by the banker of the village who would come sometimes with his wife and walk over it and say that this should be done here and that there. This shook, I must confess, my belief in my own ownership.

But from my earliest days I have had possessions to which I clung with animal ferocity. It began with a black featureless doll, very soon it became books—my first set of Walter Scott in limp pale-green leather, a fanciful edition of Shelley and the early volumes of the world's classics. Then in Cornwall I added a number of things, the model of a ship, a set of Arundel prints, two bad water colors by an aspiring painting friend of mine; then a dog, a mongrel who was called in reality Jacob but became afterward in the pages of certain books Hamlet.

It was Jacob, I fancy, who made my homecomings for the first time real. I had picked him up in the streets of London, a dirty puppy kicked along by the boot of an itinerant ruffian. The ruffian, when I made a protest, gave him to me. So the only home he ever knew, I suppose, was mine and it became a kind of duty on his part to see that when I came home from journeys I realized it. So he would lead me all over the tiny cottage in Cornwall pointing out everything as we went, the changes, the additions, the catastrophies, and regarding me through his peaked beard with a grave anxiety as to whether I was pleased.

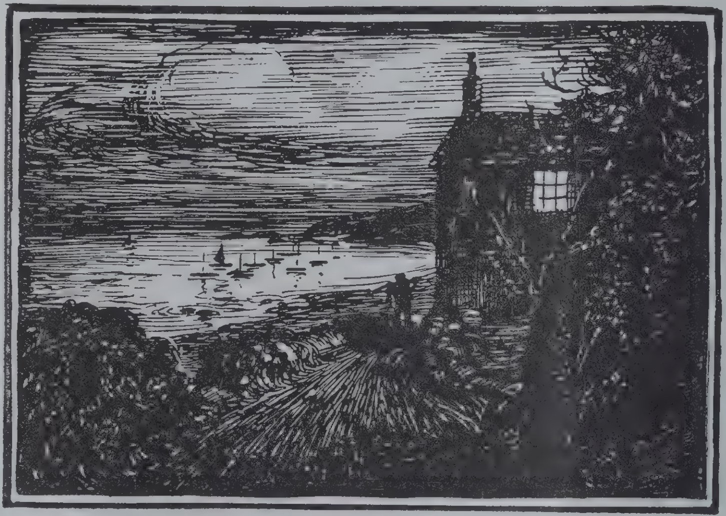
Jacob went the way of all dogs who today are and tomorrow are not; in plain words he ate too much and died of greed.

After that I had a house in London but I don't think that I ever quite came home to that. I had more servants than a bachelor should have and the house was over grand. No bachelor should live in a house with more than half a dozen rooms because he can't be in all of them at once and it ends inevitably in his camping in one or two and then the others go dead with neglect. I came home to pieces of this house, fragments of it, here a wall and there a corner, but always after five minutes of warm recognition I would suddenly tumble against a block of cold indifference that made me feel that I was a stranger there and had no right to call it home at all.

But from the first blessed moment when I saw this present abode of mine I knew that it was home. I came upon it by accident; I had been searching the district for a week or more and had seen nothing at all; I was in the car starting for Edinburgh when someone stopped me and said that he knew of a little house with a beautiful view of the lake and that it had 'To Be Sold' in the corner of the little garden. So back I went and I climbed the steps, saw the view of the lake, surveyed the sitting room and the thick quiet stones of the walls, turned to the elderly lady who owned it, and five minutes later had purchased it.

My solicitor, when I told him of my rashness, was horrified; his dominating idea from that moment onward was that as soon as possible I should get rid of it—there must be something wrong with it, all sorts of horrors would be discovered. I agreed with him, it seemed to be impossible that there shouldn't be something wrong with it, but as a matter of fact there was not and has not been to this day.

I have come home to it a good many times since that first occasion and each time it has had a special quality of its own. For one thing in this northwestern quarter of England the weather is very uncertain; that is, in the estimation of many worthy persons, to put it quite moderately, it has the reputation of being the wettest spot in England, and indeed only two miles away at Seathwaite there is the heaviest English rainfall.



But what no one who has not lived here realizes is that the weather in these parts is almost vocally personal; it has quite as many moods as a vain and spoiled woman or rather, as I would prefer to put it, as an exceedingly healthy and animated child who doesn't know what to do with his high spirits. It doesn't merely rain here as it does in the south, it rains in a thousand different ways. Your homecoming is generally accompanied with rain but it may be soft rain with a gentle purr in it, or a perfect 'plosh' as they call it, the buckets of heaven being emptied, or thin silver rain lighted with a strange shine, or whispering rain that you cannot see at all but only hear and feel, and it seldom lasts for more than an hour or two without a break, with the result that just when you begin to be irritated with it, it turns and smiles on you, offers you a piece of blue sky and a sheet of sun on a distant hill.

But what I have felt on this particular homecoming is the peace of the rain. There are many very stormy days when the clouds rush over my cottage from the other side of the hill like torrents of smoke from an enormous conflagration and all the trees shriek and scream and the water of the lake is wild with anger, but it has chosen on this particular homecoming to rain so quietly that it is like a cool hand on my fevered brow.

It happens that I have come home at the beginning of May when the grass is starred with jonquils and primroses and the larch trees are brilliantly green so that the rain seems to be performing a special duty rather as someone goes round the house and rubs everything up before the master returns. I am not so arrogant as to suppose that the rain is doing this especial benefit to my garden for my flattery, but when you own a piece of ground, it is very difficult not to take the weather personally.

But the real thing that makes this homecoming different from any other is that I have learned at last to live for the moment. All my life, like many other of my fellow humans, I have been expecting next week to be perfectly wonderful. 'When Tuesday comes,' I have said to myself, and then when Tuesday comes it is the Friday following. But now this time it is actual realization that I am experiencing. When I sit in my library and look at my books I am worried no longer by wondering whether I shall ever afford a first edition in its original boards of the *Essays of Elia;* when I look at my Whistler etching on the mantelpiece of my sitting room I sink into it with a perfect content without wanting to possess the whole of the Venetian set.

The bathroom is small and six months in America have given me a kind of millionaire's complex about bathrooms, but after all, however many people there are in the cottage, baths with a little adroitness can be managed. My two silver birches are few beside the glorious birch trees of Vermont but they are mine and they know it; the pansies and wallflowers in the garden are neither orchids nor double carnations but I know no color the world over more marvelous.

And this is the placid and unadventurous contentment of middle age? Not altogether. I am aware, now that I have come home, of a thousand things to be done, of a million improvements to house and garden, character and work, health and ambition. Nor is it complacency; there is more complacency perhaps in restless dissatisfaction than in grateful acceptance.

The OLD MAN of the RIVER

By MAX BENTLEY

THIS is the record of a man who, at eighty years, says true happiness comes only to him who lives among the wild things of Nature. I will make it brief because he, Uncle Jim McMahon, is himself an economizer in words, and, besides, insists he has no story. His love for the finned and furred and feathered folk amounts to a life's passion; and yet, illogically, he snares them for his living, and has been snaring them for fifty years.

He is so old, is Uncle Jim, that you would think a good-sized beaver could whip him in a fair fight; but no, he catches 150 of them every year—and violates no law, either, for Texas has no conservation act worthy of the name, and its wild game is being skinned out at a fatal rate. And he is so ugly that he is downright beautiful. Once (he tells this story himself) he was sleeping in a prairie schooner as it jolted along a winding Rio Grande road. His brother Bob was riding horseback ahead—a custom of the country in an earlier day. Bob met a stranger, who, without a word, handed him a silver dollar.

'What's this for?' inquired Bob.

'Well,' the stranger said, 'I've always had a standing bet of a dollar that I was the ugliest man in Texas, but you win. Here's your money. So long.'

'Wait!' Bob called out. 'Both of us lose, neighbor. Hey, Jim, come out here and get your money!'

One of the places along the Rio Grande where 'Uncle Jim' has run his boat between perpendicular walls 1,500 feet high.
Right—Uncle Jim McMahon.

I found Uncle Jim McMahon on Mud Creek, sixteen miles east of Del Rio, Texas, and therefore the same distance from his river home. The Rio Grande rolls sullenly by Del Rio gathering strength for its semiannual onslaught on the cultivated valleys hundreds of miles south; and on the other side is Mexico. I had been following the river from El Paso, awheel, and for the last two hundred miles had been searching for Uncle Jim. The tradition of him had met me at every port.

He had been the first, and has been the last, to run the rapids of Santa Helena, Mariscal and Boquillas canyons, comparable to the Grand Canyon in height, steepness and sheer beauty; he was known and trusted by every revolutionary chief on the border; he was called 'The Old Man of the River,' or, by an affectionate younger generation, 'Uncle Jim'; his St. Louis fur-buying house had written him up as the world's champion beaver trapper, in a poor beaver land at that—the Rio Grande runs through an arid country almost without timber and is given to devastating floods.

He has a right to the title of champion. His season (voluntarily imposed on himself by himself, since Texas imposes none) is from November to March, and since 1874 his season catch has averaged 150 beavers. He is a beaver specialist—it is only occasionally, even in off season, that he will stoop to trap the plebeian species of the brushy uplands. The river is his home. He is happy nowhere else. But I found him skinning a skunk miles from the river and apologizing for it. He was out of potatoes and tobacco and was simply accommodating a ranchman friend willing to pay ten dollars a scalp to be rid of depredating animals.

Uncle Jim was born in Tennessee in 1845 and came to Texas as a boy of twelve. He entered the Texas ranger service on his sixteenth birthday, while the Civil War was raging. He has always been a frontiersman. When civilization pushed the Texas frontier westward he moved with it. He was twenty-nine when he pitched his first camp on the Rio Grande. He remembers the occasion well.

'It was right here near where Del Rio is,' he said. 'The moon was shining on the river and the stars were big and grand. I was moseying along the bank when I saw a fat, shiny beaver push out for midstream to head off a floating log. That night I counted thirty. They were purty things, sleek and brown, and all frolicking together. I decided right then to be a trapper—and I've been one ever since, right on this river.'

He has had no other occupation. Judge Roy Bean, the double-fisted 'Law West of the Pecos,' lived out his rip-roaring career at Langtry within

When *a* Mighty River *Goes* Mad

Wrecked Homes *and* Ruined Fields Are *in* Wake *of* Mississippi Flood

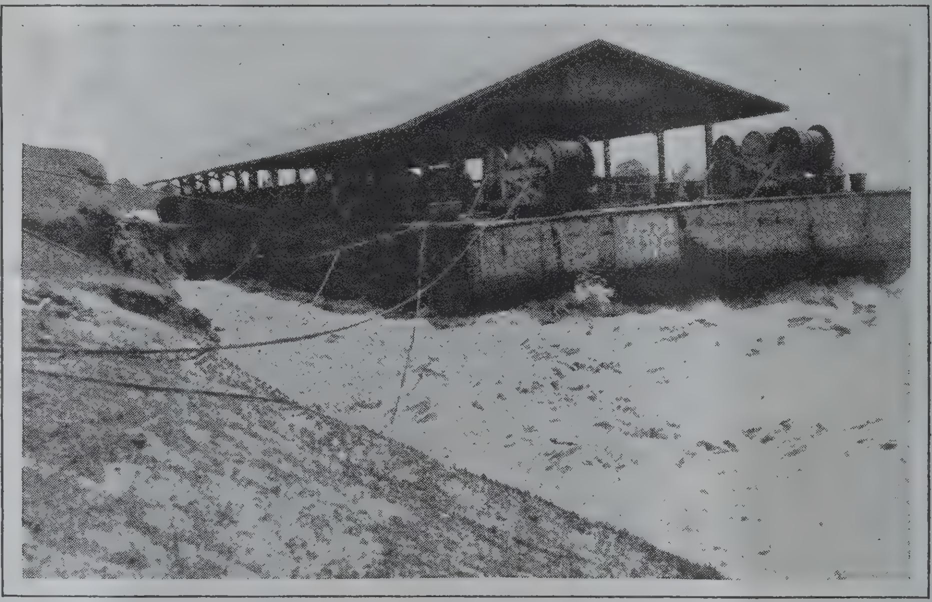
By PIERCE CUMINGS

THE story of the Mississippi Flood is a sickening repetition of man's defeat at the hands of the river. Levee after levee crumbled as the crest moved southward. County followed county under water, state followed state. Human beings perished by hundreds, animals by thousands. Property loss, which in the majority of cases means the entire livelihood of families, was counted in the millions.

The tributaries of the Mississippi joined in pouring death and destruction over the countryside. The Saint Francis, the White, the Arkansas, all broke their bounds. Farther south the Yazoo, the Red and the Atchafalaya rivers were filling, ready to double the spread of desolation.

In many ways the battle between man and river resembles the action of a great war. The fight is waged in sectors. Men are mobilized, moved, countermoved. Defeat in one sector means renewed efforts in another.

There are the front line trenches—the levees. There are the reserve forces of men and material in the rear. There is the same concentration of boats, automobiles, airplanes, ambulances, trains and trucks. There are great rows of tents, hundreds here, thousands there. There is the commissary problem—the feeding of the great army of fighters and the greater army of refugees.



Government barge, Atchafalaya River levee at the McCrea crevasse. It crashed through the opening shortly after this picture was taken. Part of the levee can be seen crumbling away.

The Memphis-Vicksburg sector was fought for—and was lost. North of Greenville the Mississippi tore away the levee, flooding the city and a large portion of the state to which it had given name. Ten thousand refugees were grouped in Greenville, as well as the 12,000 residents of the city. To evacuate these in safety presented a titantic problem.

Arkansas, already under water from the swirling onslaught of its namesake river, was made a vast brown lake when the Mississippi ate away levees below Helena. Town after town sent calls for aid to the Red Cross headquarters at Memphis. Boats picked men, women and children from levees, from tree limbs, from railroad cars, from housetops. Airplanes scouted overhead for those in remote localities, circling back when they discovered refugees to direct boats to the rescue.

Heroism was a matter of everyday routine. Relief workers placed their lives in jeopardy every hour. For the fliers a forced landing would have been fatal. But these things were not talked of. Disregard for danger was commonplace. Men were saving their fellow men; and that was that. There were no parades, no drums, no flags, no hero-insanity. There was no need, and no time.

Refugees were grouped at central points, and later removed to concentration camps. Many had only the clothing they had grabbed when the dread cry, 'Crevasse! Crevasse!' alarmed and drove them from their homes. Most had gone without food for hours, many for days. Rain—the same rain which had brought on the flood—pelted down, adding to already heaped-up misery. Fires were out of the question. The rude shelters afforded little protection.

Strange outcroppings of human nature were manifest. One youth mourned the loss of his new spring suit; another the death of a pet dog. A little group spoke in awed voices of the fate of neighbors who had failed to heed the flood warning the night before. 'Oh, the water won't reach us,' the neighbors had declared; and they had stayed by their cabin when the rest fled. Late at night cries had been heard from the direction of their home.

Interest of a white-haired, 65-year-old mother was centered in a chair she had saved: the chair in which she had rocked her seven babies to sleep years before. An aging farmer whose life possessions had been wiped out refused to accept food without paying for it. That would have been charity. A strapping Negro hugged a phonograph in his arms. Asked to play it, he shook his head glumly. 'Dis baby don' feel like singin'.'

There were instances of strange friendship among animals. On one fence post was a turtle, and on the turtle's back a frightened mouse, both marooned in the flood of waters. Ants and other forms of small life filled the branches of trees. Snakes hung from the limbs, dropping often into passing rescue boats.

All up and down the river and its tributaries the scenes were repeated. Men toiled to save the levees, and their homes. White-faced and weary women packed what belongings they could, ready for flight at an instant's notice. Cattle clogged the roads leading from the threatened regions, but there were few places for them to go. Land for twenty, or forty, or fifty miles around was doomed. Trucks, wagons, sleds drawn by oxen, all piled high with furniture and hens and trunks and pigs, raced before the advancing water. Some waited too long. Along many roads automobiles were submerged, their occupants rescued in the nick of time by people in boats or in lighter cars.

One planter, fortunate in having high ground on his plantation, set up a temporary home in a circus tent for his workers and prepared to withstand the watery siege. A colored parson, warned of the imminent approach of the water, supervised the building of a 20th Century Noah's Ark. When the water began creeping over the ground he led his flock aboard, ready to begin a modern voyage of forty days and forty nights. The water rose but the ark did not; and after waiting a decent interval, the pastor and his followers hopped gingerly to safety atop a levee.

Thousands owed their lives to the airplanes. Clothing and supplies were dropped to those in isolated places. One aviator spied a shirt being waved from a hole cut in the top of a cotton mill. Unable to guide rescuers there because of the danger of the current, he returned with a package of provisions and, flying low, 'bombed' the small opening with food. For days he repeated the stunt, once flying within ten feet of the roof during a heavy gale. Another flier landed in the swollen river near a levee. With a long pole he received messages, hastily penned by the refugees to friends and relatives in the outside world.

Others flew in advance of the floodwaters, dropping or shouting warnings to the inhabitants. Planes proved invaluable in reconnaisance work, mapping the inundated areas and determining the daily march of the water.

In its early days the flood struck with little warning. Levee after levee broke under the tremendous pressure of the river. The waters spread rapidly. Often people would waken in the night to find their homes

How France *Has* Restored *Her* Finances

Raymond Poincare Saves *the* Franc *From* Perdition

By SOMMERVILLE STORY

A MIRACLE has occurred in France within the past few months—a miracle which is none the less real and absolute though it is one of finance, a region in which miracles are least expected. It is the raising of the franc, which in July, 1926, was at 240 to the pound sterling, to 120 last December, and between 124 and 123 at the time of writing.

It is no wonder that at a recent public meeting the man who has done this—Raymond Poincaré, ex-president of the Republic and at present prime minister and minister of finance—should have been acclaimed and cheered as the 'savior of the franc.' For he has saved the franc from perdition, and his success is perhaps the greatest triumph that a political man could or ever has had.

The franc still has hard times to go through—France is not yet out of the financial jungle—but it will weather the storm if the policy of M. Poincaré is steadfastly pursued and the country is saved from the intrigues and experiments of the politicians.

IT MUST be borne in mind in the consideration of the facts that the economical and financial condition of France was never really so bad as the fall of the franc seemed to indicate. The franc tumbled in a catastrophic manner during last year, but it never was and never could be in so low a position as the mark in Germany; the financial and monetary condition of the country was never at any time so bad as that of Germany.

Although the position still remains serious today—especially the monetary as apart from the financial—it can be improved slowly as the result of a program of drastic economy and the application of increasing taxation over a long period of years. For this, political stability is required above all things.

A few words as to how this situation arose are necessary. First and foremost, French finances suffered gravely from the enormous expenditure incurred during the war. During those years the people were scarcely taxed. Taxation of any sort has never been popular in France, and there was a great natural reluctance to tax the families of men called up to serve their country, whose earning capacity was thus much reduced. Not only that, but millions were paid out to these same families to help support them in the absence of the breadwinners. What was more extraordinary was that the manufacturers, in a large or small way, who piled up enormous fortunes on war contracts, were also not taxed. Some fortunes were made with startling rapidity in France, as in other countries, by mere workmen. An instance is that of a foreman mechanic named Chausson, who at the beginning of the war was living in a small lodging house. He invented a method of making cheap effective automobile radiators, found financial backers who obtained contracts for supplying the army at big prices, and in 1920 was paying taxes on an annual income of five million dollars!

To provide money to carry on the war, government loans were launched at the rate of two or three a year, and bills known as national defense bills were continually being issued bearing interest at 5 or 6 per cent. So great was the number of these bills issued during and immediately after the war that in 1923 the chairman of a parliamentary budget committee admitted that the state did not know to a billion dollars or so how many such bills were in circulation.

When the end of the war came the people were still not taxed adequately; the wealthy industrial classes—the new-rich—especially were allowed to go almost scot-free. The reason underlying this anomalous state of affairs was that the politicians were constantly saying that Germany must be made to repay France all the money spent on the war as also to pay for the rebuilding of the ten departments that had been wrecked and destroyed. No French politician dared to ask for additional taxation, or dared to undeceive the nation by telling it that Germany was not materially in a position to pay. And the nation, or a goodly portion of it at any rate, was only too willing to be deceived.

THE politicians had to reckon furthermore with the irritation of the working classes, who after the war were enraged to find that so many had got rich quickly by staying at home and profiteering while they had been fighting in the trenches or had been at forced work in the factories.

Successive governments went on borrowing, without considering how or when the money was to be repaid. The taxation being still very insufficient, borrowing was resorted to in order to keep the machinery of state going; and this was possible on account of continued confidence on the part of the public, who, entirely ignorant of the real state of affairs, willingly lent the government money at 6 per cent—a high rate of interest for Europe.

The French franc had during the war been kept at the rate of 27 to the pound sterling, or 5 to the dollar, by the guaranty of the British Government, which supported the French currency. This being a heavy burden to Great Britain, the guaranty was withdrawn soon after the signing of the peace, and the consequence was that the franc began immediately to decline in value.

After the general election of 1919 when M. Poincaré came to power, as a result of the continued issue of paper money the franc started to fall rapidly. Speculators—German, Dutch, Scandinavian, and cosmopolitan Jews—thought it a good opportunity to 'bear' the franc, with the idea that it would go the way of the German mark.

THIS began to open the eyes of M. Poincaré, who up till then had been absorbed with the troubles of the Ruhr. Boldly and with great courage, on the eve of the general election, M. Poincaré—in spite of violent radical and socialist opposition—got a number of laws passed making enormous increases in taxation and enacting drastic financial reforms. In this way he stopped the speculation in the franc, which recovered from 120 to 60 to the pound.

But the radicals then started the battle cry of 'not another cent on taxation,' which naturally met with favor among the majority of the electors. The result was that the republican majority of 1919 was overturned, M. Poincaré fell, and in 1924 the radicals and socialists were put in power.

These two parties had formed a coalition, the radicals agreeing to do nothing without the socialists (so forming a sort of democratic party). But this coalition soon found itself in difficulties. Bound by their election promises, with a huge annual expenditure to meet and not a third enough revenue to meet it, and not daring to institute fresh taxation, they went on borrowing as their predecessors had done. At the same time they began seriously to discuss the question of cutting down the amount of interest paid on the government issues and even of ceasing to pay the

The Home Town of GOLF

Royal and Ancient Clubhouse.

St. Andrews and the 1927 British Open Championship

By ALEXANDER KEITH

> Think, in this northern city, old and gray,
> Where men talk Golf all night and play
> all day,
> How many million Players with their Clubs
> Abode a little while, and went their way.
>
> R. K. Risk: *Songs of the Links.*

THERE is to take place on the links this year at St. Andrews, on the world-famous Old Course, the final rounds of the tournament in the British Open Golf Championship. Some of the most thrilling contests in golfing history have been fought on the Old Course, and every hole has its legends of matches won or shots played.

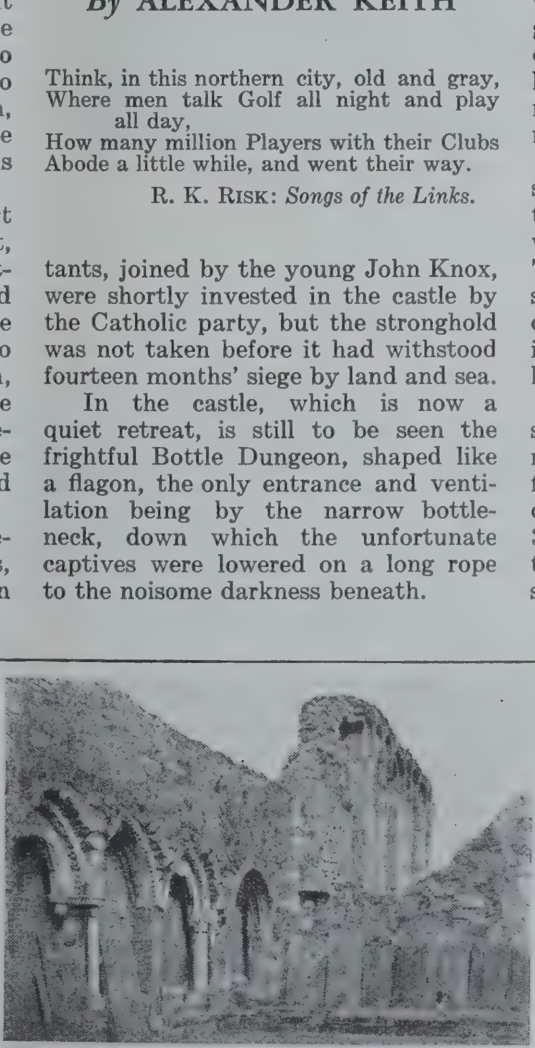
St. Andrews is full of ghosts. It takes its name from Andrew, one of the disciples, whose remains are said to have been brought from Asia Minor to the coast of Fife by an early Christian, Regulus, in whose honor one of the towers of the great ruined cathedral is named St. Regulus.

It was in St. Andrews that Robert the Bruce held his first parliament, long before Bannockburn assured Scotland of its independence. A few hundred yards from the cathedral is the house in which Mary Queen of Scots used to reside during her visits to the town, and it was here that her importunate French admirer, Chastelard, was executed. St. Andrews also boasts the oldest university in Scotland, founded in 1413.

On the sea front, about midway between the cathedral and the golf courses, stand the ruins of the castle, perched on a lofty cliff jutting out into the sea.

Here occurred some of the fiercest incidents of the Reformation nearly 400 years ago. Before the castle George Wishart, the Scottish Protestant pioneer, was burned by Cardinal Beaton, the chief representative of the Catholic Church in Scotland. Three months later, Wishart's friends captured the castle by stratagem and slew the cardinal; and next morning the townsfolk awoke to the grim spectacle of Beaton's body nailed and spread-eagled on the walls of his own fortress. The Protestants, joined by the young John Knox, were shortly invested in the castle by the Catholic party, but the stronghold was not taken before it had withstood fourteen months' siege by land and sea.

In the castle, which is now a quiet retreat, is still to be seen the frightful Bottle Dungeon, shaped like a flagon, the only entrance and ventilation being by the narrow bottleneck, down which the unfortunate captives were lowered on a long rope to the noisome darkness beneath.



Part of cathedral wall with old tombstones.

Although the Old Course is not thought to be the oldest golf links in the world, and although the Royal and Ancient Club is only fourth in order of age among golf clubs, St. Andrews is the acknowledged home and capital of the game. There the laws of golf are made and interpreted, and the whole town makes its livelihood by the game. The Old Course itself, though the advance in golf architecture has enabled more difficult and scientific courses to be laid out, is still recognized by the majority of golfing opinion as the most magnetic links in existence.

In a rough triangle bounded on the south by the town, the east by the sea, the north by the Eden estuary, and the west by the railway are four courses. The short Jubilee Course is next the sea; next is the New Course, which dovetails the Old; then the Old Course itself; and last the Eden Course. These latter three are all first-class courses.

As most golfers are hardly 'up to scratch,' and many American golfers may this year visit the course for the first time, they will appreciate a brief description of the Old Course as the 3-8 handicap man finds it. There are, to begin, two general rules to be observed. A 200-250 yards' drive, placed according to the caddie's instructions, is always necessary, and all approaches to the green must be played with mashie or mashie-niblick and have 'spin' in them.

Hole No. 1 is a drive and a mashie over the famous Swilcan Burn—a 4. No. 2 is a drive, long brassie or full iron second, and probably a pitch, as the green is guarded by ridges and bunkers—a 5. No. 3 is a drive and approach—a 4. No. 4 is drive and mid-iron—another 4. No. 5 is a full drive up a gully, a well-lifted brassie to get up on the plateau

Choosing SHOES

Illustrated by RUTH A. THURBER

THE embarrassment of leaving any shop without having made a purchase is one of the discomforts to which I never become hardened. But of all shops I find a shoe shop the most difficult to extricate myself from, and unfortunately there is no commodity in which I am so seldom 'suited' as in footwear.

The mortification one suffers as sample after sample is produced in vain! After you have been trying on for over half an hour it really isn't possible to sneak off with some unconvincing murmur about 'coming back in a day or two.' For the sake of one's foot, high ladders have been scaled, the nethermost reserve ransacked, and the whole floor is now littered with open cardboard boxes. The supercilious black-satin attendant looks jaded and frankly bored. Her eyebrows rise higher and higher. Was that a weary wink at the successful attendant who has just sold three pairs of shoes to that woman with—yes, with 'ridiculously small feet'?

For the rich, I suppose, it is no great misfortune to buy a misfit. No drama attends their shopping. But if poverty condemns you to wear out your failures, then indeed you should be assured of your moral courage before you risk it in a shoe shop. For if it fails and lets you in for buying a shoe that pinches, how much *physical* courage will be required before that shoe is worn out!

I don't know which is the more disconcerting type of saleswoman. There is the soothing flatterer who refuses to admit that her customer has large feet. Everything she produces is too small, and you begin to apologize for your size; but still she coos: 'Long, moddum—yes, very long and rather wide, but *not large*. Oh, dear me, no!'

Then there is the no-beating-about-the-bush type. She makes no secret of the fact that she considers you a freak. 'No,' she says brutally, 'this style wouldn't look at all well in an *outsize!*' Convinced of inconvenient abnormality, you try to console yourself by remembering the enormity of the Venus de Milo's feet. No comfort in that! *She* didn't have to wear shoes. You feel a fit subject for a comic song. Strains of

> Oh, my darling Clementine . . .
> Her feet were number nine

float mockingly on the air.

You discover yourself thinking with unwonted sympathy of Cinderella's ugly sisters as your foot compels you to place yourself in their class. With a pang you come to realize that your feet have outgrown that charming bit of verse hitherto considered appropriate for your own spring yearning:

> Here's to the day when it is May
> And care as light as a feather,
> When your little shoes and my big boots
> Go tramping over the heather.

Unconsciously your attention becomes riveted on shoes: ill-fitting, unkempt, neglected shoes; old but well-kept, comfortable shoes; neat, trim, snug-fitting shoes, and plain, sensible, low-heeled walking shoes. How can the shoes proclaim the woman! With a start your big, unanswered problem confronts you.

You remember an attractive pair of shoes you saw in the window. Why haven't they been shown to you? Hopefully, defiantly, you describe them. Comes the crushing explanation.

'Oh, no, moddum, we don't stock them in your size!'

You can't bear it any longer. 'I'll have these,' you say with a sigh of relief, as at last without any shock of pain your foot slides into a proffered shoe. Your object was to buy a pair of black evening shoes. These are beige walking ones. Never mind. Anything to get out of this mortifying shop!

Dreadful thought! You remember that one of your feet is even bigger than the other. Which is it? Heaven grant it be the right one, now quite comfortably ensconced in a serviceable shoe. 'I'll wear them away,' you blurt out, deciding to risk it.

Alas, alas! It is your right foot that is the smaller of the two. Your left foot tells you this as it contracts into cramped confinement, and thus one-half of your new and very expensive property is far, far too tight.

Impossible to withdraw now. Forcing a bright smile, you limp off the premises. Your heel, your toe, your instep—all are being tortured! Literally your heart is in your boots, and soon you will be on your way to the chiropodist, vowing that nevermore will you lack the courage of your own convictions. But somehow, however sternly you resolve to walk out of the shop the next time you find nothing there to suit you, a month or two later will find you in the same predicament, and (let us whisper it!) facing it in the same way as before!

Work—The Greatest Power

MISTAKES, whether they occur in the social region or in the building of a new machine, are often the result of active research. The mind knows the end which it wishes to reach. It sees an opening here, and enters it. It explores far enough to discover that the opening does not lead where the mind wishes to go. Another opening is explored in like manner, and withdrawn from. And so on, experience being gained at every step. This is not waste, by any means. It is not evil, it is not blameworthy. It is part of the material of knowledge.

You know your way from your home to the shop, but a real part of that knowledge is the other knowledge that certain other ways do not lead to the shop. The negative knowledge is in the back of your mind, unused; but it is part of knowledge just the same.

A piece of mechanism that does not work we know is wrong. What does not work perfectly requires improvement. What breaks down periodically requires strengthening. But if the whole thing is wrong it will not work at all, except destructively and wastefully. Within our range of knowledge and necessity, we have made things work, we have found certain principles, and while there may be newer and better applications of these principles, we have laid the foundations.

> *THERE is knowledge even in mistakes because mistakes are part of the material of experience. Experience is gained by work, that is, the kind of experience that leads to doing something useful or producing something that will be beneficial to the community. It is a mistake, however, to scrap a thing because it is defective without first ascertaining whether or not the defect can be remedied. More knowledge is thus gained. If constructive methods are not followed unemployment waits in the background. The winning of security can only be accomplished by continually growing, making and carrying things, and doing so in the best way. Work is the greatest power.*

Certain foundations have been laid in the region where we adjust our relations to one another as social beings. We have all the same needs, and we are all subject to the same necessity of supplying them. And that necessity is relentlessly the same. Needs can be supplied only by work, someone's work. Not only relentless but inevitable is this necessity, for it is marvelous to consider how very, very few in the world can live without work. There are a few aged, a few ill folk, a few pitiable offspring of the wealthy—that is all. Of the rest of the world, of any condition, those who work are a mighty ocean, those who do not are but a handful.

There are parts of the world where this principle of work is not understood, but it is painfully forcing its way into understanding. There are perhaps more parts of the world where the differences in work are not completely understood. Some work in one sphere, some in another; the spheres fit one another.

In the ordinary household the husband is the breadwinner, the wife the manager of all the home affairs. Both work in their own way, and the product of their joint toil is the home. In the industrial world these spheres are duplicated, the managerial and the manual, being more commingled than ever before, and the joint product is service to the world and a living for the men who render the service.

What needs to be done is obvious—the winning of security for those who work, whatever their work may be. All human affairs are mutable; the factor of individual discipline steps in at unexpected moments; there are troubles and difficulties of one kind or another assailing all people of all kinds. Sorrows and joys, disappointments and anxieties, losses and tragedies, are not the monopoly of one group. Every life is very much like another these days.

But it should be made possible—indeed, it is perhaps not too much to say that it can be made possible—for every man to be assured at least that there will always be the opportunity for work afforded to him. The basic insecurity of the industrial realm may at least be abolished, even though the other insecurities of life remain what they are.

There are three main divisions of work: Growing the food and the clothing material which people use; manufacturing the tools with which these necessities are raised and turned into articles of use; transporting both to those who need them. Growing, making and carrying—these are the three principal things we do. And as there is always something to do in all of these lines, at least always in two of them, unemployment would not occur if industry were organized with a view to the whole need.

This would seem to be one direction in which progress can be made for the purpose of giving security of employment. This is the making of legitimate improvements. And with this assured, other improvements could be undertaken without that stress of mind and need which enters into the making of so many advances.

There will never be security if destructive changes are substituted for constructive. There is no ingenuity in simply destroying things. If work is fundamental, if industry is really a beneficial and productive fact, then the imperfections which accompany it, like unemployment or uncertainty of employment, would seem to be susceptible of adjustment. Cure the defects without destroying a fundamentally good and tried method.

EDITORIALS

OF THE DEARBORN INDEPENDENT

The Man on the Dike

THIS is by way of tribute to a Louisiana state penitentiary inmate—name unknown—who, despite his present circumstances and surroundings, must have somewhere deep down in his make-up the instincts of humanity.

It was during the battle to save the levees in the treacherous flood region of the Atchafalaya and the Mississippi. Six hundred prisoners from the great institution were taken out of their cells and placed at work upon the ramparts, among them our unnamed hero. There was no time for patrols and sentinels—so the convicts arranged an honor system of their own. To their credit it should be noted that they toiled willingly, even while their lives were constantly endangered by the crumbling dikes.

The temptation to escape was there, of course; and 599 prisoners ignored it. They swung pick and shovel by day; and by night slept in damp, unpleasant quarters, all part of the battle to save the state. The six hundredth prisoner was tempted and fell—he escaped.

Free from the necessity of labor; free from bars and chains; free from striped suits and guards, he swiftly sped away from there. The air never seemed so sweet. He reveled in his liberty. Then his footsteps began to lag, as he suddenly felt a wave of shame rush over him. Something halted him. He could not go on, while his fellow convicts fought on the levee against the growing waters.

Shamefacedly, he retraced his steps, returned to the levee, regained his shovel and pick, and went back to work. Voluntarily and apologetically, he asked for a place in the line. He sinned—if it be a sin to escape guards—but he repented and came back. And if the Gospels be true, there was joy somewhere when this poor fellow, name unknown, scrambled back on the levee, and took one step upward toward manhood.

Voices of the Past

MOONLIGHT floods the Ozark hills. The lilting voice of the night bird is heard above the sound of the rapids. From the mountains come the hill people bringing their old-fashioned fiddles and hymn books. They gather about an open space in the forest by luminous camp fires. It is the annual 'singing bee' and all who are able to attend are there. Here one listens to old ballads so expressive of early life in the Ozarks; love songs of many verses, such as our grandparents chanted while returning home from frontier parties; crooning cradle songs, the same songs that lulled to sleep the great Lincoln in his infancy; ballads of bravado and inspiring lyrics of another day. In this way the folklore of pioneer days is preserved. Ordinarily folklore is becoming more difficult to obtain as the pioneers pass on. It is only through the family fireplace councils and these singing bees that the melodies and ballads of the hills are carried from generation to generation.

Try This on Your Ouija Board

THE harbinger of the next presidential election will shortly put in its appearance. It may be Maine—may be South Dakota; may be the way the sunspots scurry across the sun; perhaps the way some magazine's poll happens to result. The primary in South Dakota is a good illustration. Coming as it does on the third Tuesday of next March, it will foreshadow, as does the groundhog, the inevitable ballot.

Back in 1920, the future was predicted by this early primary, in the defeating of Lowden by General Wood, who, as we all know, is now governor-general of the Philippines. In 1924, Senator Hiram Johnson carried the primary, and as we likewise all know, he is still a senator.

But despite these apparent discrepancies, one harbinger is as good as another; and all signs point to the election of someone as President in November, 1928.

Jupiter in the Wrong House

EVER since the stars in their courses fought against Sisera, someone has been searching the heavens to read the future and particularly to cast the horoscopes of great men. Now we learn that Candidate So-and-So hasn't the ghost of a chance in the next presidential campaign—because at the hour of his birth some planet was in the wrong house; or some sign of the zodiac stood in the path of the moon.

It must be slightly discouraging for a politician or an occupant of public office who has arrived at the point of at least being mentioned in connection with the White House to discover suddenly that he was born in an unlucky hour or that some distant planet was in the wrong house. To surrender one's ambition and dreams, to go down into oblivion instead of attaining the lofty eminence which otherwise might have been attained, seems cruel punishment for one who had no control over the planets in the first place.

The stargazers who have cast the horoscope of a distinguished presidential possibility may be predicting the truth. They have two guesses, and one is bound to be correct. But what is to be done about it should the guess prove to be wrong? Will it prove the planet's influence not working? Or was the diagnosis wrong? How can such mistakes be avoided in the future?

Have Faith in China

THE most remarkable statement that has yet come out of China is that of Mrs. John E. Williams, widow of the American university professor slain during the Nanking riots. For honesty, temperate judgment and absolute fairness, the statement is without peer. It is as straightforward and simple a message as any that modern Christianity affords. It cuts through jingoism with the sharpness of a keen-edged knife. Mrs. Williams spoke for both her daughter and herself. She said:

'To us the most impressive thing in the whole incident in Nanking was the great love and instant response of all Chinese students, faculty, and servants. The news of the death of Dr. Williams within ten minutes was all over the city, and with one accord they sprang into action as though an electric shock had gone through the entire community. By their sacrifice of self and money and clothes, and even at the risk of all their lives, they tried to save the other foreigners . . .

'We do believe firmly that if the conservative group can maintain their position and power the very best forces in China will back them, and that China will work out her own salvation. We believe in the Nationalist cause. In it we see the only possibility for a united country, and we believe that China can work it out *without intervention.* Always we have absolute faith in the Chinese with whom we have worked. It was not China that was responsible for the situation at Nanking; it came from the outside.'

Those are words of a Christian—the widow of a Christian martyr!

A Nicaraguan Chronology

1912—United States Marines are landed in Nicaragua 'for the protection of American lives and property.'

1912—J. and W. Seligman & Co., New York bankers, float a loan of $1,500,000, secured by a lien on the Pacific Railroad, sole one in Nicaragua, government-owned, and rich in revenue.

1924—The Nicaraguan Government repays the loan and gets back its railroad.

1925—United States Marines are withdrawn after thirteen years occupancy of the country.

1926—The Nicaraguan Government (Liberal party) is overthrown by force and Emiliana Chamorro (Conservative party) seizes the presidency. The Liberals revolt.

1926—Chamorro resigns in favor of Adolfo Diaz (Conservative party).

1926—Diaz is promptly recognized by the United States Government. The Liberals continue their revolt.

1926—United States Marines are landed 'for the protection of American lives and property.'

1926—Lawrence Dennis, American Chargé d'Affaires at Nicaragua, is accused by Liberals of influencing the selection and recognition of Diaz.

February 8, 1927—Dennis is ordered to report in Washington 'about March 1.'

March 12, 1927—It becomes known that Dennis has resigned, after charging certain officials in the State Department with incompetence, neglect of important news dispatches, waste of Government funds in transmitting worthless information and general lack of fitness for their posts. He is persuaded to withdraw his resignation, pending his return to Washington.

March 15, 1927—A sensation is caused by reports that Dennis possesses a document in the name of Secretary Kellogg, instructing him to exert pressure to bring about the election of Diaz. Official denial that such a document exists is made by the State Department.

March 21, 1927—Dennis arrives in Washington and after a conference with Secretary Kellogg adds his denial to that of the State Department.

March 26, 1927—J. and W. Seligman & Co., and associate bankers, advance $1,000,000 to the Diaz government. They withhold all details on the ground that the transaction was strictly private. News dispatches report that through it they have again gained control of the profitable Pacific Railroad.

June 4, 1927—New York *World* announces that Dennis resigns from the diplomatic service and will join the firm of J. and W. Seligman & Co.

Why Pay More Interest?

THE Treasury has announced an offering of bonds at 3½ per cent to redeem the outstanding second Liberty bonds and such maturities as cannot be retired from revenues this year.

Why the high rate of interest?

National bank currency in circulation is largely based on bonds bearing but 2 per cent and netting the banks less than that because of a circulation tax imposed by the Government. These bonds were floated without trouble; the demand was so great for the 2 per cents that at no time from their issue have they fallen below par, while other bonds have ranged far below, at times, although bearing twice the interest rate and more.

The difference is in what is known as the 'circulation privilege' with which these 2 per cents alone were endowed, and which was specifically denied the Liberty issues.

The attention of the Treasury was called to the feasibility of funding a full half of the national debt by a bond issue at 2 per cent carrying the circulation privilege in the form of a redemption in lawful money at the holder's option. Of course there is no tax on such circulation.

A saving of ½ to ¾ of one per cent, where the saving of 1½ to 2¼ is possible, is not financing for the people.

Where the MOTHER *of* LINCOLN *Was Born*

By WILLIAM E. BARTON

PRESIDENT LINCOLN was aware that his father had been born in Rockingham County, Virginia, and his knowledge and written statement to that effect are found correct. He knew, also, that his mother, Nancy Hanks, was born in Virginia, but in what part of Virginia he did not know, or if he knew he did not relate. No member of the Hanks family ever told anyone who communicated the information to a biographer of Lincoln in what part of the Old Dominion Nancy Hanks was born. No careful inquiry was made until 1865, and by that time all the Hankses of her generation were dead. The oldest relatives of Lincoln who bore the name of Hanks had been born in Kentucky, and they may not have known.

Not till 1899, and then not on the basis of any knowledge obtained from the family, was there an attempt to discover the county in which the President's mother had her birth. What came to light then was welcomed by writers on Lincoln, and by the time of the centenary, ten years later, was undisputed and accepted by all who wrote on the subject during that period.

This story was that the Hanks family in Virginia had its American origin in or near Plymouth, Massachusetts, where one Benjamin Hanks arrived at the very end of the 17th Century. It was affirmed that one member of this family went to Virginia early in the 18th Century, and that a group of his sons, who were named, and whose land transfers were published, went to Amelia County, Virginia, where they became related by marriage to four families named Berry, Thompson, Mitchell and Lincoln.

It was affirmed that Abraham Lincoln, paternal grandfather of the President, and Joseph Hanks, maternal grandfather of the same, and a son each of the families of Berry, Thompson and Mitchell, went to Lunenburg County, and each of the five married daughters of a man named Shipley. The names of the five women were given. All five families later moved to Washington County, Kentucky, so it was stated, and there, Thomas Lincoln, son of Abraham and Mary Shipley Lincoln, married Nancy daughter of Joseph and Mary Shipley Hanks; and their second child and first son was Abraham Lincoln, afterward President of the United States.

For twenty-five years this story was undisputed, and it won eminent support, as the crowded library shelves testify.

I had every inclination to accept this story. When early in 1920 I published my first large work on Lincoln, *The Soul of Abraham Lincoln,* I had found no cause to dispute this narrative. But a few months later, when I published *The Paternity of Abraham Lincoln,* I was aware that this story was not so easy to believe as I had supposed. In that book, however, I accepted the Amelia County narrative, though with some hesitation. I had no reason as yet to investigate it. I knew that I must investigate it, and with an open mind, but I expected and hoped that the Amelia County story would be confirmed.

When I began investigating this matter, as I did about 1921, I wrote to the clerk of the courts in Amelia County and obtained all the records he had concerning the Hanks family in that county. To my amazement, there were exactly six, and all of them were of some years before the Revolutionary War. Two Hanks brothers lived in that county in the 1760's. One owned one farm and the other two, and when they sold, they sold in the same lots which they bought. The two families were out of Amelia County before the Revolution, and there were simply no records of the Hankses covering the period of the 1780's, when Thomas Lincoln and Nancy Hanks were born.

I visited Richmond, and there as I pursued my inquiries, I met a man of repute in matters of historical investigation, who had twice visited Amelia County in the employ of earlier biographers of Lincoln. He had data, also, on cognate matters in other counties. He still had the notes of his investigations and professed to have, and I am confident did have, the right to their further use. As these earlier writers had published their books, I felt at liberty to deal with him, and I bought copies of all his notes made in these two searches, and some besides. I secured some data of value, but so far as these earlier writers were concerned, my purchase was of value to me simply in certifying that I already knew all that they had learned about Amelia and adjacent counties. So far as the Hanks family was concerned, all that these other writers had been able to secure was the same little group of real estate entries of which I had certified copies.

I went to Amelia County, and I saw the records with my own eyes. There were exactly those six. There was not a record of a Hanks will, a Hanks marriage, a Hanks serving on a jury or a Hanks paying taxes in any year after the Revolution began.

But I found out where the other entries came from that had been published. They were family names and records of an entirely different family, that of Hawks. The Hawks family was in Amelia County before the two Hanks families passed through and made their brief sojourn, and it is there still. One can find any kind of record he wants about some Hawks. Certain Hawks records had been copied, and the name had been changed to Hanks. And all the Lincoln authors had accepted the documents without question!

I made other journeys to Richmond, and began an exploration of the archives of the state, the state library and the state historical library, to find, if I could, all the Hankses that had ever been there. I went also to the land office. It was no small task, nor was it accomplished in a single visit.

I began to encounter fragmentary references to persons named Hanks in Richmond County. I supposed at first that Richmond was the county where I was then sitting, the county of which the city of Richmond was county seat. But this was far from the truth. Richmond County is a remote, rural county, in the lower end of Northern Neck, with no railroad. I found also stray Hanks records in Lancaster and in old Rappahannock County, the latter a county that ultimately was obliterated by territorial division, and the name revived later for a new county in another part of the state. When I superimposed these records, I found that while they referred to three or more counties, a number of them were of the same locality, under different county names.

Later, when the roads were passable, I went to Richmond County, and for three years now I have been working there personally and with local assistants. The result, thus far, is this: That the Hanks family has been continuously resident in that section of Virginia since before 1653. I have not yet the fixed *terminus a quo;* but this I know: The Virginia Hankses did not come out of Massachusetts, but were in Virginia more than fifty years before Benjamin Hanks ever saw New England.

Such explorations are wearisome and full of disappointments. A score of questions are still haunting me, and I am still at work. But I was now in position to discover whether Nancy Hanks, who certainly was not born in Amelia County, might possibly have been born in Richmond County.

I hardly hoped to find her baptismal record, for she was born after the Revolution. Before that everybody in Virginia was required by law to be baptized in the parish Episcopal Church. There was great laxity in the matter, but I found the date of baptism of Joseph Hanks, which information I greatly wanted, in North Farnham parish in 1725. This, as I made certain, was Nancy Hanks' grandfather, and he died in Nelson County, Kentucky, in 1793; a record of his will was dated January 9, and was probated May 14 of that year. Of his nine children I have discovered the baptism of only one, thus far, and that is Elizabeth, daughter of Joseph and Ann Hanks, baptized May 4, 1771.

Catherine Hanks, mother of Joseph, died in 1779, after a widowhood of thirty-nine years, and Joseph, her second son, was administrator of her estate. A little before its final settlement he took what was then available of his share, and he and his wife Ann and their nine children disappeared from the Northern Neck.

But they did not immediately go to Kentucky. Where did they go? Where was Nancy Hanks born?

I asked for help from the United States Census Bureau, and learned that a number of Virginia counties had a census in 1782 and 1784 which was later incorporated in the records of the United States Census for 1790, the first such census. They found for me Joseph Hanks, with a family, including himself, of eleven persons, all white, in Hampshire County, Virginia, in 1782. In that census there was no division by sex and age. But the

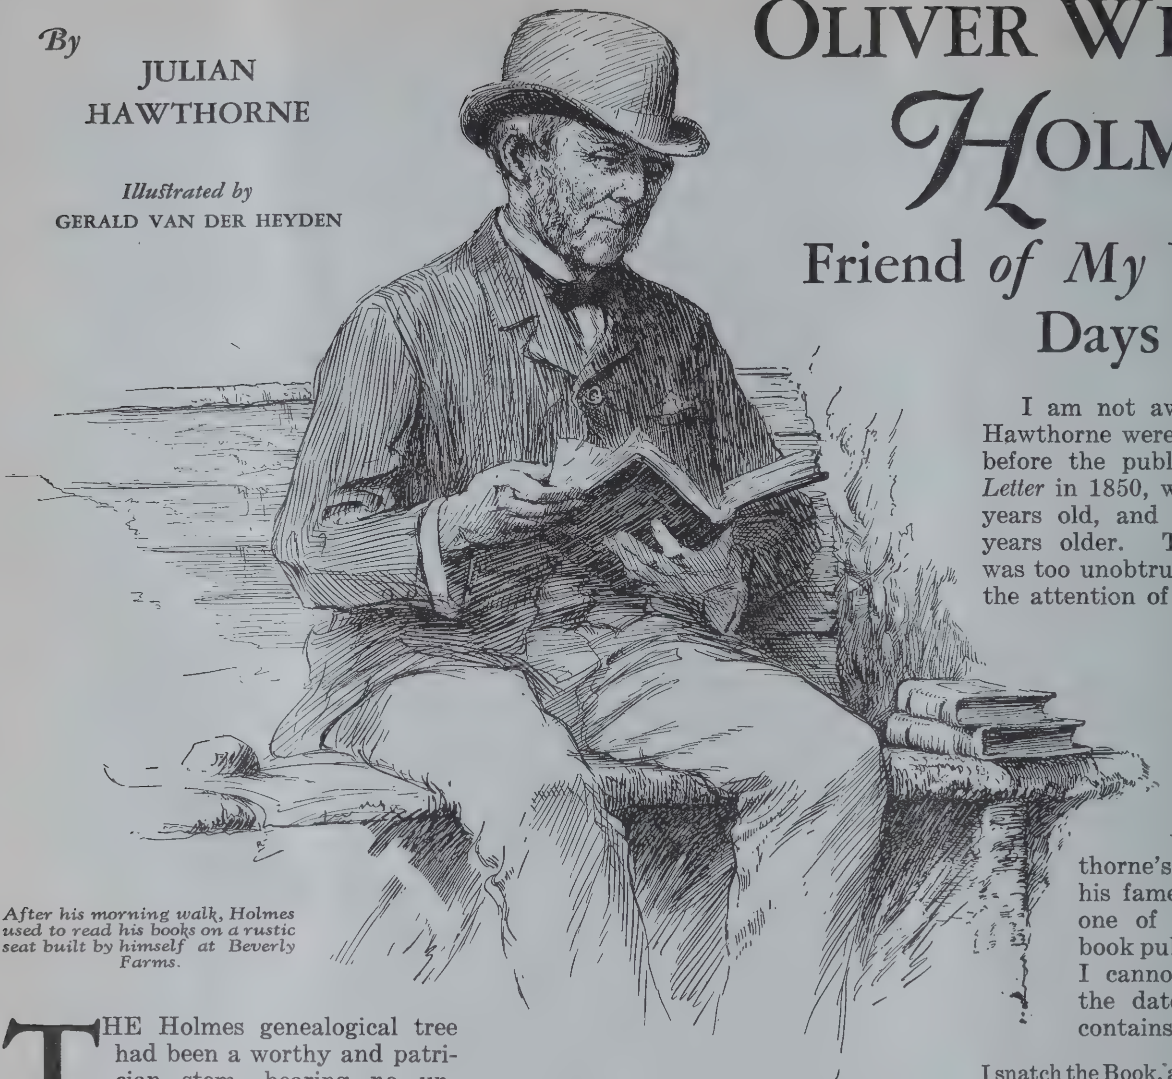
OLIVER WENDELL HOLMES

Friend *of My* Younger Days

By
JULIAN HAWTHORNE

Illustrated by
GERALD VAN DER HEYDEN



After his morning walk, Holmes used to read his books on a rustic seat built by himself at Beverly Farms.

THE Holmes genealogical tree had been a worthy and patrician stem, bearing no unseemly fruit either from the breeches or the distaff side; rooted deep it was, too, in Boston soil, and well content with itself and its environment; but not anticipating any startling development. But there was in it a drop of sap not yet accounted for, which, during the early years of the last century found its opportunity and improved it. It was christened Oliver Wendell, and carried the patronymic of Holmes all over the English-speaking world.

When I say 'Boston,' I mean of course Cambridge, so far as Oliver Wendell himself is concerned, for good Dr. Abiel was clergyman of the Congregational Church there when Oliver was born, and much of Oliver's life was passed in that fortunate suburb. Still, Cambridge derives from Boston and contains Boston elements raised to the *nth* power. What more unlikely than that a wit, a humorist, a poet jovial and sentimental, a sparkling essayist, an admirable and original novelist—Oliver was all of these, and a society darling into the bargain—should break through the dense chrysalid of such an ancestry and fellowship, and rise unique and radiant above it all?

And yet, strictly speaking, these accomplishments and achievements were but a side issue for Dr. Holmes, the physician and lecturer before the Harvard Medical School, and unanimously declared by his pupils to be the best equipped and the most edifying of all. Those familiar with his lectures declare that they would, if collected, make a volume more captivating and brilliant than anything else published under his name. From the little I was able to hear of them personally, I am inclined to support that opinion.

And this astonishing person did not limit himself to the begetting of brain children: he was also the proud father of two sons, the younger of whom was one of my dearest friends in Harvard, and the other, five years older, still lives, a pillar of the state, eighty-six years old, a most active and valuable member of the United States Supreme Court.

As for Edward, he was a boy beautiful in person and in nature, and in his freshman year already in the first rank of scholarship. He had the promise in him of becoming eminent in either literature, art or science; he took hold of all knowledge with eagerness and understanding. But his organization was sensitive and delicate, and he died, I think, before his class was graduated.

I am not aware that Holmes and Hawthorne were personally acquainted before the publication of *The Scarlet Letter* in 1850, when Holmes was forty years old, and my father five or six years older. The *Twice Told Tales* was too unobtrusive a volume to catch the attention of a busy man, who was 'in' so many activities of his own; and the *Mosses From an Old Manse* was in a like category. However, I may be mistaken in this, and assuredly Holmes had read every word from Hawthorne's pen very soon after his fame began. He was also one of the first to give the book public recognition, though I cannot at this moment fix the date of the poem which contains the lines—

I snatch the Book, along whose burning leaves
His Scarlet web our great romancer weaves!

By the time I could become conscious of affairs outside of my own small tether, the two men were cordial friends, and so remained to the end. My father had not many friends, but he never lost one to whom he had opened his heart; and it is of course unthinkable that Holmes could be on other than the best of terms with every person who could gain access to him. Holmes himself began his essays, *The Professor at the Breakfast-Table* a few years after *The Scarlet Letter* date; they appeared in the *Atlantic Monthly*, and were immediately and immensely popular, about 1857; but I remember that the first lines of the first essay—'As I was saying, when I was interrupted,' were written several years before, and the interruption had been due to the sudden demise of the periodical in which the essay was being published.

It was a bit of Holmes' wit, or brightness, to take up the long lost thread in that way. He had been writing verses, chiefly 'occasional,' from a period still earlier, though his *Songs in Many Keys* didn't get into book form till about the outbreak of the Civil War. He sent copies of whatever of his he thought passable to Hawthorne, and Hawthorne read them all with liking and chuckles. And Holmes would step smilingly and affectionately into our house from time to time, as long as we had a house in America in which to welcome him.

After we returned from our seven years abroad, the friends met chiefly at the Old Corner Bookstore, at Washington and School Streets, or at the Saturday Club, an esoteric organization of the bluest blood of American literature; but it was not easy to get Hawthorne to attend these gatherings; anxieties, public and private, made him reluctant to go forth.

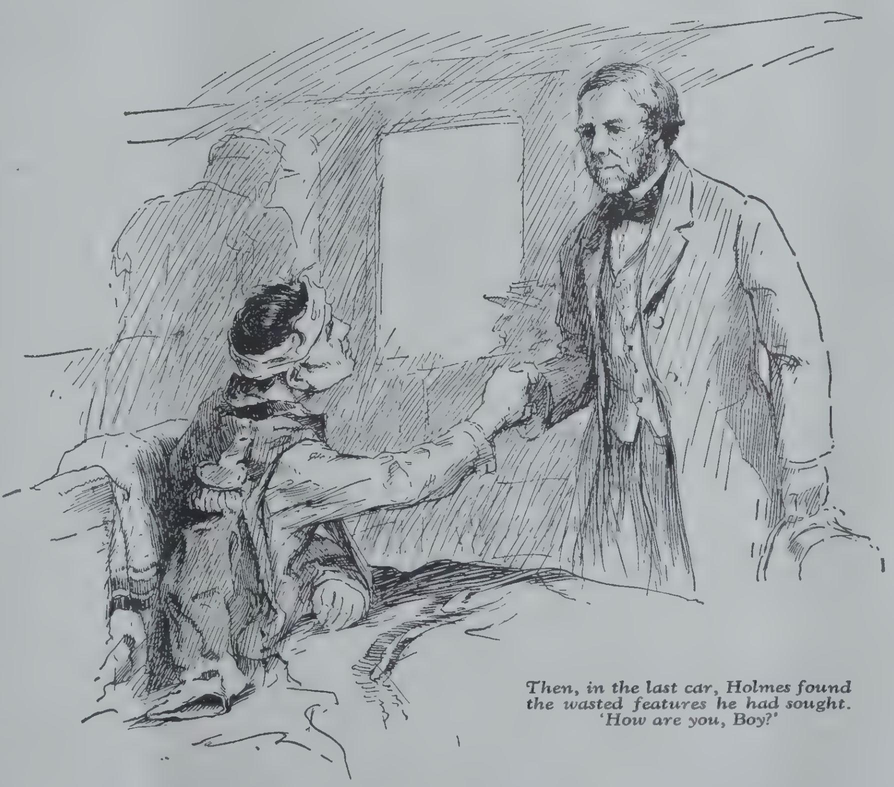
HOLMES' personal aspect was extraordinary and delightful. Long after my first recollections of him, and when past middle age, I overheard a comment made by a little girl of three years, in response to the adoring advances of a certain author who had just been presented to her. This gentleman was a dear and good fellow, and his books were very popular, but he was not beautiful to look at; and after he had expressed his admiration for the little lady by such contortions of his visage and adoring words as are deemed suitable toward infants, she, contemplating him with steady eyes, said in low, wondering tones, 'What a funny face!'

My author took it heroically, quite as if he liked it. Now I, in my infancy, never addressed such a remark to Holmes; and yet I could not help feeling that he had a 'funny face.' It was not a gargoyle, by any means, but it was not classic; it was round, with bright little eyes and a rather large mouth underlying an upper lip of considerable length. The nose was amiable but not distinguished; a very attractive visage; a sally of kindly wit seemed always about to come from it, and this expectation was commonly gratified.

Holmes seemed uniformly in a merry humor—enjoying the world and mankind, and prompt to make it more enjoyable for his fellows. He could be grave; of course he was often grave, for moments if not for long; but in such moods he did not look natural; one took them as transition periods between one mirth and the next. An immortal comedy spirit possessed him, though never tempting him below the level of his high breeding and culture, while nevertheless there was more open laughter in it than in the dry sallies of the ordinary intellectual humorist. Laughter was music in his ears, and nothing could more flatter him than when it was due to scintillations of his own.

Most of his 'occasional' poems were read aloud by him at public dinners and similar gatherings; they were full of hilarious passages, and he would have been depressed had any of them failed to take. The wit in them was usually greater than the humor, but his audiences were trained to such fare, and appreciated them the better. When Mark Twain, on a memorable occasion, gave the New England littérateurs a taste of native humor, the renowned dignitaries sat silent and stern; they were not amused, only offended. But Holmes never fell into such a mistake; he knew precisely where the funnybones of his fellow citizens were situated, and he hit them with just the right tap. Mark Twain belonged to what was then the new dispensation; Holmes was the champion of the old; and probably, were he to read one of his poems to us of today, we would yawn at him.

But he was the licensed Merry Andrew of the last half of the 19th Century in Boston and Cambridge, and was always greeted with joyous acclamations. He laughed and rejoiced with them, and the lines and wrinkles which began to appear early in his life on his round little visage must have been graven there by the spirit of good fun. They increased as he grew older, until his face was covered with little crisscross lines, and amid them his kindly gray eyes looked out hopefully and genially. He was a man of tender heart, and he had wells of pathos in him, but he seldom allowed himself to tap them. He seemed to sidestep indulgence of his own sympathetic nature, and would not be diverted from seeking the sunny side of every cloud. And when he was overtaken by personal griefs that could not be thus fought off, his aspect became painfully sad; he could not handle the emotion.



Then, in the last car, Holmes found the wasted features he had sought. 'How are you, Boy?'

IN THE last years of his life this was noticeable. Here was a mask of comedy, with tragedy looking through it incongruously. He could not feel sure of human immortality and reunion after death; he could not help recognizing the trend of science; and meanwhile his friends, one after another, failed at his side and vanished into the unknown. He once said, 'I am seventy years young!' and the term has been adopted and worn threadbare by millions of sentimentalists ever since; but he himself did not repeat it in his own eighties. He resisted for long the pressure brought upon him to write the book on his friend Emerson; what could he say of that lofty and invincible spirit? John Lothrop Motley had not been so close to him as Emerson, but he would fain have avoided the memorial volume on him too. And of all the sad countenances that stood beside the grave at my father's funeral, that of Holmes was the saddest. His poetic gifts could not have sufficed to produce such a poem as Longfellow was inspired to write upon that day, one of the loveliest and tenderest of his making. But Longfellow had from his youth been an untroubled believer. Shakespeare understood these things.

When his first novel, *Elsie Venner*, was published, we had recently returned from England, and my father read it aloud to us in The Wayside study. It was a delight for the whole family, and was a household word ever after. His second story, *The Guardian Angel*, came four years after my father's death; in characterization and structure it was as good as the other, but of an originality less startling, because the basic idea in both was similar.

They were good literature, and the exception that

(*Continued on page 20*)

FINGER

A Chinese LIVINGSTONE

Illustrated by
PAUL HONORE

A LEARNED gentleman has written a large book which is very difficult to read and more difficult to understand, all to set forth his idea that there are certain influences hovering about (like the genii of our youth) which somehow pick out this and that from creeds and religions, sprinkling them here and there, to the end that some day a new theosophic religion shall arise.

His main idea, I gather, is that influences are choosers and disseminators, picking out a little bit of Bolshevism, a dash of Christianity, a taste of Judaism, and so on, as a cook takes ingredients to make a cake. And because of those influences, religions appear, break out like measles. Which, of course, is nonsense.

RELIGIONS spread just as popular songs do; because they are strength-giving, or enlivening, or valuable, or heart-cheering. And just as Jimmie O'Neill popularized 'After the Ball,' in South America, he singing it because he enjoyed doing so, and others learning the song one from another, so do religions spread, one man taking the tidings somewhere, as Livingstone took his tidings to Africa; others accepting because they found in the message a proper way of life. There is the truth of the matter, and it is as simple as the multiplication table. The trouble is, so many want to be elaborate, whereas the truth lies more often in simplicity.

Getting back to the spread of religions, there is the case of Huien-Tsaing, a tale of tremendous interest, because it is an example of a man setting off with deliberation to find a religion.

To discover it he went to India, the India of long ago, where there seemed to be a mingling of faiths and of beliefs. Indeed, for the matter of that, there is a mingling almost everywhere. How, otherwise, account for the crosses which the Conquistadores found in Oaxaca which were used as sacred symbols? How account for the mysterious carving in the Caves of Elephanta, in India, which shows a massacring of infants in connection with a cross?

* * *

It will be remembered that when Marco Polo told of his trip to China in the 13th Century, told of things seen and experienced, he was regarded in the light of a Munchausen. Nevertheless he wrote his book, or rather dictated it.

You can imagine him in prison, dictating thoughtfully and with hesitation, because of all that disbelief.

People were ready to believe elaborate and impossible things, in the swan maidens for instance, mermaid stories, the tale of the Wandering Jew, Antichrist and Pope Joan, but not that tale of Chinese napkins which would not burn in the fiercest fire—for nothing was known of asbestos then. Nor would they listen to the story of black stones burned in fireplaces in China—for Venice knew nothing of coal, and in England where it was known the burning of it was prohibited as 'prejudicial to health,' in the year 1273.

And Marco Polo told of other wonders—as towns and people of admirable order, of sleds drawn by dogs, of towns with sewer systems, of condensed milk being used, and of paper money, and of fifty other strange things.

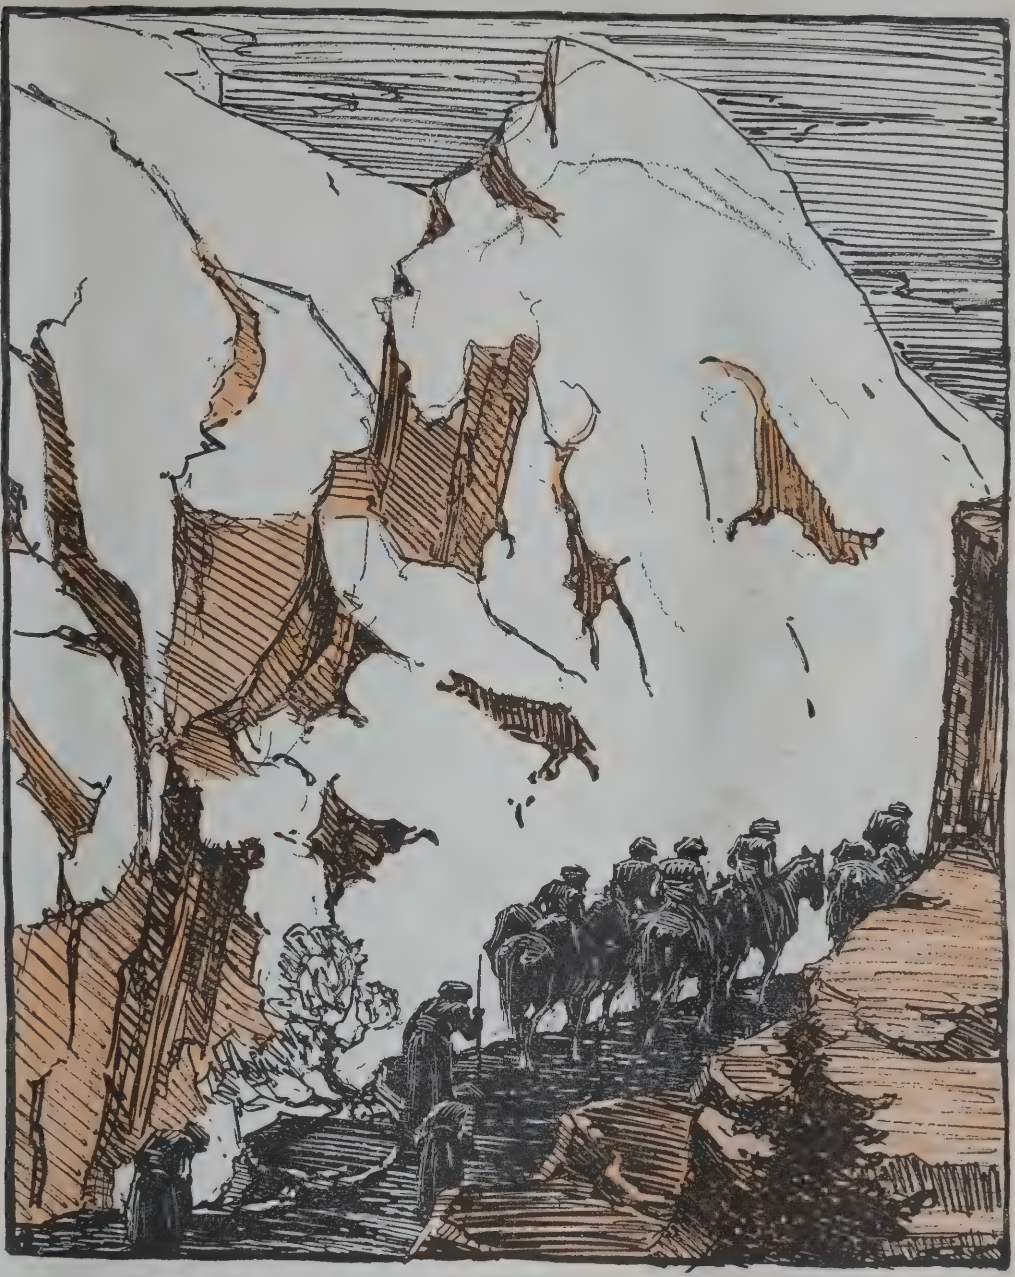
But most of the world laughed at his story of Hang Chen, a magnificent city of paved streets, and warm baths in houses, and highly accomplished people, and shops and manufactories, and public parks, and also a church which seemed to him to be Christian, or at least to teach certain lessons which seemed to have a Christian foundation to them.

SO THE world laughed, because the world was cocksure that China was a place cut off from the rest of the world, and between China and out-China no communication had existed.

Marco Polo was denounced as a lying tongue, or pitied because of his intellectual decay. And yet Marco Polo was right, for in the best Chinese minds there was a certain ideal. There was a concern to do what could be done to make men dignified, obedient, enduring, reverent. There was a desire to go upward and onward along widening ways. There was a knowledge of what might be called the fellowship of faiths.

Now as to connections between China and the outside world, not to wrap up the matter in laboriously learned language, but to take salient things, in the year 166, Marcus Aurelius had sent a mission to China, though it failed to go as far into the unknown as the emperor had hoped.

Carus, the Emperor, sent another in the year 284. And Marcellinus had information, so that he wrote of the Chinese as 'a frugal folk, studying to live peacefully and shunning intercourse with the rest of mankind for their peace' sake.' But the real pathfinder, the most daring adventurer to join China and out-China was our Huien-Tsaing, a sort of Livingstone of the Seventh Century. His story is history, not legend. But while Livingstone went carrying a message and a mode of life, Huien-Tsaing as I have said went to seek a religion which would serve as a guide to conduct.



In the mountain ranges of Thian-shan sad adventures befell the caravan of Huien-Tsaing.

When Huien-Tsaing set off on his daring journey he was in his twenty-fourth year, the date 627. To get the right perspective of things, it must be realized that Rome was then in its lowest state; the Norsemen had not discovered Greenland; the Irish were introducing Christianity in what is now Spain; the Saracens seemed to be overrunning Europe as well as Egypt; the Mayan and the Inca civilizations were flourishing in South America. In the countries adjacent to China there were wild tribesmen, barbarian princes of great material wealth, an everlasting fighting and invading and counterinvading.

THE best minds in China aimed at the Confucian idea of good government, which, according to the sage, was 'simply the maintenance of the natural relations which ought to exist between man and man; a combination of princely conduct in the ruler, loyalty in the subject, paternal love in the parent, and filial piety in the child.' But, as in all ages and places, the great question was concerning those 'natural relations between man and man.'

Now there were, floating about, stories of high teachings in lands outside China. There were tales of great moral teachers; of master minds; of faiths; of Buddha. So, to find what was to be found, the young monastic student left the province of Sz-Chen during one of those unhappy periods when China was torn with insurrection and the warrior T'ai-Tsung was trying to restore order. And all went well until he reached the northwest corner of China proper, on the border of Tibet, where difficulties arose with what might be called the immigration officials. However, in Huien-Tsaing's mind were higher things than man-made boundaries and national jealousies; so he slipped across the border at night, facing what might befall, with eyes bright and shining.

WE HAVE to piece things together, for the Chinese historian Tao-Sun concerns himself but little with details, and Huien-Tsaing in his account is more concerned with things he heard said than with his own doings. Anyway, the pilgrim got a horse, somehow, and being sought by border officials, he rode by night and hid by day for the distance of a hundred miles, when his horse fell dead.

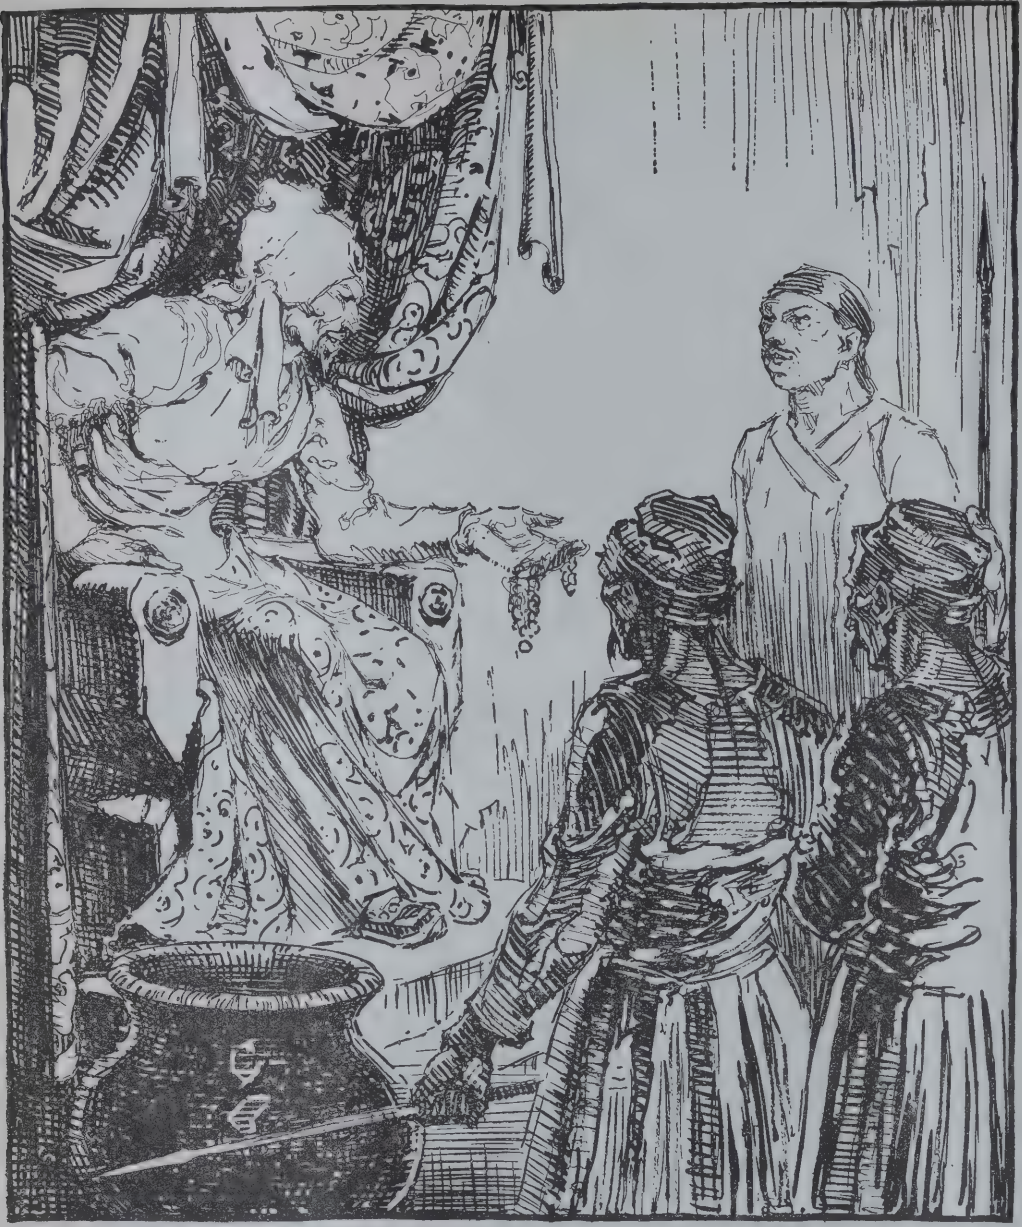
But he met a barbarian who had fearful things to tell. Farther on, he said, was the land of Ogres, a fearful folk.

And there were five forts to pass between where they stood and the Ogres. Also there was a place of shifting sands, which was the Gobi Desert. Indeed, there was little to look forward to but pain and peril and it was nonsense to venture in search of so small a thing as a way of life. What the pilgrim would find instead was the gate of death. Thus the barbarian.

But the young Chinaman put a few searching questions as to the march immediately before him and in the end the barbarian sold him a horse, which turned out to be a sorry animal. So into the 300,000 trackless square miles of the Gobi Desert the pilgrim went, a direction in mind, and how he traversed six hundred miles, how he was at one time four days without water, how he saw mirages, how he narrowly escaped death at the hands of wandering Tartars—these are only barely hinted at.

Nor is it possible to chart his course, the names given being altogether different from the names of places as they are today, except in the matter of physical aspects. There we are on safe ground. For the deserts and the lakes and the streams and the mountains to which he refers are easily identified.

SO AT last he came, after many hardships, to a place called Turfan, where the Lord of the Ogres lived, and, behold, they were only tribesmen whose reputation for evil was greatly in excess of their merits, as men's reputations often are. Indeed, the Ogre king was most kindly, and invited the pilgrim to the palace, where he sat with him under 'a canopy of precious stuffs.' What was more, when the king found that the pilgrim was a man of



There were polite insistencies on both sides, with the king and the king's men barring his way.

learning, he was all for keeping him in his train.

Indeed, the more Huien-Tsaing interested his host, the more he found himself in the position of a prisoner-guest. There were polite insistencies on both sides, and, when the pilgrim had rested enough and was ready to go on his way, there was the king, and the king's men barring his way.

Such a jewel of an entertainer did not come that way often and was too good to lose. On the other hand, Huien-Tsaing could not refuse hospitality so persistently offered. So he stayed in the palace, but went on a hunger strike, and at the end of four days the king became alarmed for his safety. Then came a compromise, with the pilgrim promising to stay for a month, and the king promising to send him on his way with ample payment.

Each kept his word, so that at last Huien-Tsaing went on his way accompanied by an armed escort, with pack horses laden with food and clothing and satins as gifts for those likely to be met, enemies especially. Also the king gave the pilgrim a hundred ounces of gold and thirty thousand pieces of silver. All of which is related with some care and particularity by the historian and repeated here, because much the same thing took place otherwheres. Nor, be it said, was the gift of satin and silver an idle one, because on the third day after leaving the king, the caravan was attacked by Ogre bandits who had to be bought off. Allegiance sat lightly on men removed from the capital.

BUT the escort proved useful and loyal, even to the point of the laying down of lives for its charge. In the mountain ranges of Thian-shan, 'very dangerous and reaching to the sky' says Huien-Tsaing, sad adventures befell. What with storms and the heights, it took seven days to cross the range, and in the passage fourteen of the men and twice that number of the animals died. We get a hint of some effort to make the pilgrim turn back, but he had his goal and was not to be shaken.

On the farther side of the mountain range they were in western Turkestan and on the southern shore of the inland sea, Issyk-kul. And there, in the palace of the Khan of the Turks, one of those gorgeous semibarbaric hospitalities which read like an *Arabian Nights* story took place.

The news of the pilgrim's approach had been carried forward; so the hillside was a wonder of tents of cloth of gold; of officials and dignitaries dressed in gay-colored silks, of mounted captains all brocaded, and soldiers with spears and banners; of wine and feasting and singing. As for the Khan, he sat open-mouthed and wide-eyed at the tale Huien-Tsaing told of China. But more still did he wonder when he learned that the pilgrim sought neither gold nor jewels, but only a 'way of life.' That amazed him.

'You must not go farther,' he insisted. 'The country is a terribly hot one, and you are too frail a man to stand the journey. Moreover, the natives are unworthy of you.'

Said Huien-Tsaing, in reply: 'Whatever I may be, I burn with longing to inspect certain ancient monuments of which I have heard. I must follow our Lord's footpath on earth,' he added, seeing signs of dissent on the Khan's face.

Neither insistence nor persuasion prevailed, however, and the pilgrim's resistance was so effective that the Khan loaded his visitor with presents and gave him escort and guides to Samarkand, which was ninety miles to the west; and his previous escort returned to Ogreland.

At this point it is well to consider distances, the habit of reading with a map at the elbow having somewhat fallen into disuse. Transferring, then, the distance traveled by the pilgrim thus far to North America instead of Asia, we must imagine a walk from New York City to El Paso, Texas, then south and the entire length of Mexico to the borders of Guatemala. It is necessary to bend south in making the hypothetical journey, because otherwise it would lengthen far out into the Pacific Ocean, and the pilgrim is not yet advanced to the middle of his outward journey.

(*To be concluded in an early issue.*)

An Experiment *That* Failed

BISHOP WILBERFORCE, of Winchester, once had to listen to a professor who had read something of heredity and was, as it were, regurgitating his newly acquired knowledge. Presently the professor dropped into labyrinths of theory, predicting the coming of a perfect human race when marriages should be arranged by the state.

'That may be,' remarked the Bishop with some trace of skepticism, 'but let me tell you of a case of which I know. A German professor of great wisdom and small beauty married a brainless but very pretty woman. The professor cherished high notions as to the outcome. But a couple of years after the marriage I met him and asked how the experiment had succeeded. "Don't mention it," the professor said. "Our child inherited my beauty and her brains."'

FINDERS, Keepers—Losers, Weepers

A Lawyer *Tells Just How Far This* Idea *Goes*

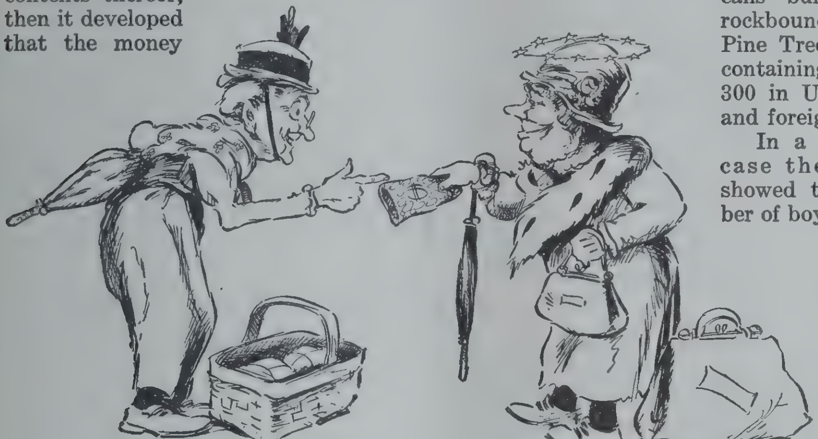
By M. L. HAYWARD

Illustrated by EDWARD McCANDLISH

'THE finder has a good title against all the world—except the real owner,' the amateur attorney avers—and he is right.

By way of illustration, take the case where a finder of a lost purse showed it to a lady friend, who promptly suggested that it belonged to her husband.

'Well, you take it, and, if it isn't his, return it to me,' the finder suggested. The husband promptly claimed the purse, appropriated the contents thereof; then it developed that the money really belonged to a fourth party. The Indiana Supreme Court ruled that the husband was guilty of theft, on the ground that the finder had a good title against everyone except the actual owner, and had not parted with that title by delivering the purse to the wife of the alleged owner.

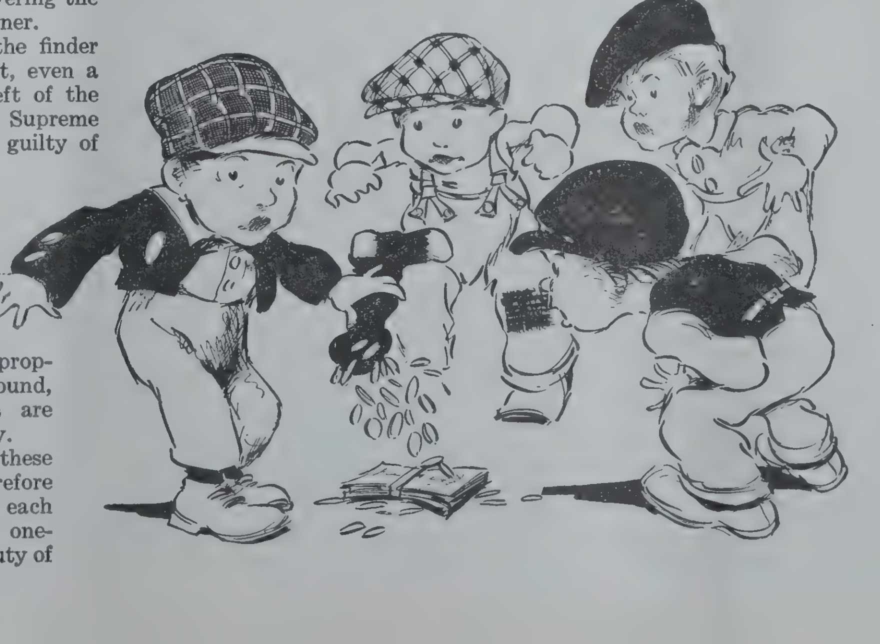


Although, as has been said, the finder has a good title to a partial extent, even a finder may be guilty of the theft of the property, and the Connecticut Supreme Court has ruled that a finder is guilty of theft who takes property lost by a party whom he knows or has the means of locating, and intends to convert the property to his own use.

Another interesting situation arises where two or more persons jointly discover lost property for which no owner can be found, in which case the joint finders are owners in common of the property.

'Upon the assumption that these parties were joint finders and therefore tenants in common of the coin, each was entitled to the possession of one-third of it and charged with the duty of holding it for the true owner, if he could be found,' says the Maine Supreme Court in a case where the lucky finders jointly unearthed three metallic cans buried in the rockbound soil of the Pine Tree State, and containing nearly $1,300 in United States and foreign coins.

In a New Jersey case the evidence showed that a number of boys were playing as boys will. A picked up an old stocking, struck B with it, and it was passed from hand to hand, for the same purpose, and finally C struck D hard enough to knock $775 out of the stocking, which A claimed as the sole finder.



In ruling that all the boys shared in the windfall as joint finders, the judge in the case said:

'I am of the opinion that the money within the stocking must be treated as lost property, which was not "found" in a legal sense until the stocking was broken open during the play. At that time, and when so found, it was in the possession of all, and all the boys are therefore equally finders of the money, and it must be equally divided among them.'

Some knotty questions arise as to the right to the possession of lost property, depending on the place where it is found. For instance, a passenger loses a parcel in a railway carriage, and another passenger and a railway employe reach for it at the same time.

'I'll take charge of it, and find the true owner,' the passenger suggests.

'No—the owner lost it in our car, and we've got the first claim,' the 'brakie' contends, and the New York Court of Appeals has ruled in his favor, on the ground that, 'after the passenger owner had left the car, forgetting to take the package with him, the finder knew the package was not lost property. It or the custody of it did not belong to him then any more than it did while its owner was in the car. He saw and knew the owner had forgotten it, had left it by mistake. It then had become the custody and the potential actual possession of the railway. It was the right of the railway, and its duty, to become as to it and its owner a gratuitous bailee. It was its right and duty to possess and use the care of a gratuitous bailee for the safekeeping of the package until the owner should call for it.'

Or, take the case where A goes to the safe deposit vault of a bank, unlocks his box, drops a $1,000 bond on the floor, replaces the box, goes his way, and where B is the next visitor, and finds the bond. Who is entitled to the possession of it, B or the bank?

In a Missouri case where this actually happened, B handed the bond to a bank official to find the true owner, which the bank failed to do, and then B sued the bank.

'The finder's got a good title until the owner shows up,' B contended, but the Supreme Court of Missouri ruled in favor of the bank.

'It is essential, however, in such cases that the property must be found; that is, it must, at the time when the finder came upon it, have been in such a situation as to clearly indicate that it was lost, and not voluntarily placed by the owner where it was found, by carelessness or forgetfulness. If it was evidently laid where it was found, it then becomes the duty of the owner of the premises to keep the property for the owner, as in such cases he is treated as a quasi bailee, and may maintain trover therefor against the finder; as if a pocketbook is found upon a desk or counter in a store or bank, the presumption is that the owner placed it there and forgot it,' said the court, quoting from the Supreme Court of the United States.

Suppose, however, that the 'finder' of the $1,000 bond is wise in his day and canny in his generation.

'It's understood that if you can't find the owner in 6 months, the bond's to be given back to me,' he stipulates.

'That's understood,' the bank official agrees; the finder swears that this conversation took place, the 6 months expire, the owner is not found, and the finder sues the bank for the bond.

This situation was involved in the latest case on the point, a decision of the Kentucky Court of Appeals, where the court ruled in favor of the bank, on the ground that, 'When the trust company acquired the actual custody of the bond from the finder, it was entitled to the custody as against the finder, because it represented the owner.'

Oliver Wendell Holmes

(*Continued from page 15*)

some hypercritic made—that they were 'medicated' novels—though it hurt Holmes, because it could not be denied, really lessens their merit not a particle. His third novel, written in his eighties, I have never read.

He made a journey to England about that time, and was splendidly received, being known and loved there almost as much as here; and he embodied his reactions in another book of essays, like the earlier ones, grown a little infirm with years.

But I must turn back for a moment to the sixties. Holmes' eldest son, Oliver Wendell, Junior, had volunteered in the Civil War, and had soon attained the rank of captain. One day a telegram came from the front, announcing that Captain Holmes had been gravely wounded, and would be invalided home as soon as he could be moved. The father, terribly shocked, but resolutely optimistic, made the best diagnosis of the wound he could from the scanty data, and then took the next train for the scene.

But the armies were moving, and the son was moved with them, and his trail was hard to follow.

The anxieties of that search, the hopes frustrated, the omnipresent dread of the worst, the persistent pursuit through difficulties and perils, made what our journalists would call a great story, and happily Holmes wrote it in detail, with such vividness and emotion as belonged to him.

It was printed in *The Atlantic*, and Fields came over from Boston to The Wayside, with the manuscript in his pocket, and read it aloud to my father and the rest of us.

The relief from the tension from which the writer had suffered for weeks enabled him to be as witty and humorous as in his best work, while at the same time the tragic and strange scenes through which his search led him were depicted with the tenderest and most attentive sympathy.

No better picture of 'the front' was ever painted. It was entitled 'My Hunt for the Captain'; we saw and heard and felt the ghastly and grotesque realities. The essay must, I presume, have been included in one of his books, but I cannot say in which.

FINALLY, Holmes tells how, searching through a train in which he was riding, on the remote chance that his beloved son might be on it, but not letting himself hope too much after so many disappointments, he entered the last car, and proceeded slowly down the aisle, scanning with fearful intensity each face of the shattered men who were lying or reclining there; some dying, others like to die, a few who might recover.

Then, looking forward, he found himself gazing on the wasted features he had sought. In the old Biblical times, he would have fallen upon his neck and wept; but in that crisis, all the stoicism of his New England ancestry suddenly came upon him.

Long afterward, Stanley, happening upon the long-sought Livingstone in Darkest Africa, controlled the leap of his heart under the calm words, 'Dr. Livingstone, I presume?' And Holmes, as if he and the treasure of his heart had been parted but for an hour, and were met casually, greeted the young soldier with 'How are you, Boy?'—to which the Boy responded as composedly, 'How are you, Dad?' No fatted calf was available then and there, but the cup of love and joy was full.

Holmes Junior could not return to the war, but after being nursed back to health, he resumed his study of the law, with what success and renown we know. For thirty years he and his father lived in tender and proud companionship, and then he had to go on alone.

One hopes that some time there will appear a volume of memories of the men and times that he has known. No hint of such a narrative has been given however; and perhaps Justice Holmes thinks that the name he bears has literary laurels enough. But what a scope he has for wisdom and judgment! A man who has so long and well adjudicated the disputes of men and the discord of events might find the clue to lead us toward harmony.

HOLMES was not fashioned on the largest lines, but his quality was sterling through and through. When I was at Harvard, Edward would often take me to his father's house on Charles Street, overlooking the Back Bay—he afterward removed to a more spacious mansion on the made-land west of Beacon Street. Surrounded by his wife and children, Holmes abated somewhat of his social hilarity; the stimulus was less.

He was quietly cheerful; all the mutual relations between the members of the family were beautiful and serene. The visitor was conscious of an atmosphere of simplicity, integrity and purity; here, nothing was unclean or hidden. Good will and good motives were presumed; these people faced one another frankly and affectionately. And yet the master of the house attempted no other form of mastership than was inherent in reason and love. He had no pride of opinion or of ownership; nothing not consonant with good and truth could have stability in his dwelling, and whether or not he accepted religion under that name, it was the essence of his life and practice.

Not a little of what appears to be personal vanity is really a desire to please other people; not, therefore, a selfish but a social impulse.

We do what we may for their entertainment and pleasure, and are glad because we succeed. Holmes had so many social gifts and was so eager to make them serviceable to his fellows, and was so delighted with their delight, that he would sometimes seem vain; but it was no such shallow thing. He never held himself high; he would regard his success as his good fortune rather than as his desert. And he was very quick to recognize merit in others, and to declare and uphold it. His own foibles were few and venial, and his virtues great.

Such persons are Christians, even when they don't know it. One may be too profoundly aware of God to claim knowledge of Him.

Where the Mother of Lincoln Was Born

(*Continued from page 13*)

family was exactly the size I needed.

I blush now to think of the work I caused them, but the Census Bureau made an amazing search for me, with the result that so far as they can discover there was no other Joseph Hanks in any of the thirteen colonies whose family was anywhere nearly that size. No birth of a baby or two, no total of probable infant mortality, would have made any other Joseph Hanks and family a possible competitor.

I had many other things to learn, and have not yet learned them all, but this was certain: Joseph Hanks and family of Richmond County disappeared from there in 1781, immediately after the settlement of his mother's estate, and reappeared in Hampshire County in 1782, just in time to get into the census there.

But why Hampshire County, in the northern edge of what is now West Virginia? Because, the lands of Lord Fairfax, which George Washington had surveyed, were just then coming into market at very cheap prices, and for the first time with good titles. There was a perfect exodus up the Potomac, and down from Pennsylvania, into those new lands.

So I had found the locality, and I gained what knowledge I could from correspondence; it all took time. At length I set out to find the spot.

I went to the courthouse in Romney immediately on my arrival. The clerk was ill and had been so for a long time. My correspondence had been with his assistant, his capable daughter. I found her and the county assessor checking up on the whole county list of taxpayers. I addressed the assessor, asking him if another day would answer his purpose, and he courteously said it would.

Then I addressed the young lady, who knew me through my letters. Said I, 'Is that candy box full or empty?' She said it was empty.

'Where do they sell the best candy?' I asked.

She named the store.

I said, 'As soon as this office closes, I am going there, and then back, and I intend to bring you the biggest and best box of candy in Romney.'

I got all the help I needed.

I had learned from her already that in March, 1784, Joseph Hanks mortgaged his farm for a pittance to a Pennsylvania German neighbor named Peter Putnam, and moved from the county and state. I had my suspicions as to why the family made this hurried exit just when their farm was coming to have a value.

THE office was rather late in closing but I got the information I wanted, in terms of the streams and 'the rode' and 'a strate line from where the rode crosses the creek to the Washington line.' George Washington surveyed one side of the Hanks farm! And Abraham Lincoln, whose mother was born there, was also a surveyor.

I am a man of my word, and the deputy clerk went home with the best candy I could buy in Romney. It certainly was in a nice, big box, and I hope the candy was good. She deserved it.

In West Virginia a man who carries passengers for hire must have a license and file a bond. There is a garage in Romney, and there I went. I said to the proprietor: 'I know you cannot accept money from me, but I need your help. I want to get back into the hills tomorrow morning, and the two men who have licenses cannot take me. Here on your desk I see a copy of THE DEARBORN INDEPENDENT. The editors are my friends.'

He inquired, 'What time will you be ready to start?'

I said, 'At seven o'clock.'

He said, 'I will be there.'

He came for me in a Lincoln.

He asked me no questions, and I told him nothing except where to go. To Burlington, on the road toward Keyser, then up Patterson's Creek, till we came to a little stream which I could identify. When we left Burlington, I watched the record of our mileage, and checked up on the map.

After traveling some miles we met some men working on the road, and I asked: 'Is there a little stream about three-quarters of a mile from here—a stream flowing in from the right?'

They said there was such a stream, at just the distance I had named.

'What is the stream called?'

'Mike's Run.'

We had found it! Joseph Hanks' farm was in the forks of Mike's Run of Patterson's Creek. The papers called it a drain, or as they spelled it, a 'drean.' It is more than that. It is a really pretty little stream. We crossed it, and found the Peter Putnam house just where I expected, and now occupied by a family named Arnold. Also we found an old road leading to the right, up Mike's Run.

We went up this old road as far as the heavy car could go, and then got out and walked.

'I want to find the site of a human habitation between the forks of this stream,' I said, 'and the spring from which that house obtained water.'

When we had found it, I said: 'You have asked me no questions, and I have told you nothing about the reason for my errand. This is the site of the home where the mother of President Lincoln was born, and you and I are the first two men to visit it, knowing that it is so.'

THE man who starts on a quest like this must expect to do a great deal of hard work himself, and he cannot afford to be too modest in asking for the assistance of others. Such assistance I have had, and from very many persons besides the few I have named. And now, for the first time, the world knows where Nancy Hanks was born.

On April 19, 1927, with simple, but impressive ceremonies a movement was sponsored by a local committee for the rebuilding of the Hanks cabin, which movement, it is hoped, will become national. The final tests were made assuring the committee of the accuracy of measurement and computation. The local surveyor, J. S. Martin, gave his final judgment of the lines of the old farm, and the spring and tumbled stones gave the location of the home. The spring was badly clogged, but with a little digging ran freely, and its water was found to be good. It is said that the spring never fails. Digging at the outside of the apparent line of the building disclosed the original corners, and these were officially marked. Logs for the actual rebuilding will be provided from nearby cabins; it is possible that one such cabin only a half-mile away will be taken down and reërected almost is it stands; its dimensions are proper for the purpose.

W. H. Barger, editor of the Keyser *News and Tribune* presided, and an informal speech was made by the writer of this article. A more formal address was made in the evening at a banquet served in Keyser. An organization was effected, to secure incorporation and purchase the farm and build a road to the home where Nancy Hanks was born.

Perhaps the birthplace of President Lincoln's mother will become as widely famous as her grave.

The spring from which little Nancy Hanks drank. The spring flowed freely after it was cleaned.

How France Has Restored Her Finances

(Continued from page 6)

interest on national defense bills. This aroused a general feeling of alarm among the possessing classes, great and small. Added to this was the fact that the socialists urged a tax on every conceivable form of capital—on land, houses, farms, livestock, shops, or in other words 10 per cent of the estimated capital value of any possessions whatever, to be paid over a series of years.

The first result of this was that people not only ceased to subscribe to government issues, but rushed to the treasury to get their bills reimbursed as they fell due. The treasury was soon cleared out, as insufficient revenue was coming in from customs or taxation. The government once again turned to inflation, without informing the nation of what it was doing. The Bank of France was ordered to print more notes to meet its obligations.

This led to a further heavy slump in the currency—to such an extent indeed that by July, 1926, there was no money in the treasury to meet the wages of government officials falling due at the end of the month, to say nothing of the huge amount due in interest on government bond issues.

The socialist-radical coalition unfortunately had no capable financiers in their ranks. Their greatest man in this respect, Joseph Caillaux, was tried, and a sort of miracle was expected from him; but M. Caillaux had been too long away from office. His conception of finance was of the old prewar type, and he failed to grasp the new situation in proper time. By the time he did understand it, he had been swept away from office by a hostile vote.

THUS at the beginning of July, 1926, with an empty treasury, and in face of a general lack of public confidence—the public believing that owing to financial mismanagement the franc was going the way of the German mark—the country was on the eve of bankruptcy. The franc was falling at a catastrophic rate, and the question was: What was to be done? How could the situation be saved? The radical-socialist groups were blaming the financial policy of their predecessors for all the trouble through their continual borrowing and their printing of incorrect statements of the real conditions. Meanwhile the people were sending their money out of the country in large quantities. The two democratic parties, however, forgot or omitted to say that, when M. Poincaré had as prime minister tried to improve matters, they had opposed him tooth and nail from purely political motives.

In face of the growing crisis a split occurred in the radical-socialist party, and about half of the former element broke away.

These then decided to help in the formation of a government consisting of members of all parties—a united parties government of national defense, to save the country from financial disaster. The socialists refused to enter into this combination.

The presidency of this new government, as well as the ministry of finance, was, as we know, offered to M. Poincaré (already several times prime minister and, during the war, president of the Republic). He was to have extended powers.

M. Poincaré had been openly stating that the franc was worth a great deal more than the rate at which it was quoted, and that its fall was due more to lack of public confidence than to anything else. At that time more than a billion dollars of French capital was outside the country through fear of the threatened tax on capital and through a desire to find a more stable currency than the franc.

M. Poincaré formed a government of both parties, and at once introduced drastic measures of taxation, furthermore maneuvering credit conditions at the Bank of France in such a way as to compel French people to bring back a large portion of their capital from abroad.

With the money which the new taxes placed at his disposal he proceeded to buy large stocks of British pounds and American dollars.

M. Poincaré's drastic methods quickly restored public confidence to a considerable degree. People began again to purchase government bills, and ceased selling government stock. In less than five months Poincaré had brought back the value of the franc from 240 to 120 to the pound.

IN performing this miracle Raymond Poincaré has been helped by the two big assets of his character: First, he possesses a straightforward, determined nature; secondly, he has the confidence of the people since he represents in a highly efficient manner the forces of law and order (even though one or two of his political measures have been severely criticized). He is recognized to be eminently honest, prudent and free from personal ambition. And the Frenchman, it must be confessed, whatever his personal politics may be, is most easily touched through his pocket. When Poincaré came to power, he learned that there were only 81 million francs to the credit of the treasury, and the government had no resources with which to meet imminent liabilities. Besides launching the new taxation, he adopted the simple technical expedient—which however nobody had thought of before—of raising the rate of discount of the Bank of France. Other banks could but follow suit, and dearer money became general. This touched the French traders, who had placed their investments abroad. Between the necessity of paying 14 to 15 per cent on borrowed money at home, or of selling part of their investments abroad, they chose the latter course. Bringing home the proceeds of sales and changing them from pounds or dollars to their own currency, they started the franc on its upward movement, and so the problem which had for months racked the brains of French politicians—to bring the money back to France—was solved. Again the peasants, with reawakened confidence, brought out their savings. In less than a month the metallic reserve of the bank was increased by about 10 per cent. The citizens responded to an appeal to restore the credit of the state, and took up large amounts of treasury bonds and national defense bonds. The last issue of treasury bonds, amounting to some three billion francs, was fully subscribed in twenty-four hours.

It is not generally known that in adopting these and other measures M. Poincaré has been largely guided by the advice of a number of financial authorities, notably M. Weindel, a wealthy industrialist and a neighbor of his at his country home in the Meuse, and Baron de Rothschild, while it is reported that Montagu Norman, the governor of the Bank of England, has watched his work with more than mere interest. Some of his severest critics in the past, like Dr. Gaston Jèze, professor of finance at the Paris Law Faculty, have been his warmest supporters in his policies.

AMONG the criticisms leveled against France's brilliant minister, one is that by hastening the revaluation of the franc he precipitated an industrial crisis giving rise to a certain amount of unemployment, whereas if the franc had been left at 170, where it was last October, the export trade would not have been seriously affected and there would be no unemployment. But the logical reply to this is that even if France were not going through a minor crisis of unemployment—the importance of which must not be exaggerated—she would have had to face a crisis of another kind. Prices throughout the country have not come down, in spite of the widespread official campaign to force them down, and the cost of living is the same as it was six months ago. Does this not prove that when the franc was at 170 internal prices were not adjusted to their true level, and that if the franc had remained at the higher rate internal prices would again have risen considerably; with consequent loud complaints from consumers and further demands all round for readjustment of salaries, which could not but have had a disastrous effect on the national budget, and on employers' balance sheets.

The other form of criticism is to ask why M. Poincaré did not proceed to legal stabilization of the currency—why Belgium's example is not followed and advantage taken of the steadiness of the present situation to return to the gold standard by means of a decree fixing the rate at which French paper can be turned into gold.

M. Poincaré's reply to this is that, as an ardent supporter of stability himself, he has almost attained stability, since the franc has not varied more than a few centimes a day since last December, but that stabilization cannot be obtained merely by passing a decree. Belgium's example, resulting nearly in financial bankruptcy, is rather to be avoided than followed. The minister must first be assured that commerce and industry have sufficiently adapted themselves to the new monetary situation, and must above all be sure that the return to the gold standard will bring no unsettling effects in its train.

In acting as he has done M. Poincaré has the approval of the best financiers of the country and the confidence of the people, who as long as stability is more or less a fact are not concerned about its being legalized, since a really prosperous France does not depend upon that in any durable way.

The Home Town of Golf

(*Continued from page 7*)

on which the green, a large double one, lies—a 5. No. 6 is a drive and pitch—a 4. No. 7 is flanked on the right by a wall of whins, and is dog-legged in form. A drive, then a brassie or full iron over a big bunker, and perhaps a chip give a 5. No. 8 is short and flat—a 3. No. 9 is a drive and short approach—a 4. This makes 38 for the Out half, a score quite easy to get.

The homeward journey is the difficult part. No. 10 is simple enough, drive and pitch—a 4. No. 11 is one of the worst short holes in existence. It is about 140 yards long, the green on a mound with a broken top which faces and slopes down toward the tee. Eighty yards from the tee is Strath bunker, already crossed going to No. 7. Cut out of the face of the mound, under the green, are two deep pots, and beyond the green is an unspeakable wilderness of bent grass and sand on the bank of the river Eden. Luck gives a 2, daring a 3, and prudence a 4. No. 12 is a long drive and approach, but the player, unless he is hitting hard, should pull his tee-shot to the left to avoid the two chains of hidden bunkers across the fairway, the first string 150 yards from the tee. A 4 can be got here.

No. 13 is a long drive and well-lifted iron on to a plateau, with perhaps a short run-up—a 5. No. 14 is the Long hole. A full drive and brassie, if they don't land the ball in one of the numerous bunkers, end in very rough country near the green, and most golfers are happy with a 6. No. 15 is similar to 14 in its rough surroundings—there is very little fairway—but it is shorter—a drive and full iron. The green, like most of them in the Home half, is cunningly beveled at the edge, and it needs skill to get 'dead'—a 5. No. 16 has on the left the celebrated Principal's Nose bunker system—three deep pits grouped round a hillock. A player who gets into one usually visits another ere he wins clear. The green is difficult to get on and stay on. A drive and jigger is the hole's length, but a 5 is respectable.

No. 17 is the most famous of all, the Road Hole. The tee is situated close to a stone wall which runs straight ahead for 100 yards. Behind the wall, and out of bounds, are a railway goods yard and sheds, and into this corner go all sliced and weak tee-shots. Once clear of the corner, there are still 400 yards to reach the green, which is heavily guarded by arrangements of bunkers on the fairway that often trap a good second shot. The green itself is high and narrow, with a big pot hazard, built into its front, and the player, approaching over this obstacle, often plays too strong, and lands on the road behind the green—a very good 5. The last hole is a drive and mashie, but a sliced ball will land in the garden or drawing-room of one of the houses of the town—a 4. This makes 43 'home,' and 81 in all.

British players are anxious that the 'Open' Trophy should stay in Britain in 1927. It will be disappointing to them if the American contingent is not up to full strength, but in any case they are rather hopeful of success. Abe Mitchell and Aubrey Boomer are their two chief professionals. Neither has won the 'Open,' but Mitchell's golf this year has been better than ever. He has already won the Roehampton tournament, led the field in the qualifying rounds (southern section) for the *Daily Mail* competition and won the final stages by three strokes from Fred Robson. Boomer has not made such a fine start, but last year he won the *Daily Mail* tournament at St. Andrews and the Glasgow *Herald* tournament at Gleneagles.

George Duncan is so incurably erratic that Britain cannot depend much on him in the 'Open.' This year he even failed to qualify in the *Daily Mail* competition. He can play one or two rounds brilliantly, but seldom four, and four are needed for the 'Open.' Compston, who took third place, after Robson, in the *Daily Mail* test, is another possible winner, but he is not so steady as Mitchell or Boomer.

Of our amateurs, there are two outstanding, Roger Wethered and Cyril Tolley. Although the former, who is in government service, has little leisure for golf, he has this spring won the *Golf Illustrated* vase. In 1921, it will be recalled, he tied with Jock Hutchison at St. Andrews for first place in the 'Open,' and was beaten in the play-off. Tolley, who is also in excellent form, is less consistent than Wethered.

The difficult Hell Bunker on St. Andrews' course.

A Miracle in Stone

THAT is the Great Pyramid which, as the author, Julian Hawthorne, remarked when he submitted the article, 'is the most amazing natural phenomenon in the world. It has been of great interest to me for forty or fifty years.' The writer condenses into one article many of the secrets which students in the past few decades discovered from this 4,000-year-old mass of stone.

In addition, a generous offering of articles covering a wide range of subjects.

When a Mighty River Goes Mad

(Continued from page 5)

surrounded. Or the distant shrilling of whistles and firing of guns would tell them that a new crevasse had come.

After the rescue work had been systematically organized, every effort was made to evacuate people while the land was still dry. Trains and automobiles were provided, and even trucks, to help them remove some of their belongings. But love of home was strong, and many refused to leave until the water was at their very doors. Governors of all seven states resisted all suggestions to declare martial law; and there was nothing for the rescuers to do but wait in patience until the people could see the danger for themselves and would consent to leave. Even then many took refuge on the levees near their homes, and this necessitated arrangements to ship them food by boat.

Citizens in some of the larger towns stayed by their homes in comparative safety. Boats, and in some cases automobiles, plied through the streets, carrying provisions and medicines. In cities where the depth of the flood was not great, children splashed in the water, happily oblivious of the lurking dangers of typhoid.

Even the fundamentals of sanitation and disease prevention were unknown to many in the stricken regions. It was a common sight to see householders dipping drinking water from the muddy swirl passing their homes. This lack of ordinary precaution gave the Red Cross one of its greatest problems.

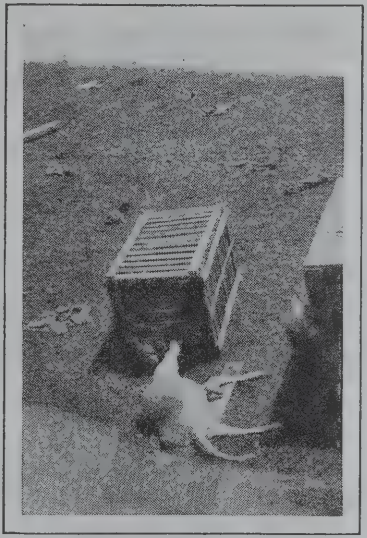
With additional thousands streaming from flooded and threatened territory, the concentration camps took on military appearance. As far as possible the Red Cross kept family groups together. Recreation was planned to take their minds off their troubles. Instruction in the fundamentals of health was given. Lectures, motion pictures and pamphlets were utilized. The people were taught how to purify their water supplies when they returned home, how to dispose of dead animals, how to spray malarial pools. Thousands were immunized against typhoid and smallpox. Talks were given by agricultural experts. Odd jobs were supplied for the men wherever possible, to give them a little pocket money. Cleanliness was a paramount order at all camps. Nurses took advantage of the opportunity to instruct mothers in the rearing of children. Hospitals were established. At the Lafayette Negro camp, triplets were born—named appropriately Highwater, Lowwater and Backwater. Other babies were given like names. Refugee Jones had the distinction of being first 'flood baby.'

But all this came after the work of rescue. The earlier days of the flood were filled with tragedy. Typical was the call flashed by Mayor J. C. Gillison of Lake Village, Arkansas:

'They are clinging to small rafts and floating trees in water twenty to thirty feet deep, or packed like sardines in barn lofts and other places that have not been reached by the raging water.'

The response to such calls was magnificent. A fleet of more than a thousand craft plied back and forth in the dangerous waters—coast guard cutters, lifeboats, tiny pirogues, skiffs, rowboats, river steamers, rafts, speed boats, canoes. Many perished in the flood, but many more were saved. To the Red Cross and assisting agencies a mighty tribute is due. Had the flood occurred in any other land, the dead would have been counted in thousands instead of hundreds.

Floodwaters from the north, marching relentlessly toward the Gulf of Mexico, drained back into the Mississippi through lateral streams, battered through new levees, flooded new territory. The river continued to rise. Higher levels than ever before were predicted.



A dead deer on the levee near Melville. Refugees were living in the packing box, shown at the extreme right.

At New Orleans the racing water lapped uncomfortably close to the tops of levees. The city of 400,000 lies for the most part *lower* than the level of the river. Once the Mississippi gained the top a disaster incomparable to anything in American history was predicted. The crest of the flood was still far up the valley; *and the river was rising!*

April 29 there was carried into execution one of the most desperate expedients ever resorted to in time of peace. A levee was broken by executive order of the state. Levees had been broken before (the armed guards patrolling hundreds of miles of levees knew that: frantic men might blow up the levee on the *opposite* bank to relieve pressure on their own), but never before had the work of destruction been done officially.

This time it was different. Engineers consulted, and the only way to save New Orleans, they decided, was to break the levee below the city and give the river a new outlet to the sea. It meant over $2,000,000 damage. It meant a wilderness of wrecked homes and ruined fields. It meant aching hearts to those who loved the doomed country and it meant death to countless wild creatures. But it also meant saving New Orleans. The Governor of Louisiana signed the official decree, and 3,500 residents of the parishes of St. Bernard and Plaquemines were ordered out.

That tragic exodus turned back the pages of history two centuries and a half, to the exile of the Acadians. And it would take another Longfellow to write, as he did in *Evangeline*, the bitter story of their second flight. The 'Cajans,' sons of those old Acadians who found refuge in the then French colony of Louisiana, still speak the language of their ancestors, still cling to the old customs, still cherish a smarting hurt from the old exile.

Resentfully they bade farewell to their homes and plodded to the great city, some behind cattle, some behind oxen. Many among them were trappers and hunters, and carried their guns as they walked. Dust rose in clouds from the hoofs of the cattle. Hens squawked; pigs squealed. It was county-fair day on a grand scale, with the pleasure distilled out. Refugee camps were established for the exiles, and the city pledged its honor to reimburse them for their losses.

The blasting of the levee showed two things: the tremendous strength of the artificial banks, and the still more tremendous strength of the river. The first explosion was a dud. The river failed to rush through; it did not even trickle. The levee remained virtually intact. Other blasts, and finally, hours later, the water began to flow through.

That first charge of dynamite proved the nemesis of many a newspaper correspondent. While they were marooned on an official boat miles from the scene, vividly descriptive stories of the explosion had been written hours before it took place, and were already in newspapers marked 'hold for release.' When the first blast came the 'release' was flashed to the newspapers; the papers came on the streets with lurid stories about the levee being shot high in the air and the water pouring through 'with the force of a thousand Niagaras.' So much for modern journalistic enterprise.

The Poydras crevasse probably saved New Orleans. The river level dropped a few inches; not the *feet* predicted by engineers, but enough to save the city from being again seriously menaced. New Orleans was never under water from the flood. A rainfall of 14.1 inches in one day inundated the streets of the city for a few hours, and the pictures that were sent broadcast gave many the erroneous impression that the city was under water. It was not.

The saving of New Orleans, however, by no means ended the flood. A great wall of water was moving slowly southward along the west bank of the Mississippi, at places twenty miles wide, at places forty. Planters in northern Louisiana fought furiously to build up their levees against the onslaught. Once again the battle was lost. In the Vicksburg-Baton Rouge sector the Mississippi won almost every encounter. Levees gave way above and below St. Joseph, above and below Vidalia. Waters from the

Ouachita and Tensas rivers added to the catastrophe. The Black and the Red rivers poured in their burdens.

A last desperate stand was made along the Bayou de Glaises levee in northern Louisiana. Thousands of men toiled day and night building revetments, piling bags of earth, repairing sand boils. They knew their fight was vain, but they fought on. The result was inevitable. One morning a small fissure appeared. Within a few hours it was a crevasse. A few hours later the levee was honeycombed with breaks. The last sector had been lost.

But even yet the men battled on. They retreated to the banks of the Atchafalaya River (paralleling the Mississippi to the Gulf) and attempted to build its levees high enough to withstand the flood. Their efforts were futile. The whole state watched the fight with eagerness. Men from all parts offered their services. Even convicts volunteered, and were utilized at McCrea. The river poured past, unheeding. It caught the steamer on which the convicts were quartered and capsized it. All were reported rescued.

Twenty-five hundred men worked day and night at McCrea on the east bank of the river. Suddenly, at five o'clock one morning, the river switched its attack and broke through at Melville, fifteen miles downstream on the opposite bank. Residents cheated the waters by a matter of seconds, taking refuge on that part of the levee still intact. Once again the river turned its attack to McCrea, and at last gained victory. Six Government barges tied alongside the levee crashed through in the first hour. A seventh remained for a time, to be carried through later. The levee crumbled on both sides. Before noon (the break had come at three in the morning) the gap was 1,100 feet wide. The next day it was 3,500 feet.

The breaks at Melville and McCrea sealed the doom of Louisiana's famed 'Sugar Bowl.' They brought the flooded regions to one-seventh the total area of the state. Thousands of animals perished, but the rescue of human beings was carried on with military precision. Louisiana had more time to prepare than did the other states; and the emergency relief work under direction of the Red Cross moved smoothly and efficiently.

Flood waters in Louisiana do not rush over the countryside; they creep. In the low-lying areas, the force of a crevasse is spent in a short distance. The river waters pour out in voracious search for the nearest swamp or marsh or bottomland. These must be filled before the flood begins its march across country.

Fanlike, from the lowlands, the flood stretches across meadows, over roads, through rich, lush fields. Gradually the crotches between the fingers are filled and new fingers are extended. As the waters advance brown becomes the predominant color.

There is a horrid fascination at the edge of the flood, with the waters creeping forward by quarter-inches. Ants scurry in crazy circles. Their homes, too, are lost; and their lives. Back in the woods a splash sounds as a deer fights its way through the underbrush. A dog bays desperately. Hens cluck in amazement as the water enters their domain and they are forced to the tops of coops or the lower branches of trees. Hens form one of the minor tragedies of the flood. It is an ordinary experience to see them clinging to precarious perches throughout the overflow regions, clinging for hours or for days until they finally drop from exhaustion into the water. Scant attention is paid them. Where human lives must be saved, little energy is wasted in the rescue of chickens. Attempts are made to save livestock, but even these are largely futile.

It is still too early to count the cost of the Mississippi Flood. The actual known dead, identified and unidentified, are 115, with Arkansas contributing 59, Illinois 2, Louisiana 10, Mississippi 42, Tennessee 2, and Missouri 0. But this list is based upon the count of bodies. Many more are believed to have perished, of whom no record is yet available. Ordinary estimates place the dead between 300 and 500. Lew R. Palmer, past president of the National Safety Council, declares the final death list will stand closer to 1,000.

Property loss was estimated in the early days at $1,000,000,000. This figure is now believed excessive, but that the loss will be enormous no one can deny. The crop loss alone mounts into millions. Efforts are now being made to reduce this by getting seed into the ground as soon as the water goes off, but the success or failure will not be known for some time.

Next to crop loss stands that of livestock. No total estimate has been attempted, but a preliminary survey in Arkansas alone gives: horses and mules 9,253 head; cattle 20,929; sheep 308; swine 66,589; poultry 521,353. The loss in Mississippi may equal this, that in Louisiana exceed it. Other states did not suffer so heavily.

Buildings, highways, railroads, all sustained tremendous loss. The levee loss alone is large. Approximately 25,000 men were engaged in the fight to save the levees, and $2,500,000 to $3,000,000 was expended in the losing battle.

Wild animals in some areas were virtually exterminated. Their plight was the same as that of domestic animals: there was no place to flee from the advancing water. Some mingled with cattle and with humans on levees and other high points, but their number was necessarily small. In St. Bernard and Plaquemines Parishes, where trapping is an important industry, rafts were turned adrift with food for muskrats. The rafts became literally alive with rats, but trappers believe that far more were drowned than saved.

The Red Cross coördinated and supervised the work of all other relief agencies, and helped reduce the loss of life to a minimum. It established and maintained 73 camps, ranging to 20,000 in numbers accommodated; it cared for refugees in 130 other concentration points, such as schoolhouses, public buildings, and railroad box cars. It cared for a total of some 600,000 refugees, with 382,605 still in camp June 1. It threw a small regiment of physicians, nurses, sanitary engineers and relief workers into the field. It supplied, to June 1, 596,000 pounds of hydrated lime for sanitary purposes, 28,250 pounds of chloride of lime, 100,420 gallons of crude oil for burning animals, 5,450 gallons of spraying oil for malarial pools, 53,000 yards of mosquito netting for private homes (in addition to that for the camps), 222,500 points of typhoid vaccine, 130,500 points of smallpox vaccine and 3,119,878 grains of quinine sulphate.

In the camps it gave complete typhoid inoculation to 285,500 people, and preliminary inoculation to 62,000 more. It vaccinated 110,000 against smallpox.

The Red Cross is also attempting some of the work of rehabilitation. Those who leave the refugee camps are given a two weeks' supply of rations, emergency feed for their stock, seeds, and essential medicines. But the Red Cross emergency fund stands only slightly above $14,000,000. There are 700,000 refugees in all. That means $20 a refugee.

Hand Craftsmen *Still Hold* Their Old Stand

ARTICLES made of mother-of-pearl are known to nearly everybody. Churchgoers in particular encounter the beautiful religious ornaments that are carved from mother-of-pearl.

A large part of the world's supply of these fixtures comes from Bethlehem. From there it is shipped to Jerusalem, twelve miles distant, then to all parts of the world.

One may see along Bethlehem's ancient streets numerous shops where workmen are painstakingly cutting and carving huge shells procured from the depths of the Mediterranean Sea.

The saw, vise and other tools of these old mother-of-pearl craftsmen are antiquated makeshifts, but this lack of fine equipment makes very little difference to them, since they are largely ignorant of modern improved mechanical manufacturing methods.

America's *Oldest* Manor House

Castle Philipse, *near* North Tarrytown, New York

By E. IRVINE HAINES

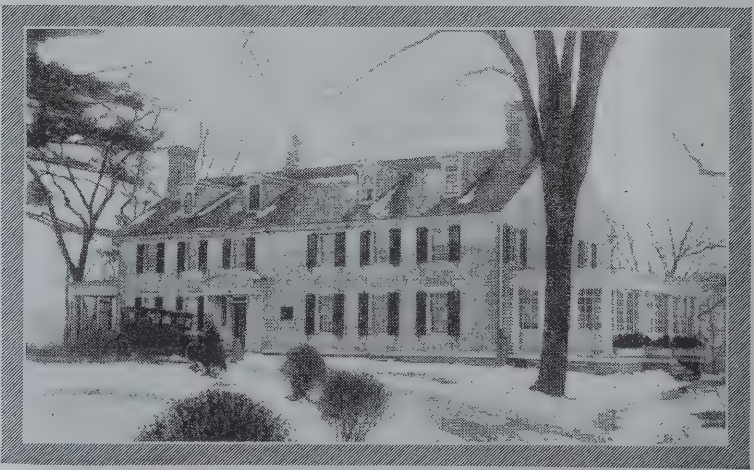
PHILIPSE MANOR HALL near North Tarrytown, New York, is the oldest Colonial mansion standing in this country, and is famous as an historic landmark of the Colonial period, as a survivor from the ancient feudal system that once prevailed throughout America as well as in England, and the scene of many happenings of considerable historical and political significance.

Here George Washington slept during his visits to the historic mansion.

In the year 1650 there came to the little Dutch settlement of Nieu Amsterdam one Vrederyck Flypse, a victim of religious persecution in Bohemia where he had been a viscount and keeper of the king's deer forests. The young nobleman erected a rough cabin and a log stockade on the banks of the Pocantico River near the Hudson, and shortly afterward, when he had become the richest merchant in the province, he built a stone mansion that is today as strong and substantial as a modern steel structure, if not more durable. He was a dealer with the Indians, shipowner in the East and West India trade, importer of slaves, leader in provincial politics, founder of Sleepy Hollow Church, probably a secret trafficker with Captain Kidd and other sea rovers, and owner by purchase of the territory that was erected by royal charter of William and Mary into the Lordship and Manor of Philipsburgh.

Mary Philipse married Captain Roger Morris in this room.

The Pocantico River joined the Hudson in the midst of a wilderness in which Indians and deer abounded when Vrederyck Flypse caused the stone mansion to grow out of the green hill slope in 1650. He planted a foundation five feet thick and thereupon raised walls whose thickness was sixty inches. He would have a residence wherein he might defy alike the savage elements, men, and beasts. For the front end of his entrance hall he imported a massive mahogany door from Holland. The rear door of the hall was similar. Ponderous were the hinges and bolts, being ordinary blacksmith work. Solid were the panel mouldings. He brought Holland brick wherewith to trim the openings of doorways and windows. He laid the floor of his kitchen with blue stone. The chimney breasts and hearthstones of his principal rooms were seven feet wide.



Castle Philipse, or Philipse Manor Hall, near Tarrytown, New York.

Here, in feudal fashion, with many servants and slaves to do his bidding and tenants to render him dues, dwelt Vrederyck Flypse with his second wife, Catherine Van Cortlandt, and the children left by his first wife, Margaret Hardenbrock. He built mills near the manorhouse and erected the Sleepy Hollow Church across the Pocantico, immortalized by Washington Irving's story of the Headless Horseman.

In 1745 when the second lord of the manor—Vrederyck Flypse's grandson—came into possession of Castle Philipse, the province was becoming less Dutch and more English. He, therefore, imported marble mantels from England, had the walls beautifully wainscoted, the ceilings adorned richly with arabesque work in wood, and a lawn laid out in the best English fashion between the mansion and the Albany post road.

In his time Castle Philipse flourished long and grew venerable and multiplied its associations. He had thirty white servants, twenty black slaves and a numerous tenantry, happy because in many cases the yearly rent was but nominal, being three or four pounds or a pair of hens or a day's work. The Philipses, thanks to trade and to officeholding under the Crown and to the beneficent rule whereby money multiplies itself, did not have to squeeze a living out of the tillers of their land.

With the accession in 1751 of Frederick Philipse, third and last Lord of the Manor of Philipsburgh, began the splendid period of Castle Philipse; then the panorama of which it was both witness and setting wore its most diverse colors. The old contest between the French and the English on this continent was approaching a glorious climax. Whether they were French emissaries coming down from Quebec by the Hudson or by horse, or English and Colonial officers going up from New York in command of troops, they must stop and pay their respects to the Lord of the Manor of Philipsburgh, drink his wine, and flirt with his handsome sisters, one of whom was the Colonial beauty and belle, Mary.

Soldiers would go from New York by the post road to Castle Philipse, and then embark at the little landing to proceed up the Hudson on the way to be scalped by the red allies of the French or mowed down by Montcalm's gunners before impregnable Ticonderoga. Many were the comings and goings of the scarlet coat and green. But most of all in those days the mansion received its character from the festivities devised by its own inmates for the entertainment of the four hundred.

CHATS WITH OFFICE CALLERS

'Europe is not in love with America. Europe is in love with our dollar,' remarked the ***Returned Traveler,*** 'and her affection stops right there. Europeans think that because we have all the money in the world we owe them a substantial rake-off.

'Money lenders of foreign countries are already on the job, and past experiences are teaching them that only safety-first tactics pay. They have been brought face to face with the deadbeat germ in Europe: with Europe's propensity for wanton repudiation of old indebtedness. There is Russia, for example, the arch deadbeat of them all, who has turned her back absolutely on old obligations; then there is Poland which offers to refund only a fraction of its old debts; Rumania is putting forth every effort to avoid the redemption of her prewar debentures; Austria and Hungary are bankrupt and we well know how much is to be expected from these countries in view of the circumstances.

'France has consistently balked at any attempts to repay her war debts to the United States, and Germany has wiped out her entire internal indebtedness by refusing to recognize the absolute validity of former financial arrangements. Indeed, such repudiative antics on the part of respectable, civilized nations do not make for the economic restoration of Europe, which is so much desired; and it is about time that someone somewhere put a stop to this pernicious debt-dodging practice!

'Let me emphasize the fact that if we must loan out our money to notoriously bad actors on Europe's shores, we shall not continue to do so without drastic reservations. We should ever be on guard against the irresponsible loan seeker whose aim is solely to borrow while the borrowing is good, but who gives no thought to tomorrow's reckoning.

'And so our debtors must understand unequivocally that indebtedness involves a moral as well as a financial obligation, and that a debt is a debt and not a trapdoor. They should know that when we loan them one hundred cents on the dollar today, we do *not* expect to be handed back fifteen or twenty or even fifty cents tomorrow.'

* * *

From a Paris letter. 'Somewhere, on the outskirts of Paris, on a ground usually haunted by the London Air Line "Goliaths," more than 150,000 pairs of eyes are searching the sky for the tiny "David" who fled from New York some thirty hours before. The mob has come to Le Bourget using all kinds of vehicles, feet included. And a sea of human beings carrying children and dragging dogs is still battering the iron gates. Many more will remain cornered on the road without even the possibility of moving toward home. I am among the lucky ones, having the rare privilege of being ushered in by a king of the moment—a military aviator whose uniform and decorations outweigh all official passes.

'A large dark square hemmed with spotlights, waves of faces quartered around, other denser waves massed behind the gates, and still others squeezed along a long string of rapid showers of crude light thrown by projectors, and the heavy silhouettes of the hangars suddenly emerge from the darkness.

'The soft blue night over all this, and the divergent fluxes of imponderables—who could explain the psychology of a crowd, its common thoughts and reflexes? I am myself unable to hush the pounding of my own heart, to allay the terrible anxiety which I know is but a part of the huge burden weighing on all those who are here tonight. We all remember another night, just as soft, as starry, as electrified with enthusiasm, two weeks ago. Roars which seemed to be uttered by a thoroughly delirious world rent the air: "He has arrived!" It was for Nungesser and Coli; but the roar became a hush of tragedy, for they had not arrived. They never did.

'That is the burden which weighs on us tonight. Songs are not so vibrant, nor eyes so clear as they should be—we are in mourning.

' "I wish I could throw flowers to the sky," chants a dark-eyed "midinette."

' "And keep some to throw into the ocean," adds the grave voice of a silver-haired laborer.

'Hark! A humming? How black the night has grown! A humming! A thunder! A glimmering fly cutting through the projector's rays, up in the sky. Now a silver bat. And it is a gray eagle which skims the ground and rapidly escapes toward the darkness.

'Escape? Madness. As boiling milk the crowd is overflowing from everywhere. Poor Lindbergh! Abandon all hope of moving a foot! You came flying over 6,000 miles in spite of rain and winds, but here, just try to cover twenty centimeters!

'Tomorrow, papers will write big things in big capitals, words which were spoken, and others which were not. But I shall write just what I saw—the *summum* of human joy, tears.

. . .

'I wish I could express something else. The corner of my heart which is still American, and shall remain American, has ached bitterly very often, during these last two years. A so-far-away land!—Officials and diplomats wrecking such a splendid friendship.—Papers showering you and us with vinegar words. I had to muster all my strength to fight sour souls in sad discussions about the heart of the valor of America. But now I get my reward. Stars and Stripes are waving in the light of Paris, and I feel all hearts are ready to believe that Uncle Sam is not a mere gold bar.'

* * *

'A recurrent question of the curious,' remarked the ***Angler,*** 'is how long certain fishes will live out of water. As to that, in a general way, it may be said that any of them will live a great deal longer out of water than man will under it. A few minutes, perhaps, in the case of the more sensitive species, but a great deal longer in the case of many.

'It is a singular fact—to generalize again—that our game fishes as a whole succumb more quickly under this test than do the so-called rough fishes. Fighters though they are when in the depths, valiant and swift and strong, they cannot endure, save for a brief time, such treatment as carp, for instance, seem little harmed by. From these facts it may be surmised that game fishes, broadly considered, are essentially more highly sensitized and more subject to the effects of shock. They die as a race horse does, straining out their hearts, because there is no trace of phlegm or apathy in their make-up. Trout perish so, and bass; it must be admitted, however, that certain rough fishes also die quickly.

'But the catfishes do not, nor do the carp, nor the suckers, nor those odd little sculpins which boys call mud cats. On a day of mild warmth, or in winter, any of these varieties will live for hours after having been removed from water—the catfishes longer than all others. How long? Three hours, frequently, and doubtless longer.

'If sunshine does not dry the moist mucus of their skins and scales, and if they are otherwise uninjured, any of these fishes will immediately revive when again placed in water—revive and give evidence of hunger, despite their strange surroundings. There are fishes, of course, that have modified and improved the air sac or "bladder" until they are equipped for extensive sojournings away from water—the lung fishes of South America and Africa. Virtually they are possessed of lungs.

'The test of a fish's endurance out of water is obviously a cruel one, and most anglers kill their captives as soon as these are landed, as all should do, unless the fish are to be kept in water until they are placed in the creel. A blow on the spine at the base of the head, a knife-thrust for the larger ones, is merely the mercy that sportsmen should dispense. For the death of a fish out of water must be comparable to that frightful end we know as suffocation.'

* * *

The ***Motion Picture Producer*** mentioned a virgin valley filled with lions, recently discovered by action photographers in a little-known section of Africa. There was something naïve in his description of this region, where kingly beasts were so friendly and unaccustomed to white folk as to clutter up the camp grounds while the operators sought to obtain 'wild life' films.

'So tame was the average lion thereabouts that it was necessary to whistle in order to attract his attention,' he explained. 'Families numbering from eight to fourteen strolled around, getting in the way of the camera man, no doubt stumbling over the tripods and stepping on the plates.

'Whistling at a full-grown Numidian does not appeal to me personally, no matter how tame he may appear. I doubt if I could pucker up my lips sufficiently to sound a whistle in his presence. And if I could, I should hesitate lest he learn my whistle and come bounding to me, as do my dogs, whenever he heard it. Since there were 147 lions in this valley by official count, you will understand the danger of teaching them your whistle, at least all at one time.

'Lake Paradise—as they called it—was a good name for this Eden. When camera men whistle at lions, the millennium cannot be far away.'

The Old Man of the River

(Continued from page 3)

a day's skiff ride of McMahon's camp; the Southern Pacific Railroad wiped out the border frontier at one stroke when it built the California-Louisiana line through Texas; the Rio Grande country took national leadership in sheep raising; fine cities sprang up and men were made rich in real estate—but Uncle Jim pursued his even way. The river was his home. In time he married and raised children, housing them in comfort at Del Rio; but his wife has died, his children are scattered, 'It's only me again,' he said briefly, tossing the bloody refuse of a skunk into a roaring camp fire.

From El Paso, Texas, to Point Isabel, at the Rio Grande's mouth, it is 1,500 miles by the winding of the stream. Centuries ago in the upper stretches the river ruthlessly cut through the hearts of three mountain ranges, and now passes, boiling and roaring, between a series of perpendicular cliffs up to 1,500 feet in height—fifty miles of nearly continuous rapids, with no retreat once you are in the first shut-in. These are Santa Helena, Mariscal and Boquillas, alluded to. As late as 1884 it was considered sure death to tackle them. But Uncle Jim ran them. He has run them many, many times, sometimes alone, sometimes with a single companion, once as guide to an official party of the United States Geological Survey.

Where the Rio Grande River emerges from Santa Helena canyon.

'I run them the first time in December of 1884,' he told me. 'Willis Pafford was with me.

'We went to trap but nary one trapped—Mexican bandits put that idea out of our heads. They chased us from Presidio to the shut-in of the first canyon, Santa Helena, then tuck around the mountain afoot and shot at us as we came through. We saw the body of a white trapper who'd been killed some time earlier. He was lying on a sand bar, shot to pieces, rotting in the sun. No, we didn't stop; we were in too big a hurry.

'It tuck us fifteen days to go through—quickest trip ever made. We was traveling light, carrying only one hundred pounds apiece (mostly grub), and a 250-pound cypress boat drawing only a few inches of water.

'The boat turned over four or five times and we was always portaging it over bowlders fallen from the cliffs. Once we had to lift it 120 feet, pulling it hand over hand; tuck us three days to pass one rock, but when we dropped into the current it whirled us along like a train the next five miles.

'The walls was so high there that there were quails that couldn't fly out, and beaver everywhere. We didn't stop to catch them; what could we 'a' done with them?'

The canyon country is far from a railroad.

Uncle Jim therefore prefers the middle and lower stretches. In his homemade skiff he is continually patrolling a six-hundred-mile stretch from Boquillas to Laredo. From Laredo south to the mouth the Rio Grande irrigates nearly three-quarters of a million acres of land—and the beaver shuns civilization. Uncle Jim's best stretch is in the low hilly country on each side of Del Rio, too rough for settlement, almost inaccessible to any save a veteran, and teeming with furred game. The beaver is not orthodox there. He doesn't build dams; the river is too wide and swift. He lives in the banks, cutting his holes under the water line and then climbing up to his subterranean chambers just above.

Beaver meat, Uncle Jim says, has been much maligned. Of course there are difficulties if the meat is from a fifty- or sixty-year-old animal (not an uncommon age), but fried beaver ham from a frisky three-year-old, or a stewed forequarter, 'is as good as a man ever et.' He believes the average lifetime of the Rio Grande beaver to be thirty years, and the average weight of an adult is ninety pounds. They breed rapidly; one pair, if not disturbed, will increase to fourteen or sixteen in a few years. Uncle Jim has frequently found fifty in a single colony.

'Life is easy on the beaver once he gets down here,' he said. 'There isn't an alligator on the river and no mink or otter, and I'm the only trapper whose catch amounts to anything—only a few Mexicans that shoot 'em from the far bank and then lose 'em. And I catch 'em carefully. I'm taking care of my game.'

Pretty soon Uncle Jim will be eighty-one. The marks of old age are showing on him all too plainly. Will he retire, and go to his town house?

'Never!' he answered with quiet conviction.

'They call me The Old Man of the River and I guess they're right. I don't belong to civilization any more. I've spent fifty years in my canoe up and down the Rio Grande. Many has tried to drive me away—I guess I've been shot at a hundred times.

'A lot of things have happened on this river, it has a lot of secrets, and I know most of 'em.

'It's my home. Towns choke me. I'm too old to change.'

A Mountain Song

WALTZ Quadrille Movement. Square formation. Instrumental music is not necessary. The words fit both the music and movements of the dance. Can be used in the ballroom, in the home, on the lawn, on the playground or at summer camps. Learn the words of the song first.

THE SONG or CALLS

The head lady swing
with the left hand
around . . . . 4 bars

(Head lady turns the gentleman on her right each with the left hand.)

Next with the right,
and all the way
around . . . . 4 bars

(Turn the next gentleman, each with right hand.)

Next with the left and
turn him around . 4 bars

(Turn the next gentleman, each with left hand.)

Right hand to your
partner, salute . . 4 bars

(Give right hand to partner and bow to each other.)

Then swing your cor-
ner ladies all . . 4 bars

(Gentleman give both hands to lady on his left and swing.)

And balance to your
partners all . . 4 bars

(All turn, face own partner and balance.)

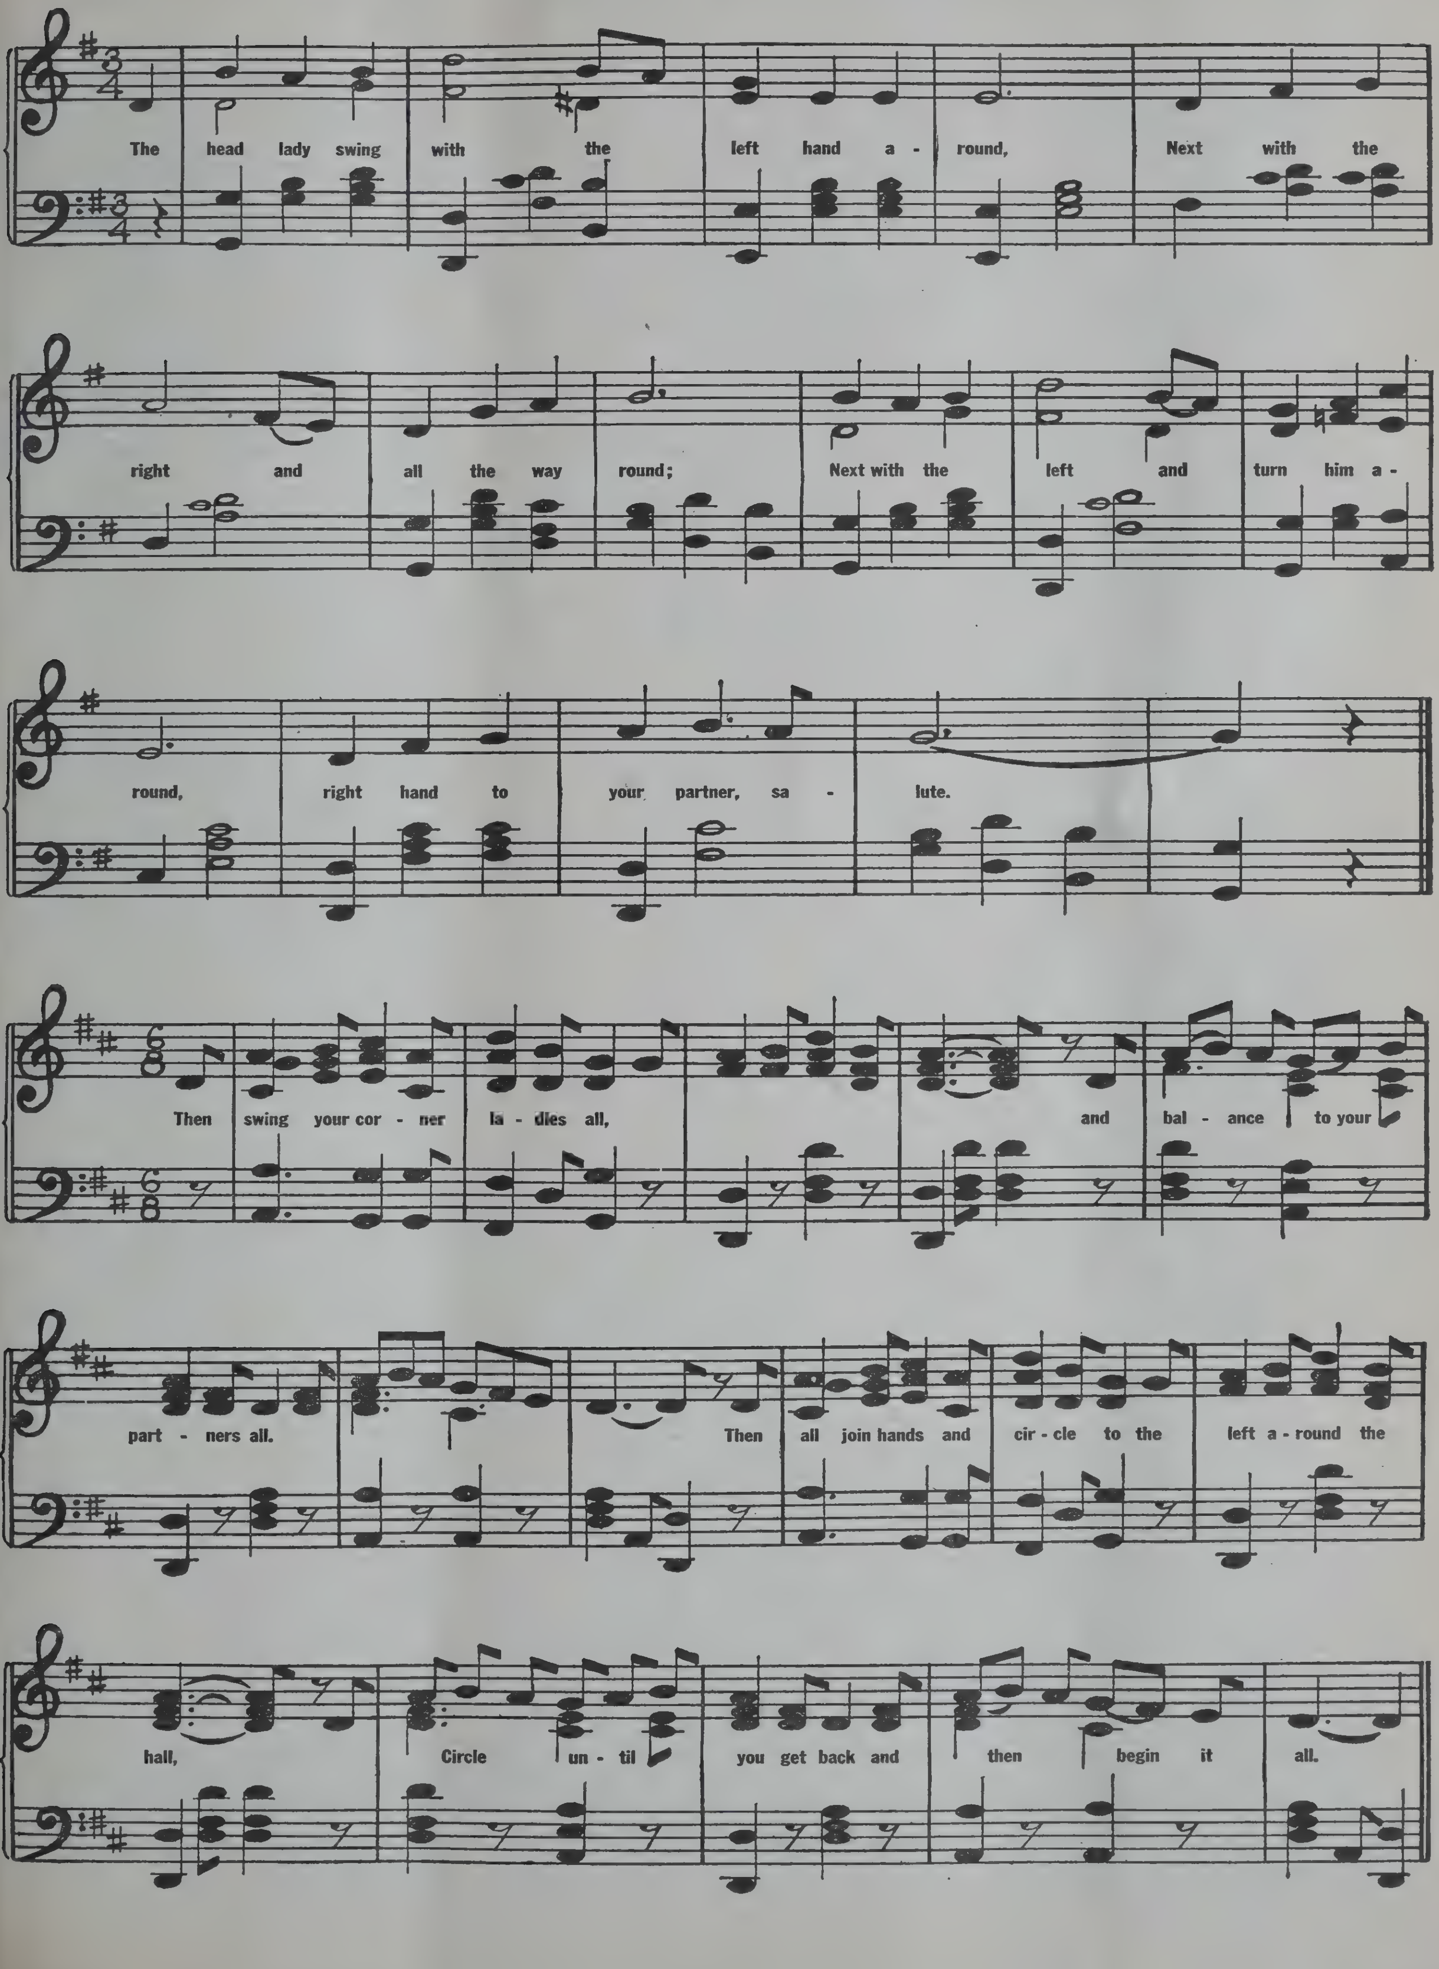
Then all join hands
and circle to the left
around the hall . 4 bars

(All join hands and circle to the left.)

Circle until you get
back and then
begin it all . . 4 bars

(The next lady on the right begins, and so on until all four ladies have gone through the movements. The head gentleman may then begin the number by turning the lady on his left, etc.)

A Mountain Song



The head lady swing with the left hand a - round, Next with the
right and all the way round; Next with the left and turn him a -
round, right hand to your partner, sa - lute.
Then swing your cor - ner la - dies all, and bal - ance to your
part - ners all. Then all join hands and cir - cle to the left a - round the
hall, Circle un - til you get back and then begin it all.

CAN YOU TELL ME?

Question. What is the truth about the war debts? On what basis were they settled, and what is their present status? How much was canceled?

Answer. Congress originally authorized settlement of these debts within a period not to exceed 25 years, with an interest rate fixed at not less than 4¼ per cent. It was represented, however, that this was beyond the capacity of most of the debtors to meet, so the debt commission was given general powers to negotiate settlements and submit them to Congress for approval.

The dispute over the exact percentage on war debts being repaid by the various nations arises mainly out of differences in rates at which interest on these loans is figured. The result is the same either way; whether the principal is cut and a higher rate of interest is applied, or whether the principal is paid in full and a lower rate of interest applied.

The 'funded debt' is the amount of the original loan plus accrued interest to date of settlement with the various nations. If we consider that the funded debt is paid in full, the following average interest rates will apply:

	Funded debt	*Interest rate*
Belgium	$ 417,780,000	1.8%
France	4,025,000,000	1.6%
Great Britain	4,600,000,000	3.3%
Italy	2,042,000,000	.4%

Now suppose that, instead of the various interest rates given above, the 4¼ per cent rate is applied, which is the approximate rate the American taxpayer has been paying, although it is being reduced at the present time. If we take the French debt settlement ($4,025,000,000 at an average of 1.6 per cent interest), France at the end of 62 years will have paid $6,847,674,104.17. The principal would have to be cut to $1,996,509,000 at 4¼ per cent if the final figure received at the end of 62 years ($6,847,674,104.17) is to be maintained. Applying the 4¼ per cent rate to the above cases we have the following figures:

	Principal on which interest is paid	*Approximate per cent of funded debt to be paid*	*Interest rate*
Belgium	$ 225,000,000	53%	4¼%
France	1,996,509,000	49%	4¼%
Great Britain	3,788,470,000	82%	4¼%
Italy	528,192,000	25%	4¼%

As shown by this table, if the 4¼ per cent interest rate is applied, the debt of the various nations has been reduced from the figure given in the first illustration under 'Funded debt' to the figure in the second illustration under 'Principal on which interest is paid.' Secretary Mellon in his letter to Mr. Peabody which appeared in the United States *Daily* on July 17, 1926, said: 'In effect America has canceled the obligations of France for all advances during the war, and France in the Mellon-Berenger agreement has undertaken only to repay the advances and obligations subsequent to the Armistice. No other creditor of France has accorded such generous treatment.' Mr. Mellon is also authority for the statement that the after-the-Armistice borrowings of the various nations in all instances except that of England were greater than the present value of the debt settlement. In other words we have canceled the pre-Armistice borrowings of all the debtor nations except England and under the various debt agreements are collecting only those amounts loaned since the Armistice.

But there is still a third method of computing interest on these debts. When the settlements were presented to the Senate for ratification, they were objected to by some Senators on the ground that the 4¼ per cent rate should have been applied to the total of the 'funded debt.' If the settlement had been made on this basis the first interest payment for France, instead of zero (according to the debt agreement) would have been $171,062,500. Under the pending agreement France does not, in any year of the 62, pay more than $125,000,000 in both interest and principal. If this rate had been applied to Great Britain her first annual interest payment, instead of approximately $138,000,000, would have been $195,000,000. Under the settlement made, Great Britain does not in any year of the 62 pay more than $187,250,000 in both interest and principal. If this rate had been applied to Italy, her first annual interest payment, instead of zero (according to the debt agreement), would have been $86,785,000. Under the debt agreement, Italy does not in any year of the 62 pay in both interest and principal more than $80,988,000. If interest is computed at this rate, it will be readily seen that the total amount, both interest and principal, paid by the debtor nations will not equal the interest (at 4¼ per cent) on the total of their funded indebtedness. Thus, at the end of 62 years the debt itself will be canceled in full, and the interest will be only partially paid.

All the nations that have negotiated settlements are paying the United States under the terms of their agreements, except France. The French Government has not ratified the settlement, and until this is done it will probably not be ratified by the United States Government. Armenia, Austria, Greece and Russia have not funded their debts.

* * *

Q. Was Benjamin Franklin a Freemason?

A. Yes.

> *In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.*

Q. Is there still a guard around President Harding's tomb? What does it consist of?

A. A guard consisting of a first lieutenant and twenty-six enlisted men selected from the various companies of the 10th U. S. Regular Infantry is still on duty at the temporary tomb of the late President Harding.

* * *

Q. How much does Pennsylvania spend annually for her schools?

A. The state appropriation for education in 1923-24 amounted to $27,628,755; expenditures by counties and municipalities amounted to $143,242,658, the total amount expended for education, exclusive of expenditures for colleges and universities, being $170,871,413.

* * *

Q. Is a child born to American parents on a foreign vessel in international seas a citizen of the United States?

A. Citizenship may be acquired by birth, every child born on the soil or within the jurisdiction of the United States, even of alien residents—except of foreign official representatives, whose residences are assumed to be part of their country's territory—or of citizen parents traveling abroad, or of its officials resident abroad, being a citizen.

* * *

Q. Is attendance upon strictly agricultural courses in our colleges and universities increasing or diminishing?

A. Comparative studies of land-grant colleges for white students show a decrease in the enrollment in agricultural courses. In 1914-15 the enrollment in agricultural courses was 17,169; in 1919-20, 15,370; in 1924-25, 13,206.

* * *

Q. Who is the legal successor to the Russian imperial throne?

A. The legal successor to the Russian imperial throne according to the fundamental laws of the Russian Empire is the Grand Duke Cyril Vladimirovich, first cousin of Emperor Nicholas II who was murdered by the Bolsheviki, and grandson of the Emperor Alexander II called the 'Liberator.' Grand Duke Cyril Vladimirovich on August 31, 1924, issued a manifesto in which he stated his rights as emperor of all the Russias.

* * *

Q. Who was the first commissioner of agriculture who put out a bulletin showing how much cotton, wheat, corn and other commodities were raised by the farmer?

A. In the winter of 1862-63 circulars were sent out gathering information on crop production; in the spring of 1863 monthly reports were made, and in that year there was published the first annual report giving an estimate of the acreage and production. This report was prepared by Lewis Bollman, statistician, and published by the Honorable Isaac Newton, the first commissioner of agriculture. Since that time reports of this character have been issued regularly.

This is the record of a man who, over eighty years of age, says true happiness comes only to him who lives among the wild things of Nature. Max Bentley, whose contributions have appeared in our pages from time to time, brings this out in his story of 'The Old Man of the River.' (p. 3)

* * *

A man on Mars, peering through his telescope, might have wondered at this strange new canal which had appeared so suddenly on the Earth. Nearer—say from an airplane—he would have seen great islands in the midst of the vast expanse of water. Nearer yet, he would have perceived that the islands were tree tops, with muddy water swirling beneath their limbs. (p. 4)

* * *

Those trees were symbolic of the Mississippi Flood—lone sentinels left to guard man's few remaining possessions. For miles on end they would be the only living things. Beneath them floated death: bodies of animals, skeletons of homes. Overhead soared the birds of death—buzzards. Desolation stretched as far as the eye could see. And yet this region, a few scant weeks before, had been one of the garden spots of the world! (p. 4)

* * *

Prime Minister Poincaré, who is minister of finance as well, has been acclaimed as the 'savior of the franc.' Sommerville Story, editor and writer on international subjects, for many years resident in Paris, gives a very incisive account of how the ex-president of France wrought this wonderful change. (p. 6)

* * *

The Royal and Ancient burgh of St. Andrews, in Scotland, may be called the home town of golf, for it is the only town in the world where the inhabitants almost entirely depend on the game for their living. Golfing tradition in St. Andrews goes back for centuries, and here, on its Old Course in the British Open Championship, at present held by Bobby Jones, American players will once more try conclusions with the crack players of Britain. (p. 7)

* * *

Alexander Keith, a graduate of Aberdeen University, and a writer and journalist of note, sends us a first-hand account of the course with its hazards, as well as an historic sketch of the gray old town by the sea. Mr. Keith has played over the course several times and knows just what sticks to use to get the best results. (p. 7)

New Orleans, Louisiana.

There may be some magazines the equal but I am satisfied after reading same for several years there are none superior.

It would be a great thing for this country if we had more magazines like THE DEARBORN INDEPENDENT. I would not be without it nor exchange it for any other.

E. J. LESSING.

San Antonio, Texas.

Guy Haythorn's communication regarding monuments in the May 28th edition struck me as timely.

I have solved the problem to my own satisfaction as follows:

My Monument

Carve not for me in senseless marble dull and cold
An image o'er my grave for mortals to behold.
Erect no costly shaft above my ashes dry
To let the gaping know where doth my body lie.
'Let me be known as one who loved his fellow man';
As one who helped his brother o'er this fitful span;
As one who bore a part of burdens hard to bear,
And in his neighbors' sorrows always took a share.
I care not for your marble, bronze, nor granite pile
That draws the envious glance, that makes the cynic smile.
Enough for me when I have shuffled off this mortal coil,
And laid my body down to mingle with its mother soil—
Enough to leave, as monument, the name I sometime bore
Engraved in human hearts and memory forevermore.

FREDERICK ABBOTT.

St. Louis, Missouri.

I consider THE DEARBORN INDEPENDENT one of the best magazines which comes to my home, and I take no fewer than twenty different ones.

F. L. SCOTT.

Friend, Oregon.

I believe this magazine to be the best I have ever read. I like it because it is different, because it deals with subjects that are of interest to every citizen and in a manner not to be found in any other magazine.

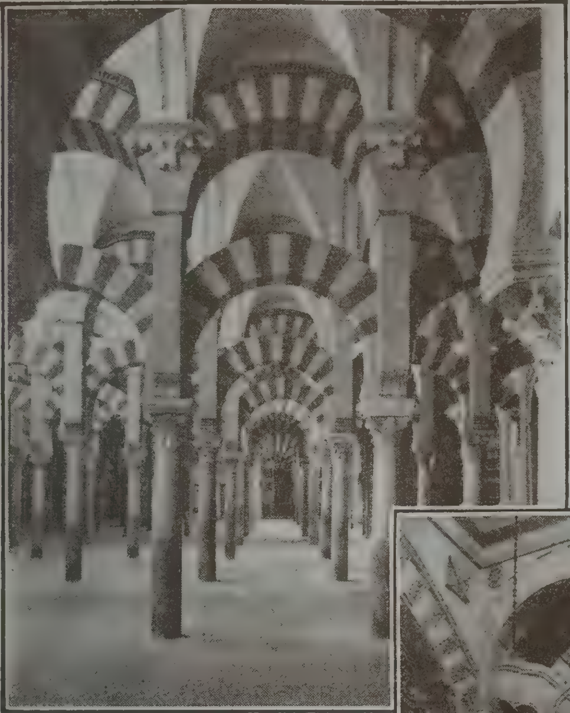
JOHN W. CLARK.

Taunton, Minnesota.

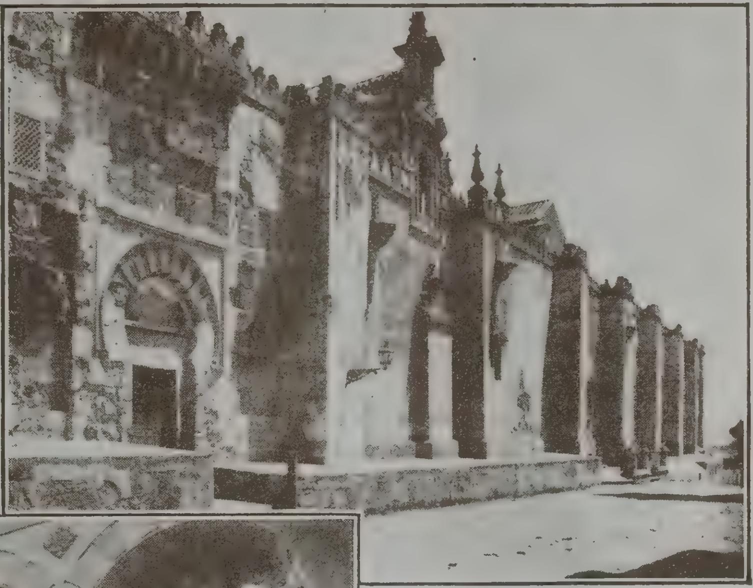
I find that your paper is a valuable reference in school work in that its subject matter is varied advantageously so as to attract the attention of both adult and youth.

CLEMENT HOLLAND.

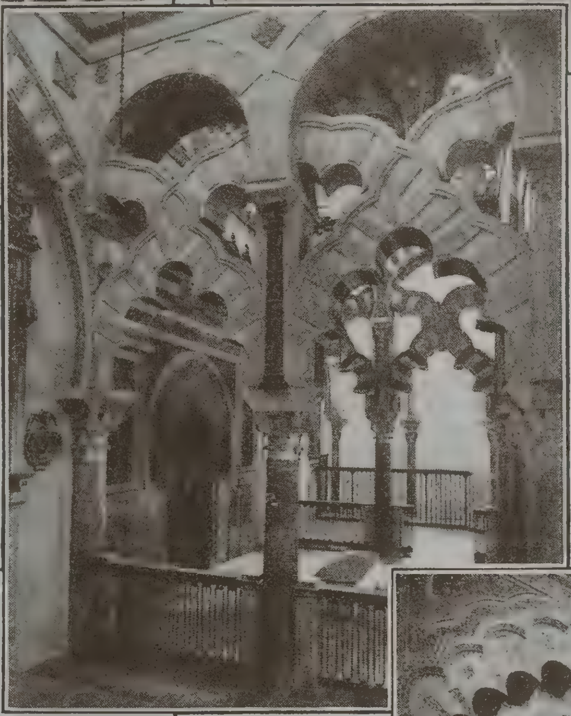
From Moorish Mosque *to* Christian Cathedral



Magnificent and bewildering labyrinth of pillars in which porphyry, jasper and many-colored marbles are boldly combined. Originally of different heights, the pillars have been adjusted to their present standard of twelve feet either by being sunk into the soil or by addition of Corinthian capitals. The pillars divide the building longitudinally into nineteen and transversely into twenty-nine aisles.

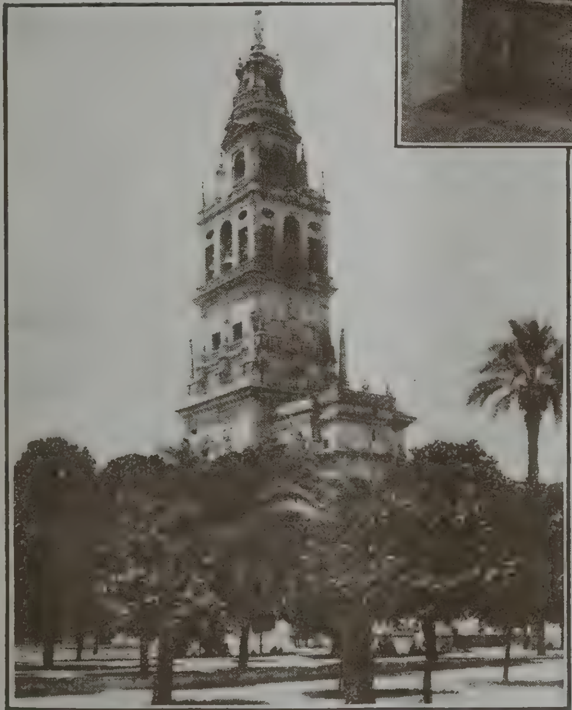


These exterior walls served to fortify the mosque. Their plainness is somewhat relieved by the toothed stonework at the top and the horseshoe arched doorways. So immense are they that the Spanish authorities find it difficult to keep them in repair.

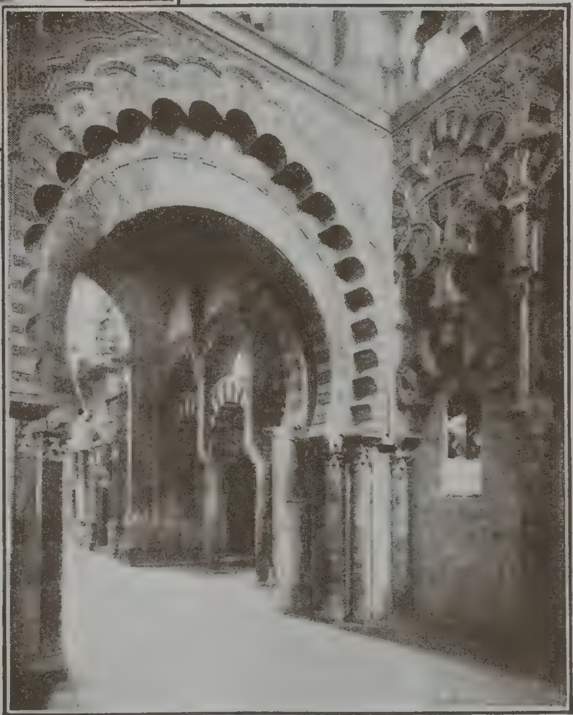


Left—

Entrance to the holy of holies, where the sacred Koran was kept, is an excellent example of the careful detail in archways and intricate design which is the dominant note of this splendid example of Moorish architecture.



Tower as seen from interior court of the cathedral. At right, through the orange trees, is the wall of the Moorish fountain, at which neighborhood women fill their water jars.



Interior portal of the Mizquita or Mosque, which was named Zeca, or House of Purification. After its enlargement it was the largest sacred building of Islam, after Kabba at Mecca.

In the Interest of Public Safety

More and more women are insisting on Firestone Balloons because experience shows that these Gum-Dipped Tires are dependable and safe. The woman driver likes to feel the sure response to her hand on wheel and brake; she is certain of a true hold on any road—she is relieved of anxiety of possible tire trouble with its annoying delays.

Among the special features which Firestone has worked out to increase the enjoyment of motoring is Gum-Dipping—the special process in tire building by which the cords of the carcass are dipped in a rubber solution. This insulates every fiber of every cord, minimizing friction, so destructive to tires. Another advantage is the Firestone Balloon Tread, which gives extra safety, comfort and long wear. The small units and sharp projections of this tread are scientifically placed so that they permit easy flexing and result in extraordinary riding comfort.

The Gum-Dipped carcass supporting the scientific tread makes Firestone Tires ideally adapted where safety and dependability are paramount. Let your Firestone Dealer tell you why these features are so essential to full tire value. Avail yourself of his "Better" service as well as these "Better" Tires. Enjoy the economy of—

CUBA *of* Today—*Something More Than* Sugar

By SAMUEL CROWTHER

THEN came the crisis—and we stopped work.' You will hear that the length and breadth of Cuba. About Havana you will see many pretentious buildings abandoned with the walls half up. You will come across enterprises all over the island that have not been finished. You ask why. And always you get the same answer.

Cuba is sugar. It is the world's sugar bowl, for just as cotton grows better in our South than anywhere else in the world, so grows sugar in Cuba. In the virgin lands of the Province of Oriente as many as twenty-five harvests have been had from a single planting, and ten is usual in all except the older plantations of the island. Nowhere can great wealth be had out of the ground with so little effort as in Cuba. And that has been her making and can be her unmaking.

In the war years when the beet fields of Europe were being fought over and there was no shipping to send far off to Java, Cuba supplied the world's sugar. The United States bought the whole crop of 1918, while the Cuban Government bought that of 1919. Then in 1920 the controls went off and sugar which had been considered well priced at three and a half cents a pound in Cuba soared to twenty cents. A cent in a pound is a big change in Cuba. With sugar headed for the skies the country for the first time had a taste of real money. It went wild with money—just as the United States went wild. Men who had become rich overnight started to build great houses.

The Cubans sadly refer to those days as the 'Dance of the Millions.' But the piper had to be paid—and there was no one to pay him. Sugar dropped in six months to below two cents a pound in January, 1921. The banks had loaned millions at ten cents when sugar was twenty cents. And even at two cents little sugar could be sold. That was the crisis—that is when the building stopped. The newly rich found themselves poor again.

Magnificent headquarters of the president of Cuba, near the center of Havana.

But out of that catastrophe have grown the beginnings of a new prosperity under one of the biggest men which Latin-America has yet produced—General Gerardo Machado, the president of Cuba. He has not yet grown to full stature. Perhaps he will not grow so large as he now seems destined, but whatever may be his personal future, it is certain that he has grasped a new future for Cuba. For he has learned the lesson which the United States stands to teach—and which so few care to learn. He is Americanizing Cuba without taking away anything that is peculiar to Cuba.

Cuba, it should be understood, is nearly all owned in the United States. Of the total commercial investment in the island, Americans own to the value of about one and a half billion dollars, which is somewhere around two-thirds the value of all property in productive enterprise. About one-half of this is in sugar. The balance is scattered among banks, tobacco companies, hotels, railways, and power stations.

This investment, it is to be noted, is not in bonds issued by the government. The Cuban debt is small and is now in good shape. The money is in productive enterprise operating in Cuba and employing Cuban labor.

It has been estimated that of all the wages paid in Cuba about two-thirds in dollar value comes from the investment of American capital. Therefore, as nowhere else in the world, we are squarely met with the question of whether this American ownership is a good thing or a bad thing for Cuba. The American money did not go in for charitable purposes. It did not enter with any other thought than benefiting its owners. To some extent it has benefited them. Has it also benefited the Cubans? Or have they merely been exploited?

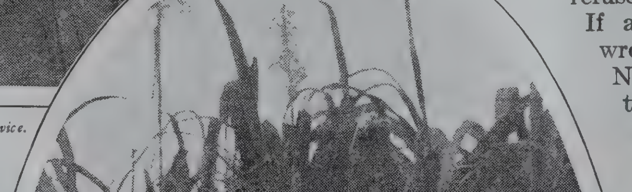
First have a look at Cuba. Many Americans know Havana but they know it only as a pleasure resort. A few Americans outside of those who were in the Spanish War know Santiago, but they know it as the place where the

A crooked, narrow street with meager sidewalks and overhanging balconies in a section of Havana. —*Publishers' Photo Service.*

war started and was won. The Cuba of the day's work is not in the cities. The island has practically no factories and hence the cities are only places where things are bought and sold. They are not points of production. Cuba has no Detroits or Pittsburghs.

Havana is a modern city. It was made so under the direction of General Leonard Wood, and when a Cuban wants to make any administrative comparison he takes General Wood as the ultimate measure. For it was under him that Havana was cleared up. He built the Prado which is a fine boulevard where once was an open sewer. He built the sea wall and broad drive known as the Malecon and made himself a man of mystery by letting neither himself nor his friends in on the real estate. But one cannot drive fifty miles from Havana—except toward Matanzas. One cannot drive five miles out of any other Cuban city. For then the roads stop. The only automotive vehicle capable of touring Cuba is a caterpillar tractor.

It was the policy of Spain to keep the means of communication between different parts of the island as difficult as possible in order that the people might not have the chance to know one another and to organize. Spain did not really colonize. She thought that she could exploit peoples—and consequently made little of her over-sea possessions. A line of railroad runs the length of the island with branches to all the principal ports, while the sugar estates have their own railroads to take the cane from the fields to the mills and the sugar to a shipping port, but the countryman has to depend mainly upon the horse. The Cuban has to be very poor indeed not to have a horse or what passes for a horse, because the animals are almost without exception miserable little beasts with sore backs and a general air of half-starved melancholy. For heavier hauling a great high-wheeled cart is used with from four to six oxen, but a yoke of oxen represents an investment of around one hundred and fifty dollars and this is beyond the means of the average man.



—*Courtesy,* The Cuba Review.

Sugar-cane cutters in a Cuban field of fine growth.

As a result of this lack of transportation the Cuban is not a farmer. Rarely does he even raise his own vegetables nor can he be induced to raise them. He will put in a few banana trees and some plantains to supplement his regular diet of rice, beans, and pork. The rice, beans, and pork he has to buy. Oddly enough, the national food is not raised on the island. He cannot be a farmer because he has no way of getting his products to market. Whatever truck gardening there is in Cuba is done by Chinese on lands given to them by the sugar estates. But it is quite doubtful if the Cuban ever will be a farmer, for his tastes are away from the land.

The high ambition of every Cuban is to wear a white collar—which is an ambition not unknown in our own country. If he can be a doctor or lawyer, so much the better and the land is overrun with them—which is a phenomenon also not unknown to our own country. But given a chance, the Cuban makes an excellent machinist. A few years ago gasoline hoisting engines were put on many sugar estates. For a year or two the natives refused even to try to understand them. If anything went wrong, it stayed wrong until a repair man came along. Now only a major repair requires the services of an expert. The natives quickly learn to manage automobiles and tractors and in the railroad repair shops they do really fine work.

It is not generally known that the Spaniard is an accurate mechanic—he has not lost the skill which made Toledo blades famed the world over. The engine rooms of many of the ships in the Caribbean trade are manned wholly by Spaniards. What they lack is the ability to plan and create—they have never had the chance to learn.

For rough manual labor they have no liking and the sugar cane is cut by Negroes imported from Haiti for the season. And incidentally these citizens of Haiti to whom our emotionalists would give complete self-government are worth looking at. If anything they are a little less civilized than their forbears who came over in the slave ships. None of them know their ages, few know who were their parents, and unless they have been in Cuba before they do not have names.

While in Cuba they usually take the name of the contractor they work for and keep that as a name afterward. They have almost no language, and of course can neither read nor write. So near are they to the primitive that often they will refuse to sleep in the *barracones* provided

(*Continued on page 24*)

IN THE early days of psychic investigation only two hypotheses were advanced. The phenomena observed were declared to be either the work of spirits or were denounced as entirely fraudulent. During the last thirty years, however, scientific investigators of the subject in the New World as the Old have employed a third hypothesis; namely, that these supranormal manifestations may be due to unknown powers of the human organism. This hypothesis which the radio machine and the dark-ray photograph appear to support is concerned with what has been called 'unexplored biology.'

Last night a man speaking in Paris was distinctly heard in Detroit. Twenty years ago this would have been called 'supernatural,' it may be that twenty years hence many spiritualistic phenomena of today may be included under the head of supranormal biologic activities and be of everyday occurrence. The mystery of life after death, if solved, must agree with the physical laws of the natural world.

The Dark Side of the MOON

By HAMLIN GARLAND

TO A business man, to the average citizen in fact, the material universe is an orderly and rather humdrum matter of routine. The seasons come and go without any event exciting wonder or surprise. 'Nothing inexplicable ever happens to me,' my friends say. True, they cannot tell why an apple turns red nor how a grub becomes a butterfly, but these mysteries, so habitual, so familiar, are commonplace. Even the night and the alchemy of the moon no longer appeal with their old-time wizardry.

Nevertheless, mystery remains in the world, and one has but to step aside from the dusty beaten path to find oneself confronted (in the dark and silence) with hooded forms, flitting to and fro, and to feel intangible forces pulse and play. Ghosts still walk at midnight, innumerable voices thrill through space and strange warnings quiver across the void. The ultimate is as unknowable as ever.

Forty years ago, like most young men, I smiled at the dreamers who pottered about the libraries with volumes of 'psychic research' under their arms. I was a bit impatient of those who permitted their affections to mislead them into acceptance of portents, mediumship and the return of the dead—it smelled (as Emerson said) of a kind of 'rat-hole philosophy,' a creed for which a vigorous and active young student could have no sympathetic relationship whatsoever.

Nevertheless, through a man in whom I had faith, I was induced to become a member of the American Psychic Society of Boston. I was, indeed, for several years a member of its executive board and a special committee to investigate the physical phenomena of spiritualism. I was at that time an admiring student of Spencer, Huxley, Darwin, and other of the great evolutionary group of thinkers, and, most important of all, I was not yet bereaved. I had not lost a mother or wife or child.

In preparation for my work I turned to the literature of the occult and my first surprise came in reading the work of Sir William Crookes who had applied the same analytic care to the study of mediumship that he used in attacking a new problem in chemistry. From him I passed to Sir Oliver Lodge and Alfred Russell Wallace. Their references led to an examination of Continental authorities like Flammarion, Lombroso, Richet, Maxwell, Morselli, Bottaozzi, and many others. The books dealing with psychodynamics were many. Myers with his theory of the subconscious, and Zollner with his fourth dimension hypothesis, interested me less.

Meanwhile, together with the secretary of the psychical society, I began my experiments. My second surprise came in the realization that there were many persons in private life apparently gifted with supranormal power over matter. Requests for investigation poured in upon us. Haunted houses and magic wells claimed our attention. Poltergeists offered their pranks. Automatic writing and trance artistry abounded. Telekinesis was common.

Up to this time, like most men of outdoor life, I was inclined to grant the stability of matter. Silicon was silicon and carbon was carbon. The fact that air could be liquefied was curious but not revealing. Space was filled with ether, an exceedingly tenuous form of matter, and matter was conveniently divided into solids, liquids and gases.

Now, suddenly, things began to happen which disturbed my acquired philosophy. Matter began to change position and weight without known cause. Under my own test conditions books were moved from A to B without a visible or tangible push or pull. Metals and heavy wooden objects floated in the air and globes of flame moved silently and without apparent heat across the room while cold winds blew illogically from dark corners without reason. In brief, I found myself in the world of 'unexplored biology.'

There was always something unconvincing in these phenomena. They puzzled me, they interested me, but they did not startle me. Being young, healthy and without bereavement, I set myself the task of following out the leadings of these amazing exceptions to the prevailing laws of my world. As one of a small committee on 'the physical phenomena of spiritualism,' I darted hither and yon wherever a good subject offered, steadfastly insisting on physical tests, and resolutely throwing out doubtful results.

LIKE all other investigators I soon discovered that the events of this occult world were not lawless. The confusion was only apparent. Upon closer study the phenomena were found to be orderly and rather monotonously restricted in their orbits. The same things were stated of the mediums in Australia that were recorded of those in Vienna and Boston. The dreams, prophecies and warnings of German sensitives were precisely the same as those of the men and women we were studying in New England. Whatever the causes of the phenomena might be, they plainly did not transcend human nature. They plainly began and ended in the minds of men.

Do not misunderstand me. The phenomena exist. They are imaginary only in the sense that all things are imaginary. The constitution of matter is imaginary. Space is imaginary. No one knows what life is or where it originates, but there are certain settled, agreed-upon notions concerning space and matter and time, that is all.

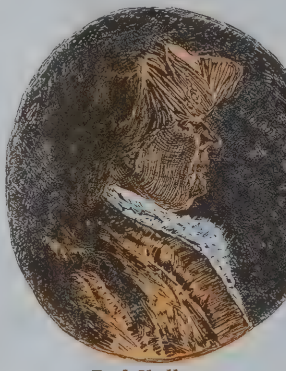
I soon found that under certain conditions the mind of man can act upon matter independent of visible means. Over and over again psychics have produced for

(Continued on page 18)

AMERICA'S *First* Peace Conference

By RANDOLPH C. ADAMS

THE final act of the American Revolution was the peace conference at Paris in 1782. As the nation enters upon the years which mark the one hundred and fiftieth anniversary of the independence of the United States, and as her foreign relations claim an ever larger and larger share of public attention, there is something peculiarly interesting about that first peace conference at Paris which America attended. The story from the American viewpoint has been told, for the family papers of the American commissioners, Benjamin Franklin, John Adams, John Jay and Henry Laurens, have been open to the public for many years.



Earl Shelburne.

But the papers of the British statesman, Earl Shelburne, who engineered the peace, and the British commissioner who negotiated it, Richard Oswald, have remained in private hands these hundred and fifty years. These papers have at last come to America and have been deposited in the great collection of books and papers relating to the Revolution in the William L. Clements Library at the University of Michigan. They include the original papers relating to the Peace of 1782-83, such as might be expected to exist in the archives of the British premier who was called upon to salvage the wreck of the British Empire at the conclusion of a war which had been so disappointing to Britannic ambition.

One thing which stands out above all else in the papers of the British statesman, now open at last, is the fact that the American aspect of the peace conference was by no means the most considerable so far as England was concerned. Great Britain in 1782 found herself in a position similar to that which Germany occupied in 1918.

The American Colonies had revolted in 1776. France had joined them in 1778, and in the next year England found herself at war with Spain and Holland as well. As usual under the circumstances, the Irish bestirred themselves and demanded better treatment. As far as the malcontents in the Emerald Isle are concerned, they fared far better than did Pádraic Pearse and his companions in the Easter revolt of 1916.

The American Revolution had taken on the aspect of a general European war, and the conference at Paris was a general European peace conference—not merely a set of negotiations between England and the United States. No one can examine the Shelburne Papers without having this constantly borne in upon him.

At that peace conference, many things were against Britain. The Americans had captured two British armies and their generals, Burgoyne and Cornwallis. The French had captured numerous British colonies in Africa, the West Indies and the East Indies. The Spanish had captured the Floridas from Britain and were besieging Gibraltar. The Dutch had seriously injured British overseas trade. Britain needed peace and needed it quickly. When, after the debacle of the British arms at Yorktown, the British ministry of North and Germain resigned, the King called in the Rockingham-Shelburne Whigs to extricate Britain from the disasters to which mismanagement and defeat had reduced her. Rockingham died and Shelburne soon became the moving power in the negotiations which were under way at Paris.

The American commissioners refused to negotiate at all unless their independence was first of all granted. Gaining this they set to work with Shelburne and his representative Oswald to make a treaty of peace. In the Shelburne Papers at Ann Arbor are no less than six preliminary drafts of the treaty. Through them it is possible to trace the evolution of the treaty. Mingled with the manuscripts as they now stand are numbers of papers relating to the simultaneous negotiations of England with her European foes.

Out of it all came a treaty which gave America a great deal more than many Americans had any reason to believe they would get. Out of it, also, came treaties between Britain on the one hand and Spain, France and Holland on the other. But if the allies are to be considered victorious in the Revolution, it sometimes seems as though the United States gained a great deal while the others fared not so well. Certainly in proportion to her effort France got little. Spain did fairly well, getting Florida from England.

Yet it is noticeable that there was a cordiality between the British and American negotiators throughout the conference which did not subsist between Britain and her other enemies. That this was due to the influence of Shelburne there can be no doubt. He wanted peace between the great English-speaking peoples. He had belonged to the party which had opposed driving the Americans into rebellion, and he foresaw that the peace of the world depended upon the utmost harmony existing for all time between England and America.

The tone of his letters and dispatches is always that of making peace with America in the most generous way and upon the most generous terms. Yet he was by no means timid, as is abundantly revealed by the tone of the British commissioners in dealing with their other foes.

Shelburne's genuine and sincere friendship for America was not shared by all Englishmen of his day—nor since. But at that critical time in the history of America, the responsible head of the British Government wanted to establish the basis of an eternal peace between the two English-speaking nations—a fact which goes far to explain the generous terms the Americans received.

In looking over the papers, one is sometimes inclined to feel that Britain and the United States were working together, not against each other—and certainly if this be true, it is in no small measure due to the liberality and broadmindedness of the British premier.

But it takes two to make a peace as well as a quarrel, and Shelburne found at least one of the American commissioners who was likewise willing to take a large and generous view of the whole matter. That man was Benjamin Franklin. No one can read the letters of John Adams and John Jay without having a feeling that here were two able and brilliant lawyers arguing their case with astonishing success. But sometimes a lawyer irritates—particularly if he is both right and successful—and though he gains a victory, the irritation sows the seeds of future discord. Both Shelburne and Franklin were determined not only to

'A Map of the British and French Dominions in North America with the Records, Distances, Limits and Extent of the Settlements. Humbly Inscribed to the Right Honorable, The Lord of Halifax and the other Right Honorable, The Lords' Committee of Trade Plantations By Their Lordships' Most Obliged and Very Humble Servant, John Mitchell.'

end the war but to avoid future conflicts between the two English-speaking nations.

That the American commissioners were far more able than the British representatives at Paris is beyond question. Few Americans have ever heard of Richard Oswald, Henry Strachey or Alleyne Fitzherbert—but many outside America have heard the names of Adams, Jay and Franklin.

There were points upon which Great Britain might have insisted with some justice. For example, there was the pathetic case of the loyalists. These 'Tories' had been citizens of the American Colonies. They were exiled from America and had their property confiscated.

The British commissioners came to Paris determined, if they got nothing else, to secure a recompense for the poor loyalists. They got practically nothing, and that because, every time Oswald brought up the question of the loyalists, Benjamin Franklin dragged a red herring across the trail by bringing up the immense indemnity the United States might demand from Great Britain for the atrocities committed and the destruction wrought by the British and the German troops in America — particularly the German. Finally on one occasion when the British commissioners got too insistent, the American threatened to break off negotiations if the matter were pressed.

During the course of the negotiations, the British found themselves unexpectedly in a much better position as regarded France and Spain, because of the British admiral Rodney's brilliant victory over the French fleet in the West Indies. At this point better news began to come in of the headway being made by Warren Hastings and Sir Eyre Coote in India. Right here Shelburne, had he been an ordinary diplomat seeking mere victory, could easily have broken off the negotiations and have told the Americans to go home. Yet in all the Shelburne Papers there is not a hint of this—a fact which seems to establish Shelburne's sincerity beyond the possibility of a doubt.

Of course the British took advantage of Rodney's victory to get better terms from France and Spain, with whom they probably expected to be at war again. But the Shelburne group wanted to settle once and for all with the United States—a fact which is of course immensely to their credit and one which later generations of both British and American politicians have often failed to regard.

The papers of the British statesman contain many delightful sidelights on the state of opinion at the time. During the negotiations one English politician was sure the war might yet be fought out to ultimate British victory and his plan was as ingenious as it was naïve. He believed that if France and Spain could be distracted England might yet defeat America—and certainly relieve the pressure on Gibraltar. He urged that the Russians be brought into the conflict, that the British ambassador at St. Petersburg be instructed to induce the Czarina of Russia to send thousands of Russian troops to Kamchatka, where they would be met by British transports who would convey them to the west coast of South America. There the Russians would harry the Spanish colonies at Lima, Callao and Valparaiso, settle themselves as masters, send the transports back to China for thousands of Chinese coolies who were to establish themselves in South America, and Spain and France would be reduced to utter consternation. The immense detail in which the plan was thought out failed utterly to take into account that the czarina who was to be convinced of the feasibility of this wild scheme was no other than the

The English FOLK SONG in Ohio

By MARY O. EDDY

There are song antiques that I would rather have than anything else in the whole field of antiques. One point about a song antique is that the tax assessors can't see it. Some of these ballads that Miss Eddy has collected have the feel of hickory-splint chairs, of old jackknives and brass pistols, of copper kettles and mountaineer kiverlids.—CARL SANDBURG.

THE southern Appalachian Mountains are generally believed to be the last foothold in our country of the old English folk song. It is undoubtedly true that it has survived in that region in a greater state of purity than elsewhere. What a delightful picture to recall—that of the plain little mountaineer grandmother, in her clean gray dress and white apron, with her hair smoothly parted in the middle, sitting beside the picturesque cabin door, singing, with inimitable variations of tune in the different stanzas:

Sweet Mary was a servant girl;
She loved the sailor boy
Who plowed the main much gold to gain,
Down in the lowlands low.

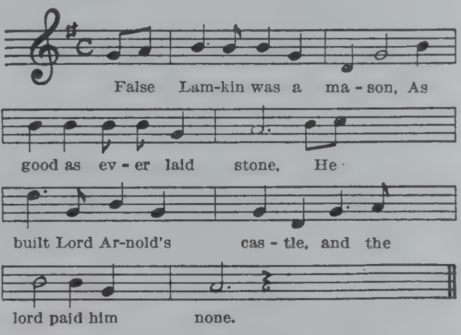
It is a pity to destroy the myth that here only, remote from the rush of modern life, are the old English ballads still known and still sung. Yet it is only fair to give other communities their due.

Not lacking in picturesqueness of much the same sort is a home in central Ohio which comes to my mind as I recall this Tennessee mountain scene. The Clear Fork of the Mohican River winds its way through picturesque hills sufficiently steep, sufficiently covered with evergreens and underbrush, to remind one of a Southern scene. Let me whisper it low, the natives of this infertile part of the state are said to maintain the same carelessness toward the provisions of the Volstead Act as is traditional among the mountaineers.

These Clear Fork hills, in spite of their wild beauty, cannot claim a great degree of remoteness from civilization. Only three miles away by a very comfortable, if unimproved, road is a village on the main line of a New York to Chicago railway, the village itself affording the usual advantages of Ohio life, up-to-date schools, paved streets, a picture show, scores of automobiles, and easy access to the outside world.

Back in the hills, three miles from town, is the home of my friend Miss Jane Goon—a home she has not left for any length of time since she entered it the baby of the family, some sixty-five years ago. Here Miss Jane has sung to me as delightful old folk songs as one can read in Child's celebrated collection. Her repertoire is not so extensive as that of the famous Mrs. Brown of Aberdeen, or that of the English singer who sang a hundred ballads for Cecil Sharp, the English collector. Her tunes are not always of unusual quality. But who would not experience a thrill of joy to hear this plain little Ohio countrywoman sing a complete version of 'Lamkin,' twenty-one stanzas? The tune, it is true, lacks something of the lilt of the familiar English tune, but it has an individuality especially to be discerned in the last note. Miss Jane's version of 'Lamkin' is pronounced by those who know to be the only complete one found in America.

Here is the Ohio version of the story of the Scottish villain who for two centuries or so has been used so much in frightening disobedient children into submission:



False Lam-kin was a ma - son, As
good as ev - er laid stone, He
built Lord Ar-nold's cas - tle, and the
lord paid him none.

FALSE LAMKIN

False Lamkin was a mason,
As good as ever laid stone;
He built Lord Arnold's Castle,
And the lord paid him none.

False Lamkin he swore
That revenged he would be
On Lord Arnold's castle,
Or on his family.

Said the lord to his lady,
'I'm going from home;
And what would you do
If false Lamkin should come?'

'Oh, I fear not false Lamkin
Nor man of his kin;
For I'll keep my doors fastened,
And my windows pinned in.'

So she kept her doors fastened,
And her windows pinned in,
All except one kitchen window
Where Lamkin came in.

'Oh, where is Lord Arnold,
Is he not at home?'
'No, he's gone to old Ireland
To see his dear son.'

'Oh, where is his lady,
Has she gone along?'
'No, she's up in her chamber
Where no man can get in.'

'Oh, what shall I do
That I may get in?'
'You must pierce this little babe's heart
With your silver bodkin.'

So he pierced the little babe's heart
Till the blood did spin
Out into the cradle,
So falsely she did sing:

'Oh, hush-y-bye baby,
Oh, what aileth thee?
Come down, loving mistress,
Oh, come down and see.'

'Oh, how can I come down
So late in the night,
When there is no moon a-shining,
Nor stars to give light?'

'Oh, you've seven bright lanterns,
As bright as the sun;
Come down, loving mistress,
Oh, come down by one.'

She had not advanced
But steps two or three
Till she spied false Lamkin
A-standing close by.

'Oh, spare me, false Lamkin,
And I will go back
And get you all the money
You can carry in your sack.'

'I want none of your money,
Nor nothing that I know
That will spare this bright sword
From your neck white as snow.'

'Oh, spare me, false Lamkin,
Oh, spare me one hour,
And I'll call down daughter Betsy,
The queen of the bower.'

'Go, call down daughter Betsy,
So neat and so clean,
To hold the silver basin
To catch your blood in.'

'Daughter Betsy, stay up
In your chamber so high,
Till you see your dear father
In a ship sailing nigh.'

Daughter Betsy stayed up
In her chamber so high,
Till she saw her dear father
In a ship sailing nigh.

When Lord Arnold came to the castle
And opened the door,
He saw his companion
Lying dead on the floor.

False Lamkin was hung
On a gallows so high,
And the false nurse was burnt
To a stake standing by.

This ballad has lost nothing in its journey, centuries long, from mouth to mouth. In fact, it has acquired a distinct gain over the usual Scottish version, namely, a motive for Lamkin's villainy. One is usually launched into the story with the stanza:

The lord said to the lady
Before he went out,
'Beware of false Lamkin,
He is lurking about.'

Ballads are constantly undergoing changes during the process of oral transmission, and these are sometimes significant, sometimes merely amusing. It is doubtless a touch of the democratic spirit of America which has transformed Lord Randal into plain Jimmy Randal. Mrs. Trumpower, who lives in the above-mentioned village, gave me the words of 'Jimmy Randal,' and I joined with her in regrets that I had not taken down the tune from the singing of her mother, an old lady whom I remember seeing when I was a child. The 'fried eels and fresh butter' which appear here as the immediate cause of Jimmy's death adhere quite closely to the English tradition.

In old-country versions, Lord Randal's death was encompassed by a wide variety of dishes, 'eels fried in a pan,' 'a wee, wee fishie,' 'a dish of sma' fishes,' et cetera. But these are tame and colorless compared with the variety of poisoned foods mentioned in the North Carolina versions. How much more thrilling are 'cold poultry,' 'cold pie and cold coffee,' and a plain 'cup of cold poison.'

JIMMY RANDAL

'Oh, where have you been, Jimmy Randal, my son,
Oh, where have you been, my own true loving one?'
'Away across country, mother—make my bed soon,
For I'm sick at the heart and would freely lie down.'

'And who met you there, Jimmy Randal, my son,
And who met you there, my own true loving one?'
'I met with my true love, mother—make my bed soon,
For I'm sick at the heart and would freely lie down.'

'And what had you for your supper, Jimmy Randal, my son,
And what had you for your supper, my own true loving one?'
'Fried eels and fresh butter, mother—make my bed soon,
For I'm sick at the heart and would freely lie down.'

'Oh, I fear you are poisoned, Jimmy Randal, my son,
Oh, I fear you are poisoned, my own true loving one.'
'Oh, yes, I am poisoned, mother—make my bed soon,
For I'm sick at the heart and would freely lie down.'

'What do you leave to your mother, Jimmy Randal, my son,
What do you leave to your mother, my own true loving one?'
'Four and twenty milk kye, mother—make my bed soon,
For I'm sick at the heart and would freely lie down.'

'What do you leave to your sister, Jimmy Randal, my son,
What do you leave to your sister, my own true loving one?'
'My gold and my silver, mother—make my bed soon,
For I'm sick at the heart and would freely lie down.'

'What do you leave to your brother, Jimmy Randal, my son,
What do you leave to your brother, my own true loving one?'
'My houses and my lands, mother—make my bed soon,
For I'm sick at the heart and would freely lie down.'

'What do you leave to your true love, Jimmy Randal, my son,
What do you leave to your true love, my own true loving one?'
'The fire and the furnace for to scorch her bones brown,
For she is the cause of my lying down.'

All self-respecting ballads glorify common objects. When Randal's mother, with rather undue haste, asks her dying son what is to be her share of his property, the answer is bound by all rules of balladry to be something picturesque, 'four and twenty milk kye,' 'my gold and my silver,' or 'my houses and my lands.' This tradition is well preserved in Mrs. Trumpower's song. The wide departure from such ballad glorification in the song, 'Henry, My Son,' sung by a young Jewess who learned it from an English friend in Massachusetts, is very amusing. The story is exactly the same as that in 'Lord Randal,' but how the glory has departed! 'Shoes and stockings,' forsooth!

HENRY, MY SON

'Where have you been all day, Henry, my son,
Where have you been all day, my sweet loving one?'
'Up to grandma's, up to grandma's;
Make my bed soon, I've a pain in my side,
And I want to lay right down.'

'What did you do there, Henry, my son?'
'Mind the baby, wash the dishes,'

'What did she give you, Henry, my son?'
'A glass of poison, a glass of poison.'

'What will you leave to your father, Henry, my son?'
'Suits to wear, suits to wear.'

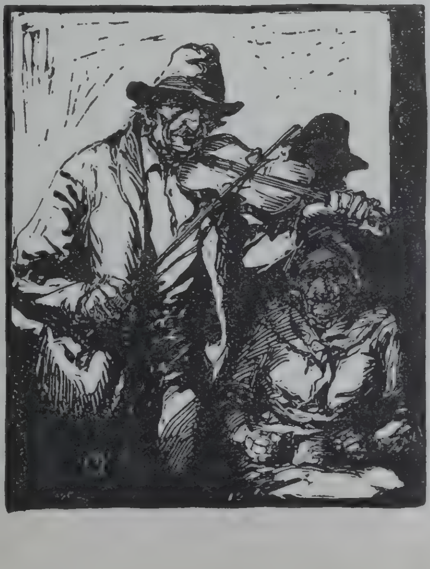
'What will you leave to your mother, Henry, my son?'
'Kisses from heaven, kisses from heaven.'

'What will you leave your brother, Henry, my son?'
'Shoes and stockings, shoes and stockings.'

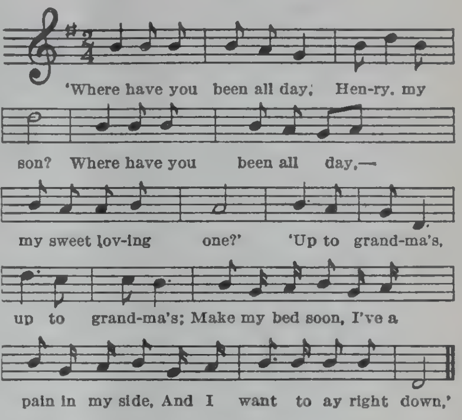
'What will you leave to your sister, Henry, my son?'
'Dresses to wear, dresses to wear.'

'What will you leave the baby, Henry, my son?'
'Toys to play with, toys to play with.'

'What will you leave your grandma, Henry, my son?
What will you leave your grandma, my sweet loving one?'
'Ropes to hang her, knives to kill her,
Make my bed soon, I've a pain in my side,
And I want to lay right down.'



The old people whose songs I have taken down have been most generous with their store and very patient with my rather unprofessional methods of getting the tunes reduced to writing. Miss Jane not only was willing to sing all the songs she knew, but went with me across fields to the homes of neighbors in order to make sure of certain lines. She even offered a chicken dinner as an inducement for a whole day's songfest, and while the dinner was being prepared, she sang tunes over and over, some of which were slightly untuneful and consequently difficult to put into notes.



'Where have you been all day, Hen-ry, my
son? Where have you been all day,—
my sweet lov-ing one?' 'Up to grand-ma's,
up to grand-ma's; Make my bed soon, I've a
pain in my side, And I want to ay right down,'

Ensconced beside the kitchen stove in the only warm spot in the house, I labored long over the air to 'The Bramble Briar,' which I was most eager to capture but which seemed, as Miss Jane sang it, to follow no known time scheme. As I was struggling with the musical staff, my good hostess suggested that the organ in the unused parlor might help me. The suggestion was a welcome one. With its help the tune would soon be complete. The first pump of the bellows dashed my hopes. Two notes sounded continuously, and no others at all!

'The Bramble Briar' with its quota of fifteen stanzas had been kept in the family Bible, written on a sheet of foolscap paper in the handwriting of Miss Jane's sister, long dead. This song had proved of unusual interest, narrating as it did, though in garbled English, the story of the pot of basil, told by Boccaccio in the 14th Century, by Hans Sachs, the German poet, in the first half of the 16th Century, and immortalized by Keats in more modern times. With such a literary ancestry, 'The Bramble Briar' became a song of importance. Investigation showed it to be one of ten versions, six American and four British, all preserving the essential features of the old story, and, curiously enough, all written in the same imperfect English. Of the American versions, two had been found in Kentucky, two in North Carolina, and one in Missouri. The garbled phraseology of the song added greatly to its historical value.

(To be concluded in an early issue.)

HAARLEM, *the* Home *of a* Great Master

By **HILAIRE BELLOC**

Illustrated by
EDMOND WARRE

THE two characteristics of Haarlem which mark it apart from its fellow towns of the north are first the Frans Hals Museum and next the seal set upon it by the residents, of its Napoleonic king, Louis Bonaparte.

The latter point goes somewhat unemphasized especially for foreigners. The episode is brief: succeeding history has tended to obliterate it. The effort of the coalition after Waterloo when it had defeated Napoleon was to reduce southern influence as much as possible to subject the Catholic provinces to the Protestant and to put up a dynasty very different from that which Napoleon had planned and had failed to establish. In one sense the second

Show Windows of Europe

Most *of* Them *Are* Decorated *for the* American Eye

By PUTNAM PHILLIPS

EVERY country of Europe is maintaining a show window and most of these windows have been decorated for the American eye. (I am excepting Great Britain and Ireland throughout all of this, for they are on a different basis.)

Most of the news that comes to us in America has to do with the contents of the show windows, because only the big events are worth the cable tolls. Americans traveling abroad, especially those in groups to study conditions, see only these windows—they talk only with politicians and big business men and bankers. And so we have come to the notion in America that Europe is concerned only with big international questions—that the ordinary citizen talks of little else and that the first qualification for office-holding is being an international expert of profound astuteness. All of which is show-window stuff. The man in the European street has exactly two interests: the first is getting a day's pay for a day's work or, if the chance offers, getting a day's pay without the day's work, and the second is keeping out of the next war. All questions of reparations and finance are equally simple to his mind; he is in favor of collecting money but is not in favor of paying out any. He knows little about America or any other nation. Also he cares but little.

THE Continental newspapers carry very little American news and that usually of an unimportant character, and, although thousands of Europeans have lived in America and returned home, they seem to have learned nothing except that the United States pays good money, expects hard work, and does not permit wine to be sold. I have talked with dozens of working people who have lived from five to ten years in our industrial centers. Few of them can speak much English and none of them have the remotest notion of American institutions.

As to good will, only the people who have nothing else to do are bothering about good will—the others are too busy with their own affairs. It is quite generally felt that a lot of good will was wasted on America—because we did not even cancel the war debts, let alone come across with some new money. The United States is recognized as the one best place on earth to get to right now, but it is not revered as a kind of heaven—it is the place where the money is. Just that and nothing more.

I have visited nearly all of Europe and I have had the chance to talk with people from every country in Europe. I know that, although one cannot say what all of Europe thinks and feels any more than one can say what the whole United States thinks and feels, this summary of sentiment, or rather of attitude, is substantially correct and especially in the utter lack of interest in what we call international problems, except from the viewpoint of paying or not paying money.

AND, as usual, the ordinary common people who always, and properly, think of their own families first—and of outside affairs only as they affect their families—are right. Except, perhaps, in Germany, it is the home and not the foreign affairs which is really vital; and about nine-tenths of the international difficulties spring out of an effort from the inside to do something either to relieve or to divert the home pressure. Right after the Armistice, when I was last abroad, conditions were very different from what they now are and not nearly so critical. Then both the victorious and the defeated peoples thought that the war had settled something, and in particular had settled some things which wars do not settle—as, for instance, the abolition of poverty.

They had been promised a new and somewhat fantastic world specifically outlined in 'reconstruction plans.' For a little while, through currency inflation—that is, through the simple process of printing money—the promise of a new world was made good. The discharged soldiers, the unemployed, everybody, received state support. When prices began to catch up with the printing press money and trouble threatened, trade booms based on inflation began everywhere. Each country, after its boom, passed into deep depression, unemployment, and of course into a season of treatment by political panaceas. The ordinary man has not been able to understand why one year the state supported him and the next year failed. The communists have from time to time stepped in with red flags and riots, hoping to stampede the peoples into proletariat government—and sometimes they have nearly succeeded.

The governments have either been weak or amateurish, and often they have been both. Amid the whirl of half-baked, flannel-mouthed politicians, the man in the street does not know where he is; the man of education does not know where he is; the man who formerly had an income from investments does not know where he is. The particular government which is in power does not know where it is, and it only hopes to raise issues outside which will keep the people from asking what is going to happen.

But it is useful to realize that no single mixture can be concocted to pour down the throat of Europe and make it well. Each country has its own internal diseases and the moment each country begins to turn to the treatment of its own diseases, at that same moment the number of international problems will decrease.

The important study in Europe is the strength and the kind of effort that each country is making to help itself. For they have every problem which the United States has—but magnified a thousand times and thrown on a screen for observation. Every quack remedy which is being proposed at home for the relief of this, that, or the other national ailment has been thoroughly tried out somewhere in Europe, and has failed.

UNFORTUNATELY, however, we Americans have taken a different view of Europe. Instead of looking at it as an experimental station which can teach us some things to do and many things to avoid, we have just glanced at the show windows and never bothered to go inside.

We have a stake in every country in Europe. Whether the cotton mills in the north of Italy run or do not run may seem of no consequence to a man employed by a watch manufacturer in Connecticut. But it is of considerable consequence, for the Italian mills buy their cotton from our own South; if they do not buy, then the South sells that much less cotton. The employes of those Italian mills eat macaroni and that macaroni is largely made from wheat grown in our own Northwest. If the Italians are not drawing wages they will have to get on with less macaroni—and our farmers will sell that much less wheat. And so neither our cotton people nor our wheat people will have any extra money with which to buy Connecticut watches, and the employe of the watch factory may find himself working on less than full time.

Flattery Not Friendship

WE HAVE developed in this country a habit of back-slapping and indiscriminate boosting. In the past these never did go down with men of hard horse sense, but they had a pernicious influence on young men, because young men naturally thought that this was the standard way to do things.

This is a situation which mature business men have observed with something of impatience and something of misgiving. It must not be assumed, however, that they regret to see a human tone in business relations. Nor must it be assumed that their ideal of a business man is that he should be strong as steel and just as cold.

> *SMOOTH talk in business has been too much relied upon in the past. Flattery is a weapon which has been too frequently used. A compliment entirely loses its value if it arises from any form of self-seeking. A man's word of praise ought to be as sound and good as his word of promise. But there are people who know that some of those with whom they come in contact are so susceptible to praise that a little of it knocks them off their balance. It saps their good sense and places them at considerable disadvantage. To do business in this manner is distinctly dishonest. Flatterers are never friends, although seeming friends are often flatterers.*

There are two great barriers to the free intercourse of minds, to absolute transparency of conduct, and they are, first, a designing attitude toward another; and second, that which the designing attitude breeds, namely, suspicion in the mind of the man against whom the design is laid. They are both unwholesome mentally and disruptive socially. They constitute the major part of the silent warfare of life.

All men like praise. If a man says he doesn't, he should examine himself again. He may not like to be praised to his face. He may be irritated by the fawning form in which the praise is offered him. He may be angered by his knowledge that the offered praise is insincere and has an ulterior motive. He may be sickened by the hollowness of it.

A man who had done nothing very much was once pained by the praise he received. He said, 'They all praised me for the wrong thing.' They had not considered his work enough to see the real point in it. And what he wanted was not the sticky sweetness of personal compliments, but discriminating and appreciative consideration of his work.

All men like their good work to be praised—but that is quite a different thing; there is something normal and wholesome about friends being able to meet frankly in consideration of a piece of work. So, if a man says he dislikes praise, he must define what he means. When a man is able to praise his own work to himself, to behold the work of his hand and take pleasure in it, he is taking praise, just as much as if he eagerly drank in compliments spoken by another.

The evil of life consists in all these wholesome and pleasurable sensibilities being misused to selfish ends. No matter what department of human nature you look into, the evil you see comes from selfish misuse. And so men have brought in evil through the gate of praise. If you see that a man's weakness is liability to flattery, and you take advantage of that to influence his judgment and his will, you are following the same tactics as the man who sees another's purse conveniently exposed, and takes it.

If you see that a man is built of such malleable material that a friendly complimentary advance disarms him and lays him open to your power, and if you deliberately thus disarm him for the accomplishment of your design whatever it may be, good or bad, you are working along a dangerous line; you are exalting yourself to a place which no human being is entitled to assume toward another for reasons of profit. It is a serious thing to descend to this kind of strategy or trickery even for the best purposes.

No one adopts these tactics without sacrificing a good deal of sincerity. And besides, they are not necessary. There is nothing that this sort of strategy can accomplish, which frankness, honesty of purpose and even blunt truthfulness of statement cannot better accomplish. The straight open way is healthier for the mind of the man who is making the advance, and it creates a better relation with the man who is being advanced upon.

The young business man will more fully trust the older man who does not flatter him and who does not follow his flattery with presumptions on the young man's favor. Thousands of people are that way; they pay a compliment, and they believe that constitutes an admission ticket to special privileges. Deny them the privilege, and they go away saying quite opposite things about the person they hoped to 'work.'

A certain delicacy of character will teach the self-seeking person that it is a vast presumption to offer praise to anyone; and the only consideration that can justify it is its sincerity and unselfishness. Otherwise it is a profanation of one of the finest forms of human relationship.

If a young man is in business and is wise he will pay less attention to those who flatter his self-esteem, and more to those who stir his energies. A good, well-balanced critic who is looking to the success of the work and not to the feelings of the men who may be at the head of it, is the best kind of friend for a young business man to have. And if the young business man is keen he will see that such a one's interest and attention is the most real, yet the most delicate form of friendship and praise.

What Price?

AT THE United States-Great Britain-Japan naval disarmament conference Japan is expected to ask that:

> *The United States bind itself not to establish a naval base at Hawaii.*
>
> *American coastwise trade be opened to the commerce of the world.*
>
> *The Panama Canal be neutralized.*

Great Britain is expected to ask that:

> *Cruisers be limited to 6,000 tons each.*

Behind these expected proposals are interesting facts, facts which should be known to the American people before the nation is committed to any further policy of disarmament or abnegation.

At the former Washington conference (where the United States purchased paper disarmament from the world powers at so great a price to itself), the other nations carefully considered all potentialities entering into naval warfare. They considered islands and naval bases; they considered cruising radius; they considered sources of such supplies as oil, coal and food. The United States considered ships alone. As a result the United States not only scrapped magnificent fighting ships in exchange for paper plans, but agreed not to fortify further the Philippine Islands and not to fortify Guam at all!

One strategic point remains to the United States from which it could reasonably safeguard its Pacific possessions. That point is Hawaii. If this nation forgoes the privilege of fortifying Hawaii, it must operate its ships in time of war from the American mainland, thus curtailing their range of action some two thousand miles. Such an action would be suicidal insofar as defense of the Philippines is concerned.

Whether it be due to higher standards of living and more stringent seamen's laws, or to some other reason, American merchant ships in general have been unable to compete with those of other nations in international trade. Thus, the coastwise trade is by far the most important in American shipping. Reserved explicitly for vessels flying the American flag, it is a source of rich profit to this country. Probably the surest and quickest way completely to wipe the American flag from the seas would be to throw open United States coastwise trade to the boats of all nations.

The Panama Canal is considered part of the American coastline. It is fortified, and in time of war could be closed to the enemy. But if neutralized or internationalized, the canal would be as open to enemy nations as to this country. They would have the same rights there that we enjoy; and the tremendous advantage of passing a fighting fleet quickly from one coast of the United States to the other would be common among all belligerents.

There remains the question of cruisers. A 10,000-ton cruiser naturally has a greater radius of operation than a 6,000-ton cruiser. In this hemisphere Great Britain has naval bases at Halifax and Bermuda, at Trinidad and Jamaica; in the Mediterranean at Gibraltar, Malta and Port Said; in the Orient at Singapore and other points. It is obvious that if cruisers were limited to 6,000 tons, with correspondingly lesser radii, Britain would be in much more excellent position than the United States, forced to operate its ships from the American mainland alone. And of the 6,000-ton cruisers, Britain now has 39, Japan 21, and the United States 10—ranging in age from 10 to 20 years.

Many people are wondering just what America hopes to get from the new conference. The illusory ideal of world disarmament is, of course, highly admirable, but it is likewise fraught with extreme danger for the idealist nation. The concessions made by other nations must be high indeed if they are commensurate with the new sacrifices asked of the United States.

A Rare Opportunity

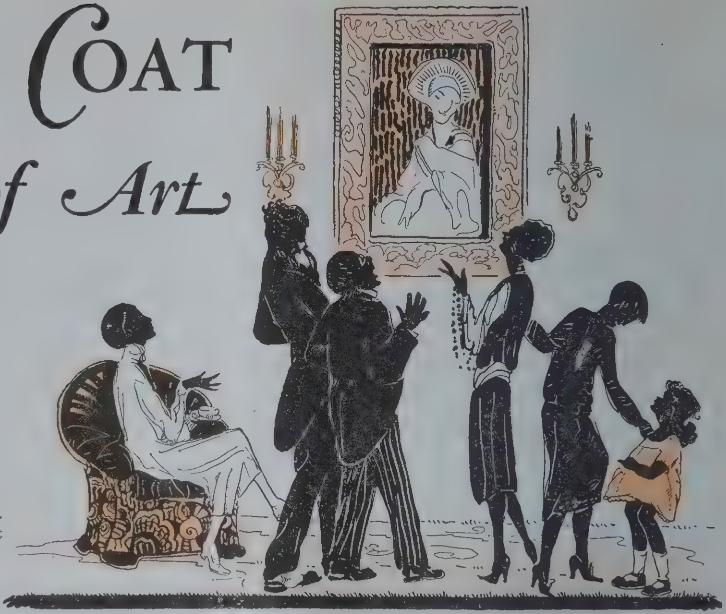
THE nation's chief reaction to the semiofficial suggestion that Congress be called in special session early in October is one of indifference. Vital matters are awaiting legislative action. Foreign affairs need thorough and lengthy airing. Corruption is a paramount issue. Unfinished business, left as a doubtful heritage by the unlamented 69th Congress, requires immediate attention. Farm legislation of some sort is a political necessity. Tax reduction is essential. Muscle Shoals, muffed by session after session, looms in the offing. And added to all these are the titanic problems arising from the Mississippi flood: problems not only of future control, but of immediate relief.

Yet in spite of the need for decisive action, the country as a whole is indifferent to the proposed special session. Wrangling, jugglery and trickery such as marked the 69th Congress have turned the interest of the public to disgust. The trust of the nation has been sacrificed on the altar of cheap politics. A great responsibility rests upon the new Congress, whether it convenes in October in special session, or in December in regular session. New leaders and new policies will develop. Ward politics can be eliminated, and the ethics of a former day restored. The duties of the 70th Congress will be heavy, but they will be more than equaled by a rare opportunity—the opportunity to regain the confidence of the nation.

The Emperor's New COAT As Seen in the World of Art

By NELL UPSHAW GANNON

Illustrated by
BETTY JANE KIDD



The art galleries are seldom visited by any but artists and tourists.

HANS Andersen in his *Fairy Tales* tells us the story of an emperor who wanted a new coat. Two crooks, deciding that he was an easy mark, went to him and offered their services. 'Sir,' they said, 'we are wondrous weavers. We can take gold and silver thread and devise a coat for you, the like of which the world has never known. So delicate is its texture that only those with extraordinary intelligence can see it.' The idea appealed to the emperor's vanity and he made the rascals his official tailors.

After spending much time measuring and collecting quantities of gold and silver, they pretended to bring the coat in and held it up for inspection. Its peculiar merits had been noised abroad and the emperor was constrained to admire it before his courtiers, although for the life of him he could see nothing.

'Am I so stupid that I cannot see what every one else sees?' he asked himself. His followers, feeling also that their reputations for wit and sagacity were at stake, could not praise it highly enough.

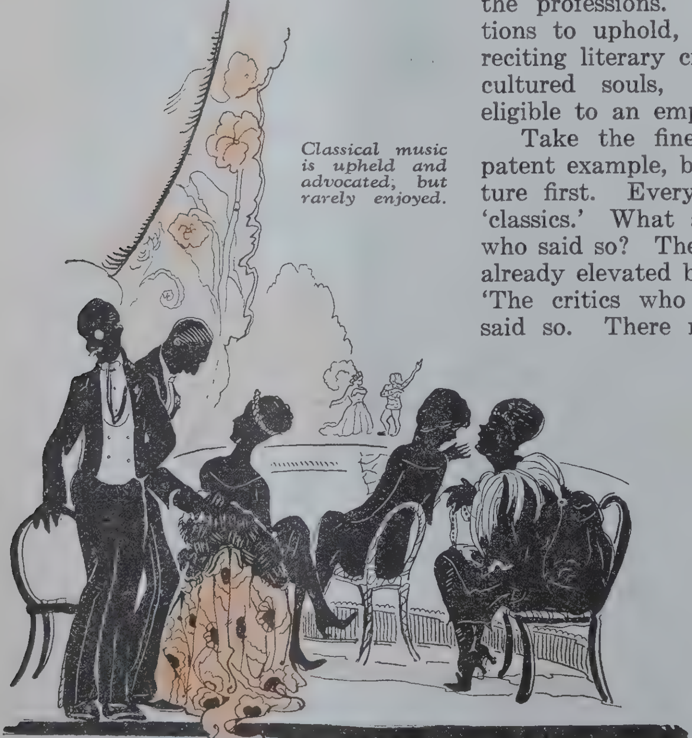
Finally it was suggested that the emperor have a parade and allow the populace to give itself an intelligence test. The people were filled with dismay, for every man on hearing his neighbors praise the beauty of the coat felt obliged to hide his own ignorance by joining in, lest he should betray himself. So in a noisy manner the emperor's subjects shouted their approval of the coat—everybody except one queer little boy who in a bewildered way inquired, 'But, father, where *is* the coat?' 'Hush, son! People judge your intelligence by your speech!'

The father was right. Indeed they do, and generally while the dupes are shouting and the thoughtful minority are wondering, the thieves are getting away with the booty.

Perhaps the most frequent wearers of the emperor's new coat are the self-styled educated classes who follow the professions. They have reputations to uphold, and, if talking and reciting literary creeds will save their cultured souls, they are certainly eligible to an emperor's paradise.

Take the fine arts as the most patent example, beginning with literature first. Every other word is the 'classics.' What are the classics and who said so? The cultured raise their already elevated brows and hurl back, 'The critics who know what's what said so. There now!'

Where did the critics find out? Most of them found out at college. They imbibed their information from a big red (or was it green?) book with a title in gilt, 'The Survey of English Literature.' Regardless of the language the treatment is the same. The English survey invariably starts with Beowulf and stops with Kipling. Since all the surveys are practically the same, the young Socrates who would stake his soul on the printed page is led to believe that the favored few included within those pages are the only ones worthy of notice. When he has finished the book and passed the course with a 70, he extinguishes his lantern and his search for truth has ended.



Classical music is upheld and advocated, but rarely enjoyed.

THE average student, being gullible and ignorant and ambitious to learn everything at once (so that his education will be complete at graduation!), very readily accepts the dictum of the author. The author can be counted on as perfectly reliable, for his textbook is very likely a rehashing of some other man's book and entirely unoriginal. A great many authors and books are listed which no one reads, but which are 'excellent reading' and therefore entitled to a high place.

Not to know Chaucer is indeed ignorant. 'Yes, I enjoyed his *Canterbury Tales.*' I bet you did! And you adored (did you not?) Edmund Spenser's *Fairie Queene*—especially if it had not been revised. No doubt you read Francis Bacon's essays while you are waiting for the street car.

It is treason not to admire Shakespeare, and, although you have read only four of his plays (under compulsion), I am sure you love him passionately. His every line must be studied, his every act must be analyzed and, when in doubt, there is always an obliging commentator who can set the erring student straight.

Shakespeare is the great master for all time, and yet were any to model after him, rejection slips instead of fat moneybags would be the reward. He is as safe from imitators as if he had a copyright, for our young geniuses in order to survive must produce something that people will read. And they don't wear glasses from reading Shakespeare.

You brand yourself by not praising Milton's *Paradise Lost*—the great 'Puritan epic.' Yes, that's what my survey called it. It is one of the masterpieces of English poetry—sublime lines in 'sonorous rhythm,' yet I have never met anyone unless he was a teacher who had read the book through.

LEAVING our own language, we cannot omit the ancients who put class into the classics. We lunch on Aeschylus, Sophocles, Euripides; dine on Seneca, Aristophanes, Plautus, Terence and all the rest of antiquity that we recommend without reading. Of course in high school the children cry for Homer, Virgil, Demosthenes and others, or they are supposed to. However, in my experience, I have never yet heard one admit that any of these inspired that emotion.

Recently I came across a statement of a famous man who expressed himself in the following terms: 'If all the books in the world were in a blaze, the first twelve which I would snatch out of the flames would be—the Bible, Homer, Thucydides, Virgil, Dante, Milton, Imitation of Christ, Aeschylus, Tacitus, Marcus Aurelius, Shakespeare, and Wordsworth.' I don't know whether he read the newspaper or any modern fiction. He probably didn't—if he really took the time to read the books he named.

Of course, every one has his individual taste and personal preference and it is his right. Very few use the right, for most of those who try to read the classics are afraid to commit themselves.

MY PUPILS are like the little boy who couldn't see the emperor's new coat—they will admit when pinned down that these relics of the past are tiresome and in need of abridgment. In the classroom their intuitive fear, which society has instilled from infancy, prompts them to speak of their assignments in glowing terms, and any writer in the book can be sure of a cordial reception—if a mark depends on that reception.

Occasionally I see a list of ten or twelve books that some benighted individual or some would-be literator has selected to carry with him to a desert island. Even the professed infidels can't forget their literary training and always head the list with the Bible. They never read it at home, but they are afraid to ignore its reputation. The old literary stand-bys are chosen instead of less famous books that might really give them comfort and assistance. But they are only theorizing and, if the truth be known, in nine out of ten cases our friends would prefer drowning to reading those books through a couple of decades.

Pharisaism among the 'diploma' class is based on three things: they have empty bookcases and want to fill them with 'standard authors.' They really have not read much except periodicals and are willing to take some one's word for it. It really doesn't make so much difference, for they aren't going to read the books anyway. That is why they always get sets instead of good books at random. All of us know that no one man can write twenty books the equal of other well-known authors' masterpieces. But they come cheaper in sets and the author's name is standard.

Second, when they make nice little talks and entertain their blue-stocking acquaintances, they can give quotations and make learned references without going any further into the subject.

Third, they have a reputation which will be made or marred by the judgments they pronounce. It is easier to memorize a list than to read a library and pronounce an honest opinion on it. The only way they can be sure of saying the right thing is to repeat the sayings of 'accepted authorities.'

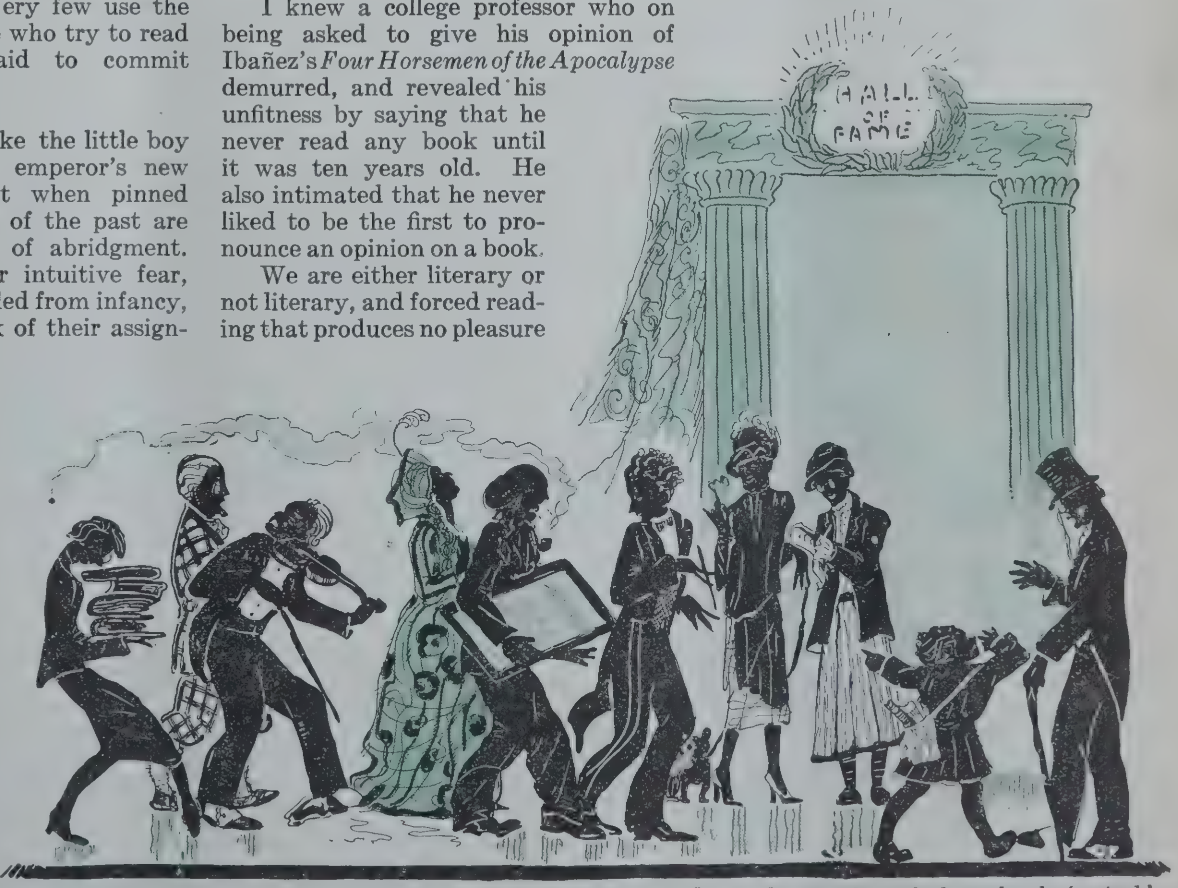
I knew a college professor who on being asked to give his opinion of Ibañez's *Four Horsemen of the Apocalypse* demurred, and revealed his unfitness by saying that he never read any book until it was ten years old. He also intimated that he never liked to be the first to pronounce an opinion on a book.

We are either literary or not literary, and forced reading that produces no pleasure will not alter our mental make-up. Unimaginative and timid instructors with stock phrases for standard authors will not develop interest, nor will reading a stereotyped list produce critical appreciation.

WE study for improvement, and if it can be demonstrated that a hopelessly dull and antiquated book can train the mind, we will have to admit it to our curriculum, provided we can find no better book that will produce the same results. But reading in the main should be for pleasure and inspiration, with culture as a by-product. Culture should not be an end in itself, but an accompanying result. If our education does not fit us for life but merely leaves a cultured adult, as it so often does, then it is time that we examine the course of reading and see whether something can't be done to place the emphasis on the living instead of the dead.

Music is perhaps abused worse than literature. While most of us can get the sense of a printed page, a large number never know what the music is all about. With the exception of music teachers, students, musicians and a limited group of music lovers, there is practically no musical appreciation. It is considered a part of culture and, as that, a certain amount of it is to be taken in broken doses, regardless.

Classical music is upheld and advocated, but rarely enjoyed. Take Grand Opera as an example. We are expected to attend (*Continued on page 22*)



There is one thing worse than the failure to recognize the real thing. It is toadying to those who have already 'arrived.'

A Miracle in Stone

By JULIAN HAWTHORNE

IF YOU were asked tomorrow to build a structure which should embody, in simple and compact form, the fundamental facts concerning the planet on which we live, and the solar system of which it is a part; and which, more than this, must be a symbol of the profoundest truths of science, of religion, and of the past history of mankind on this earth, together with, perhaps, an intelligent forecast of the destiny which still awaits us, what would be your reaction to such a proposition?

Your employer would further stipulate that you should comply in the strictest degree with the simplicity-and-compactness feature. The outward form must be such as to be taken in by the eye at a glance—the most primitive form, in fact, of solid geometry. The dimension, externally, must be vast and its substance of the utmost attainable massiveness and endurance; so that it would withstand the shocks of time for endless ages, and forever impress the imagination of the beholder as being one of the most signal achievements of humanity.

—Keystone View (Inset). Publishers' Photo Service.

The Sphinx at Gizeh and, in distance, right, the pyramid of Cheops and, left, the second pyramid of Kepheron. Inset—Climbing up the Great Pyramid.

As to the interior of the edifice, it should be in the main a solid mass of stone; but should nevertheless contain, hidden in its enormous bulk, details of construction, accurate to the least fraction of an inch, whereby, when the key was given, to decipher the alphabet of all things of knowledge, faith, and hope. It should solve the problems of astronomy, and announce the laws of the universe. It should reveal the philosophy of history, and explain the problems of physics. But, above and beyond this, it should interpret the mystery of the soul, and of its relations to the Creator. And all this, and more, should be built and hewn in imperishable stone, so that thousands of years from now, men should peruse it and confess that here was a faithful account of the truths, facts and secrets of the infinite complex of things in which we move and have our being.

If you were offered such a job as this, would you take off your coat and go to work?—or would you decline it with thanks and depart, with the purpose of stopping in to apprise the director of the nearest insane asylum that an overripe patient was awaiting him? Indeed, had you waited to hear more of the insane project, you would have been the more confirmed in your diagnosis. An inexhaustible stone quarry, innumerable workers, skilled and unskilled—what would these avail? And you would perceive, on looking into the matter, that before a single stone was laid, you must know to the last detail every item of the whole inconceivable operation; your working blue prints must tell it all, before a hammer fell or a chisel cut; the work must proceed with no reconsideration or remodeling, from the cornerstone at the base to the capstone on the summit. Every angle must be true, every measurement justified, and the whole affair must be an epitome of the design and accomplishment of God, not only in the realm of nature, but in the mind of man. Why, it was a chimera, a joke, a madman's dream! Great though are the resources and attainments of modern engineering and architecture, they would be impotent either now or in coming time to attempt such a miracle.

* * *

Such being your state of mind, what would you say if, after leaving your message with the asylum manager, you were to be arrested in your career by concrete and indubitable evidence that the miracle not only could be done, but had been done; that the impossible building stands today for all men to see; that not only does it stand, but has stood in its place for four thousand years, the marvel and riddle of mankind; that the men and magicians of ancient Egypt stared upon it in dumb amazement; that old Herodotus sought in vain to understand it; that Alexander the Great was not great enough to solve its meaning; that Pliny the historian gaped at it to no purpose; that Al Mamoun, son of Haroun Al Raschid, got so excited about it that he forcibly broke through its walls in quest of treasure, and came out empty handed, and the tribes of Arabia contemplated it with fear and reverence; that Napoleon, halting his legions in its mighty shadow, bade them to be steeled against peril and hardship by the thought that from the summit of this vast enigma, forty centuries looked down upon them. He would conquer the earth; but he felt in his heart that the builders of the Great Pyramid had done a mightier work and made a more enduring conquest.

The Pyramid is not the final flower

of unknown thousands of generations of thinkers and artificers: it is not a supreme example of evolution; it is unique in all human history; its makers reached the zenith of achievement at the first trial, and down to this year of our Lord 1927, there has been no sign of rivaling it. It justly deserves to be regarded as the foremost of the Seven or of the Seventy Wonders of the World; and there is nothing in sight to endanger its supremacy.

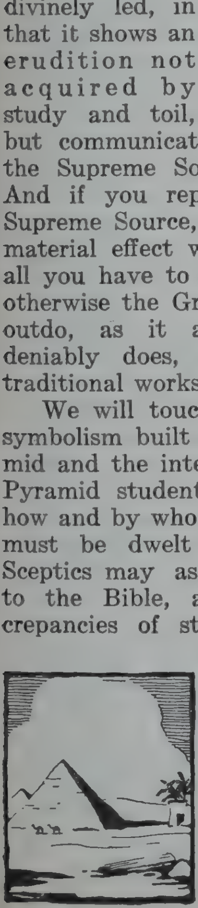
It is not too much to say that it seems to have been inspired, like the Word of God which we call the Bible; or, if you prefer a pagan similitude, that it sprang into being unbegotten by human means, as did the goddess Minerva from the head of Jove. Not, of course, that human hands didn't put it together, but that the work was divinely led, in that it shows an erudition not acquired by study and toil, but communicated immediately from the Supreme Source of all Wisdom. And if you reply that there is no Supreme Source, and that there is no material effect without a cause, then all you have to do is to explain how otherwise the Great Pyramid came to outdo, as it abundantly and undeniably does, all other extant or traditional works of man.

We will touch presently upon the symbolism built into the Great Pyramid and the interpretation thereof by Pyramid students; but this thing of how and by whom it came to be built must be dwelt on for a moment. Sceptics may assign a natural origin to the Bible, and criticize its discrepancies of statement and its incongruities with established scientific fact—so far, of course, as its literal contents are concerned. But the Pyramid cannot be so disposed of.



The most that the sceptics can do with it is to say that the interpretation of its symbolism is mere imaginative guesses. But this symbolism is so harmonious throughout, so perfectly interrelated, so consonant with the best results of modern investigation of the cosmos, that the question is inevitable—if the builders didn't mean what the interpreters assert, what else did they mean?—or is it conceivable that they meant nothing at all? Did they execute this stupendous work with nothing else in view than the gratification of idle vanity, or the amusement of profligate leisure? Human credulity may go far; but hardly so far as that!

But is it less unthinkable that God came down in person and performed the masonry, or even that He superintended the work of men inspired by Him for that purpose? We may regard the Bible as having been divinely inspired; there are plenty of 'inspirational' scribes today; but the Pyramid is in another category. Besides, though we may charge the books of the Bible with being products of ignorance and superstition, or even of forgeries, no such indictment can be brought against the Pyramid. After forty centuries of existence, there it stands, unaltered and unimpugned. Whether or not it can be explained, at any rate it can't be done away with. If we deny it any spiritual significance, it renders it only the more insoluble.

The Pyramid stands as a contradiction of all human experience and in defiance of our theory of the origin and progressive development of man. If not a miracle in stone, it is a riddle deeper than that of the Sphinx and propounded not in philosophic subleties but in granite and mortar. And it involves the attendant riddle, even more perplexing, of the identity of the builders. The more we muse upon these facts, the more disturbing do they appear. It is a Gordian knot, which no Alexander can cut nor Plato untie.

* * *

A volume could be written about the Pyramid; indeed a dozen or more books have already been devoted to it, by expert and industrious students, and a magazine article can do little more than call attention to the subject. Modern investigations began about the middle of the last century, but their outcome was so bewildering that efforts to elucidate the matter ceased before the year 1880. The last work treating of it, that I am aware of, is by the late Reverend Joseph A. Seiss, D.D., a copy of which came into my possession about the time of its publication, 1877. It summarizes the data so far obtained, and the author is very strong in his support of the divine or miraculous genesis of the Pyramid; but though this persuasion colors his apostrophes, he always sticks faithfully to his facts; he is emotional but veracious. He addressed an audience more consenting than ours, and it is curious to note how far in the last fifty years we have diverged from his point of view to that of science.

But let us accept the knot as tied: What was the motive of the tying?

Pillars are for fame; gravestones for the dead; and they bear inscriptions of their designation. But pillars are overthrown, and tombs destroyed, and the language

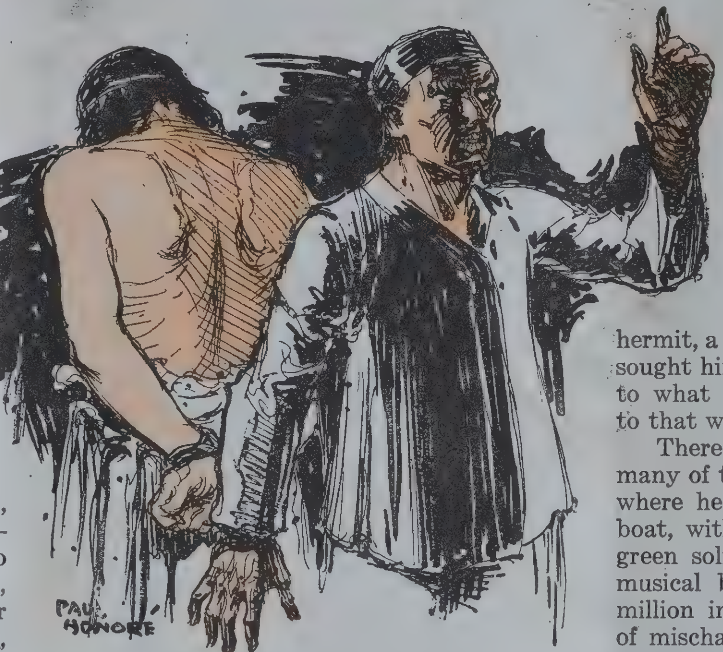
A CHINESE LIVINGSTONE

By CHARLES J. FINGER

Illustrated by PAUL HONORE

PART II.



BETWEEN the Hindu Kush pass and Samarkand, Huien-Tsaing encountered hard men who were rulers, and he saw strange sights. The wonder of it is that, though unarmed, he never hesitated in going to the relief of the oppressed though their oppressors were bloodthirsty kings and chiefs. He pleaded for the lives of those about to be beheaded, for wives who had been unfaithful and were to be cast into boiling oil, for those in prison, and always he won. No matter how wanton and severe his host, in palace and in hut he taught and expounded. Possessing an open and observant eye, seeing with sharpness and clearness, he was enabled to advise rulers through whose realms he passed, sometimes regarding things they had seen so often that they did not see them at all.

In some respects he was like a chess player who sees four moves ahead when his opponent sees only one. So, because of his common sense in worldly matters, he was heeded in matters spiritual and ethical. We gather that his themes were all based on the necessity for order in human affairs, much as were those of Livingstone. 'Your compassion is needed for the oppressed.' 'Like the bee, which gathers sweetness without destroying the beauty or the fragrance of flowers, so should a man live his life.' 'Hatred does not kill hatred; so let a man keep his speech in subjection.' 'The purpose of the good man is to increase the mercy, kindness and piety of all mankind.' Such were his texts. And, had he chosen, he might have lived in ease in any one of a dozen rich households. Instead, he said what he had to say, and then pushed on.

He pushed on in that amazing journey, over mountains 'of prodigious height'; through a pass 'closed by double wooden doors studded with iron'; over morasses of mud; across plateaus dangerous with snow-whirlwinds; into the Hindu Kush, where 'ice, pile on pile, rises into mountain masses, and snow blasts dash on for a hundred leagues'; through places where there were 'murderous robbers to be met with.' Again and again he was captured, and again and again released.

Sometimes he went a hundred miles out of his way to see some monument with an inscription. He describes 'great Buddhist images carven out of solid rock,' which, be it said, were unknown to the world until the year 1843, when they were discovered during the Afghan-English campaign. And he writes of the people of Little Tibet as a 'fierce, passionate folk, ill-mannered and uncouth,' describing them much as did Marco Polo six hundred years later.

At last he came to Kashmir, where news of his coming as the bearer of a message of peace had preceded him. So 'the road was covered with umbrellas and banners; it was carpeted with flowers, and the air was filled with sweet scents; and the king walked behind an elephant' on which Huien-Tsaing sat in a howdah.

It is impossible to read the account of Huien-Tsaing's travels without closing the book to wonder at the strange eagerness with which people received him as one to bring gladness. Perhaps those he mixed with were full of admiration for his discipline and courage and spirit of self-denial, his honesty of purpose, and so he won an audience as any daring traveler does. And because of that attention he was able the easier to mould opinion and direct thought. Perhaps it was his experience of life, so much greater than the experience of those he encountered. Perhaps it was his extreme worth of character. But to my thinking, the valuable thing about him was that he brought order.

As did Livingstone, the Chinese pilgrim lived with those he studied. He talked their language and acquainted himself with their thoughts and ideas. The influence which radiated from him moved people to a higher, purer and more intelligent life. But he was learner as well as teacher. Did he hear of a learned man, a hermit, a holy man, then the Chinaman sought him out, sat at his feet, listened to what he had to say and held fast to that which was good.

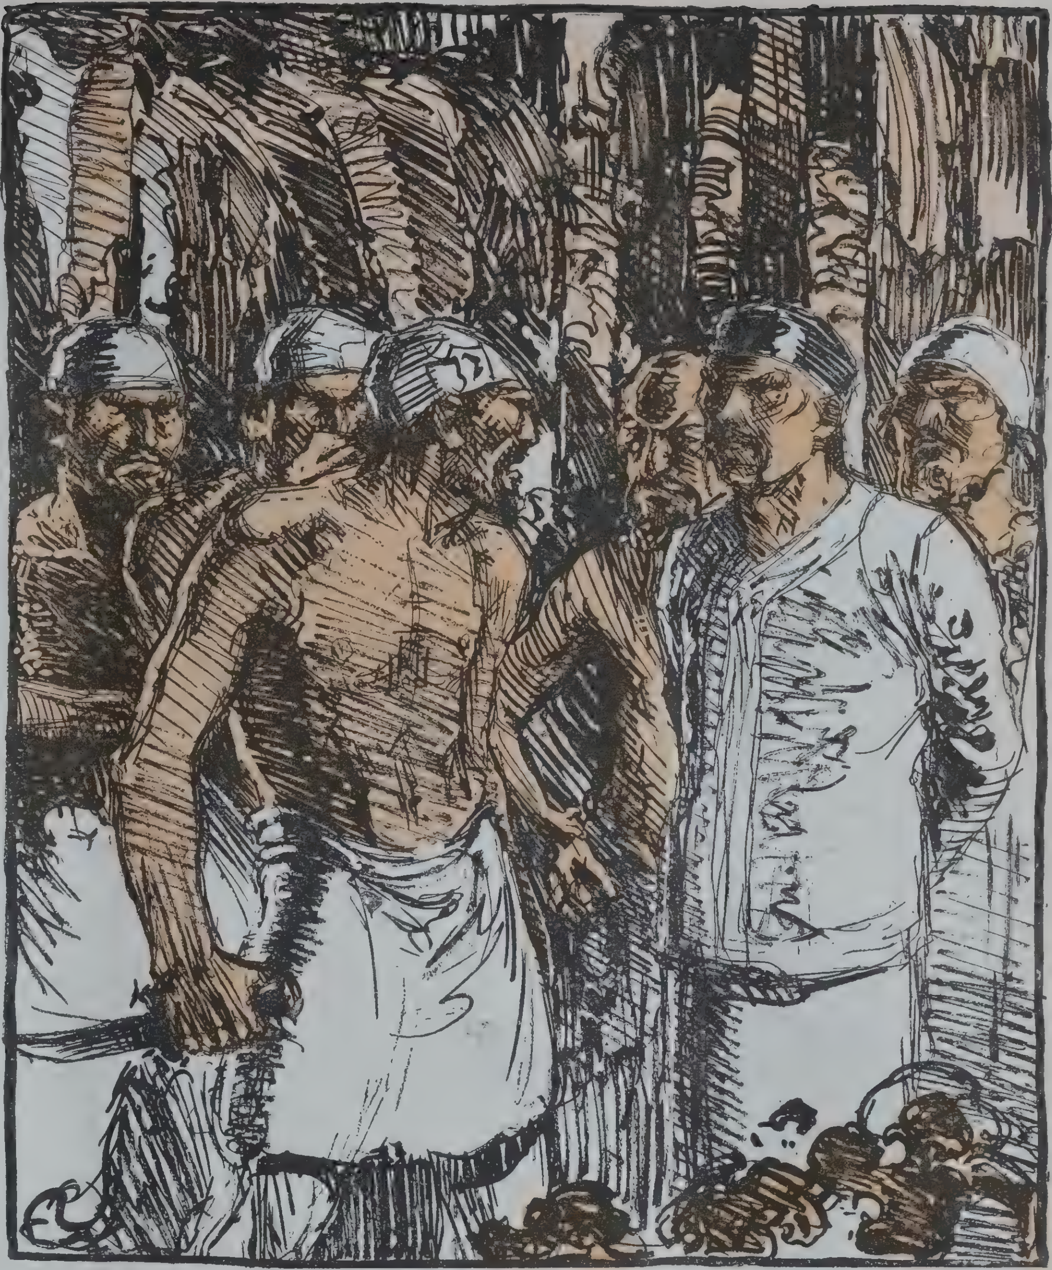
There were startling adventures too, many of them. One was on the Ganges where he was being rowed in a great boat, with sixty companions. In that green solitude, with the perfumed air musical because of the droning of a million insects, there was no thought of mischance. But suddenly, out of a dark backwater which was a sort of leafy cave, river pirates shot forth in their swift boats. They were worshipers of the goddess Durga, bloodthirsty Siva's wife, to whom every year a human victim was offered as sacrifice, and it was the time when their god thirsted for blood.

At sight of them many of the people in Huien-Tsaing's boat leaped into the water and were swiftly dispatched, for the goddess refused the cowardly as well as prisoners of war. The sacrifice most to her liking was a man in the prime of life. And the choice fell upon Huien-Tsaing, the more readily because he was a foreigner. But, somehow, 'he drew the hearts of them all into his net of love.' Against that calm front cruelty could not prevail. When the time came for the victim to say his say, his words were all mildness and modesty and reasonableness. He did not bemock their god and their goddess, but he spoke of an eternally living Master. Then he unfolded 'the Law' and told of duties which he hoped to fulfill, but could not if they killed him. Nor did he shrink when one came with the knife, making a motion as if to slash open his breast. In the agony of death he was undisturbed and serene. He would not plead for life. And being spared for a little while, instead of exhibiting joy and gratitude and a desire to be away, he sat with them, talking with infinite frankness and amiability. So in the end he was released.

A wonderful thing in the pilgrim's account is the description he gives of the temple at Nalanda, the ruins of which have been discovered and described in our own day, testifying to the excellent observation of the man of the Seventh Century. He gives a picture of a block of buildings four stories high containing a hundred halls in which classes were held and lectures given, with apartments for ten thousand inmates.

'From morning to night, young and old help one another in discussions for which they find the day too short,' he says. In gardens and courtyards there were shade trees, fountains, cool retreats, quiet retreats for meditation. It must be understood that not only spiritual things were studied, but practical. Out of such surroundings came the invention of arithmetic and the expression of numbers by ten characters, each with an absolute value and a value by position. In that storehouse of knowledge Huien-Tsaing stayed for five years.

Also while on the subject of the pilgrim's description of places it should be said that he wrote of certain buried cities of eastern Khotan, once the center of great activities, but when he was there, buried by drifting sands. In 1855, the traveler W. H. Johnson verified the pilgrim's statement. And Sven Hedin, more recently, exactly confirms what the pilgrim had to say of eastern Turkestan and its trackless desert in which 'sometimes one hears plaintive notes and piteous lamentations, and men get confused and know not whither they are going. Hence many a life is lost.' For what the unlearned attributed to genii, we know to be due to the shifting of sand ridges.



He did not shrink when one came with a knife, making a motion as if to slash open his breast.

Briefly, Huien-Tsaing's journey took him from the Kyber Pass to the source of the Ganges and on to the eastern coast. Doubling on his trail sometimes, making long incursions inland, looping again and again, crossing India to strike the Bay of Bengal a little south of Madras, then back again to the northeast to Burma, then northwest again to the Kyber Pass—that roughly describes his journey. If a similar journey on this continent is assumed, a man might fairly be supposed to have continued on the march from Central America across Venezuela into Brazil, then south to a point five hundred miles below Rio de Janeiro, after which the return journey to New York City would be before him. And the time taken would be sixteen years.

And all for what?

That he might discover and take back to his own people *the best that had been said and thought in the world, to the end that a way of life might be found.*

Materially, he started back with many relics and curiosities; with six hundred and forty-four written books borne by twenty-two horses, with six images of Buddha in gold or silver or sandalwood. Much of that was lost, once when an elephant was drowned, again when a boat upset, and again when mountain robbers attacked them on the Yizil Yart range.

But the net purport of his pilgrimage rested in certain teachings, which, in time, were written in the sacred books and treasured in Pekin. They form the Counsels of Perfection and the Way of Life and may be summed up in less than a hundred words, just as the Christian fundamentals are summed up in the Sermon on the Mount and the Lord's Prayer.

These, then, are Huien-Tsaing's 'findings':

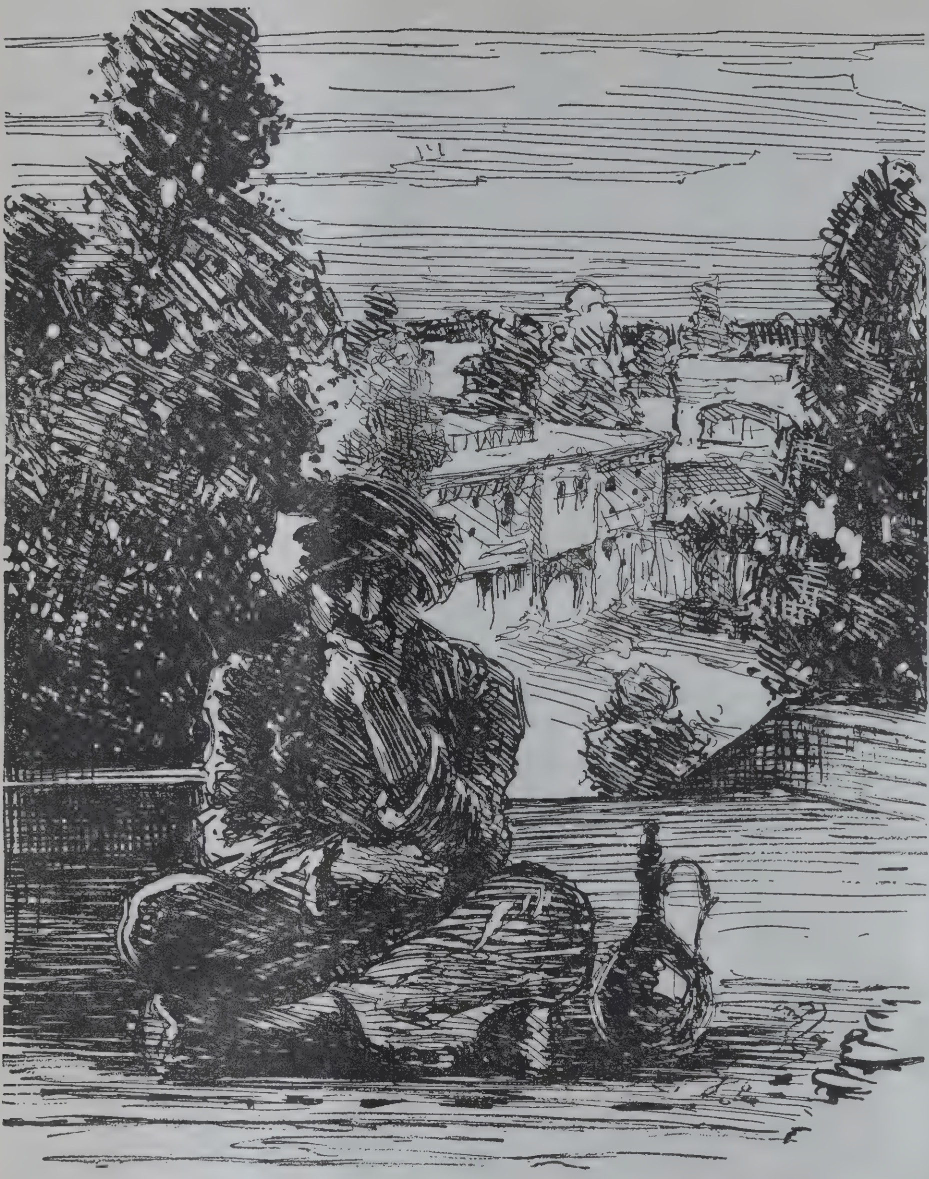
A man must cultivate right seeing, right judgment, right language, right purpose, right profession, right application, right memory, and right meditation.

There are five primary 'nots'—not to kill, not to steal, not to commit adultery, not to lie, not to give way to drunkenness.

There are six virtues always to be practised: charity, purity, patience, courage, contemplation, and knowledge.

So may the whole be put into a nutshell.

There is this, too, to be said. Somehow, by misunderstanding or wrong interpretation, we of the Western civilization have gained a notion that the Chinese are given to ancestor worship. Most certainly there is nothing of the sort to be found in Huien-Tsaing, nor in the writings of any other Chinese philosopher. But there is something else which may be the truth behind that error. It is this, a perfectly logical and reasonable idea: *That it would be well for all of us to familiarize ourselves with the*



In gardens and courtyards there were shade trees, fountains, cool paths, quiet retreats for meditation.

best that has been done and thought in the past, before we reach out to grasp a new thing because it is new. To that commendation most of us would adhere gladly.

Huien-Tsaing died at the age of sixty-five. His span of life was like Livingstone's: his mode of life much the same. And both men burned themselves out without knowing it. 'Notwithstanding differences in climate,' wrote Huein-Tsaing, 'notwithstanding mode of life and perils beyond count which have menaced me, I thank Heaven that nowhere did I come to harm. Reverence, beyond all limit, has been done to me; my body has suffered no ill; and I have fulfilled all that I vowed to accomplish.'

Much the same kind of proud simplicity was in Livingstone. If genius is persistence, then Huien-Tsaing was a genius. If fervor and zeal constitute the great part of religion, then he, though so neglected in history, must stand as one of the world's great religious teachers. If moral vitality and a belief in active service make a Man, then, it seems to me, the Chinaman's name should be set high. For he believed in the religion of Be and Do. He believed in serving humanity in full allegiance and splendid force. He was a master spirit.

IN CONGRESS, JULY 4, 1776.

The unanimous Declaration of the thirteen united States of America,

When in the Course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume among the powers of the earth, the separate and equal station to which the Laws of Nature and of Nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation. We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty, and the pursuit of Happiness . . . .

The Dark Side of the Moon

(Continued from page 3)

me writing under my hand, in a slate under my foot, in the central pages of a pad held tightly between my fingers. It is of no use to talk of 'trick slates' for I have dictated the words or lines to be written *after the closed slates were in my hand.* Voices have spoken to me from the air and nimble hands have developed from dusty corners to play tricks for my amusement. Heavy objects forgetting, apparently, the laws of gravity have risen without discoverable human agency and pencils have taken on life and intelligence.

NATURALLY I read as I experimented, keeping clear of those who took their phenomena on trust. I was not much interested in the vague, unverified reports of wondrous clairvoyant readings, vivid portents and warning visions. I was after the physical side of every phenomenon. The Italians, who had 'put the screws' on the psychics, interested me above all others.

In these books I found my own experiences duplicated and now and again surpassed. All of them agreed that matter was moved without known cause, that writing outside the psychic's ordinary reach took place, and that appearances resembling fragmentary human forms flitted about the room and in some cases permitted themselves to be photographed. Ghosts were discovered to be akin to these phantoms and poltergeists were related to mediumship. Visible 'third arms' emanating from the psychic's body were taught to perform difficult tasks, such as opening boxes and sealed packages in a way to suggest that 'the astral body' could penetrate matter at will.

With all these things to stimulate me, I kept at my own experiments. One by one I duplicated some of the most striking experiences of Crookes and Wallace. Tables rose under my hands without adequate physical cause. Mysterious odors filled my nostrils and masses of cold, white flame developed from the darkness and floated across the room, precisely as described by Crookes and Flammarion. Several times taking my cue from Wallace's reports I removed the closed slates from the psychic's control and, *while holding them in my hands, dictated the lines to be written on them.*

ONCE in the presence of a company of my friends in a private library I tested the powers of a psychic by placing my hand on the closed lid of an upright piano and asking her 'guide' to drum upon the strings in time to my whistling. This was done. The room belonged to the librarian of the public library, the psychic was a stranger and had never been in the house before. The library was dark but *I controlled the piano cover and dictated the performance while my hand was on the lid.* At my request the invisible force leaped from bass to treble and back again.

At another time sitting alone with a psychic in a brightly lighted room at four o'clock in the afternoon, I interrupted the slate-writing seance by saying, 'I'm something of a psychic myself; it isn't necessary to place the slates under the table, put them down on top.' She did as I commanded. I laid my hand on the slate, she put her hand above mine and I flung the cover over both our hands, and still the writing went on. I could feel the vibrations beneath my palm while the psychic's right hand remained motionless; at my command the slate was laid in the middle of the table. Neither of us touched it but the writing went on. But strange to say, her left hand lying in full sight twitched in hundreds of the small muscles, synchronously with the writing. The message amounted to nothing. It had no reference to me and was signed by the name of a man I had never known, but the physical test was complete.

In the home of my friend J of Indianapolis, I made another severe demand of a psychic. She was in the house for the first time. It was about three o'clock of a summer day. After some fine examples of slate writing, I went to my friend's desk, opened a drawer at his direction, and took from it a large yellow paper pad. Without surrendering this pad to any other hand even for an instant, I approached the psychic and extended the closed end of it. She merely laid her finger tips upon it. Almost immediately I felt a weight, and the center of the pad sagged. When I withdrew it and opened it, I found on several of the middle leaves messages written in pencil. I drew a circle around each of these and again extended the pad to the psychic keeping it in my hand. In this way I secured three other messages all seemingly signed by personalities known to me.

As another test I took a book from a shelf, a thick tome selected at random. Opening this I placed a pencil in it and held it for the psychic to touch, carefully retaining it in my grip. Stepping back I opened the book. The number of the page which I did not know was written across the opposite page in pencil. The pencil did not stir and the book never left my hands for an instant. It was a marvelous exhibition of psychodynamics but it did not convince me of the presence of the individuals whose names were signed. On the contrary, I was perfectly sure the psychic did it. How she did it I do not know.

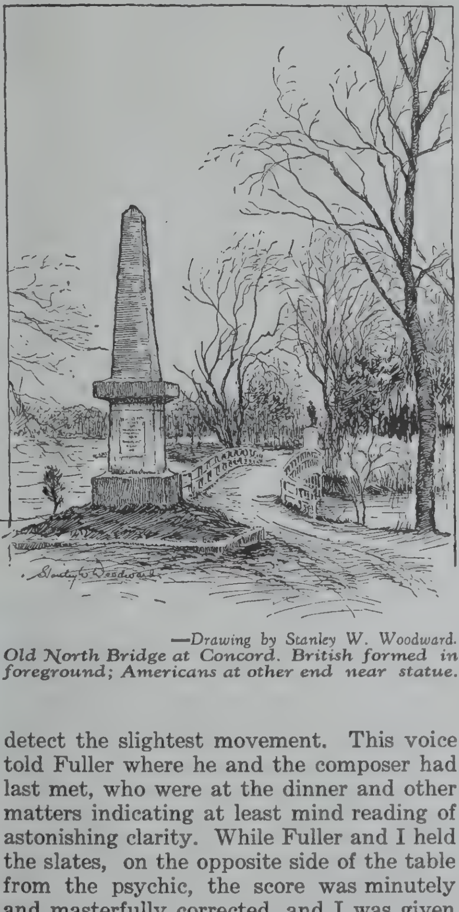
In all these experiments and scores of others I worked solely for physical phenomena. I used every precaution to satisfy myself that they were supranormal. I sought no messages from the dead. I had no creeds to uphold. I was simply curious to see what the human organism could perform. However, to be perfectly fair, I am obliged to state that all along the way I met with unaccountable forms and listened to unaccountable voices.

At the same time that Professor D and I demonstrated to his bewilderment in his own library that some of the laws of physics are unknown, we both listened to 'spirit' voices and watched 'spirit' hands under our own test conditions—with no one present but the psychic, D, Mrs. D and myself—we witnessed the movement of heavy objects without apparent cause and conversed for hours with a humorous voice which came through a trumpet absolutely out of the reach of the psychic, and yet neither he nor I could believe that we were talking with the spirits of those who had formerly lived on the earth plane.

Connected with these physical phenomena we recorded marvelous exhibitions of clairvoyance. Facts known only to me were written upon slates under my fist. The names of dead relatives were whispered from the air in daylight, and yet nothing came that convinced me of the personality of the speaker.

Once only in my thirty years' experience did I thrill to the conviction that I was about to demonstrate the personality of a spirit. Henry Fuller and I, under the most satisfactory conditions, received on folded slates several bars of a complicated piece of music, written (the 'guide' declared) by the spirit of my friend M, an eminent American composer, *while the slates were entirely in my control*. Part of the time the psychic did not even touch the slates, and yet under these conditions the music was written and corrected. Bars were changed, the sound and vibration of the writing being plainly perceptible.

At last a whispered voice spoke to me apparently from the air. It sounded just above my head in a sunlit room and though I studied the lips of the psychic, I could not detect the slightest movement. This voice told Fuller where he and the composer had last met, who were at the dinner and other matters indicating at least mind reading of astonishing clarity. While Fuller and I held the slates, on the opposite side of the table from the psychic, the score was minutely and masterfully corrected, and I was given to understand that this fragment would be found among the composers' manuscripts in New York City.



—Drawing by Stanley W. Woodward.
Old North Bridge at Concord. British formed in foreground; Americans at other end near statue.

For the first time in my many years of experimentation, I became excited. It seemed that I was about to secure from a medium who knew nothing of music, irrefutable proof of the identity of my 'spirit voice.' M seemed (at the moment) veritably present, and when Fuller played the weird little composition we had thus supranormally produced, I experienced a genuine stir. The score was difficult, and very idiomatic, beyond the comprehension of the psychic or myself, parts of it baffled Fuller. 'Never mind,' said the voice of M kindly, 'I will write it differently.'

With these notes and the bars of music carefully written out, I went to New York to see Mrs. M. At the first touch of her hand the whole of my glittering edifice fell to the ground. No such MS existed. No such transaction with a publishing house had taken place. Nothing in all that astounding mass of testimony concerning the musical composition was true.

Only one thing interested Mrs. M and that was the signature on one of the folding slates, a signature which I had considered of no value for the reason that it did not in the least resemble the composer's signature as I knew it. Mrs. M at once exclaimed, 'That is exactly as Edward signed his name when I first knew him in Germany.'

This was wholly unaccountable until I suddenly remembered having seen this very signature on a framed certificate hanging in Mrs. M's studio. Like the information concerning the family, and the account of Fuller's dinner in New York, this signature appears to have been drawn from my mind and in some supranormal way written upon the slate.

Again and again in the absence of Fuller I tried to go on with the music, but without a musician the 'spirit' was helpless. The psychic could not record music and neither could I, so the ghost plaintively asked for Fuller and fell silent. The melody upon close examination bore curious resemblance to M's masterly scores but Fuller suggested that it was a close blend of his knowledge of M's piano pieces and my own memory of Sioux, Cheyenne and Hopi song.

Despite this failure, with many others, I retained and still retain my interest in psychodynamics. From time to time I verify some of my experiments. The phenomena exist, there is no reasonable doubt of that, but what they mean I do not assume to say. They should be studied in this country by men of science, working in the spirit of Crookes and Morselli, not with intent to prove or disprove a theory, but to develop and record the latent powers of the human organism. There should be full, careful and considerate coöperation between the psychic and the scientist.

This study has an unexpected virtue. It brings back a sense of the wonder of the world which our inventive, money-chasing age has lost. It enlarges the potential field of mental activity. It humbles the bigoted, half-educated scientist and puts a check on the emotional geographer of heaven. After all we are forced to confess that matter is quite as mysterious as spirit and that both are parts of the unknowable ultimate from which all life is drawn.

'The March of Westward Expansion'

is the title of Hamlin Garland's next article for *THE DEARBORN INDEPENDENT*

'I am glad that I was born early enough to catch the dying echoes of their songs, to bask in the failing light of their fires,' remarks Mr. Garland, with reference to those adventurous pathfinders, the early American pioneers.

'Our material pioneering is done, but as we look back along the trail already dim in the gloaming of the past, we see the camp fires sparkle. We hear the call, "Hello, the house!" and catch the hearty answer, "Come in, stranger!" We see the prairie schooners . . . the border wars . . . action, self-sacrifice.'

Read it in Next Week's Issue

The Gypsy Cave Dwellers of Spain

By LOUIS C. KARPINSKI

Illustrated by AUSTIN EUGENE BRIGGS

The gypsies, or *gitanos,* of Spain travel from place to place—never staying more than a week in one vicinity. The tribe usually consists of about six or eight families. The gypsies of Spain have the same reputation as the gypsies of America or any other country—they never work. The women tell fortunes and the men steal chickens, vegetables, et cetera, for a living. The police do not take any action, for they know these people will soon travel on and they steal for their present needs only. Occasionally a tribe steals a burro from one of the farmers and in this case they go immediately to another vicinity and sell the burro—this makes them wealthy.

HABITATIONS made by hand have been used by men since long before the days when historical records begin. In an earlier stage of development cave dwellers utilized the natural caverns in the rocks. In later times pirates and bandits have always had their meeting places in great caves, at least in the land of romance. Smugglers must always have caves, and the fleeing bandit, whether in Asia, Europe or the far West, takes his refuge in a cave among the rocks. But outside the pages of primitive history and of romance there continue down to the present day a number of cave dwellers whose modest abodes are cut out of the solid rock.

In general these caves in southern Europe are found in regions where the first habitable openings were made by the natural erosion of water in limestone. Upon this foundation furnished by nature whole colonies have established themselves, extending and enlarging the natural shelters into fairly serviceable dwellings.

In southern Spain, where the climate makes it possible to live practically in the open, cave dwellers are found in numerous localities. It may well be that the natural coolness of a cave makes it an admirable retreat from the fierce heat of the summer sun; at the same time the cave furnishes some protection against the cold of the winter months.

One of the largest colonies of modern cave dwellers is found within the city of Granada extending for a mile or more into the outskirts of the city. Here the dwelling places rise in successive tiers, far up the slope, giving the appearance of a tremendous mountainside apartment house, with people dwelling on many different elevations. One cannot quite, with propriety, say that these various apartments are on different levels, since nothing is level.

The inhabitants of the caves in Granada, and almost everywhere else in Spain, are the gypsies, *gitanos,* who are more attractive in the pages of Washington Irving or in those of the Italian writer De Amicis than they are in nature—face to face.

The approach to the gypsy section of Granada is made so abruptly that suddenly you find yourself confronted with the houses cut into the hillsides. Quite as suddenly you are beset by a crowd of gypsy women, old hags and young women of some beauty. You are invited to enter their gypsy homes. The old hags wish to tell your fortune. The young women wish to arrange a gypsy dance for your entertainment.

Inside the houses old brass, basket work and flowers are the articles offered for sale. With the advent of the stranger a crowd of vociferous children soon gathers, asking for 'money,' a word which seems to be taught to the gypsy child as soon as the child shows any sign of speech.

Near the cities the gypsy caves in the hillsides are dressed up much like ordinary dwellings. There is the ordinary doorway, with a stone sill and even a small section of tile roofing shielding the entrance. Once within the door, however, you are immediately aware that you are in a real cave. No light of window illuminates the interior, only that which comes through the doorway. The room at the entrance is a combination sitting room, sewing room with an American machine, and bedroom. The cleanliness of the linen is worthy of note, as well as the whiteness of the wash spread out on the cactus plants to dry. Upon the wall the polished brassware adds a bright touch, much needed. The kitchen stove is in a room directly back of the entrance. There must be a chimney, but it is only a makeshift one emerging somewhere on the hillside.

A second bedroom in the house which the writer visited opened from the combination front room. Within this room there were flies and an odor of animal presence explained by the fact that the faithful burro had his quarters in the room adjoining toward the back.

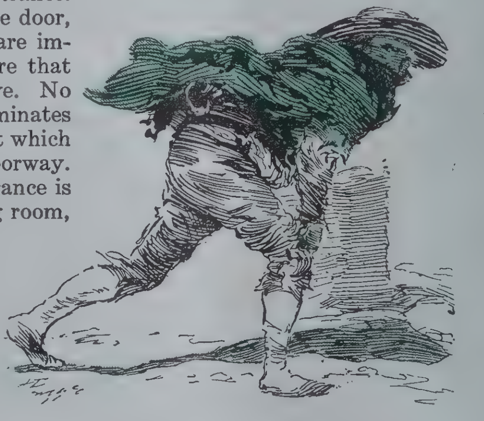
Such is the gypsy cave dwelling as found in Granada. In the larger gypsy quarter of Seville there are ordinary dwellings, not luxurious; but about ten miles outside Seville in Alcalá there are more such hillside residences. The village of Cória on the Guadalquivir, not far from Seville, also has the cave man. The famous coast resort of Málaga in southern Spain boasts a colony, and more are to be found with a little search in the Iberian peninsula.

The life of the gypsies has been described many times but probably not anywhere more entertainingly than by George Borrow whose *Bible in Spain* is well worth reading today. Borrow spoke the language of the gypsies so fluently that he had no difficulty in being accepted as a 'Rom,' or gypsy, by the Spanish members of the tribe. In the case of Borrow his familiarity with these wanderers led to genuine contempt and a somewhat harsh judgment as to their native character.

The universal fear of the gypsies is well illustrated by an ancient Arabic saying: 'For that which is unclean by nature thou canst entertain no hope; no washing will turn the gypsy white.' Borrow concurred in the Arabic estimate of the natural villainy of the gypsy.

Whatever the original home of these people, whether in Egypt whence they have their name, or among the southern Slavs of Europe, certain characteristics mark them whether in Russia or America, whether in Spain or in England.

Fortune telling by the women and horse trading by the men are their principal legitimate occupations, although blacksmithing was also long recognized in many countries as the trade of a gypsy. In every country petty thieving and kidnapping have been ascribed to them, and worse crimes often imputed.



Volubility is a characteristic particularly of the women. Among this strange people the women are actually encouraged by the men to cultivate this gift, whereas in other countries this has not been found necessary. The elderly gypsy women pursue you upon the street with a constant flow of speech which is overwhelming; the children are quite as persistent and insistent. A gypsy proverb reads: 'The poor fool who closes his mouth never wins a dollar,' in contrast with our 'silence is golden.'

Upon occasion the gypsy hag will curse with a quantity and quality of vocabulary such as to make a sailor envious. By chance a policeman escorted us through several blocks of cave dwellings, and one hag, feeling slighted as we did not stop in her home, poured forth a torrent of language, a fine specimen of vituperative fluency, persistent and yet apparently within the legal limits.

In all countries the Zincali, as Borrow

calls them, are darker than the natives. Beautiful faces and figures are not uncommon among the young while the representative 'old hag' is to be found among the aged women of the race. Young and old wear gaily colored garments, the women having a weakness for bright shawls and kerchiefs, beads and earrings, bracelets, and beruffled skirts.

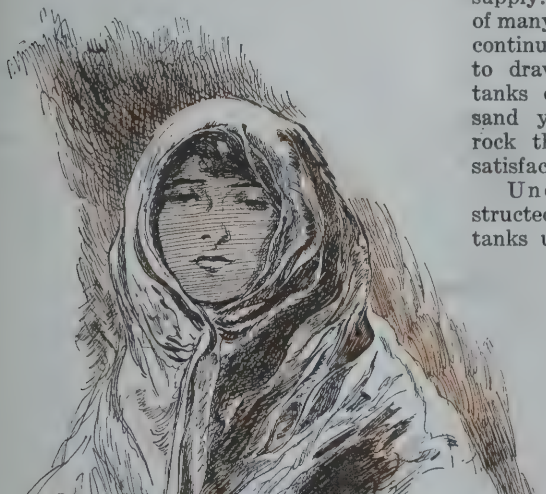
In many European cities the gypsies have, like the Jews, been confined to restricted areas. Persecution has often been their lot; but in Spain this persecution was largely, for several centuries, a matter of legal enactment rather than a fact. The gypsies did not have tangible property sufficient to warrant active prosecution.

The language of the Zincali varies slightly from country to country, like dialects of a parent tongue. Probably two English words which have their origin in this tongue give also a key to the weakness of the gypsy. The two words are 'hoax' and 'hocus,' whence also 'hocus-pocus.'

George Borrow tells of sitting with a group of Zincali and having them assist him in translating the Creed into their language. The gypsies were delighted with the achievement, but were without any real interest in the content. Similarly their interest in the Gospel of Luke which Borrow translated and distributed in printed copies was wholly curiosity. Borrow confesses that this Gospel was frequently carried as a kind of charm on smuggling and thieving expeditions.

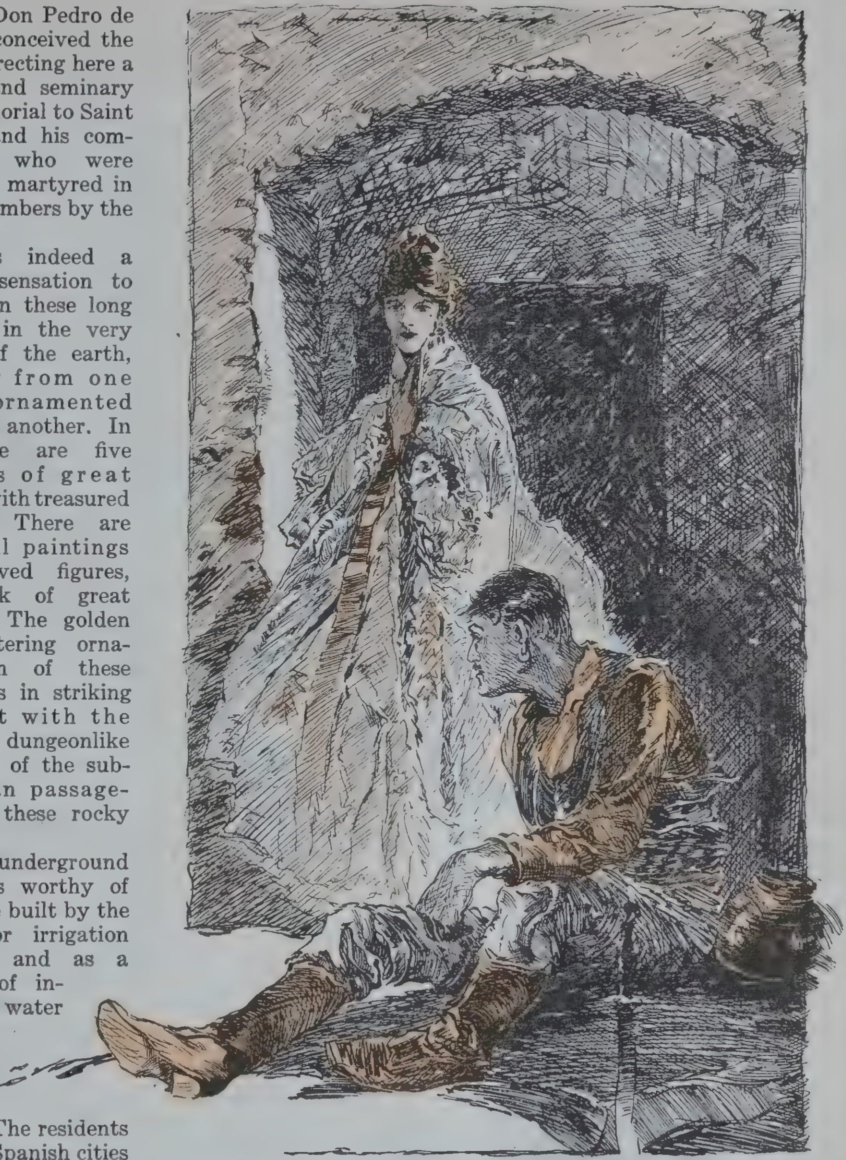
Cave dwellers existed in Spain and other countries for many centuries before the gypsies made their appearance in Europe. Of these underground habitations doubtless the most famous is found at Sacro Monte some two miles outside the city of Granada by the road on which you pass the *gitano* section.

The tradition is that the early Christians sought refuge from persecution in the rocky caverns at Sacro Monte and that in these depths the first Christian Mass was celebrated in Spain.



In 1594 the series of subterranean chambers, with numerous human remains, were found within this hill. The pious bishop, Don Pedro de Castro, conceived the plan of erecting here a college and seminary as a memorial to Saint Cecilio and his companions who were probably martyred in these chambers by the Arabs.

It is indeed a strange sensation to wander in these long galleries in the very bowels of the earth, passing from one highly ornamented chapel to another. In all there are five chapels of great beauty, with treasured relics. There are beautiful paintings and carved figures, the work of great artists. The golden and glittering ornamentation of these chapels is in striking contrast with the sombre dungeonlike character of the subterranean passageways in these rocky caverns.



Other underground structures worthy of note were built by the Arabs for irrigation purposes and as a method of insuring a water supply. The residents of many Spanish cities continue to this day to draw water from tanks constructed by the Arabs a thousand years ago. Deep down into the rock the Moor sunk his wells, until a satisfactory flow of water was assured.

Underground arches were constructed, with an arrangement to fill the tanks under the protection of the arches. Access to the tanks was given from the outside, usually by an archway leading to the tank. Here the women bring their stone water jars, similar to those used here at these very wells a thousand years ago.

On the tops of the hills outside the cities of Granada and of Valencia the Moors built tremendous cisterns to provide water for irrigating the land. Some of these systems continue in use to the present day. Not only do the waterworks themselves persist but even the Arabic type of people's court for the adjudication of disputes concerning water is still held.

The writer walked up the mountainside above the Alhambra one glorious day to the gardens of the Generalife, the fine old gardens of the moorish rulers. From this point the walk up the mountain was most inviting. Far up on the mountain top, at a distance from any human habitation, an opening as for a well was found with a bricked-in top. Investigation revealed that this was the top to a reservoir some seventy-five feet below the surface of the earth, extending apparently for a long distance underneath the ground. This was doubtless a portion of the great irrigation system of the Arabs which is a source of amazement to engineers today, and another testimonial to the scientific ability of that people.

Upon the same mountainside the writer found a second cave which revealed underground chambers and heavy supporting arches. What a place to people with bands of robbers or smugglers! However it must be admitted that this romantic-looking structure was doubtless built to insure a water supply.

At the highest point of the mountain, miles away from any other habitation, clothes hanging upon bushes indicated a dwelling place. This turned out to be a real cave at the summit inhabited by a gypsy family, as well as by chickens, goats and sheep.

The land of romance and the world of today meet in these primitive dwellings on the hillsides of sunny Spain. Strange enough it is to see these simple dwelling places which appear to have been used for centuries without change, and that in a land which boasts many of the finest architectural achievements of the world.

The Emperor's New Coat

(*Continued from page 13*)

and we squirm and twist through aria after aria. People are the same everywhere. They go to this place or that place because it is the thing. How many people would go abroad if it had to be kept a secret?

A reputation, deserved or undeserved, certainly brings the crowds and the praise. You may have a voice of rare beauty and your talent may be far beyond the ordinary, but no one will venture a comment upon your merit until some critic makes or ruins your future by expressing his idea.

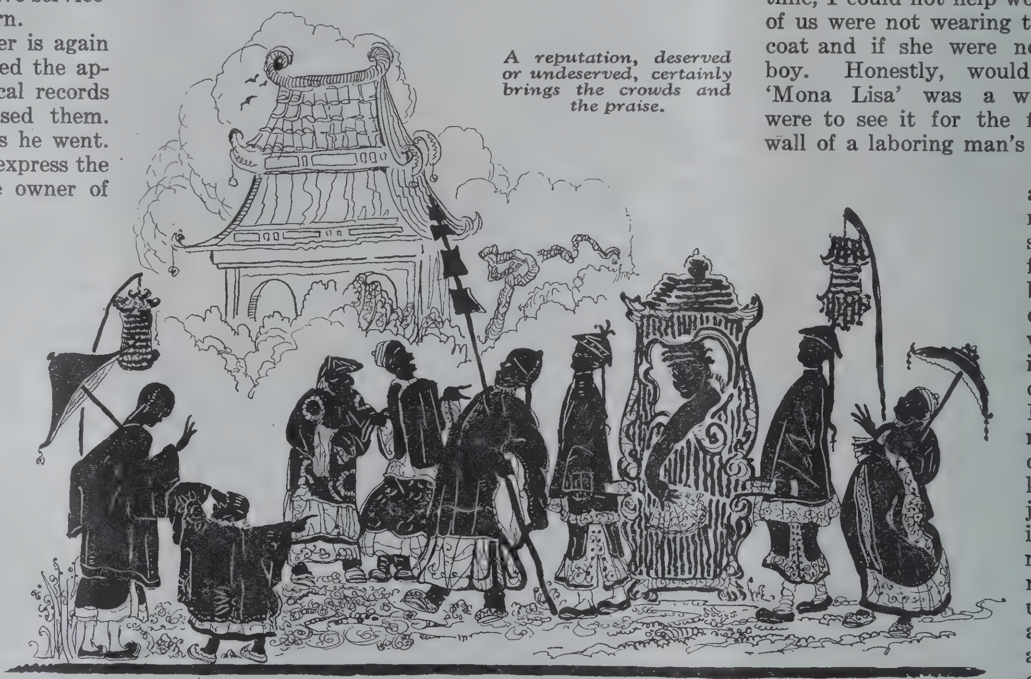
Yet a man would be ashamed to admit that he was too stupid to know whether he enjoyed hearing a person sing or give an instrumental selection. And music, after all, is the concord of sweet sounds, but the shrinking one is afraid to express himself.

It would surprise the echoes to know that a great many of the so-called critics do not themselves base their opinions on knowledge. To say the least, they have the courage of their convictions regardless of their other vices. And courage is something.

We all hoped that the phonograph would educate the people in musical appreciation. Our hopes were dashed to earth; and it was not the fault of the producers, for in every magazine we see the list of those artists who are rendering 'exclusive service' to this or that concern.

The culture seeker is again to blame. He secured the approved list of classical records and piously purchased them. But that is as far as he went. The records did not express the genuine taste of the owner of the phonograph and are still as good as new, because they are only played when guests assemble.

It would be far better for the musical education of that man if he would play stately hymns and old folk songs every evening than own all the classical records in existence and not use them. Music, like friends, becomes dearer the longer known, and many a song wins its way into favor by frequent repetition.



A reputation, deserved or undeserved, certainly brings the crowds and the praise.

Noise is ever popular and the syncopated kind is secretly loved and fostered by the most devout conservatives when they can shift the responsibility of the selection to some one else. Every family should have one reprobate who can be given the credit for making all the poor literary, musical and artistic selections. A nice thing about a professional reprobate is that he, or she, is too depraved to resent the insinuation that taste is lacking.

Cheap, inferior and maudlin music and songs are the favorites. It is strange how some popular dance piece that no one will admit liking gets played more than all the rest of the records put together. The phonograph people are in the business to make money and not to discover new artists. They naturally have only two kinds of records—the kind people think they ought to like and don't, and the kind they think they ought not to like and do.

The radio gave us another promise which was not fulfilled because the people would not coöperate. The man who tunes in picks his own music. He brags about hearing the opera stars and master performers, but he leaves them any time for other numbers. He will give his undivided attention when there is a Dempsey-Tunney fight or when the Miami jazz orchestra gets on a rampage. It is perfectly permissible for him to like his jazz or his semiclassical music, but why will he deny it, and pretend to love another, all for the sake of a reputation he doesn't deserve?

We Americans because of our youth are prone to feel that nothing good can come out of Nazareth—our country being Nazareth in this case. This particularly applies to music and art. We feel that no woman by the name of Smith could possibly sing nor a man who was christened Jones could ever compose.

In our pictures and statuary an American has about the same chance as a white man would have with a cannibal tribe. Everything that is far away looks good and it is easier to conceive of genius in one we do not know. If he has studied abroad or is at present residing in the celestial world we are more ready to render homage.

Art is another victim. The galleries are seldom visited by any but artists and tourists. They are never crowded and stay open all the time. In spite of the talk we do not really care for art—if we did we would enjoy looking at it.

The excuse that the Americans often give is that here in our own country we have only copies of the masterpieces and few originals. Of all the ludicrous remarks, that is the most absurd. There are not twenty people, barring professional collectors, who can tell an imitation from the real.

Recently I came across a list of the 'World's Twelve Greatest Masterpieces.' They were: 'Sistine Madonna'—Raphael; 'The Last Judgment'—Michelangelo; 'The Last Supper'—Leonardo da Vinci; 'Assumption of the Virgin'—Titian; 'Immaculate Conception'—Murillo; 'Holy Night'—Correggio; 'Last Communion of Saint Jerome'—Domenichino; 'Descent From the Cross'—Rubens; 'Mona Lisa'—Leonardo da Vinci; 'Beatrice Cenci'—Guido Reni; 'Aurora' (a ceiling painting in Rospigliosi Palace, Rome); 'Night Watch'—Rembrandt.

I heard an ignorant woman discussing her visit to the Louvre where she saw 'Mona Lisa.' Her remarks were at least sincere: 'I saw an awful ugly picture of a woman whose name was Monopoliza. Why it was on exhibit I don't know—unless it was because she was rich. Our guide pointed at it and said, "Well worth a hundred thousand dollars!" So I guess it was her money after all, for goodness knows she was nothing to look at.'

After gazing at the original for some time, I could not help wondering if the rest of us were not wearing the emperor's new coat and if she were not like the little boy. Honestly, would anybody think 'Mona Lisa' was a work of art if he were to see it for the first time on the wall of a laboring man's home?

The matter of art in the home is not a question of style. Styles and fads come and go but a good piece of work will always be welcome in the home of a cultivated person. It is a serious mistake to buy a copy of a well-known masterpiece just because it is in the catalog. It reveals crass ignorance to accept unquestioningly, and people generally find out. It doesn't pay.

Several cultured friends called on a lady and eyed a copy of a masterpiece for some time but failed to comment on it, although they professed to admire all her other imported pictures. At last she relieved their doubt and explained that they were viewing a copy of a rare masterpiece. As soon as they realized that they were safe in expressing a favorable opinion they admitted that it was beautiful beyond a doubt.

There is one thing worse than the failure to recognize the real thing. It is toadying to those who have already 'arrived.' Nothing is more disgusting than the groveling attitude of would-be patrons who cater to famous composers, artists and authors, and then brag about their friendship.

A Miracle in Stone

(Continued from page 15)

of the inscription forgotten. How make a monument permanent almost as the strata of geology, which in itself conveys its reason for being? The Great Pyramid is the only adequate answer.

Languages change and are forgotten, but the language of the Pyramid will be the same at the end of time as at the beginning. Its form and substance are of all the most enduring. It stood and stands not in a community, but apart, and of dimensions so great that the immeasurable toil of its building would be less than that of its destruction. Even cupidity for hidden treasure would recognize the shape of the Pyramid as least adapted to harbor it—not a hollow vault, but a rocky mass almost monolithic in its integrity. Subsequent eras, seeking its cause, would conjecture it to commemorate some unknown deity, and superstition would respect it. So might it remain in the sands of the desert, a wonder and mystery forever, till the drift of ultimate centuries should bury it out of sight and memory.

THIS, however, has not as yet been its fate, and the comparatively recent effort to discover its true purpose may bear fruit. The existence of its message, as well as its purport, had to be unsuspected until today, because today, for the first time in history, could it be understood, and even now, in part only. Had its presence been surmised in former times, it would have been destroyed by ignorant efforts to decipher it; and when deciphering proved impossible, it would have darkened counsel. But it has not been robbed of its treasure, because its treasure was spiritual; the seal of it was not broken because no seal was perceived. It was in vain that the savage Arabs under Al Mamoun, the successor of Mahomet, broke through the wall; they found only darkness and emptiness in those crawling passages and narrow chambers. And when the Egypt of the Ptolemies, seeking material for their palaces and dwellings, quarried it from the Pyramid's marble shell, it was still beyond their power to mutilate the essential structure. How those gigantic blocks had been lifted, ready fitted, to their places, was beyond their conception (and is beyond ours today), and they did not dislodge them.

But the message is there, in its own language, and it must be read to its last jot and tittle. This language is as universal as that of the universe which it describes. Its alphabet is measure, form, position or mutual relation; and each letter of the mighty words is precise and accurate to the breadth of a hair. The deeper and wider the knowledge which the student brings to its perusal, the better will he comprehend it; but it will outreach his best wisdom. Step by step it vindicates its own truth; but its final steps are beyond our present following. For cosmic facts, in their higher aspects, inevitably merge into spiritual truths, and that research has no mortal term.

The fundamental of all measurement is the inch, based upon the breadth of a man's thumb; from that is derived first the cubit (meaning the so-called Hebrew cubit), the length of the ordinary step in walking, and of a man's extended forearm and hand. The inch, therefore, appears in all pyramid dimensions. The sides of the Pyramid measure 9,155 inches each; its height—intersection of slope of sides—is 5,819 inches, and this length multiplied by 1,000 million is the mean distance of the sun from the earth. The diameter of the earth at the poles is an inch multiplied 500 million 500 thousand times. Taking the inch as time measure, it enters into the profiles of the Pyramid's four sides as many times as there are days in the year. Passing to cubic measure, the capacity of the granite coffer in the king's chamber indicates the mean density of the earth. The numbers four, five and nine are 'pyramid numbers,' and they and their multiples enter into all its features.

The astronomer Thales, fifteen hundred years after the pyramid builders, announced the sphericity of the planet; we find the fact demonstrated in the Pyramid, which shows our earth to be an oblate spheroid. The builders also recorded the earth's rotation on its axis, and how often, in its journey round the sun, it revolved. They knew the exact position of the poles and thereby determined the site of the Pyramid—the thirtieth parallel north—which is the precise center of Egypt, and also, as it happens, of the land distribution over the entire surface of the globe. This is very modern knowledge; and it leads to a corollary of greater importance—the precession of the equinoxes—the discrepancy of fifty seconds between the sidereal and the equinoctial years.

HIPPARCHUS thought he had discovered this a century and a half before the Christian Era; but it is stated in pyramid language nearly two millenniums before that learned man was born. And by means of this greatest of cycles, Sir John Herschel was able to fix the date of the Pyramid's creation. The entrance-tube on the north side points upward toward the sky: Sir John surmised its objective must be the polestar of its era. Calculating back he found that Alpha Draconis had sent its rays down the tube just 2,170 years ago. This estimate was afterward checked by measurements taken in the grand gallery; 2,170 inches brings us to a line, deeply incised, in the polished granite wall, and to two upright stones to indicate erection.

These apparently omniscient artificers also established the 'pi' proportion between the diameter and the circumference of the circle, or, as the phrase is, they squared the circle. But there is no space here to follow these details further; indeed, only expert mathematicians can follow some of them at all. The results are 'up to date,' and it is natural to assume that when future ages shall have attained to higher knowledge, the Pyramid will be found still anticipating them. When we know how and where to search, we shall find. There is no reason why 1927 should be the limit.

Babylonia, Chaldea and Egypt built well. But there is nothing transparent or spiritual in their building; it does not tell more than meets the eye. The ancient Temple of Nebo at Borsippa was celebrated

About Books *and* Reviewers *By* CHARLES J. FINGER

The Duffer (Sports) *By* H. G. SALSINGER

Marrying *an* Actress *By* LADY CYNTHIA ASQUITH for its astronomical accuracy; yet they missed a true orientation by no less than six degrees: the Pyramid, seventeen hundred years before, is correct to a hair's breadth.

The pyramid builders had no previous model to go by; they must conceive at first hand their own symbolic language; and then take their material from the mountains, carve each stone into its right form and its relation to the whole, and put all together without error or need of revision. When, for example, the stone courses reached the level of the king's chamber, then and there, and not before or elsewhere, must the giant block of granite be lifted up and the coffer carved out of it, and with an accuracy so perfect as to serve for a standard of concrete measurement forever. And throughout the entire structure, every line, surface, angle and position must be fixed before the first stone is quarried and laid, and then the whole external form be sheathed in shining marble, and every access to the interior be closed and hidden, so that no secret should be revealed till the fullness of time were come. Other builders crave credit for their work: the pyramid men were content to be regarded as heapers together of a brute mass devoid of aim or consequence. Yet it is the most wondrous achievement of mankind, before or since.

AUTHENTIC history does not begin till long after this date; the books of Moses date six centuries later. Whence came this astounding and minutely accurate knowledge of the frame and constitution of the universe? Is there a chapter of human annals yet to be written which shall point to intellectual vistas in the remotest past, fully abreast of the present? Did a race exist in that dawn of time, side by side with anthropoids and cave dwellers but somehow segregated from them, and indeed of a higher type than any other of which there is record? No other testimony of such a race exists, save the Great Pyramid; but does not that suffice? The truth of the theory of evolution is well supported; but must we add to that another theory to account for this mystery of the ages—this miracle in stone?

We ask one another this question. Meantime it is of interest to open the Bible at *Chronicles*, and read the few first chapters describing the Temple of Solomon. It is the acme of magnificence—gold, silver, precious stones and woods, woven draperies, all dedicated to the glory of God and the affluence and piety of the great king. It is gone now; man glorified it, and man has destroyed it. The Great Pyramid still stands in its naked and severe simplicity, and the names of its builders have never been known. They sought no glory; their God was too great to praise. But the Temple leads us to meditate on human splendor; and the Pyramid calls us to the desert, to humble ourselves before man's Creator. It is well to praise God for His perfections, but better to demonstrate what some of those perfections are.

* * *

NOTE. The excellent and captivating little volume—*A Miracle in Stone*, by Joseph A. Seiss, D.D.—was published in 1877 by Porter and Coates, 822 Chestnut Street, Philadelphia. The above article is based upon it. It may be out of print by this time, but could probably be found in a public library.

Cuba of Today

(Continued from page 2)

and prefer to build for themselves palm-thatched huts and sleep on the ground. But they, too, are emerging. Formerly they had no needs at all. Now they have certain standard needs. Each man going home buys a doll's-sized trunk in which he puts a pair of shoes and usually a shirt and blue jean trousers. Also he invests in a gamecock. And these men take a lot of money back to Haiti. From one estate alone the laborers annually take over more than $300,000 above their living expenses.

These American sugar estates have created wants in the Haitians—absurdly primitive wants, it is true, but considerable as compared with zero. And that is also what they have done to a far greater degree among the Cubans.

Sugar growing is big business. To turn cane into sugar requires a mill investment of a million dollars or more. For the cane has to be brought in within two days after cutting and run through great crushers to extract the juice, and then this juice has to be treated until it becomes sugar and blackstrap. This is an intricate process requiring not only exact chemical control; but it has also to be done on a large scale. A mill which cannot turn out half a million bags of sugar in a season is hardly in the running.

Cane is grown by many native Cubans; indeed most of the cane is grown by them. They are known as *colonos* and sell their cane at a fixed share to the centrals—as the mills are called. These centrals also finance them and run in railroad sidings to bring out their cane and in many cases actually own the land. The *colono* is only a share-cropper but on a recognized basis, for his relations with the central are fixed by law. Without a central near at hand it is quite out of the question in these days to grow cane, for the old method of grinding cane in an ox mill and then recovering the sugar with a big boiling kettle gives a product for which there is no market.

Thus big business controls sugar and the economic life of Cuba. This big business is American. And it is truly American. The managers have found that only under good conditions can good work be done, and therefore every American central is an oasis. In the best of them the medical department is in full charge of all living conditions. Many maintain fine hospitals, and the plantations, for instance, of the United Fruit Company and the Hershey chocolate interests will stand up with any industrial community in America.

The houses are clean, screened, and electrically lighted. They go to great expense to find good water and to put in sanitary appliances which the people have been taught to use. In spite of the many diseases of the tropics, these estates are healthful. Yellow fever and dysentery have been stamped out and even malaria is rare, while hookworm has never found a hold in the best estates, in spite of the fact that nearly every Haitian arrives with hookworm and has to be treated.

The company stores are sometimes very extensive, and I know of several that do a gross business of more than a million dollars a year. These are not company stores in the way the old mine stores were. They sell for cash and at prices lower than the native stores—which buy on credit and sell on long terms. These stores sell American goods, whereas formerly the goods largely came from Spain.

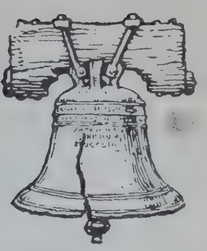
The people are thus being Americanized through American goods. The Cuban flapper can hold her own anywhere. The young Cuban feels that he has not arrived until he can sport heavy-framed glasses and show a fountain pen or two clasped to his breast pocket. The cotton stocking is obsolete. The people I am speaking of are not the rich or even the well-to-do, but the workers who ten years ago were living in thatched huts. Many are still living in thatched huts and are content so to live—but not the younger generation. And, what is more, this younger generation is learning, although sorrowfully, that the things they want can be had only through work.

THE richer people are quite Americanized. Before the war they sent their children to Spain or to France to be educated. They bought their motor cars abroad and the women went to Paris for their clothing. Now the children go to the United States and one seldom sees other than an American automobile. The women buy their clothing in New York. And the country is gradually becoming bilingual through the motion pictures. These are all American-made and have the captions in both Spanish and English.

Cuba thinks itself in the depths. In point of fact there is more money to spend in Cuba than in any country in the West Indies. That is what the American dollar has done. For the moment, they think themselves poor only because they are comparing with the boom year. But it never hurt anyone to hitch his wagon to a star.

The next step is about to be taken. For a long while the project of putting a good road down the center of the island with laterals to all towns has been talked about. Now President Machado has actually started building under a contract with a Boston firm. The thought in the president's mind is that the automobile made America and so the chance is going to be offered to see if it will make Cuba. The experiment is one of the most interesting that is anywhere going on and the next five years will tell the story.

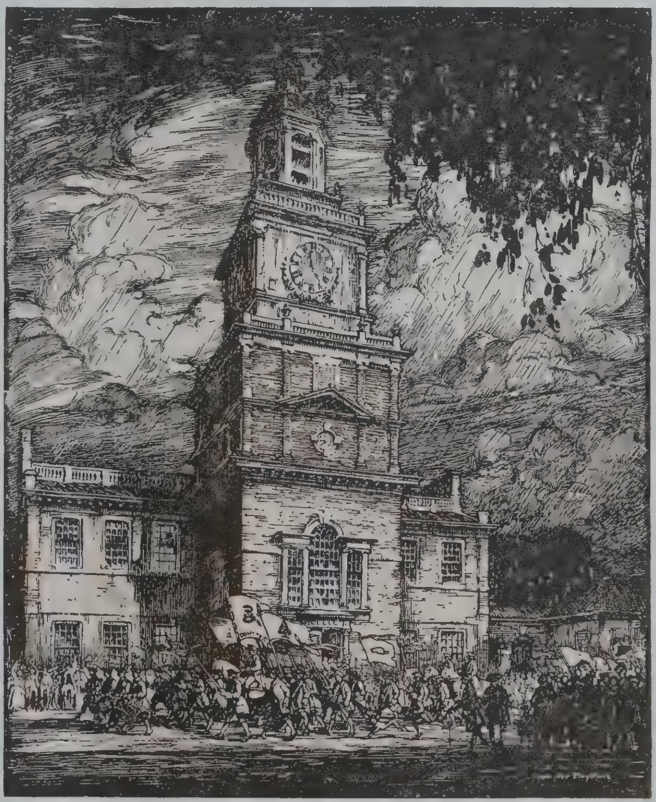
The First Reading *of the* Declaration *of* Independence



Reprinted from Howard Pyle's *Book of the American Spirit*, by permission of the publishers, Harper & Brothers, New York and London.

ON THE 8th of July, 1776, at Philadelphia, a procession of intelligent Americans passed out of the venerable State House and, ascending a platform at the front on Walnut Street, prepared to commit an act of treason against King George, of daring self-devotion to the interests of mankind. They had not only declared themselves free, independent; they were resolved to read publicly their declaration to their countrymen and the world. It was to be the signal to the people to rise from their bondage in Europe and America. We who can survey the political and moral progress of a hundred years—since Franklin, Adams, Jefferson, and their associates proclaimed themselves rebels at Philadelphia—may distinctly trace the wonderful results of their rare courage, their greatness. To them the future was covered with doubt and gloom.

‘The day was fine, the sun shone brightly. An immense throng of people had gathered around the State House to listen to the language of freedom. All was joy and hope. There was no trace of fear in all the great multitude, but an assurance of final triumph. At twelve o'clock the city officials, the congressmen, the sheriff, and the reader were at their posts. John Nixon, who had been selected on account of his sonorous voice to read for the first time the Declaration to the people, led the procession of the representatives as they filed from their chamber to the public rostrum. Franklin came next, almost the founder of the new nation. He was now seventy years old, his frame still vigorous, his intellect, like Plato's, growing calmer and clearer with time. The next ten years of his life were to be the most laborious and the most important of all. He had snatched the lightning from the heavens; he was now to wrest the scepter from the hands of tyrants. Franklin's venerable face and form on this memorable occasion, as he modestly walked to the platform, must have convinced the people that philosophy and discretion were now satisfied that there was no hope for freedom but in resistance. He had pledged his liberty and life for his country. Next came the impulsive orator, John Adams, to whose effective eloquence on the 2d of July is ascribed the final passage of the act of independence. He was thirty years younger than Franklin, in the full strength of his powers. Eager, ardent, ambitious, studious, the cultivated schoolmaster of Worcester had now become one of the world's benefactors. Beside him, and still younger—he was only thirty-three—the tall, thin form of Thomas Jefferson might be seen, the author of the admirable appeal. The keenest, subtlest intellect of his time, Jefferson had embraced the principles of democracy with ardor, and labored to discover and heal the woes of the people. Samuel Adams followed, the pure democrat, who believed more than Jefferson taught, whose life of self-devotion proved the value of freedom. To him John Adams was accustomed to ascribe the decisive blow that divided the New World from the Old. He determined the future fate of generations of men. Hancock was with them, the polished, graceful merchant, wealthy, singularly aspiring, who bore Washington's rise to the chief command of the army with some impatience, but whose courageous hand signed, as President of Congress, the first copy of the Declaration alone.



—*Drawing by Gerald Van der Heyden.*
Independence Hall, Philadelphia.

‘Then Charles Carroll appeared, who afterward, at the signing, when some one said there were several of his name, fixed upon himself the glory and danger of the act, and wrote, ‘of Carrollton.’ Hopkinson, comic poet and political writer; Robert Morris, the financier whose loans and credit saved the army in its moment of extreme destitution; McKean, the learned delegate from Delaware; Samuel Chase, the worthy associate of Carroll, from Maryland; and Edward Rutledge, the brilliant patriot from South Carolina—complete our picture. These were a few only of that rare, memorable body of men who signed the Declaration. They were of varied qualities, of almost equal excellence. Jefferson, austere and philosophic, represented the extreme school of the thought of the day—he embodied it in his famous composition; Charles Carroll, cultivated in all the graces of Parisian society, a Roman Catholic, educated in France; the polished Hancock; Rutledge; Chase—threw over the assembly something of the formal manner of the ancient régime. The stern severity of Samuel Adams showed what republicanism must be. Wiser and truer men never lived than these representatives of America. But as yet the traitor's doom hung over them; the executioners were assembled in New York Bay.

‘Meditative and composed, they showed no fear. It is said that Nixon's sonorous voice filled all the great assembly, that it was heard distinctly on the opposite side of the street, that not an accent faltered nor a word was lost. For the first time the remarkable paper, that for more than a hundred years has been sounding in the ears of men, was declaimed at Philadelphia; it had all the attractions of novelty, all the force of deep conviction. Happy the men who heard for the first time its germ of wisdom! Happy those who could so hail its perilous truths! “We believe that all men are born free and equal; we believe in our indestructible rights; we proclaim ourselves independent.” It is easy to imagine the intense interest of the people, the unbounded joy, the sense of a new existence. They cheered, they shouted. For the rest of the day Philadelphia was given up to enthusiastic rejoicings. The people wandered cheering through the streets; at night bonfires and illuminations lit up the scene. The reading of the Declaration awoke everywhere the same enthusiastic ardor. At Princeton, the college glowed at night with a fine illumination.

‘Washington, while the guns of the English armada were heard at the Narrows, ordered the Declaration to be read before the army. It was received with shouts of joy. That night the patriots tore down the gilded statue of King George in the Bowling Green, and soon after cast it into bullets . . . Boston, just snatched from the grasp of the tyrant, broke into fierce enthusiasm . . . The Declaration was not commented on in the newspapers.’

America's First Peace Conference

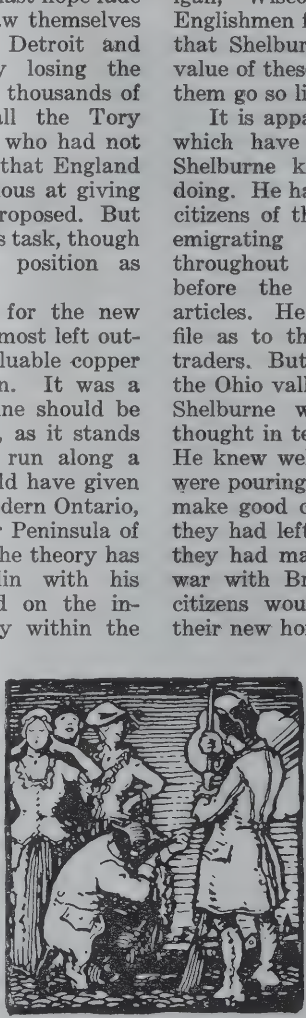
(*Continued from page 5*)

great Catherine, who certainly had a mind of her own; it failed to regard the difficulty of transporting thousands of troops overland from St. Petersburg to the far point of Siberia, a distance of nearly five thousand miles, before the days of railroads—ignoring entirely the possibility of hostilities of the Tartars and others who are even today by no means conciliatory to intruders.

The scheme involved sending a British fleet from Plymouth, around Africa, across the Indian Ocean, up the coast of China, thence across the Pacific to Peru and Chile. It was a great idea on paper.

When the terms of the preliminary treaty were announced, a storm of opposition arose against Shelburne. The British merchant classes were wild at the inadequate provisions made for the collection of their debts. The loyalists saw their last hope fade out. The British exporters saw themselves losing the Indian trade to Detroit and 'Chicagou' and consequently losing the valuable fur trade which kept thousands of Londoners busy. Above all the Tory squires and Whig landowners who had not yet got it into their heads that England had just lost a war, were furious at giving up so much territory as was proposed. But Shelburne kept resolutely at his task, though it ultimately cost him his position as premier.

The boundaries arranged for the new Republic of North America almost left outside the United States the valuable copper country of northern Michigan. It was a question as to whether the line should be run through the Great Lakes, as it stands today, or whether it should run along a parallel of latitude which would have given the United States a part of modern Ontario, but would have left the Upper Peninsula of Michigan to Great Britain. The theory has been advanced that Franklin with his interest in electricity insisted on the inclusion of the copper country within the borders of the United States. This story is probably apocryphal—certainly the papers of the English premier give no evidence of any discussion on the point and the writers on Franklin have not yet turned out any evidence on the subject. But it is true that for some time a line was seriously considered which would have deprived the United States of the copper lands.



Boundaries provided for were drawn in such ignorance of local topography that England and the United States argued until 1842 straightening out the difficulties. The American commissioners have mentioned the use of the John Mitchell map of 1755 as the one by which the boundaries were drawn. The New York Historical Society has John Jay's copy of the Mitchell map so used. Historians have long known of copies of the maps with various markings by Oswald and Franklin which were used at the time of the Webster-Ashburton Treaty in 1842 to settle the Maine boundary. However, the papers of the British minister make no mention of the use of Mitchell's map, but frequently allude to the use of a map by a well-known 18th Century geographer, Herman Moll.

Shelburne's generosity to America in the matter of boundaries was so violently attacked by the Tories of the time, that it has sometimes even been alleged that he was ignorant of the whole continent of North America and what it contained. His papers substantially disprove this charge. On all the points which subsequently aroused controversy, he was in the possession of documents which gave him the best contemporary information. When the treaty gave the United States the most important British fur-trading posts along the Great Lakes and, in addition, all the territory of what is now Ohio, Indiana, Illinois, Michigan, Wisconsin and Minnesota, many Englishmen felt they had been overreached, that Shelburne should have known of the value of these lands and should not have let them go so lightly.

It is apparent however from the papers which have now come to America that Shelburne knew very well what he was doing. He had reliable information that the citizens of the Thirteen Colonies had been emigrating west into the Ohio valley throughout the war—and that, months before the signing of the preliminary articles. He had plenty of information on file as to the interests of the British fur traders. But he deliberately sacrificed both the Ohio valley and the trading posts. For Shelburne was one of those men who thought in terms of centuries, not of years. He knew well enough that the people who were pouring over the mountains would not make good citizens of British dominions—they had left the eastern seaboard because they had many of them been ruined by a war with Britain. What kind of British citizens would they make if they found their new homes under the domination of the same British king they were trying to get away from?

It has sometimes been suggested that the winning of the old Northwest was the work of George Rogers Clark, whom Thomas Jefferson had sent out to capture the British posts during the war. That may be true, but there is not the slightest evidence in Shelburne's papers that he ever heard of George Rogers Clark and his exploits. Shelburne based his decision to give the West to the United States on very different grounds. When he said he wanted no matters of contention nor any international danger spots to remain between the United States and England, he meant it, and that is much more likely to be the real reason why he consented to let the United States have the country between the Ohio River and the Lakes.

It is difficult to read Shelburne's letters and his comments on the various drafts of the treaty without the conclusion being reached that he was one Englishman in a thousand and that so far as United States history is concerned, we were exceedingly fortunate to have such a man in power in England at precisely the moment of making peace. The papers contain also Shelburne's notes on the fierce debates in Parliament when he was called upon to defend his conduct to the nation. From these it is evident that the parliamentary reporter has not always given full reports of what went on.

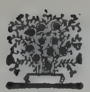
Shelburne not only defended his policy on the grounds of the intrinsic importance of peace, but he exposed the sad state of the British navy as a reason for stopping the war at once. One significant bit of paper in Shelburne's writing contains the following words: 'Loss of discipline—repugnance to distant service—bad state of the dockyards—bad raw material—no cordage—neither dispatch nor secrecy.' Other notes which exist in his own handwriting show that with all his ability he could not foresee the activities of the modern 'realtor.'

In defending the loss of Florida to Spain, he commented: 'Florida only a small sandbank—circuitous navigation—no port for cargo ships—not worth risking—and must at last fall into the American Union.' On the last he was right at any rate. Another set of notes contains the following interesting philosophy: 'Wars rarely pay for themselves—certainly not losing wars—nor equal wars—nor wars for colonies—nor wars for future colonies.'

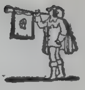
It was this homely common sense and geniality in which Shelburne excelled—just as did Franklin. The minds of these two stand out in vivid contrast to the more rigid and less imaginative mentalities of the other Britishers and Americans who were engaged in the negotiation. Franklin and Shelburne were building a structure of international amity which they intended should last—whereas one frequently feels that the other commissioners were sparring for temporary advantage and were often unduly elated when they scored a diplomatic point. Shelburne and Franklin were consciously trying to be the architects of an enduring peace—a peace based on the undeniable unity of the English-speaking peoples.

Washington's Farewell

'The name of American, which belongs to you in your national capacity, must always exalt the just pride of patriotism, more than any appellation derived from local discriminations. The independence and liberty you possess are the work of joint councils and joint efforts, of common dangers, sufferings, and successes. Europe has a set of primary interests which to us have none or a very remote relation. Hence she must be engaged in frequent controversies, the causes of which are essentially foreign to our concerns. Hence, therefore, it must be unwise in us to implicate ourselves by artificial ties, in the ordinary vicissitudes of her politics or the ordinary combinations and collisions of her friendships or enmities.'—George Washington in his Farewell Address.



CAN YOU TELL ME?



Question. Was the Declaration of Independence signed by all the delegates on July 4?

Answer. No. The Declaration of Independence was signed on July 4, 1776, by the president and secretary of the Continental Congress whose signatures only were borne by the printed copies sent out. On July 19 Congress passed a resolution to the effect that it should be engrossed on parchment and on August 2, 1776, it was signed by 53 members present; Gerry of Massachusetts, McKean of Delaware and Thornton of New Hampshire were empowered by their legislatures to sign later, Thornton not signing till November 4.

* * *

Q. Why does the Postal Department assess a fine of two cents for parcels of patrons living on the rural route, mailed at the office?

A. The law passed by Congress on February 28, 1925, effective April 15, 1925, does not require the two-cent service charge for parcels collected on rural routes, but it does require the two-cent service charge on parcels mailed at all post offices, irrespective of whether those mailing parcels at the post offices are farmers or not.

* * *

Q. How many people are employed in the Custodian Service of the Treasury Department of the United States?

A. There are 5,901 employes in this Service.

* * *

Q. What is the homicide rate for the United States and how does it compare with that of other countries?

A. Homicide rates per 100,000 of population for the following countries during the years given were:

United States (Registration Area) 1911-21	7.2
Italy, 1910-20	3.6
Australia, 1911-20	1.9
South Africa, 1912-18	1.8
New Zealand, 1911-22	0.9
Ireland, 1911-19	0.9
Spain, 1911-17	0.9
Norway, 1910-19	0.8
England and Wales, 1911-21	0.8
Quebec, 1911-21	0.5
Ontario, 1911-21	0.5
Scotland, 1911-21	0.4
Holland, 1911-18	0.3
Switzerland, 1911-20	0.2

Dr. Frederick L. Hoffman in *The Spectator*, New York City, states that in 28 American cities for which uniform statistics have been collected since 1900 and which in 1926 had an aggregate population of nearly 23,000,000, the murder death rate for 1926 was 9.9 per 100,000, against 11.0 in 1925. Statistics for 118 American cities reveal a combined homicide death rate of these cities for 1926 as 10.1 per 100,000, as compared with 10.5 for the previous year. The rates for the individual cities range from 75.9 for Jacksonville, Florida, to no homicides for 18 of the 118 cities reporting. It is estimated that there are at the present time about 12,000 murder deaths in this country during the course of a year.

Q. Who were the parents of Stephen F. Austin and did he have any brothers or sisters? When did he die and where was he buried?

A. Stephen F. Austin was the son of Moses Austin and Maria Brown Austin, his wife. Maria Brown Austin was the foster daughter and grandniece by marriage of Benjamin Fuller of Philadelphia. Stephen F. Austin was born at Austinville, Wythe County, Virginia, November 13, 1793. He died near Columbia, Texas, December 27, 1836, and his body was interred at Peach Point, Texas, December 29, 1836. On October 20, 1910, his remains were brought to Austin and reinterred with military honors in the State Cemetery. His sisters and brothers were as follows: Anna Maria Austin (died in infancy), Eliza Fuller Austin, Emily Margaret Brown Austin, J. Elijah Brown Austin.

* * *

Q. Who were the signers of the Constitution of the United States?

A. The Constitution originally consisted of a Preamble and seven Articles and in that form was ratified by a convention of the states, September 17, 1787. The signers of the original Constitution, by virtue of their membership in Congress, were: Geo. Washington, President and deputy from Virginia. New Hampshire—John Langdon, Nicholas Gilman. Massachusetts—Nathaniel Gorham, Rufus King. Connecticut—Wm. Saml. Johnson, Roger Sherman. New York—Alexander Hamilton. New Jersey—Wil. Livingston, David Brearley, Wm. Patterson, Jona. Dayton. Pennsylvania—B. Franklin, Robt. Morris, Thos. Fitzsimons, James Wilson, Thomas Mifflin, Geo. Clymer, Jared Ingersoll, Gouv. Morris. Delaware—Geo. Read, John Dickinson, Jaco. Broom, Gunning Bedford jun, Richard Bassett. Maryland—James McHenry, Danl. Carrol, Dan of St. Thos. Jenifer. Virginia—John Blair, James Madison, Jr. North Carolina—Wm. Blount, Hu. Williamson, Richd. Dobbs Spaight. South Carolina—J. Rutledge, Charles Pinckney, Charles Cotesworth Pinckney, Pierce Butler. Georgia—William Few, Abr. Baldwin. Attest: William Jackson, secretary. (The names are given according to the original signatures.)

* * *

Q. How long is a generation?

A. A generation is usually considered as being thirty years, or three generations to a century.

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

Q. How many land-grant colleges are there and what is the total enrollment?

A. On June 30, 1925, there were 69 land-grant colleges, 17 of which were exclusively for colored students. The total enrollment in institutions for white students for 1924-25 was 245,480; in institutions for colored students, 14,871.

* * *

Q. What countries have old-age pension laws, at what ages do the pensions begin and how large are they?

A. Noncontributory old-age pension schemes exist in Australia, Denmark, France, Great Britain, Irish Free State, New Zealand, Norway, Uruguay and in certain of the United States. Contributory pension schemes have been introduced in Rumania, Spain, Switzerland, Belgium, Italy, the Netherlands, the Serb-Croat-Slovene kingdom, Bulgaria, Czecho-Slovakia and recently in Great Britain. The German system is a form of compulsory and contributory insurance. One-half the premium payable is paid by the laborer, the other half by the employer. The state adds a subvention to the allowances paid to the annuitant. Old age is assumed to occur at some stated age which varies from 50 to 70 years according to the country. Seventy is the accepted age in Germany, Great Britain and France; 60 in Denmark, 65 in New Zealand and Australia. Danish pension varies from 50 to 200 kroner ($16.30 to $53.60) per annum; French from 5 to 20 francs per month; British from 1 to 7¼ shillings per week and Australian and New Zealand up to $2.50 per week. In the United States, Alaska had the first state old-age pension law, and Montana, Wisconsin, Nevada, and Kentucky have passed such laws in recent years. In Kentucky the maximum pension is $250 a year to applicants 70 years of age or over, who have been citizens of the United States for 15 years and residents of the county for 10 years and who are not possessed of an income in excess of $400 a year, property valued at $2,500 or a child or other legally responsible person able to furnish support. The Kentucky act is similar to the Wisconsin plan in depending upon acceptance by the various counties. Administration is by county judges. Nearly all civilized countries have in operation a system of straight pensions to Government employes.

Q. Who were the members of the Debt Commission which negotiated the settlement of the war debts?

A. The members of the Debt Commission were: Andrew W. Mellon, Secretary of the Treasury, chairman; Frank B. Kellogg, Secretary of State; Herbert Hoover, Secretary of Commerce; Reed Smoot, United States Senator; Theodore E. Burton, member of the House of Representatives; Richard Olney, formerly member of the House of Representatives; Edward N. Hurley, formerly chairman of the United States Shipping Board. Garrard B. Winston, Under-secretary of the Treasury, is secretary of the Commission.

CHATS WITH OFFICE CALLERS

'To most people,' observed the ***Astronomer,*** 'a professor of this science is a man who spends all his nights gazing at heavenly bodies with a telescope, and sleeps in the day time. But a visit to a great modern observatory would soon disabuse one's mind of these ideas.

'At the Mt. Wilson Observatory in California the astronomers are more likely to be found examining a photographic plate with a microscope than a star with a telescope, and usually they sleep all night like most other people. In fact, the observatory proper, with the telescopes, is located on Mt. Wilson, a mile high, while the offices and workrooms are located down in Pasadena. A week's sojourn on the mountain usually gives one of the astronomers enough photographic material to keep him busy for a month or more.

'In most branches of astronomy,' continued the scientist, 'the human eye has been completely replaced by the photographic plate, and at Mt. Wilson the only time that one of the telescopes is used visually is on Friday evenings when visitors are permitted to look through the 60-inch reflector, the world's third largest telescope. The 100-inch telescope, nearby, is in such constant use for photographing heavenly scenes that it cannot be spared for visitors for even a single evening.

'Of course, the matter of convenience has had something to do with the widespread use of photography in astronomy, but even more important is the fact that the photographic plate sees more than the human eye. If a person looks through a telescope he can see as much at first glance as he can by an hour's scrutiny. In fact, after looking a long while, we really see less because the eyes tire. But the eye of the camera is untiring. If a faint star can be photographed in ten minutes' exposure, one twice as faint can be photographed in twenty minutes and one ten times as faint in a hundred minutes. In this way faint stars, as well as clouds of glowing gases called nebulae, too faint to be seen with the eye even when aided by the most powerful telescope, are photographed and studied.

'But there is one branch of astronomy in which visual observation still remains superior to photography, and that is the study of the planets. These bodies are so much closer to us than the stars that their light is sufficient to reveal their details to the eye. When the eye has enough light to enable it to see at its best, it can see more than the photographic plate.'

* * *

'Considering the absolute freedom of the United States Army engineers from political control (due in large part to their being permanently commissioned and being subject to discharge only for unfitness), it seems to me reasonable that other forms of Government work could be successfully carried on under that same system. Why not a railway corps and a railway West Point to supply the members of the corps?' said the ***Major of Engineers*** who had dropped in to have a talk with the editor.

'Why should not our railroads be operated just as the Panama Canal was built and is being operated, and just as our river and harbor improvements are being carried out? The corps of engineers of the Army completed the Canal with efficiency and dispatch, and are now in charge of its successful operation. These officers also supervise the Government's river and harbor development projects from year to year. They do this work well, without 'playing politics' and without a suggestion of graft.

'Since railroading requires special training, why should not our Government establish an academy on the order of West Point without all its military features, where could be given technical training needed by young men before they enroll for a course in the great school of experience?

'Upon graduating from the academy these future railroad officials could be commissioned into a 'United States Railway Corps,' to be removable only upon demonstrated unfitness. The corps could be placed under the Interstate Commerce Commission or other nonpolitical body created to direct its activities, and these railroad men could be given promotion and retired pay such as is now provided for in the Army.'

* * *

'Did you ever see the trek of the caribou?' asked the ***Man from Alaska.*** 'I can never witness a migration of these great herds of Arctic deer without becoming convinced that in time they will furnish a meat supply to hungry humanity rivaling that of our domestic cattle. While caribou are giving way to civilization, just as the bison did, and while the herds of the present day are not to be compared to those of a generation gone, yet there are indications that these wild animals may yet be mastered into range cattle. They still represent the greatest mass of wild life on the American continent, and the railroads, gradually creeping North and West will soon touch the edges of the caribou pastures. Just now these Arctic deer are migrating from their winter feeding quarters in sheltered valleys and woodlands to summer pastures in the Alaska barrens, and that means that spring is at hand north of the Yukon.'

* * *

'Do you know the population of the Turkish republic?' queried the ***Traveler from the one-time Ottoman Empire.*** 'No? Neither do the Turks themselves. It has been a guess, ranging all the way from 7,000,000 to 14,000,000. The New Turks wish to obtain this important information themselves, and while over there recently, I found that they were taking steps to estimate the population according to provisions recently passed by the Angora assembly for making a 'true census of the Turkish people.' This will be Turkey's first real census, because under the old empire, the government considered it too difficult an undertaking, and the Sultans had no desire to have the outside world know their exact military strength. Most of the previous censuses were mere estimates, based on figures furnished by a municipal head from his count of householders and the number of attendants at the weekly markets as the population of the surrounding country. A dependable census of Constantinople has as yet never been made. The outcome will be interesting, for the new Turkish republic is trying to stand on its own feet, and the outside world is keen for many reasons to know how many Turks there really are.'

* * *

'Slipping out of one country into another in Europe, and even back into the United States, is to many a painful experience. Having gone through the process half a dozen times, I am reasonably sure of my ground,' said the ***Tourist.*** 'Let me explain.

'Customs officials greet you at the border of each country. A few of them take it for granted that either through ignorance or premeditation you have with you dutiable goods. Others, perhaps because of a grouch or an attack of dyspepsia, insist on examining each article of clothing in your baggage, no matter how private its nature. Then more or less embarrassing questions will be asked about the trifles you may have picked up for your friends.

'In addition there is a possibility that your luggage may be adjudged overweight, and you assessed a considerable sum.

'However, our treatment at Naples was typical. The porters marched ahead with our two traveling bags and two suit cases, and we found them assembled on the customs inspectors' table ready for the examination.

'Had we any tobacco, matches, or other dutiable goods, including salt, sugar or coffee? No; only clothing and a couple of typewriters. Would the *signor* kindly open one of the cases? This was done. Thanks, that is all. The baggage was passed, without an article being disturbed. Splendid. We were delighted.

'England's inspectors, too, were as kindly disposed as those of Italy, Switzerland and France. At Victoria Station, to which destination our baggage had been assigned, not a single strap was loosened or a key turned. The few questions asked related to tobacco and spirits only.

'After a pleasant voyage we were once more on American soil with our foreign purchases practically undisturbed, having passed the gauntlet of inspection by a dozen officials representing five sovereign nations.'

* * *

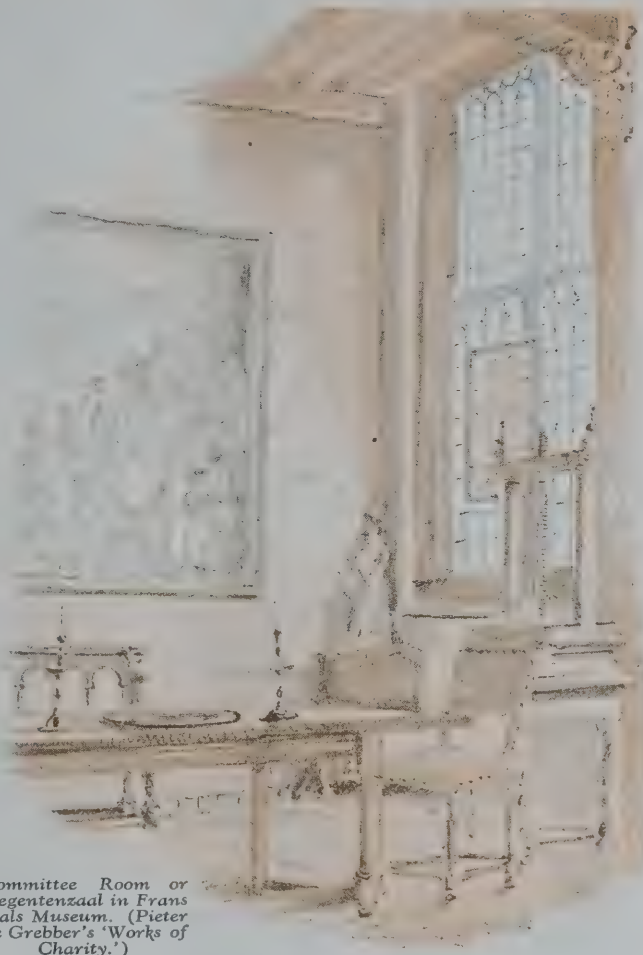
'Nothing new under the sun,' said the ***Collector of Rarities*** referring to one of the Thackeray (unpublished) letters recently sold at the New York Anderson Galleries. 'Here is an extract from a letter written by Thackeray in 1852, while on a visit to New York. "It's nothing here but dollars and flattery . . . The girls are dressed like the most stunning French actresses, the houses furnished like the most splendid French gambling houses . . . The jolly manner (jollying) answers here very well." '

Haarlem, the Home of a Great Master

(*Continued from page 8*)

effort also failed, for it was found impossible to keep the southern Catholic half of the Netherlands subject to the northern. They successfully rebelled, and form today the kingdom of Belgium. Still Napoleonic policy was reversed in Holland and on that account the impress which it set upon Haarlem stands as an isolated experiment.

That impress is subtle almost to the point of evanescence. You will not find it in the furniture or the streets, still less in speech, and only by rare accident (I am told) in the social traditions of the town. But the large house which Louis Bonaparte made his palace, with all its arrangements still exactly preserved, with its suggestion of French plantation about it, remains strongly fixed upon the memory of any man that has visited Haarlem with some thought for its history. There may be other points in Holland where this passing effect is felt. I do not know. Some might quote the library at Utrecht. Certainly in Haarlem it is unmistakable.



Committee Room or Regentenzaal in Frans Hals Museum. (Pieter de Grebber's 'Works of Charity.')

The Frans Hals Museum is a thing quite by itself in Europe. It is one of those examples which you get about once in a hundred times (where modern public work is concerned) of intelligence and imagination combined.

Imagine, instead of the regulation large rooms, crowded with heterogeneous work of all shapes, sizes and styles, the conventional skylight and the mournful guards in uniform pacing up and down the huge galleries, a *private house;* a private house such as the man himself might have inhabited or did inhabit. The rooms are small and low, in excellent proportion; each containing some few and some few only of the many masterpieces, in more than one case a single picture alone upon its wall.

It would be impossible to imagine a more exact setting or a more congenial one for great work. Indeed it is the right kind of setting for any work; and the whimsical thought occurred to me as I reveled in the congruity of the place that we might do worse than organize something of the sort for the idols of the 19th Century in England. It would be great fun, for instance, to have a large Burne-Jones collection set up in a Victorian semidetached villa with furniture complete: not omitting Japanese fans upon the walls; or a Watts collection under the same surroundings.

Or one might have one of our more modern people, with their deliberate search for ugliness, set in surroundings of the boarding house the painter inhabited while he was yet permitted by the wrath of God to offend this world.

At any rate the Frans Hals Museum succeeds more than a little; and if one could hope anything of public affairs, one might hope with a sigh that, on the model of this, other similar work should be done elsewhere. Why could not one have a Corot museum set in some large and solid French farmhouse in the midst of the country where he drew? Or a set of Constables in an English farmhouse of Essex, unspoiled?

You come upon this delightful thing in a street of small, regular, similar houses, quite low, with a characteristic Dutch stepped gable upon each, all wonderfully clean, wonderfully alike, and all of the time when the painter lived and worked. You go through a door like any of the other smartly painted old doors; you are surrounded by his atmosphere and his being, and by the 17th Century preserved and still alive.

Indeed Haarlem, though it has not that sort of antique exaggeration which marks out special towns as examples of antiquity, has in great profusion an inheritance of the greatest moment in Dutch history, when independence has been achieved and before the rise of England has overshadowed the political power of the country; the moment of the great commercial adventure and that amazing chapter in the history of art which ended after one long lifetime with such singular abruptness.

Haarlem has for its two chief monuments the very great church dating as do all the chief ecclesiastical buildings of the country from the later Middle Ages, and the market house immediately at its side. The vastness of the church within strikes one even more strongly than it does in the parallel cases of the sister towns because it has been even more thoroughly denuded of ornament.

It is completely bare, save for one interesting survival of a custom which the dominant religion of the great merchants and sea captains in Holland should have frowned upon, but which seems to have lingered on from the days before the Reformation. There are, upon the southern side of the nave, three exquisite little models of ships hanging like *ex votos.* I found them surprising.

There are crowds of such things in the French and Italian and Spanish seaport towns. There were crowds of them doubtless in the seaport towns of the northern Netherlands before the great religious quarrel of the later 16th Century. If there were such they disappeared, it would seem, save here.

For the rest, Haarlem is an example of what all these wealthy, commercial, crowded cities of the United Provinces are. It is an example of their astonishing proximity. You can walk in an afternoon from a considerable agglomeration of Haarlem to the vast city of Antwerp through the intensive agriculture of pasture land between. You can walk in a long day to Leiden.

There is always some geographic reason to explain the position of each such market and gathering place (save perhaps in the case of the Capital): either it is the junction of two rivers, or the convenience of the port, or a patch of firm land in the midst of what was originally marsh. In the case of Haarlem there was the big lake, now reclaimed, which served I suppose the origins of the place for a sort of port connected with the sea.

But what you cannot explain—at least what I have never seen explained—is the perpetual reoccurrence of one great town after another, and distances which will seem to make the separate economic life of each impossible. One would think that a place like Amsterdam would leave a neighbor like Utrecht, or a still closer neighbor like Haarlem, without any economic basis at all.

Yet somehow or other commerce has struck root in every one of these many centers and made of Holland politically what indeed all the Netherlands have been since the Middle Ages, a civilization built entirely upon jealously independent, immensely wealthy burgess cities, and to this day you get the note of that everywhere throughout the Netherlands.

One of the best historians and observers of his own country said to me in Brussels not long ago, 'We are essentially a federation of town republics and neither Holland nor Belgium is in equilibrium save when that truth is recognized.' And in Haarlem you feel that truth most powerfully. It stood its famous siege against the Spaniards, it lived intensely its own life before and after.

BRIEFLY TOLD

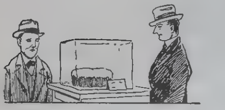
THE GERMAN CRUISER *Emden*, en route from Celebes Island in the Dutch East Indies to Nagasaki, Japan, measured an ocean depth of 34,416 feet, the greatest known depth up to this time being 32,644 feet.

A FRENCH WATCHMAKER has invented a watch that tells time without hands, by means of a moving dial which turns inside a stationary rim. The minutes appear on the rim and an opening in the dial shows the hour. The center makes a complete turn every minute.

THE INSPIRATION to propose to his wife came to Ulysses S. Grant when fording the swollen Gravois River. The manner of her clinging to him in fear gave him the inspiration and he proposed then and there.

NINETY-SIX PER CENT of the 54,318 rural mail routes have been motorized.

SINCE THE STATE CLOTHING SYNDICATE announced that it would pay fifty cents for every cat skin to be used in making cheap fur coats, a war has been waged on the cats in Leningrad, Russia.



IN A MUSEUM IN Ottawa, Ontario, there is a cake, a relic of the Arctic expedition of Sir John Franklin in 1845, made of pemmican, which is a compound of beef, fats and dried fruit; it is still good to eat.

A LONDON HOTEL keeper has finished his dining rooms in primrose and blue because these colors cause the diners to relax and be cheerful and hungry.

A POSTAL CARD three feet long and two feet wide and requiring one dollar postage was recently received in Chicago inviting the postoffice clerks to attend the national convention of their organization in Indianapolis.

A ROBIN BUILT a nest in a mop on the back porch of the home of a Chicago woman. She secured another mop and left the robin undisturbed until a family of six were reared.

EVERY MEMBER of the family of Herbert Asquith is a writer. Asquith, known as Lord Oxford, is writing a volume of memoirs; Lady Oxford has completed a novel and a volume of essays; Princess Bibesco, their daughter, is writing plays and a novel; and Cyril Asquith, the son, has written a book on trade union law.

BY A RECENT SURVEY by the United States Public Health Service it was found that colds cause a time loss equivalent to 1.4 days a year for every man employe and 2.1 days a year for every woman.

DIAL NUMBERS have been converted into raised characters to enable blind persons to tune-in different stations on the radio receiver.

HAUTEVILLE HOUSE, Victor Hugo's home in exile, has been given by his descendants to the city of Paris.

THERE WERE MORE than 5,150,000 hunting licenses taken out by sportsmen throughout the United States and the Territory of Alaska during the season of 1925-26.

SENSE OF SMELL IS worth $800 according to a case in Paris where a cook was awarded this amount for the loss of the sense of smell when knocked down by a taxi.

EVERY BRIDE in Mackenrode, Saxony, married in twelve months, with one exception, had the surname Mueller.

CRICKET FIGHTING is a popular sport in China. The combat takes place in a large earthen jar and is fought to the finish.

MRS. THEODORE HOFFMAN, of New York, recently received a postcard mailed to her in 1915 from a point twenty-five miles from her home.

BIDDY ANN, a white leghorn hen, in Iowa, being deprived of her setting of eggs, flew to the top of a tree and took possession of a crow's nest and eggs. She comes to earth twice a day for food and water.

THE SAYING that 'a cat has nine lives' is generally supposed to have originated from the old myth that Pasht, the cat-headed goddess of Egypt, had nine lives.

THERE ARE SEVERAL countries of which no census has ever been taken. They are Persia, Afghanistan, the Indo-Chinese peninsula, half of Africa, parts of South America and most of China.

WHEN ALFRED MCGEE, a wealthy farmer near Glenville, Alabama, died he made the request that his grave be made near the highway and that the farmers hauling their cotton crop to market would call out to him in a loud voice the price of cotton for that day. This has been done for forty-five years.

IN THE FRENCH NIGERIAN court of Sultan Barmous, Mohammedan traditions are carefully preserved. Like some Oriental despot of old, the Sultan has his dinner served in solitary state under a great mango tree, while the court musicians, whose duty it is to entertain him, play with backs turned, since no one must see him eat.

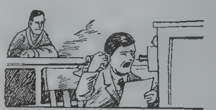
COROT'S OAKS HAVE BEEN sold to a timber merchant. The country folk of Mur, near Loudeac, Brittany, were forced to choose between the trees and higher taxes.

TWO BILLION DOLLARS IN gold are held in the New York Assay Office in Wall Street, branch of the United States Assay. Here was actually amassed the first billion dollars in the world.

WITH THE LARGEST WORLD telescope, on Mt. Wilson, California, man looks trillions of miles into space. He is able to see stars separated from him by the distance light could travel in 72,000 years, on the basis that in one year light travels 5,800,000,000,000 miles. He sees that the 'dust' in the Milky Way consists of millions of suns, each with its family of planets rotating around it.

TWENTY-TWO HUNDRED WOMEN fill important executive positions with banks.

THERE IS A BAPTIST CHURCH in Santa Rosa, California, 60 feet wide by 100 feet long, with seating capacity of 400 that was built entirely from timber sawed from one redwood tree. Although everything, except the glass, used in construction was furnished by the tree, only two-thirds of the tree was needed and 60,000 shingles were left over.



IN ABYSSINIA, a telephone message must first be written and handed to the operator, who, in turn, shouts it into the transmitter, no one else being permitted to use the instrument.

SOFT-SHELLED ADLAY, WHICH grows in tropical climes, is mentioned as a substitute for wheat in case the world's population increases to such proportion as to necessitate increased production of foodstuffs. A hard-shelled species of adlay is cultivated for its seeds, which are made into ornamental beads.

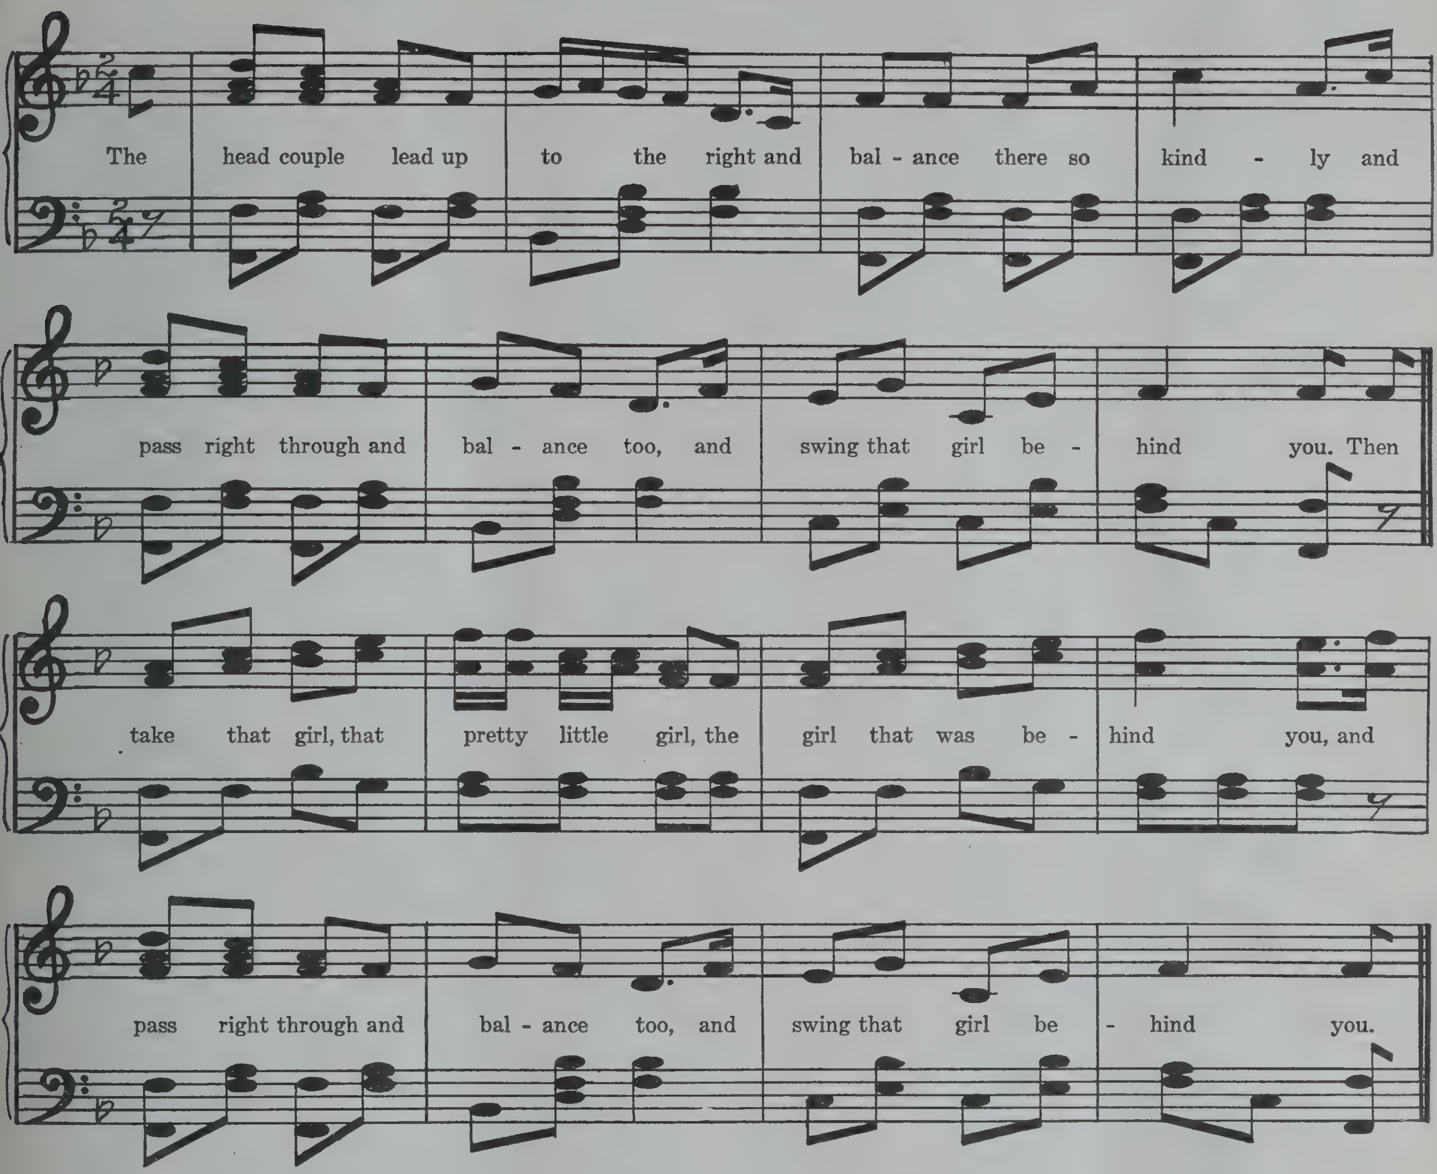
THE FUNCTION OF A RECENT calculation invention, consisting of 15,000 parts, is to predict high tides and low tides two years in advance for any port in the world.

SCIENTISTS' OBSERVATIONS INDICATE that in 1922 the sun radiated 4 per cent less heat than normally, and that since then it has not been up to par. There is no danger of sol burning out yet, however, as the life of a star such as the sun is estimated to be 30,000,000,000,000 years, and the sun is still comparatively young.

AMONG THE MOST NOMADIC PEOPLE of the world are the Bakhtiyari tribes of Persia, where the main and about the only source of income is herding. Nature doesn't allow the Bakhtiyari to settle permanently; to escape withering heat and then to avoid the cold they are constantly journeying from the Persian Gulf lowlands to the plateau highlands and back again. Their neighbors count them among the worst of the plundering hordes of the world.

THE BLACKS OF AFRICA AND their full-blooded descendants in any part of the world never sneeze.

The Girl I Left Behind Me



The head couple lead up to the right and bal - ance there so kind - ly and
pass right through and bal - ance too, and swing that girl be - hind you. Then
take that girl, that pretty little girl, the girl that was be - hind you, and
pass right through and bal - ance too, and swing that girl be - hind you.

The Girl I Left Behind Me

FORMATION in a square, one couple on each side.

- Read the description carefully.
- Instrumental music is not necessary; sing the song while dancing. The words fit both the music and the movements of the dance.
- Can be used in the ballroom, in the home, on the lawn, playground or at summer camps. Head couple begin the movement.

THE SONG *or* CALLS

The head couple lead up to the right, and balance there so kindly	*8 counts*
(The head couple lead to the right, face that couple on the side and balance.)	
And pass right through, and balance too	*4 counts*
(Head couple pass between and balance again back to back with the same couple.)	
And swing that girl behind you	*4 counts*
(The two gentlemen will turn and swing their new partners.)	

Head gentleman now leaves his original partner, takes his new lady and continues on to the next couple, and then to the next, taking a different partner each time, until he returns to his own place. The next couple on the right begins the same movement, and so on until all have gone through the changes, and each couple is in its original place.

NOTE:
If instrumental music is used, call *Grand Right and Left* at the end of each song. This introduces a variation between each couple's turn.

NOTES ❧ COMMENTS ❧ CRITICISMS

MR. FORD'S Page this week discusses the difference between flattery and truth in friendship and business.

* * *

The cover design by Irving R. Bacon represents the first reading of the Declaration of Independence. The leading figures have been carefully studied by the artist from contemporary portraits.

* * *

Cuba and sugar were once almost synonymous terms. Now it is Cuba and commercial expansion, according to Samuel Crowther, internationally known author and contributor to leading magazines. New railroads and modern highways have transformed a country where jungle trails leading to nowhere were all that its Spanish rulers would permit. 'The message to Garcia' has had results. Cuba today is something more than a mere appendage from which a foreign nation squeezed saccharine juice. It is a living, growing part of America. (p. 1)

* * *

Something psychic from Hamlin Garland, novelist and dramatist, author of the Middle Border series, marks a new departure for this historian of the pioneers. An excursion into the unseen has a fascination for everyone. Men are always striving to lift the veil with little or no result. Hamlin Garland attempts to penetrate 'the Dark Side of the Moon' with interesting results. (p. 3)

* * *

Appropriately enough there appears this week an account of America's first peace conference, by Professor Randolph Adams, custodian of the William L. Clements Library of American History, University of Michigan. The writer brings out the fact that Great Britain, beaten in the war with the American Colonies, was gaining ground against France and Spain. (p. 4)

* * *

But Britain had learned the lesson of the War of Independence and Lord Shelburne, her representative at the conference, was anxious to make the peace a lasting one. He foresaw that the peace of the world depended on peace in the Anglo-Saxon race, and the infant republic made an excellent bargain with the mother country. (p. 4)

* * *

The folk songs of a nation redeem it from sheer and sordid materialism. It is among the mountain folk that these songs mostly survive. It is generally thought that the mountaineers of Tennessee and the Cumberlands are the only real exponents of these lyrics of medieval times, but that the English folk songs also survive in Ohio is manifest from the typical specimens that Mary O. Eddy has collected from aged people in outlying parts of the country. Carl Sandburg gives a few words of introduction and commendation. (p. 6)

* * *

Another of Hilaire Belloc's stories of Holland deals with Haarlem, which was the home of Frans Hals, the great painter. The Hals museum is a private house. This gives an idea to other cities. In place of the pictures being shown in a large, barn-like hall they are displayed on the walls of various rooms of different sizes in appropriate settings. (p. 8)

* * *

A notion is prevalent in America that Europe is concerned only with big international questions—that the ordinary citizen talks of little else—but Putnam Phillips, the pseudonym of a writer of more than American reputation, calls all this 'show-window stuff.' (p. 9)

* * *

There is a fairy story which tells of an emperor who was so much flattered by his followers that he was actually led to believe he was wearing a fine new coat, but in reality the coat was nonexistent. Nell Upshaw Gannon, who is related to Congressman William D. Upshaw, has written a story to prove that people will talk themselves and others into believing anything. Affectation is particularly rife in the world of literature and art. There is much talk about the 'classics' when only a vague notion exists as to what the 'classics' mean. Independence of thought and fearless self-expression are getting rare. (p. 12)

* * *

The Great Pyramid has been called a miracle in stone, but it is more correctly the miracle of mind and muscle over matter. Julian Hawthorne gives us a revealing story of just what the Pyramid means. A world's wonder perfectly proportioned and mathematically projected, it was built to demonstrate certain scientific theories that have stood the test of centuries. Julian Hawthorne, son of the great novelist, is the compiler. (p. 14)

* * *

Huien-Tsaing, the Chinese Livingstone, completes his epochal journey in the second part of Charles J. Finger's narrative; his search for a new way of life having been successful, he returns laden with information and rich material gifts. (p. 16)

* * *

When we talk of cave dwellers we think of prehistoric man clad in wild beasts' skins and carrying a club. But there are in Spain bands of gypsies who to this day live in caves cut out of the mountainside. Professor Karpinski, of the University of Michigan, at present traveling in Spain, gives a vivid account of these *gitanos*. (p. 20)

REMARKS BY OUR READERS

Klamath Falls, Oregon.

Referring to the article in THE DEARBORN INDEPENDENT of May 28 ('Nebraska Had a Singing Mouse') by B. H. L., I may say that when a boy about sixteen years old and living with my folks at 710 Troupe Street, Kansas City, Kansas, where my mother still resides, I was working as junior clerk for a packing company in Kansas City.

About this time we were amused by a peculiar whistling noise about the pantry and in the cellar, and at times it would be quite melodious. For a while we could not make out the source of the noise and did not for some time try hard to locate it, but it kept up and we started a real investigation and found that the noise originated from a common house mouse.

Of course we did not want to kill it, and I carried the news to the office. One can imagine the result. There was nothing for me to do but prove my story, so I set about capturing our singing mouse without hurting it. We caught mice but they would not sing. We kept putting them in a cage and keeping them until we would hear our singing mouse and then we would destroy them. Finally we caught the right mouse. It did not sing for some time, but as it got tamer it would sing, and finally it would sing when someone was watching it. Of course, I vindicated myself at the office, but I cannot for the life of me remember what became of this mouse.

T. J. EVANS.

Dorchester Center, Massachusetts.

Since the first of April your excellent magazine has been coming to me. I wish to tell the editorial staff how much I like it.

First of all, the covers both front and back are very attractive and I *love the second page of illustrated poems.* In this June 4 number just at hand, I have read with great interest William Barton's article on Cotton Mather, as I did a few weeks ago of his own work at Hollywood.

Thomas L. Masson's article, 'For Those Who Don't Like Poetry,' is a fine study of the divine art of poetry—a subject which always finds me interested.

The history pages and the department 'Can You Tell Me' give much worth-while information.

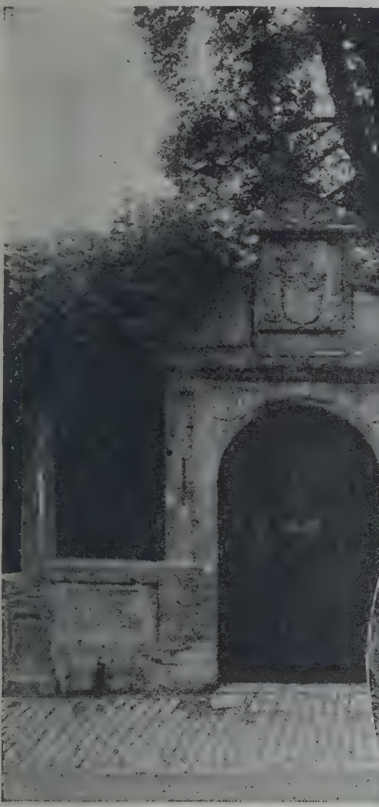
I enjoy reading Mr. Ford's Page, and that editorial, 'He Flew Toward the Dawn' is one of the finest to be had. I could go back over the numbers and speak of many things of special interest but my letter would become too lengthy.

I look forward to each arrival of THE DEARBORN INDEPENDENT with pleasure and gratefulness.

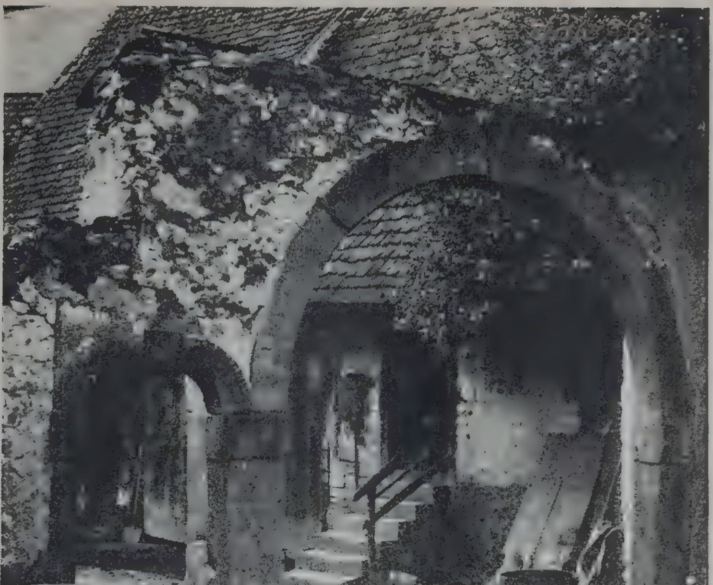
(MRS.) SOPHIA R. BARTLETT.

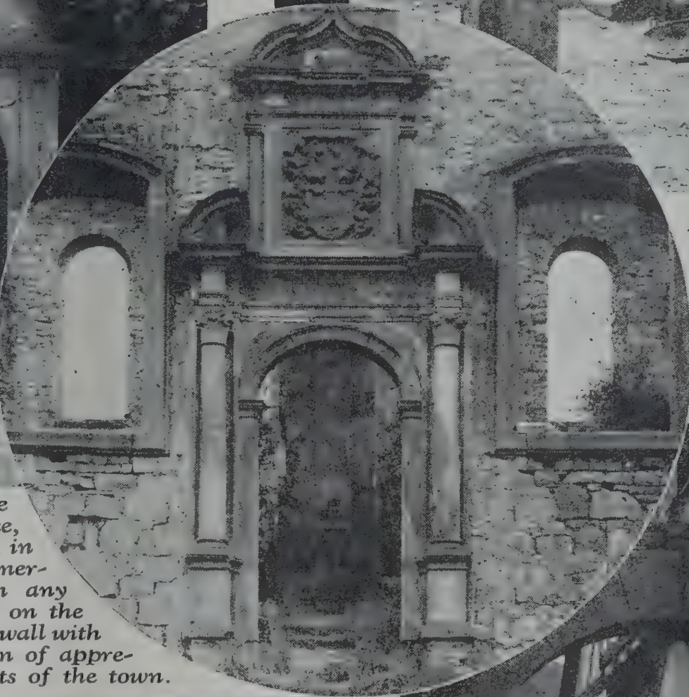
Arched Gateways in Germany

Serve the Cause of Art Through the Centuries



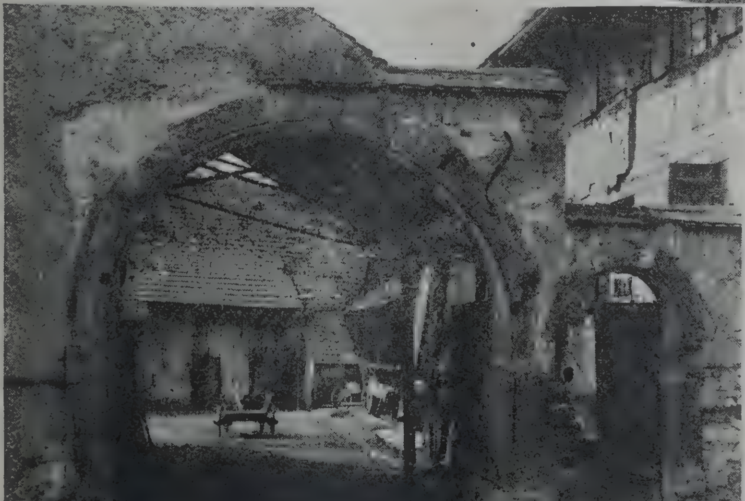
Inviting arched entrance to the 1,000-year-old linden, or lime tree, forty-two feet in circumference, in Neuenstadt am Kocher. This venerable tree, more probably than any other interest, keeps Neuenstadt on the map of public interest, and this wall with its interesting entrance is a token of appreciation from grateful inhabitants of the town.





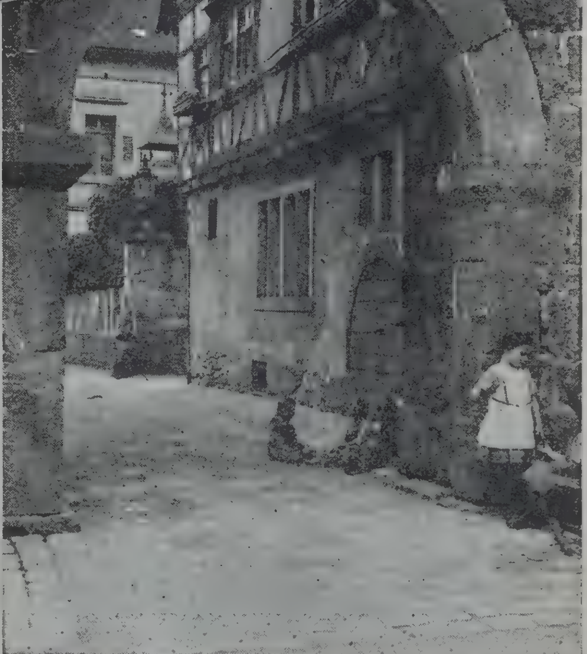
Above—
Another ancient wall with simple arches in Leiselheim, Baden, again providing for beasts and man.

Center—
Entrance to Convent Frauenalb, Black Forest, Württemberg.



These crumbling walls and carefully wrought archways, one for beasts and one for man, relic of bygone days, have become merely the entryway to a farmyard and house in Fechtingen, Baden. The carving about the arch harks back to very early times, while the gates themselves afford much-sought seclusion.

—Photos by Karl Obert, Freiburg.



Picturesque archway framing a glimpse of an old-world street in the valley of the Neckar. Old and new are shown in interesting contrast.

PATRIOTISM in its purity is not selfish. It is a fallacy to think that because we love one country we must suspect the motives and defeat the purposes of all others. The United States never has and never will become productive soil for the seeds of international hatred. We will never rise against lands or peoples to do them harm; we will only rise against the aggressive errors of which lands and peoples have become the self-deluded servants.

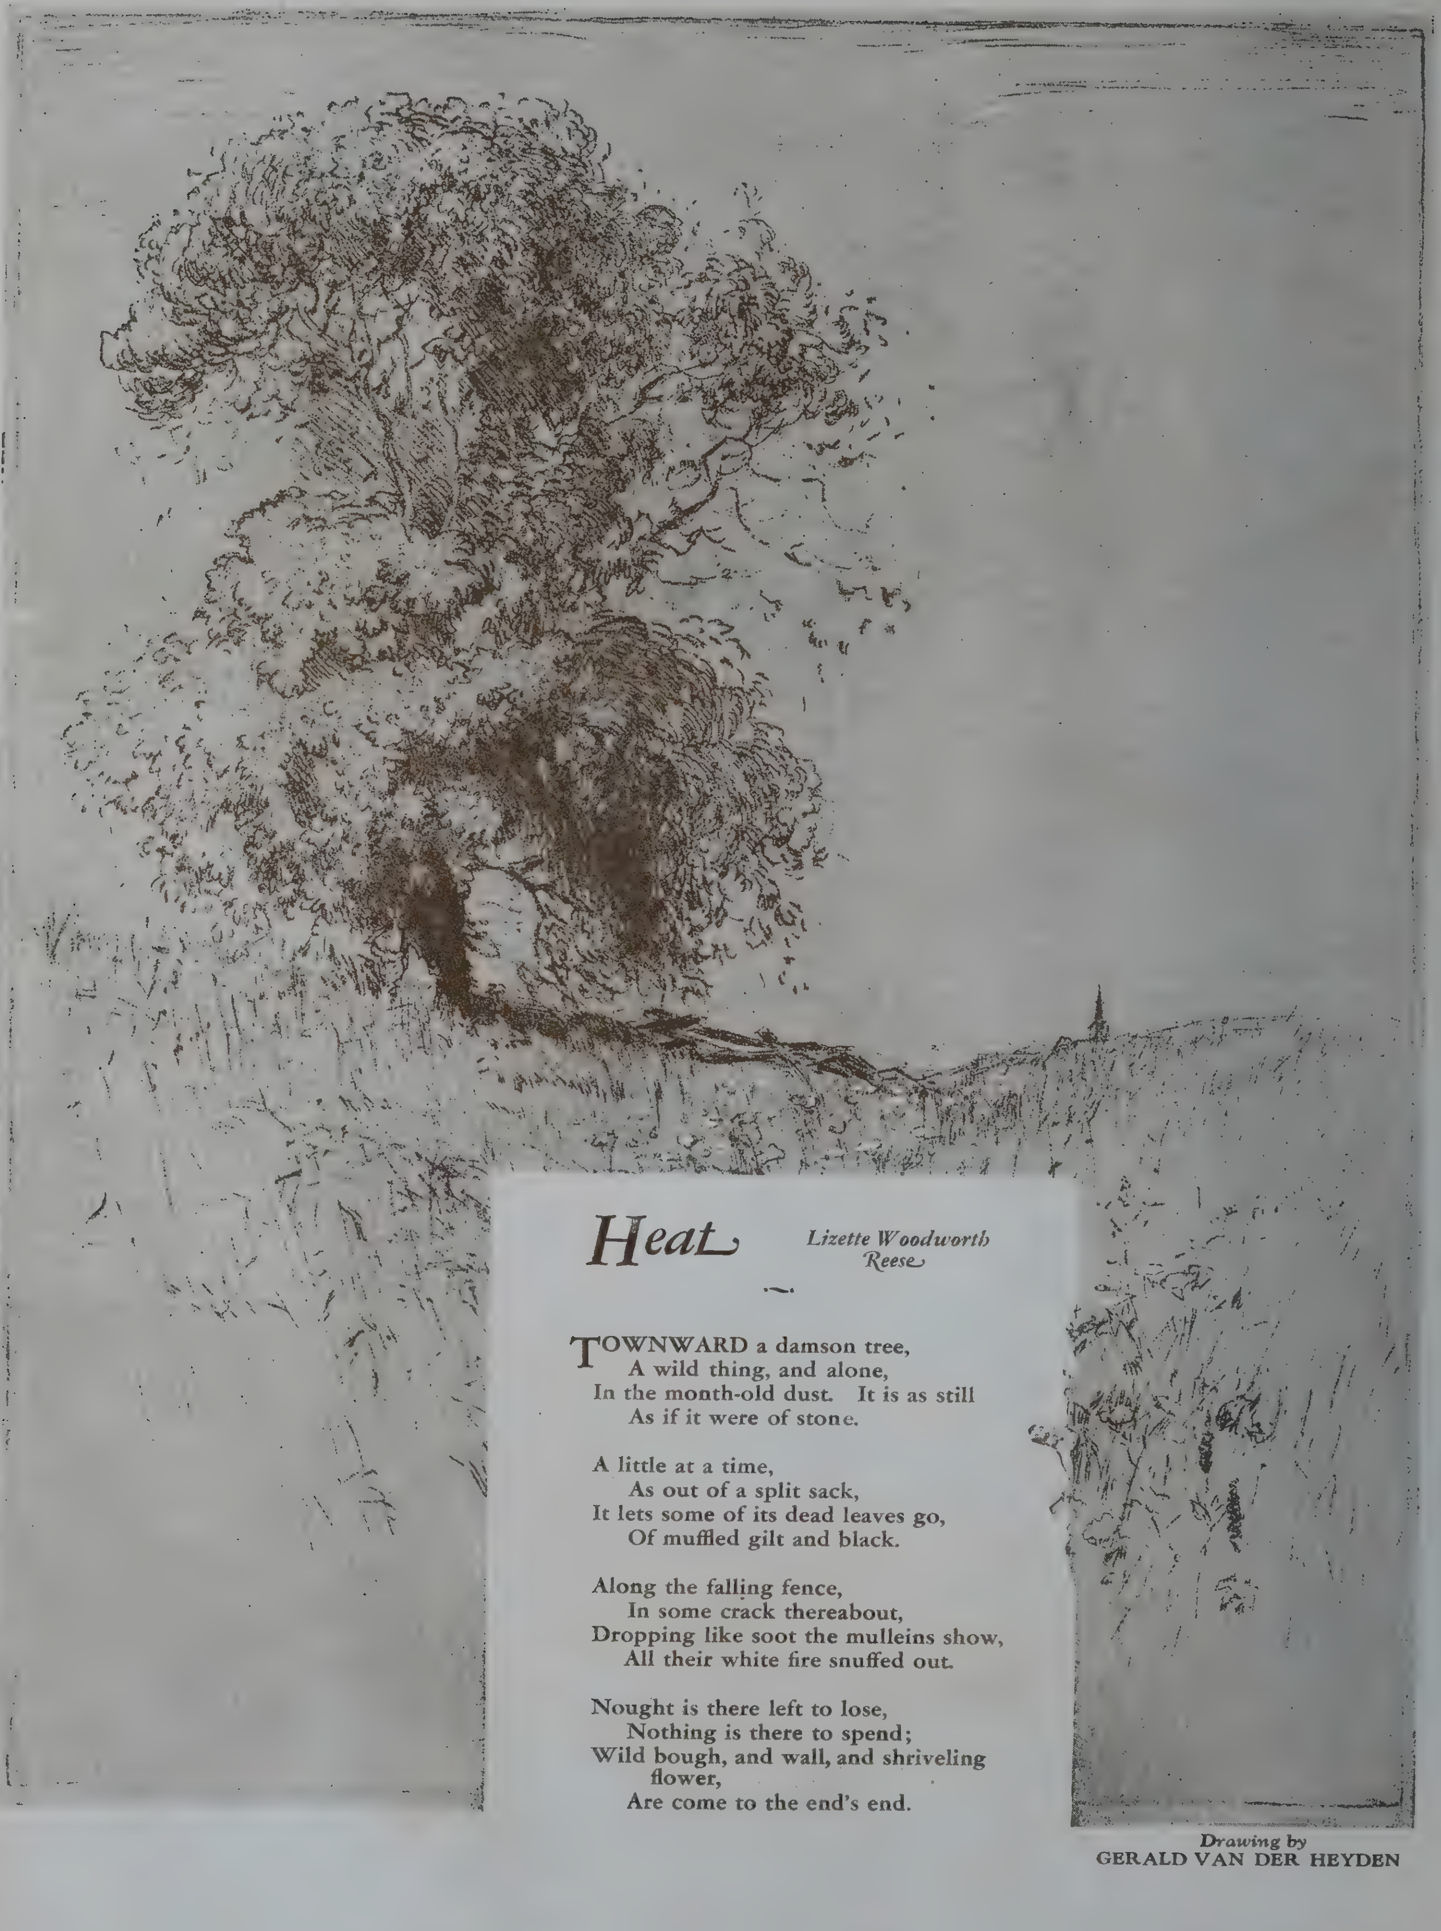
THE WESTWARD MARCH OF SETTLEMENT—Hamlin Garland



Heat

Lizette Woodworth Reese

TOWNWARD a damson tree,
A wild thing, and alone,
In the month-old dust. It is as still
As if it were of stone.

A little at a time,
As out of a split sack,
It lets some of its dead leaves go,
Of muffled gilt and black.

Along the falling fence,
In some crack thereabout,
Dropping like soot the mulleins show,
All their white fire snuffed out.

Nought is there left to lose,
Nothing is there to spend;
Wild bough, and wall, and shriveling flower,
Are come to the end's end.

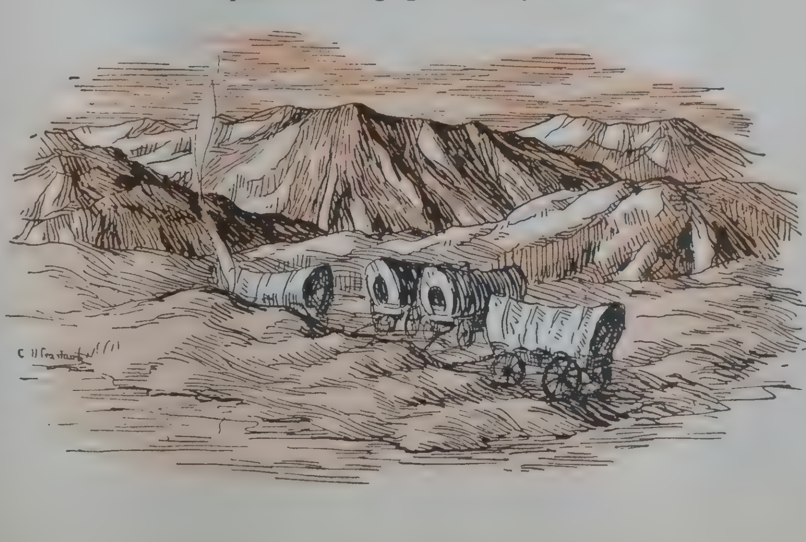
The Westward March *of* Settlement

By HAMLIN GARLAND

Illustrated by CONSTANCE H. GARLAND

IF I were asked to indicate the most characteristic figure in American literature, or in early American life, I should describe the New World pioneer—the man who took his axe, his rifle and his young wife and moved out into the wilderness to open a clearing in the forest and to build a cabin home. His like had never before been seen. Europe colonized in tribes, in communities. The individual explorer is a development of the Western Continent.

From the earliest date of British settlement at Jamestown and Plymouth, or the landing of the Dutch in New Amsterdam, for nearly three hundred years our colonists have been led by this trail maker. Walking his solitary path, this vedette of American civilization has led the way across the valleys of Massachusetts, New York, Pennsylvania and Virginia, and later over the Allegheny Mountains into the forests of Kentucky and Tennessee.



That these adventurous pathfinders, whether Dutch, English, Scotch or Irish, must have been individually the hardiest, the most resourceful of their race, is self-evident, for these qualities are demanded by the forest and developed by the stream. Only men of stout heart and strong hand, those to whom toil and hunger and solitude were accepted incidents in a life of adventure, responded to the lure of primeval vales and silent forest glades. Only the self-reliant could confront the forest and survive.

They were instructed by their savage neighbors:

Adventurous boyhood, quick to trace
The subtle pathway linking hill and stream,
  Explored each camp and fishing place,
Hearing with joy the sachem's dream.
  Pathless no longer, but generous as fair
The forest lured to further quest,
  Daring was born in each sunset flare,
  A passionate longing for the mystic West.

And so through peace and war, from age to age,
This red guide wrought the settler to his type.
Inured to toil, contemptuous of the rage
Of wintry wind, daring the grizzly's gripe,
Behold this grandson of an Oxford clerk
With keen stern eyes and lean brown face
Pursuing the panther in the dark,
Master of the woodland and the chase.

In the beginning this process of social expansion was very simple. In the annals of almost every family in the Colonial communities there came a time when certain of its sons, urged on by their need of separate maintenance, left the parental roof and looked about for land on which to make a living. All the offspring of a homestead could not inherit the home acres. Some of them must necessarily strike out into the unplowed regions to found new firesides. For a generation or two the free land lay a few miles distant, just over the hill or a little farther up the home valley and migration was short. Acres were easy to obtain but often hard to subdue. Those who came first were best served.

For the first century, the Colonies, by this easy, simple process, expanded. Mile after mile, valley after valley, the tillable lands were claimed by immigrants or by the surplus sons of homes already established. New England meadows were plowed, New York forests subdued, and Pennsylvanian hillsides planted, till at the end of the Colonial period, when the supply of desirable acres in the coast states seemed exhausted, the spies began to look away to the paradises beyond the Allegheny Mountains—a region as remote to them as Central Africa is to us.

As early as 1750, twenty-five years before the Revolution, explorers like John Finley and hunters like Daniel Boone had already found their way over the towering Blue Ridge, and down into the almost mythical country which lay beyond; their tales of fertile valleys, bright streams and abundant game led other of the sturdy sons of Virginia and Pennsylvania to migrate, and all through the Revolutionary War settlers were filing slowly through the passes of the hills, seeking the pleasant banks of the Ohio and its tributaries, building stockades and planting fields.

The hardships which the pioneers of Kentucky faced in their isolation are appalling to us of today. Fighting an almost constant war with the red tribes (who very naturally resented the seizure of their hunting grounds), the men of Boonesborough bore an important part in the war against the British claimants of this territory. Clinging with an almost insane persistence to their rude homes, they felt themselves to be (as in a sense they were) instruments in the hands of the Lord, forerunners of the nation's westward march. Although but a handful, they were invincible. The story of their struggle is Homeric in its bravery.

During the half-century from 1750 to 1800, Ohio, Kentucky and Tennessee were won from the red man and defended from the French and English by these stern pioneers, so that, at the close of the Revolutionary War, many thousand discontented citizens of the older Colonies were encouraged to migrate. The land-hungry veterans of Washington's armies, joining the swelling stream of land seekers, rushed eagerly into the new province, the western boundaries of which were unknown.

In Theodore Roosevelt's *Winning of the West*, especially in the first volume, the reader who wishes to know the facts of this struggle will find a fair and careful picture of these intrepid pioneers, and a vivid statement of the stern conditions of their march. That the wilderness has educated the Old World emigrants into something like its red denizens will at once appear. In the story of the furious struggle which went on for more than a hundred years between the rear guard of retreating red hunters and the advance guard of white civilization we see a struggle which was as inevitable as it was merciless and far-reaching in its consequences. It was a never-ending savage warfare which went on along an irregular line from the Great Lakes to the Gulf, a battle which deterred but did not turn back the dreaded invasion. In these inexorable riflemen the red men recognized the representatives of an encroaching destroying race, and they opposed them with all the skill and energy they possessed.

'The life of the backwoodsman was one long struggle,' writes Roosevelt in his *Winning of the West*. 'The forest had to be felled. Droughts, deep snows, freshets, cloud bursts, forest fires and all the other dangers of a wilderness life had to be faced. Swarms of deer flies, mosquitoes and midges rendered life a torment in the weeks of hot weather. Rattlesnakes and copperheads were very plentiful and constant sources of danger and death. Wolves and bears were incessant and inveterate foes of the live stock.'

In addition to defending themselves against nature's forces, these wood choppers and farmers were forced to be their own soldiers. With no help from the government in the East, they built and manned their forts. Fighting under their own commanders, they marched against their enemies on foot. Accustomed to the use of arms from childhood, every boy and most women were expert in the use of the rifle and the tomahawk. Boys of twelve years were given rifles and became at call of a commander warriors in the ranks.

As all the wars waged for the possession of the country between the Alleghenies and the Mississippi were carried on in a never-ending stretch of gloomy woodland, the men moved in irregular bands, on moccasined feet, almost as silently as their foes. The forest was not an open sunlit forest. All the travelers of the time describe it as dense and rank, and in many places impenetrable, broken only by occasional hillside glades or by narrow grassy valleys.

'A man might travel in it for weeks as if in a perpetual twilight, never once able to see the sun through the interlacing twigs that formed a dark canopy above his head,' Roosevelt records, and adds, 'this dense forest was to the Indians a home in which they were as much at ease as a farmer on his own acres. To their keen eyes, trained for generations, the wilderness was an open book . . . With moccasined feet they trod among brittle twigs, dried leaves and dead branches as silently as the cougar. Every tree trunk was a breastwork ready prepared for battle, every bush, every moss-covered boulder, was a defence against assault . . . Lurking, skulking, traveling with noiseless rapidity, they left a trail that only a master in woodcraft could follow . . . Half of the terror they caused was due to the extreme difficulty of following them and the absolute impossibility of forecasting their attacks.'

That this forest and this foe wrought the settler into something almost

(*Continued on page 25*)

About Books *and* Reviewers

By CHARLES J. FINGER

NO MAN, I hold, should set himself up as a guide to books without indicating something of his own standards. So to work.

There are standard measures for lumber, coal, steel rods, textiles. There are tests for bridges, girders, dry batteries, ink, automobile engines, soap, oil. When we buy a yard of this or a pound of that, we are safe in expecting thirty-six inches and sixteen ounces. If a mathematical calculation is made, we may feel certain that it is based upon the fundamental proposition that two times two equals four.

So it seems odd to me that, when critics and reviewers attack a book, we are not by any means certain that the gentlemen have a definite standard of judgment. Or if they have, it seems, sometimes, to be a variable one. That which is approved by them one week seems to form no criterion for the work to be passed in review the week after. Consequently there arises an Alice-in-Wonderland uncertainty, much as if going to buy a pound of sugar a man were given twelve ounces of it. Whereupon, objecting, he might blandly be told, 'Well, it's twelve ounces to the pound today. Sixteen ounces was all right for January and February, but not for May or June.' Such elasticity would be more startling than pleasant.

It is my contention that some reviewers, not all though by any means, have no measuring stick at all. Some of them manage to say nothing with a torrent of verbosity. They play the game of mystification. They are opinionative, shallow, 'smart' with a silly smartness. Take a case, a recent one.

There has appeared a book by a man who tells us that the novel has had its day, and the newest thing is superrealism. Some have praised the work. I quote a passage, not torn from any modifying context, but as typical of the whole book as a glass of water is typical of all the water in the tank from which it was taken. Here it is:

> I and John swing for the stairway down tripatripatripatriptrip rails bronze almost the with stairway marble almost the up unheeding them beseeching space Benefactorial John money more for room there 13 only MDCCCXX men 42 women 12 growth and John struggle of Half-Century First the during them of left to Benefactors them John of right to Benefactors Age Bronze the past jingling, dancing, tingling a John heart morning my sets that, vine of juice like, kine of breath John like in you breathe and rub and in nozzle John one's put to; cub a like with toy to John round and, pat to smooth and kiss to John warm made fat of roll little merry John her and Bacchante the of conscious John "1900 of nothing expose Exposition John

You can analyze, parse, read it sideway, backward, upside down, without getting any sense out of it—because there is no sense in it. In other words, it does not stand the test of intelligibility, and intelligibility, I hold, is the first test in literature as in everything else. So out it must go, and out must go all books of its kind.

Test number one then is intelligibility.

Test number two is based on common sense. Literature either is, or is not (among other things), the picturing of life as it is. And in life, that which counts most is character. In a true novel, the action grows out of the conflict of character upon character. In the novel that rings false we find instead of characters that live, something very like dolls and puppets jerked this way and that by the author, for the purposes of a set of imaginary circumstances which he calls plot.

In other words, as in life things come to pass because character meets character, or character opposes environment; so, in the book of fiction worth while, the paramount thing is the creation of character. And you will find, as authors have created character, so have authors lived. You think of Washington Irving, and at once Rip Van Winkle springs to mind. You think of Dickens to remember Pickwick. Hawthorne's name brings up a memory of Priscilla and Judge Pyncheon and Hollingsworth. But who remembers the name of the hero of *The Mystery of a Hansom Cab?* Or of Bellamy's *Looking Backward?* Or of Brown's *Wieland?* But you do remember, as clearly as if they had lived in your presence, these: Tom Sawyer, Huck Finn, Becky Sharp, David Balfour, Long John Silver, Mrs. Proudie, Robinson Crusoe, and a hundred more.

Test number two then is that a novel shall be a picture of life and society as it is, that characters shall be put upon the page exactly as they are in real life.

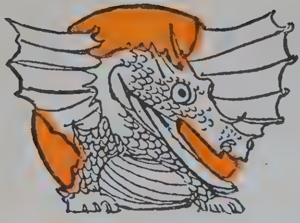
Test number three is what I would call the reading test. That is, the book must carry the reader along; shall interest; shall flow, in a word. To accomplish that there must be the well-built sentence, the right word, the turn of expression that indicates painstaking care.

So, in plain words and stripping things to bare bones, there are the first three tests by which I, at any rate, judge a book. And those tests apply today as they applied fifty, or a hundred, or five hundred years ago. They apply to the novel new from the press exactly as they apply to Chaucer. To be sure there are other niceties, but those I have named will do.

I pick up a book which Dutton puts out, one by a new hand, an Edna Bryner. The title is *Andy Brandt's Ark*, not a very happy one. But take it from me, it's a good story. It is civilized, cultured, intelligent. As for the tale, it is built upon the collision of character upon character, for a young girl achieves heights of culture to which her relatives and friends cannot attain because of lack of opportunity. An old and worn situation, to be sure, but the young author is admirable in reproducing impressions of life.

The Duttons have another good book in their new list. It is *The Sea and the Jungle*, by H. M. Tomlinson, a reprint of a book which appeared some seven years ago. The subtle descriptive touches make it a book to read again and again. A third book from the same house is a piece of fantasy and adventure, John Taine's *Quayle's Invention*. It is all about the discovery

(*Continued on page 24*)



In the HOUR of the TIGER

'Foreign Devils' *Witness* Weird Rites

By **L. M. CRAMER**

IT WAS the 'hour of the tiger' when about thirty 'foreign devils' arrived at the Confucian temple in Nanking. We had started an hour and a half earlier, and had walked, single file, over sharp cobblestones, through narrow, tortuous streets, our pathway lighted only by the thirty bobbing yellow and green Chinese lanterns we carried. We were going to the sacrificial ceremony of the equinox, performed each spring and autumn in honor of Confucius, in temples dedicated to the venerated sage throughout all China.

The 'hour of the tiger' is that weirdest hour of all the twenty-four—that most uncanny, eerie hour that comes just before the first faint gray-pink light in the east heralds the coming of day. It was three o'clock in the morning.

Our lanterns reflected grotesque figures on the white surfaces of the spirit fences as we passed through the night on our way to the Confucian temple, which our Chinese guide had assured us was 'but a step distant' from our homes. The Chinaman's 'but a step' is like the Alabama Negro's 'right smart walk'—it is elastic in its length.

As it had been promised to be 'but a step' we had not ordered our rickshas to come for us; but it took an hour and a half to walk over the rough, uneven streets extending between our boarding house and the temple, where the sacrifice of food and animals was to be made to Confucius, that he might heed the prayers of the faithful and reward them with bountiful crops; with rain in plenty to water them, and sunshine to mature them.

One of many idols in a Chinese temple.

Inside the temple yard we found other foreigners and a few hundred Chinese. The courtyard of the temple was lighted by two great iron baskets filled with blazing wood, the baskets being fastened to tall poles at each side of the main entrance to the temple. The effect was of two gigantic torches throwing light into every corner of the temple yard, and into the streets leading to it for quite a distance away.

—Herbert Photo.

'God of Destiny,' a great wooden figure, covered with gold and jewels, in a Chinese pagoda.

On each side of this main entrance were grouped musicians, their instruments being those of the time of Confucius, more than 2,500 years ago. Large barrel-shaped drums were placed on pedestal-like platforms, which were decorated in many bead ornaments. There were queer-shaped horns, and also flutes. Red, yellow, and green Chinese lanterns bobbed about in the night breezes, lending their splash of color to the fantastic scene.

We went inside the temple and faced an altar, above which hung a large, elaborately carved and gilded wooden tablet to Confucius. On the left hung tablets to the memory of the father and mother of the sage; to the right hung other tablets to the memory of the great man's apostles.

The sacrificial animals were brought in. In front of the great altar were placed a goat, a cow and a pig. Before these animals were slain, we learned later, they were brought into the temple and led up onto a platform set between rows of lighted tapers, were bowed down to, and then killed.

The long black hair on the Chinese pigs had been completely shaved off except for three little tufts that marked the line of the backbone. The animals were placed in kneeling postures before the altar, and facing the tablet to Confucius. Before the altars to the disciples and to Confucius' father and mother were placed slain goats and pigs. Many bowls of Chinese food other than animal also graced the altar of Confucius: rice, sea slugs, fish, vegetables, thousand-year-old eggs, and wine in white jade cups.

We waited nearly an hour longer for the ceremony to commence. Suddenly the drums began a more rapid beat, and the notes of the Chinese flutes shrieked in a regular frenzy, thus heralding the approach of the military governor, the tuchan of Nanking.

The master of ceremonies appeared from the recess of a dark shadow, and took his place. Out of other shadows materialized the dancers, the choir, and another orchestra apart from that without the temple entrance. Each group took its place for the ceremony. The governor, in native military uniform, but wearing a tall silk hat very foreign, indeed, approached the altar. He was attended by a police guard, armed, and acolytes bearing lighted torches.

Down through the open court they came, until the governor approached the steps leading to the central entrance of the temple. There he stood for perhaps five minutes; at regular intervals he kotowed, three times in all, with nine kotows in each group. Then he approached the altar and offered sacrifice, and returned to the same position, just outside the temple doors. This he repeated three times. The master of ceremonies announced each stage in the proceedings, his words being taken up and repeated by a second man in ceremonial robes, who stood back, nearer the temple door, perhaps for the benefit of the orchestra and the temple dancers.

Devil in the Temple of Hell, Nanking.

The orchestral instruments were weird. There were Chinese flutes with their plaintive note and an instrument called 'sen,' of twelve pipes typically Chinese, a pipe for each month of the year, played by the mouth. This instrument is said to be the original idea from which our pipe organs grew. There was a long concave table instrument, with strings upon which the performer plucked, as does a harpist, and an open box-like structure of wood, beaten upon with hammers, most unmusical to Occidental ears, and large and small barrel-

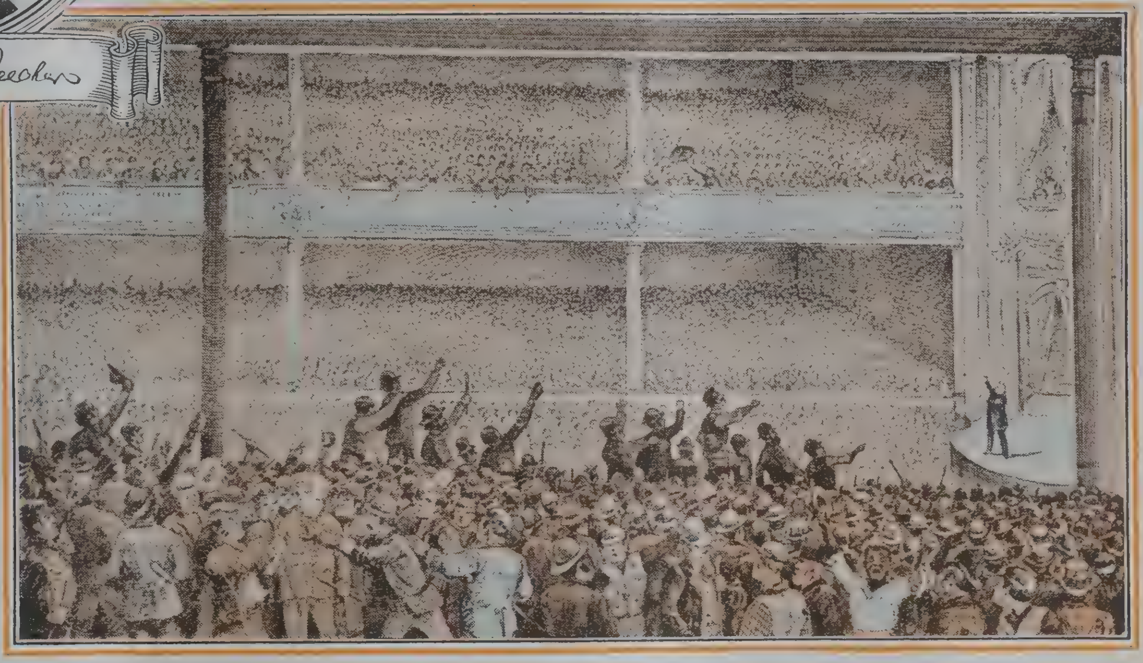
Henry Ward Beecher

Here Was an American! —Unafraid *and* Unashamed

By ALBERT MILLER



Reproduction from an old print, showing Mr. Beecher facing an English mob in Liverpool.

'NO MAN ever knows *what* his country is to him until *he has* gone abroad *and* heard it everywhere denounced *and* sneered at.'

IN THE days of our Civil War, foreign enmity menaced the life of our nation. Then France was doing its utmost to promote the dissolution of the Union and itself gain by conquest a foothold on this continent. Then the government of Great Britain gave help to the Confederacy and permitted the building of *Floridas* and *Alabamas* in British shipyards. It was then that Henry Ward Beecher faced the enemies of the Republic on English soil, and on hostile platforms, before British audiences that tried to hoot him down, and championed America as one who rejoiced in his nationality and gloried in his country's cause.

Contrast his loyalty with the conduct of the voluntary expatriates who curry foreign favor by charging America with dishonor and who, themselves soulless, proclaim that their country has lost its soul!

In that day Britain was ruled by its aristocracy. The right to vote had not received that extension through which its government has come under the control of the people. The ruling classes looked with fear upon the rise of the American democracy in strength to power. They saw in it an antagonistic form of government, the success of which would be an object lesson ever menacing the perpetuity of their special political privileges. It was the triumph of this experience in popular sovereignty that liberalized the institutions of government in every English-speaking country in the world. The war maintained by the North for the preservation of the Union was no less in its consequences a war for Britain's political enfranchisement. Had it failed, the common people of Britain would still be denied the ballot.

As political England was moved by hostile feeling, so was commercial England. It beheld in America the growth of an economic rival that some day might become a contestant for world leadership. Moreover, England was then almost supreme in cotton manufacture. The Confederacy produced most of the world's cotton. Each had intimate need of the other. Free trade between them seemed to spell greater prosperity for both, but free trade with the Confederacy could not be established until the Union should be destroyed. The one promised the other in preferential supply raw material not elsewhere procurable in volume and would open in exchange a great consuming market for English manufactures. But while the war endured and the blockade of southern ports continued, the spindles of Lancashire were idle. Great numbers of mill hands, men and women, lacking employment, were thrust into want. Yet even in their misery the workingmen of Manchester gave their sympathy to the cause of the Union and free institutions. They could not vote but they could think for themselves—and did. And their thoughts were not the thoughts of the aristocracy that ruled them. Witness the historic fact that at the end of 1862, on the eve of the new year, they sent Abraham Lincoln a series of resolutions and an address giving him their utmost moral support. Lincoln was conscious of the suffering the war had inflicted upon these non-participating victims. In a letter dated January 19, 1863, addressed 'To the Workingmen of Manchester,' he made acknowledgment of their attitude 'as an instance of sublime Christian heroism which has not been surpassed in any age or in any country.'

These were the Union's only friends—the voteless common people. Nearly all others were opposed. Lyman Abbott, Beecher's biographer, writes: 'British feeling against America was sedulously cultivated by some eminent journalists and by not a few reputable men. To speak for America was to invite every species of insult and indignity from Confederate sympathizers and was not sure to receive encouragement or support from the few sympathizers with the North.' Pro-Union sentiment in what was called 'society' was everywhere overawed and expression of it was punished by ostracism. With a few notable exceptions, among them Queen Victoria's German husband, Prince Albert, John Bright and the Duke of Argyll, almost the only friends of the North were to be found among the common people.

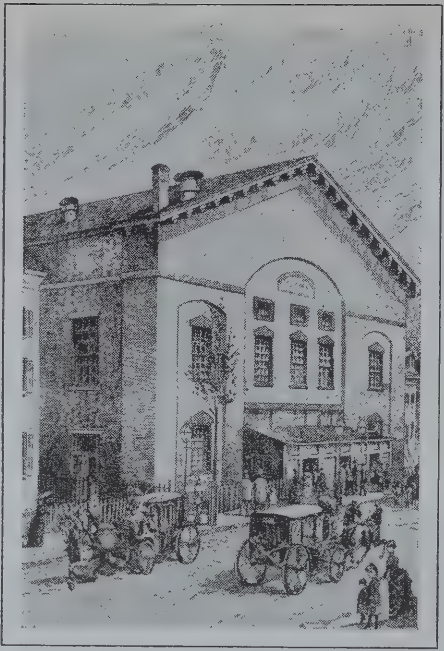
DENIED the ballot these politically submerged classes nevertheless exerted a profound moral influence. In them alone, not in high places, was the flame of England's conscience kept alive.

Parliament, at any time after the outbreak of the Civil War, would have voted to support the South against the North, had it not been for fear of the plain men and women who still could express their convictions, even though they were forbidden to approach the ballot box.

The socially centralized, class-ruled government of Great Britain itched to plunge the knife of intervention into the Union, torn by its internal dissension, but it did not dare thus affront the liberty-loving common people.

Such was the state of public opinion when Beecher visited England in 1863. Born June 24, 1813, he was then in his fiftieth year. Although in the prime of life, he had at that time drawn too heavily upon his strength. He had toured the Northern States preaching the gospel of patriotism to the people, rousing their courage to needed new endeavor and inspiring them with patience to bear their burdens. That labor had so drained his energy that rest became imperative. So he resolved upon a vacation of two or three months in Europe. Complete relaxation was his objective. He had no thought of resuming upon alien soil the crusade he had just concluded at home.

No less an artist than George William Curtis drew this portrait of the Beecher of that day: 'A man of the people; a man of strong virility, of exuberant vitality, of quick sympathy, of an abounding humor, of a rapid play of poetic imagination, of great fluency of speech; an emotional nature overflowing in ardent expression, of strong convictions, of complete self-confidence; but also not sensitive, nor critical, nor judicial; a hearty, joyous nature, touching ordinary life at every point and responsive to every generous moral impulse.'



Mr. Beecher's Church, Brooklyn, New York.

Beecher learned almost at once upon his arrival in England that its atmosphere, social and political, was hardly more hospitable than would have been that of Richmond itself. He thus describes the impression made upon him: 'When I reached England and saw what was the condition of public feeling there, I refused to make any speech and declined all invitations. I would not go under the roof of any man who was not a friend of the North in this struggle.'

He could not bring himself to breathe that hostile island air one day longer than was necessary. The Continent might not reveal a larger friendliness, but that England, the England of his culture, the land of his fathers, the England wherein was rooted the stock from which he came—that England should show such a spirit hurt him to the soul. So he crossed the Channel.

'I STARTED from England,' he records, 'refusing to make any engagements or to say anything publicly. I was in a towering indignation.

'Almost every man in England who rode in a first-class car was our enemy.

'The great majority of professional men were our enemies.

'Almost all the Quakers were against us.

'Almost all the Congregational ministers in England—not in Wales— were either indifferent or lukewarm—directly opposed.

'The government was our enemy.

'It was only the common people and mostly the people who had no vote who were on our side.

'Everywhere the atmosphere was adverse. In Manchester our American merchants and men sent out to buy were afraid and knuckled down to the public feeling. The storm in the air was so portentous that they did not dare to undertake to resist it.

'No man ever knows what his country is to him until he has gone abroad and heard it everywhere denounced and sneered at.'

If that cry was drawn from Beecher then by the sentiment of foreigners, who probably were but engaged in 'saving their souls,' what could he not say were he living in our day of an England and a France filled with the shrill scolding of boot-licking American expatriates everywhere denouncing and sneering at their country and accusing it of dishonor?

While Beecher was on the Continent came the news of Gettysburg and of Vicksburg. On Pennsylvania's hills the Confederacy, in magnificent valor, had reached its highest tide. At Vicksburg it had known the first of the surrenders in which its life was to be exhausted. He was eager to return home and went to England but to secure his passage. Again urged to make a series of addresses, he refused, saying: 'I don't want to

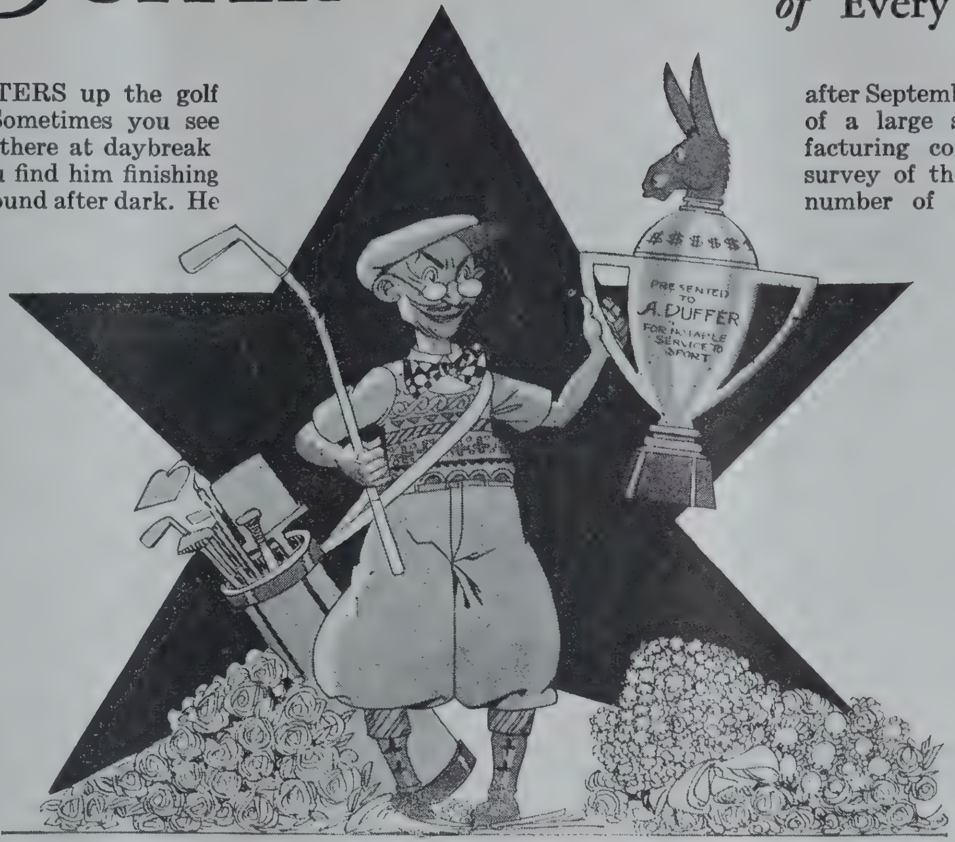
The DUFFER

He *Is the* Main Support *of* Every Sport

By H. G. SALSINGER



HE CLUTTERS up the golf links. Sometimes you see him out there at daybreak often you find him finishing his last round after dark. He spends much of his time off the fairways, deep in the rough, or in the bunkers. He introduces golf at every opportunity and often makes a nuisance of himself doing so. He will talk for weeks about a hole he made in par and for months and years about a birdie. Few of his kind ever break a hundred and when they do their friends flee. But, in this hour of triumph he would willingly part with his dearest possessions to celebrate his achievement, for he is the well-known duffer of golf and of him this country has more than two millions.

Comic-strip artists picture him, cartoonists tease him, comedians make snappy remarks about him, the joke-smiths have a great deal of fun at his expense, and the newspaper columnists base many bright paragraphs upon the futility of his pursuit. But he and the few million like him keep right on and their number increases annually.

The duffer is by no means limited to golf. You find the duffer in every sport. He abounds in baseball, tennis, basketball, hockey, swimming, polo, in every sport that you can name and it is the duffer that makes sport possible.

'They laugh at the duffer but where would the golf clubs be today without him?' asks Gene Sarazen. 'It is this same duffer that has made golf the game it is and who keeps it going.'

'Why laugh at the duffer; we were all duffers once,' says Leo Diegel.

'It is the duffer who gets the most fun out of golf,' observes Francis Ouimet.

Of the several million people who play golf in the United States, only a fraction of one per cent will shoot consistently under 100. The vast majority remain duffers. But this majority continue to chase par over several hundred, rather several thousand, golf courses that dot this country from ocean to ocean and from border to border.

It is this eternal hope of some day shooting under 100 that makes golf possible in the United States on its present magnificent scale. If the game depended for its existence upon the fraction of the one per cent who can consistently break 100, the game would cease to exist as a popular sport; it would be limited to a few select clubs.

The men 'that pay the freight' of golf in this country are the men who clutter up the golf courses, trying to produce a score of two figures. They are the great enthusiasts of golf, the men who pour the money into club treasuries that makes possible the magnificent clubhouses and well-kept courses.

One clubhouse and one course could accommodate all the topnotch golfers this country holds and most of our ranking golfers, amateur and professional, do not happen to be men of large bank accounts. It is the duffer who puts up the money, who makes possible the big tournaments and who keeps the golf supply houses working overtime. It is the duffer who keeps the professionals at work and most of them for salaries larger than the average bank president receives.

Last September one store in a middle western city sold 723 tennis racquets. These sales came in the last month of the tennis season, for tennis is rarely played in the northern belt after September. The investigator of a large sports goods manufacturing concern in making a survey of the tennis courts of a number of cities last year reported every court he visited crowded with players awaiting their turns. None of these players was an expert; all were duffers; but in tennis, like in golf, it is the duffer who keeps the game going.

Where you find tennis clubs and club-owned courts, you will discover that the majority of members are not finished players; they are enthusiasts who play tennis for the love of play. It is the duffer who keeps the courts crowded and it is the duffer who stands the expense of the big tournaments. He fights for these tournaments; they give him an opportunity to watch the experts in action and to try to copy their style.

'Gee, you surely see some terrible baseball on these sand lots around town,' a spectator told Stanley Harris, manager of the Washington team, one day last summer.

'And if it wasn't for the terrible baseball you see on the sand lots where would we be?' asked Harris in reply. 'When you come to a major league park you come to see players who used to play terrible baseball themselves on the sand lots. If the fellows who are playing on the sand lots don't go into professional baseball they still attend professional games and while they are playing bad baseball, probably, on the sand lots they are creating interest in the game and they make converts to the league parks and organized baseball.'

Basketball is one of the most popular games in the United States. The Alpine team that was runner-up for the high school championship of Tennessee last winter came from a hamlet that has no telephone, telegraph, automobile or electric lights. Only six families live there. But they developed a championship team. Basketball is played in nearly every hamlet, village, town and city in the country and this fact caused the national

She is confronted with the task of entertaining a drone.

Marrying an Actress

By LADY CYNTHIA ASQUITH

Illustrated by RUTH A. THURBER

EARL Marries Actress!' What a wealth of implication in this and similar headlines! The suggestion is: 'Hullo, another divorce in the making!'

How unfair this is! Equality of birth and of breeding is certainly not one of the *sine qua non's* of a happy marriage. In spite of all the pessimistic wiseacres, there are many precedents, from King Cophetua downward, in which the condescending husband or the 'stooping lady' has lived happily ever afterward.

Let us face the facts. There is today more than one fortunate member of our aristocracy who has, as it is said, married beneath him—nay, he has chosen a bride even from the stage, one who, everyone must admit, has been the 'making of him.'

Equally we must own that there are sufficient examples of 'suitable' brides who have daintily stepped from one stately home of England into another, therein to live *un*happily ever afterward. Too often they have married in haste for the sake of trousseau and change of scene. If *noblesse oblige* were an unfailing instinct the matter would be a very different one, but, alas, it is liable to long dozes or may dictate only one's duty to oneself.

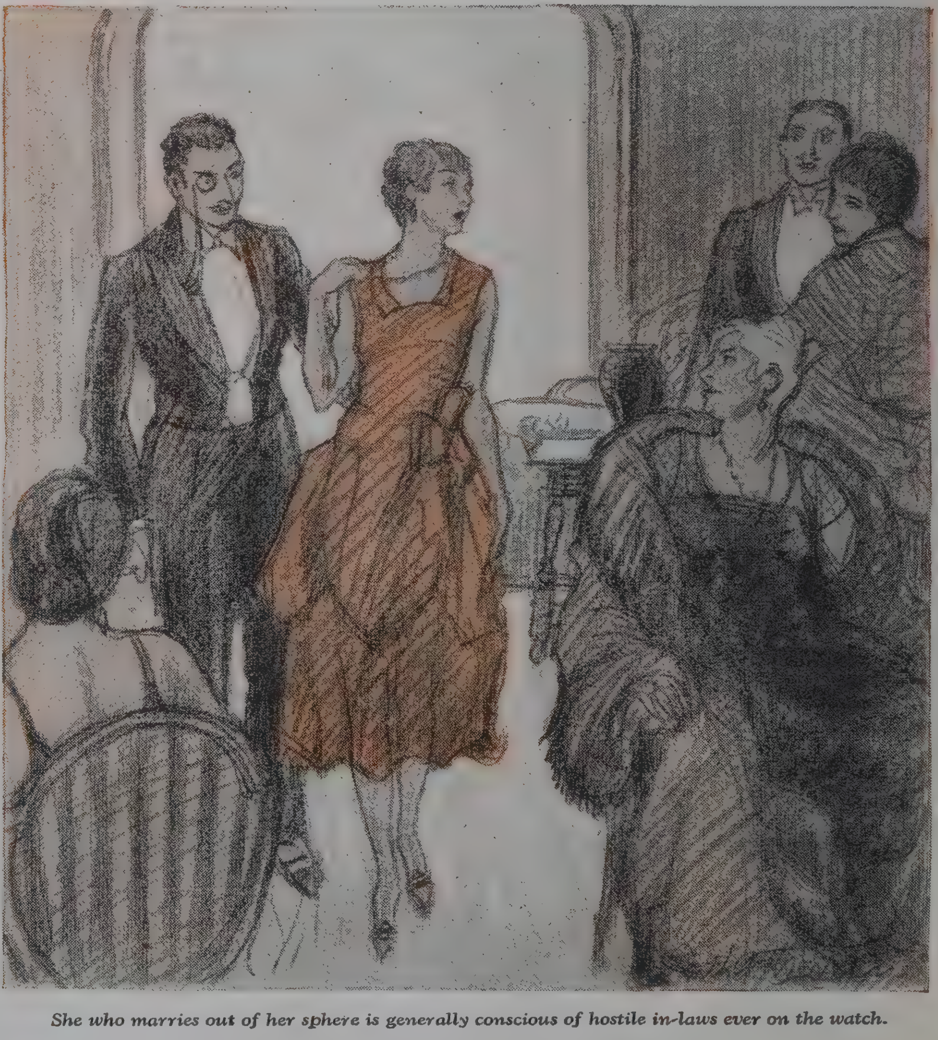
On the other hand, she who marries out of her sphere is generally, so to speak, putting herself on her mettle. Conscious of taking a step, she is likely to be extra-anxious to make a success of it. She will see herself, as it were, in a new part, and—if she have no higher motive—ambition and vanity should help her to play it creditably. And yet how difficult things are generally made for her! Hostile in-laws ever on the watch for errors in manners and morals.

We all know how much can be effected by constant suggestion. How seldom she is given anything like a fair run! That she succeeds as often as she does is indeed to the credit of her sex. The chorus of 'I told you so's' is in training for the first cue. If things go badly the sponge is thrown up for her far sooner than it would be in the case of a conventional marriage.

Possible bridges of reconciliation are blasted by eager relations, every chance of retreat is cut off, and the failure of the doomed marriage proclaimed from every housetop! . . . In these shipwrecks it is not so much any subtle out-of-touchness or incompatibility due to disparity of rank that is generally the agent; it is much oftener boredom, the result of idleness. Accustomed to earning her living among companions with the day's toil forming an invaluable foil to pleasure, she is now confronted with the task of entertaining a drone.

How easy to be an agreeable wife to a man coming appreciatively home from work, but how difficult, what rare qualities are required to satisfy the completely leisured! Professions are the safeguard of marriages. The unemployed have too much time in which to see both their own and other men's wives. Talents and hobbies ('resources,' as they may be called) frequently form adequate substitutes.

In the case of the dreaded daughter-in-law I would far rather satisfy myself as to her 'resources' than as to her pedigree.



She who marries out of her sphere is generally conscious of hostile in-laws ever on the watch.

When New York Goes *to* Paris

By L. C. K.

A NEW York evening paper had the bright idea of sending a reporter to Paris to give an account of economic conditions. For this task the selection fell upon a somewhat doubtfully distinguished hyphenated German-American. This delicate type of attention from a New York journal naturally touches the French. If only the enterprising journal could have obtained a German U-boat captain to observe the Parisians and to report his German or German-American observations! That exquisitely good taste conduces to promote international friendship.

This German-American in Paris was astounded at the cheapness of pretty nearly everything. Evidently the journal pays its reporters well, for this journalist is accustomed to buying his suits at one hundred twenty-five dollars in America. Alack, most journalists and scribes in the United States, certainly those not hyphenated, must content themselves with suits at thirty or forty dollars. This New York (?) journalist was amazed to buy a tie at twenty francs 'which in New York would cost three dollars.'

This naïve reporter found it difficult to pay more than a dollar for his dinner in Paris. Apparently his knowledge of Paris suffers from decided limitations even as does his knowledge of New York. There are a hundred restaurants in Paris, almost wholly devoted to the foreign trade, where a dollar will *not* buy a meal.

In point of fact the necessities of life, like butter and eggs and meat, cost approximately the same in Paris as in America. Clothes are cheaper but are about the same as in London and elsewhere on the Continent. Rents are cheaper particularly when you get a cheap apartment, without central heat and with a lack of the decencies. Taxis and drinks are cheaper and so is human labor, but those things do not play a great role in the expense of the tourist.

NEW Yorkers who come to Paris expecting to enjoy at most modest expense a 'fool's paradise,' as Paris is affectionately termed by the hyphenated journalist, are due for a real disappointment, as they will find that while the franc is only three or four cents, yet if it is said often enough, the total is sufficiently large even in dollars.

International good fellowship and real understanding of economic conditions the world over are both highly desirable. However, good fellowship is not furthered nor light or economic conditions obtained when an American paper sends a naïve German-American, with the accent on German, to report on French conditions.

Eating *in* Many Languages

One May Do This *by* Going the Rounds *of a* Big City's Restaurants

By A. R. PINCI

MOST of New York's gay or picturesque or eccentric restaurants, particularly those directly related to aristocratic Fifth Avenue or overlighted Broadway, have vanished. Fashionable or gay restaurants, according to their proprietors, are commercially unprofitable without wines, beers and liqueurs. But there are still plenty of restaurants.

Side streets abound with unadvertised places where one may eat the most unusual delicacies. Whether it is an Armenian or a Kosher or a Spanish or a Russian or a Chinese restaurant, the first impression is that of dinginess.

The New York restaurants, hidden away in the recesses and nooks of Lower Manhattan, afford nearly every delicacy known to man. A few years ago when the Philippine Islands occupied, politically, the attention of the people more than now, there was a place—neither restaurant nor store—where one might buy dried locusts, either plain or made up into cakes. Such food was munched dry by the pocketfuls as Americans munch salted peanuts.

I have tasted cooked rat (this was in Paris), although I did not know it at the time. It was offered as some kind of bird, and in the sea of gravy not even a zoölogist could have told the difference. Snake, too, I have eaten which I found too sweetish, but not unlike our common eel. Snails—either cabbage or vine-fed—formed a dish that I ate years ago quite regularly with much relish.

Strangely enough, when one reads on an ordinary menu 'Spanish omelet,' which is not Spanish at all, one condemns Iberian cooking as unpalatable.

But why not try at a Spanish restaurant some *puchero*—a stew of beef, bacon, chicken, chick-peas and other vegetables—or *codorniz* with *alcachofas* (quail and artichokes)? *Boquerones*, or fried anchovies, are to be found on the West Side.

Hungarian goulash is another dish which figures in American restaurants, but it is not Hungarian. *Gulyas* or *paprikahuhn, risibisi* and *beuschel* must be sought at a genuine Magyar dining place.

The Danish and Norwegian *jordboer* and *rodgrod, med flode* (strawberries or fruit jelly with cream), are not sufficiently individual or different to warrant undue attention, though both are favorites of Scandinavians, but if opportunity presents, *rensdyrsteg* with separate *gronsager* (roast reindeer and vegetables) should not be missed.

Moroccan *kesk'soo*, a national dish of *semolina, khoobz, karmus* and *kawha*, taken under Moroccan auspices, are peculiarly distinctive. The salad of the Moroccans is an institution; it consists of cucumbers, white onions, green peppers, tomatoes, garlic, vinegar, salt and oil, the pieces cut in cubes, and the whole mixed with one's fingers. The natives believe that a good salad depends upon either spirit or inspiration, so *djinnoon* (spirits) must be invoked. Whether such spirits can be conjured in Manhattan as readily as in Morocco, after the muezzin has called the sunset prayer, '*Lah Allah il Allah, Mohamet reoul Allah*,' the writer deponeth not.

Turkish dishes are very delicate and yet tasty. *Pilaf*, a rice dish, and *mousakkah*, or eggplant pie, are favorites. Stuffed grapevine leaves form a dish liked by most Americans. *Basduk* is evaporated grape juice, with flour or starch added, sun-dried for two days and then preserved in airtight jars. The Armenians like walnuts strung on twine and then immersed in grape molasses (*rojik*).

There is a vast difference between commercialized Chinese food and the food served at the table of a Chinese individual. Chinese food is now alluded to in the United States as either *chop suey* or fried rice, but there are hundreds of delicacies which the Chinese-American restaurants in our midst fail to produce. Seaweed soup with lotus berries, bean cakes and bean cheese are not especially palatable. Bean oil is a favorite medium in Chinese cooking, and in China is used (or was used) because Europeans and Americans are supposed not to like its taste.

RUSSIAN dressing for salads is often heard about, but little is said and known about Russian cooking. Novelists mention *zakuska*, or appetizer, to give the the necessary local color. But *shashlik*, peasant style, is very appetizing mutton which only recently has made its way to more aristocratic tables. Curd dumplings, or *varennik*, sour black rye bread, coffee with *penki* (a sort of foamy cream) are worth trying.

These are, of course, only a few—a very few—of the innumerable foreign dishes which in general may be discovered in native dining rooms concealed in our larger cities. If they do not appear on the bill of fare the native cook probably can turn them out without trouble on order.

Education Has Its Limits

THERE never was and probably never will be a system devised that will put brains into men's heads, and until such a system appears we must expect to find in men the same differences that have always marked them, whether with books or without them, in or out of college.

Take a group of wholly illiterate men, men who cannot read a date on the calendar, who cannot write their own names, and you will find a difference in brain power among them. One man will exhibit more native intelligence than another; he has brains even if he has little book knowledge; he has foresight, insight, initiative; he knows what he knows, and, therefore, possesses confidence and a sense of mastery.

Passing a group like this through college would probably not change the comparative brain values; one would still be more intelligent than the others. The average of ability might be raised, but there would be no enlargement of native brain power.

Just as there are some stones that will not take a polish, so there are minds that cannot be standardized so far as knowledge and the ability to use it are concerned.

An able man is a man who can do things, and his ability to do things is dependent on what he has in him, and what he has in him depends on what he started with and what he has done to increase it.

EDUCATION and ability to do things are not interchangeable terms. You cannot educate brains into a man's head but you can enable him to make the most of the brains he has. A man who cannot think is not an educated man no matter how many college degrees he may have acquired. One who can think things out can usually do them. Education along the right lines stimulates the mind and brings out its best qualities. But as crops cannot spring from barren soil so thoughts that are worth while will not come from a dull brain. Education is not to blame if it cannot do for a man what he cannot do for himself. It has its limitations.

A man who cannot think is not an educated man, however many college degrees he may have acquired. Thinking is the hardest work anyone can do, which is probably the reason we have so few thinkers.

There are two extremes to be avoided: one is the attitude of contempt toward education, the other is the tragic snobbery of assuming that marching through an educational system is a sure cure for ignorance and mediocrity.

One benefit that education can confer on a man is to give him an equal start with his fellows. Sometimes even that is not an advantage, but in the main and for the general run of human beings, perhaps it is. You cannot learn in any school what the world is going to do next year, but you can learn some of the things which the world has tried to do in former years, where it failed, and why it succeeded.

There are men at work today on theories fundamentally wrong, but they do not know that other men have followed that road and have had to come back. An education which consisted of signposts indicating the failures and the fallacies of the past, doubtless would be very useful. If education had as its objective the putting of the student in possession of the world up-to-date, so that leaving school he could meet the step of humanity it would be a great service. But whether this is the objective, it may be better to let educators themselves decide.

The best that education can do for a man is to put him in possession of his powers, give him the control of the tools with which destiny has endowed him, and teach him how to think. The college renders its best service as an intellectual gymnasium, in which mental muscle is developed and the student strengthened to do what he can.

To say, however, that mental gymnastics can only be had in college is not true, as every educator knows. A man's real education begins after he has left school, as any university graduate will tell you. True education is gained through the discipline of life.

The trouble is not with the schools altogether, but with the public illusion that schools can do for a young man what he will have to do for himself.

If young men come out of college uneducated it is their own fault, and the same would be true if it were a canning factory they came out of, or a boiler shop, or any place else. Any place, any work, offers an opportunity for education, but it is something the recipient takes, it is not something that can be handed to him.

Schools are useful only as they put men in possession of their own powers; and they cannot do this without the earnest desire of their students to be so helped. Any man can learn anything he will, but no man can teach except to those who want to learn. Education is preëminently a matter of quality, not quantity.

The test of education is what one can do to help and heal the world. If a man can hold up his own end he does well, but if he can also help others to do likewise he does far better. He may be quite rusty on many things that appear in print, but he is a man of learning just the same. When a man is master of his own sphere, whatever it may be, he has won his degree—he has entered the realm of wisdom.

That man who learns to do a useful thing and has learned to do that thing perfectly has attained the summit of real education.

Inventors, by the way, are not made by education but if they have enough education to save them from the mistakes of the past, it saves much time.

America's cigar and cigaret bill for 1926	$1,349,450,000

Isn't There a Line?

THE announcement that President and Mrs. Coolidge dropped a five-dollar greenback into a collection plate while attending Sabbath service recently in the Black Hills hardly seems to come within the category of 'news.' Just why it was permitted to find its way into the columns of more than one well-edited newspaper is somewhat of a puzzle. While the public is entitled to full information as to the President's official acts, and seems to insist on a vast amount of detail as to his private doings—isn't there a line that can be drawn somewhere?

There should be a difference between 'news' and impertinent gossip, even where the President and the First Lady of the Land are concerned. And one's contribution to the church—since time immemorial—has been deemed entitled to proper seclusion. It is a matter between the Maker and the contributor, be he beggar or be he Caesar.

Colonel Lindbergh betrayed the fact that the impositions of the press had overstepped the bounds of even his patience. When, after his flight from Washington to St. Louis late in June, photographers inconsiderately kept him posing and re-posing long after the time had come for him to leave the flying field, he turned to the Assistant Secretary of War and asked whether there was not some way whereby this imposition could be halted.

Why are all these demands necessary? Why must great men resort to solitude and extraordinary precautions if they are to enjoy even a decent freedom from ubiquitous inquirers? The private lives of Ruth Snyder, Helen of Troy and the exquisite Perdita may be fit themes for fiction or for the prying eyes of curious thrill-mongers, but cannot the curtain be drawn when the Chief Executive of the land, in the sanctity of Sunday morning worship, drops a coin on the collection plate? That, at least, should be his personal privilege, unseen and unheralded by even the yellowest of yellow scandal sheets.

Pollution Plus

SWIMMING in the local river was the sport of boyhood some twenty-five years ago. Every country town had its 'ole swimmin' hole' and in those days the sign of the two fingers meant something. Swimming at any point along the average river in the United States now is extremely hazardous from a health standpoint. From one overflow sewer enough contaminating elements are available to make the average stream unfit for use. Pollution of streams makes them a liability instead of an asset and it is high time the pollution situation was attacked with vigor and intelligence. Failure to cope with the situation is apt to lead to an epidemic that may prove disastrous in the extreme. For you cannot keep healthy boys out of a running river in warm weather unless the pollution exists to the extent that it is obnoxious. What a boy cannot see he does not fear. It is only when death and disease begin to take their toll that the public awakens to the importance of control measures.

Again, Mexico

NEWS correspondents seem agreed that Ambassador Sheffield will relinquish his post to Mexico in the near future. What will happen then they do not know. One theory is that no new ambassador will be appointed for the present, which situation will leave Mexico dangling in diplomatic mid-air like a catfish on a farm boy's willow until such time as she regains proper humility and respect for the American State Department. Such an ungentle act would not be surprising in view of this nation's attitude toward Latin American countries. But greater likelihood is that Colonel Henry L. Stimson will be sent to Mexico. This would probably be wise. Mr. Stimson, a former Cabinet officer, has held many important positions; he has the reputation of being a level-headed investigator and an impartial referee. Someone is vitally needed who can cut through this nation's muddled Latin American policy and restore the United States and Mexico to a basis of friendship. Stimson may prove to be the man.

The English Folk Song in Ohio

By MARY O. EDDY

THE Modern Language Association (XXXIII, 3) has published a scholarly study of 'The Bramble Briar' under the title, *Boccaccio, Hans Sachs and the Bramble Briar*, in which the author, the late Professor Belden, advances interesting theories concerning the uniformly bad English of the different versions.

When I questioned Miss Jane Goon as to her understanding of the mysterious 'salome' of the second stanza, she told me it was the name of the man the two brothers killed, adding the rather astonishing information that salome is the feminine name from the Hebrew Solomon.

THE BRAMBLE BRIAR

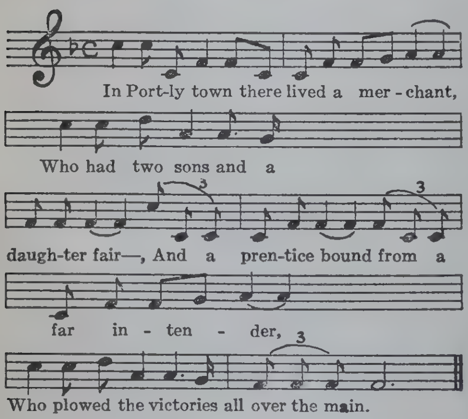
In Portly town there lived a merchant
Who had two sons and a daughter fair;
And a prentice bound from a far intender,
Who plowed the victories all over the main.

Ten thousand pounds it was her portion;
She was a neat and comely dame;
And upon the salome that plowed the ocean
She had a notion to bestow the same.

One night while they were sitting courting,
Her two brothers chanced to overhear;
They said this courtship should be ended,
'We will send him headlong into his grave.'

And for to conclude this bloody murder
These two villains hunting did go;
And upon the salome they coaxed and flattered
Along with them hunting to go.

They traveled over high hills and mountains,
Through lonely valleys that were unknown,
Until they came to the bramble briar,
And there they did him kill and thrown.



In Port-ly town there lived a mer-chant,
Who had two sons and a
daugh-ter fair—, And a pren-tice bound from a
far in - ten - der,
Who plowed the victories all over the main.

And when they had back home returned,
Their sister asked for the servant man.
'We left him in the woods a-hunting,
And we no more of him could find.'

'O sister dear, what makes you inquire
All so for this young man's sake?'
'Because I thought you seemed to whisper;
Come, tell me, brothers, or my heart will break.'

One night when she was lying sleeping,
He appeared to her bedside;
And he was all in tears a-weeping,
And all rolled over in gores of blood.

He says: 'My dear, leave off this crying,
It is a folly for you to know;
For your two brothers killed me, rash and cruel,
In such a place, love, you may me find.'

She traveled o'er high hills and mountains,
Through lonely valleys that were unknown,
Until she came to the bramble briar:
And there they had him killed and thrown.

Three days and nights she tarried by him,
Kissing on her bended knees;
When in that time she was constrained
To utter forth such words as these:

'I had a mind for to stay by him
Until my heart it did break with woe;
But I felt that hunger came creeping o'er me
Which forced me back home to go.'

And when she had back home returned,
Her brothers ask where she had been.
'Begone, ye proud, deceitful villains!
For him alone you both shall swing.'

And for to shun this bloody murder,
These two villains to sea did go.
And to tell the truth it was on the morrow
That the stormy winds began to blow.

The winds did blow, and it was no wonder
That these two villains were cast away;
And by the flood they were tost under,
And the raging sea formed their grave.

It is a far cry from the crude

And upon the salome that plowed the ocean
She had a notion to bestow the same,

to the matchless lines of Keats describing the love of the two:

Parting, they seemed to tread upon the air,
Twin roses by the zephyr blown apart
Only to meet again more close, and share
The inward fragrance of each other's heart.
She, to her chamber gone, a ditty fair
Sang, of delicious love and honeyed dart;
He with light steps went up a western hill,
And bade the sun farewell, and joy'd his fill.

It is quite clear that a complete understanding of the words is not necessary to the enjoyment of an old song. Old Aunt Mary Boney was able to repeat from memory a very good eleven-stanza version of 'The Blind Beggar's Daughter of Bednall Green' which narrates the story of the beautiful daughter of the blind beggar who was loved by a young lord ignorant of her parentage. When she proudly claimed the beggar as her father, the nobleman spurned her, whereupon a young squire spoke up:

'I've riches enough;
If she be a beggar's daughter, she's never the worse.
Your ship shall be lined with jewels,' said he,
'If you will but love me, my pretty Bet-see.'

Then the father confessed that begging, then as now, had been a profitable business, and offered to match guineas with the suitor. Here Aunt Mary stopped her story to apologize for not knowing what guineas were, and then went on:

'My daughter is not clothed as she shall,
But I will drop guineas with you for my gal.'
They dropped their guineas down to the ground,
They dropped, till they dropped ten thousand pounds.

Aunt Mary, pipe in mouth, had just showed me around her garden, and had remarked with gusto: 'Oh, but I like raspberries!' I felt that her enthusiasm over the berries was much greater than over the ballad even should I have told her that her old song was in Bishop Percy's celebrated manuscript. So I kept to myself the happy memory of the dingy old brown parchment in the British Museum, the very one which Percy had found in a Scottish home, the pages being torn off, one by one, and being used for lighting fires.

Another ballad containing a word which Aunt Mary confessed to not knowing was 'Jack Williams.' The hero was 'brought to guilt and shame' through supporting his sweetheart beyond his means, for, says he:

I took to robbing night and day
To maintain her fine and gay;
And all I got I valued not
But gave to her straightway.

And next to Newgate I was brought,
And bound down to irons strong,
With rattling chains around my legs,
And long to see them on.

For sixty years Aunt Mary has sung this song without knowing, or caring to know, that Newgate is the London prison, demolished only in 1903.

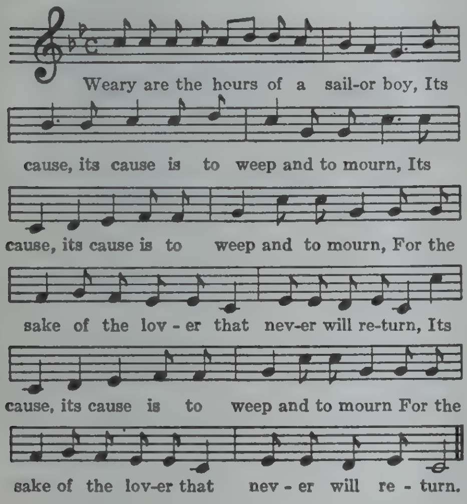
Not only do strange words become embodied in folk songs, but inconsistencies of situation as well. Fair Annie in the old Scottish ballad is too poor to be recognized as a good matrimonial catch for Lord Thomas. Nevertheless Annie appears at the wedding of Thomas riding upon a horse that

amblit like the wind;
Wi' siller he was shod before
Wi' burning gowd behind.

So gorgeous was the raiment of the poverty-stricken Annie that

The cleading (clothing) fair Annie had on
It skinkled (sparkled) in their e'en.

The song called 'The Sailor Boy' contains just such an amusing inconsistency. Henry Maurer first sang it to me. He was so interested in aiding my study of folk songs that he frequently called, a notebook in his hand in which he had been recording some newly remembered song. It was always a real pleasure to hear this old gentleman. His early talent for singing had been kept alive by frequent performances in country-school entertainments, on which occasions his repertoire would include 'The Miller's Song,' 'The Lily of the West,' or the long American ballad, 'James Bird.' He preferred to sing standing, and, as a preliminary, he buttoned his coat and rolled his eyes upward. His voice was loud and clear.



Weary are the hours of a sail-or boy, Its
cause, its cause is to weep and to mourn, Its
cause, its cause is to weep and to mourn, For the
sake of the lov - er that nev-er will re-turn, Its
cause, its cause is to weep and to mourn For the
sake of the lov-er that nev - er will re - turn.

THE SAILOR BOY

Weary are the hours of a sailor boy,
Its cause, its cause is to weep and to mourn,
Its cause, its cause is to weep and to mourn
For the sake of the lover that never will return.

Black is the color of my true lover's hair,
His resemblance is the lily's fair,
To tell, to tell will give me joy,
For none will I have but my sweet sailor boy.

'Father, father, build me a boat,
That I may on the ocean float,
And every ship that I sail by,
There I'll inquire for my sweet sailor boy.'

As I sailed down from Spain,
I saw three ships sail over the main,
I hailed a happy captain as he passed by,
And there I inquired for sweet Willy boy.

'Captain, captain, tell me true,
Doth sweet Willy sail with you?
To tell, to tell 'twill give me joy,
For none will I have but sweet Willy boy.'

'Oh, fair lady, I'll tell you true,
He was drowned in the gulf below,
On Eroc Isle as we passed by,
There we left your sweet sailor boy.'

She dashed her boat against a rock;
I thought the lady's heart was broke,
She wrung her hands and tore her hair,
Just like a lady in despair.

'Bring me a chair to sit upon,
A pen and ink to write it down.'
At the end of every line she dropped a tear,
At the end of every verse cried, 'Oh my dear.

'Dig my grave both wide and deep,
Put a marble stone at my head and my feet,
And on my breast a turtle dove
To show to the world that I did love.'

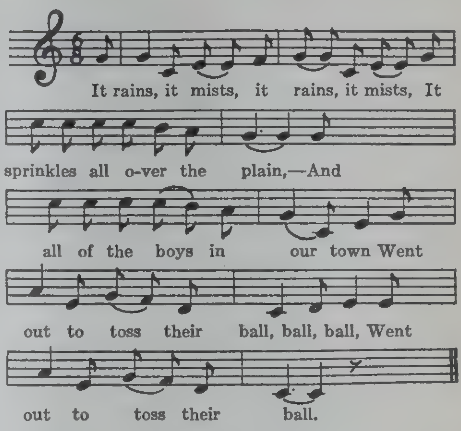
When Mr. Maurer came to the point in the story where the girl, in a boat built by her father, on the high seas, asks for a chair to sit upon, and a pen and ink with which to express her emotions, I stopped the singer. 'Surely,' I said, 'you are running two songs together, aren't you? That does not belong there.' And Mr. Maurer, always agreeable, accepted my criticism. Some months later, when he had forgotten the incident, we were disturbing the quiet of the village with the loud strains of 'Weary are the hours of a sailor boy,' in duet form. At the end of the seventh stanza Mr. Maurer went right on with, 'Bring me a chair to sit upon,' et cetera. Evidently these inconsistent stanzas belonged in his version of the story. The fact that they do rightfully belong there is proved by a comparison with the original English version where the same thing happens.

'The Sailor Boy' has such an attractive tune that it may clear my story of the impression that the Ohio tunes are doleful and lacking in rhythm.

Equally helpful in capturing these traditional songs was Mr. Maurer's sister, 'Aunt Lissie,' as she has been known in the village. Their home, as young people, was on the opposite side of town from the Clear Fork hills, but still among hills. My last call on 'Aunt Lissie' was when her last illness had weakened her voice; but there was heartiness in her tone when she said: 'I used to *love* to sing! Neighbors who lived a mile down across the fields could hear me.'

Her voice and Henry's are now still, but their songs live on in the memory of those who were privileged to hear them.

The visitor to Lincoln Cathedral, England, pauses before a broken fragment of an old shrine standing in the south aisle beside the choir. A plain, much mutilated base, a broken boss fallen from above, and a few fragments of carvings originally painted red are all that remain of the once famous shrine of little Sir Hugh, the child martyr. The story of this Christian child, who was believed to have been foully murdered by the Jews of Lincoln, was an old story in Chaucer's time. The prioress of his *Canterbury Tales* tells what was then the well-known story of 'the litel clergeon.' The shrine itself was built before Chaucer's time. The thrilling details of the story of the murder of the pious child, the finding of his body by miraculous manifestations of light and fragrance, its position of honor in the cathedral, and the song of the dead boy, all have contributed toward the preservation of the story, even to the present time.



It rains, it mists, it rains, it mists, It
sprinkles all o-ver the plain,—And
all of the boys in our town Went
out to toss their ball, ball, ball, Went
out to toss their ball.

Mrs. Charley Wise, one of the village laundresses, left her soapy tub and sang for me the following version of this ancient story. She gave it no name, and so I have supplied the traditional one of

LITTLE SIR HUGH

It rains, it mists, it rains, it mists,
It sprinkles all over the plain,
And all of the boys in our town
Went out to toss their ball, ball, ball,
Went out to toss their ball.

At first they tossed it a little too high,
And then a little too low;
Over in the Jew's garden flew one of the balls
Where no one dared to go.

Out came the Jew's daughter all dressed in silk,
Crying: 'Come in, little boy,
Come in, come in, my pretty little boy,
You shall have your ball again.'

'No, I won't come in, no, I shan't come in,
Unless my playmates do;
For ofttimes have I heard it said,
Whoever went in should never come out again.'

(*Continued on page 22*)

Having Their Own Way *in* Mexico

By WILLIAM L. STIDGER

THE people of Mexico get their way.

They are like children in their methods of getting it, but they get it.

They get action from their government more quickly than it can be had from any government that I know on the face of the earth.

When a child wants the moon he cries for it. Sometimes the common people of Mexico yell and cry and fight for the moon. But usually they know what they want and they make themselves felt by voice, protest and strike until they get it.

For example let us start with the average motion picture audience in Mexico. If there is a break in the film or any delay, boys and girls, men and women, immediately begin to yell, pound, kick, and whistle with insistence. They want what they want when they want it, and they usually get it.

Their practice of democracy is pragmatic; it works, it gets results in direct action.

When a crowd in a theater does not like a certain piece of music that the orchestra or the organist is playing, it immediately makes its dislike felt by yelling for the orchestra to stop, and the orchestra stops. It has learned that it is best to respond to the will of the people. Several theaters have been wrecked because some foolish orchestra leader has autocratically imposed his own musical wisdom as better than that of his audience.

One day as a friend of mine was walking along one of the principal streets of Mexico City in broad daylight he heard the sound of shooting. He ran to the scene and saw an inspector of police trying to arrest a half-drunken Mexican. The Mexican resisted. He refused to go with this inspector; he refused to be arrested by this particular man. He had his choice of policemen.

He said to the inspector, 'I won't let you arrest me but I'll let that traffic officer arrest me.'

The inspector, thinking to intimidate the man, took him by the throat and rammed his head against the wall; just as my friend came by he was emptying his automatic into the wall on each side of the culprit's head, coming within an inch of him at each shot. But this did not scare the Mexican. He still refused to go with the inspector. As the inspector was all dressed up in official togs, this fracas was making a merry fool of him; so he finally had to give in and allow the officer on the corner to take the man to jail while he watched traffic, much to his disgust and chagrin.

'That's real democracy,' I said to my friend, 'when it gets to the point where a fellow has his choice of who arrests him, and where he can make that choice felt and can get his desire!'

The people are not slow to make their will felt, and their power, when they feel that the government, city, state or national, is not doing the square thing.

They are a patient lot and let many things slide through sheer laziness and indifference. For instance there is no real voting as yet in Mexico, for the people are not sufficiently educated; nor do they care to vote. Most of the voting is done by the heads of cities and states, the returns being signed by one man and sent in. But even that is a step in the right direction.

When it comes, however, to practical everyday matters that are close to the people they get their way and they get it quickly and effectively. They stand for no delay nor trifling, and laws and rules have been known to be changed overnight because of a good solid strike-protest, with a few officials shot in the bargain.

One famous instance occurred when a city water system went wrong because of what the people thought was the carelessness of some waterworks official. The people, especially the very poor, suffered grievously for a week. The idea got abroad that sufficient speed was not being shown in getting the system to work again.

So came the famous water riot. The people assembled on the downtown streets one night, and shot a few officials after extending their printed protest and demanding that the water be turned on at once.

The nation has a law that a laborer may get three months' pay for absence due to any occupational sickness. The Mexicans interpreting this to mean any kind of sickness, a certain American manufacturing concern had five hundred laborers fail to show up one Monday morning because of 'sickness.'

The Mexicans have another way of making their wishes felt: stores and shops go on strike.

This means of self-expression is used in the Orient also. One of the strongest protests that the Koreans have offered against Japanese imposition and cruelty has been the closing of stores and shops until their terms are granted.

English Hunting *as Seen in the* Advertisements

By L. C. K.

TO READ the advertisements in some English sporting papers one would suppose that all Englishmen were millionaires. This is the fault of the advertising manager whose mind is on the gentlemen and not on the producers, of whom there are many.

The hunting ads occur largely in the summer issues preparatory to the autumn sport. First of all the guns! These come '*for gentlemen*' always in pairs. The idea is that the attendant carries the gun case, hands the one loaded gun to the sportsman and loads the second gun while the first one is being shot.

THE price of a good pair of guns is some £180 or $900; if you are a 'cheap sport' you can get a pair of second-hand guns for £100 or $500. Of course, there are cheaper guns but they are advertised mainly as guns costing in the hundreds of dollars. Cartridges are a mere trifle, five dollars a hundred. But still too expensive for poor men.

Next to guns boots are important to the hunter. The 'Waterproofers to H. M. the King, and H. R. H. the Prince of Wales' advertise a knee boot at 120 shillings, thirty dollars, surely a good price for a boot.

Clothing is relatively cheaper since you get 'jacket and plus fours' from eight guineas (forty dollars) and a Balmacaan or topcoat at the same price.

Pheasant eggs and cock pheasant poults, for turning into coverts, are advertised for sale, 'Strong healthy birds guaranteed.' Not only the birds are sold but also medicine to put them into prime condition for the hunt.

DOGS are not the least important nor yet the least costly element to the hunter. A 'stylish dog,' trained, can be had from fifty dollars up.

Binoculars at eighty dollars, a lunch basket at seventy-five dollars, preliminary practice costing some fifteen dollars, boot cleaners at nine dollars, sporting hats at eight dollars, and whisky at various prices and final costs, are all incidentals, more or less necessary for an enjoyable shoot.

A month's shooting where you are a paying guest costs about two hundred pounds (a thousand dollars). Nor is there great profit for the owner of the moors since he must furnish the gamekeepers, the keepers of the hounds, the dogs, and also the 'beaters' who stir up the game.

Great Figures in Fiction

By LEWIS WORTHINGTON SMITH

Amy Robsart *and* Hester Prynne

AMONG the hundreds of figures that crowd Sir Walter Scott's pages, no one is perhaps more an object of sympathetic interest than Amy Robsart in *Kenilworth*. She represents at once beauty and romance and passion and tragic misfortune of the keenest and most pitiful sort. No one can think of her as having deserved a cruel fate. No one can feel that the self-indulgence to which her father had brought her up should have been the warrant for the fearful price that she paid. She was surrounded by intrigue, and she had been taught nothing but kindness. She was both proud and beautiful, and as unthinkingly as a child she accepted homage and the simulation of homage as equally genuine.

Kenilworth Castle and Sir Walter Scott.

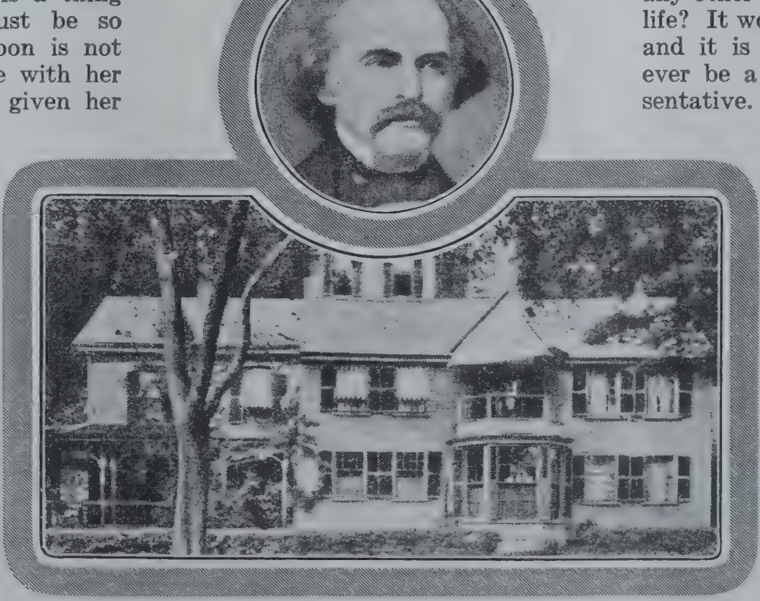
When the story opens she is virtually a prisoner at Cumnor, where her lord, the Earl of Leicester, sees her only now and then, until such time as he shall feel free to take her with him to Kenilworth Castle. She is his lawful wife, however, and she expects soon to be acknowledged publicly as the Countess of Leicester. It is a thing for suspicion that she must be so guarded while the honeymoon is not yet cold, but she is in love with her brilliant husband. He has given her reasons for the present need of secrecy, and they are quite satisfying reasons. Matters of state are involved, and it is not well, for the time, that Amy Robsart should be known as the Countess of Leicester.

What Amy does not know is that the Earl is understood to be a favored suitor for the hand of Queen Elizabeth, that, as much as his position will permit, he has taken the tone of a lover with her, and that, but for his having made Amy his wife, he might very probably become king of England. She is without a fear or a suspicion, until suddenly there comes to her a great awakening.

The Queen has announced her intention of paying a royal visit to Kenilworth. At the instance of Amy's father, her former lover has come to court to present a petition for Elizabeth's interest in Amy's abduction, her concealment, and her possible seduction by Richard Varney, a tool of the Earl's. Varney tries to protect both Leicester and Amy by declaring that she has been honorably married to him. But the Queen demands that Amy be brought to Kenilworth on the occasion of her visit there, and the situation has at once another color. Leicester is not willing that the Countess should appear publicly as Varney's wife. Yet he does not wish to make open acknowledgment of his own relationship to her.

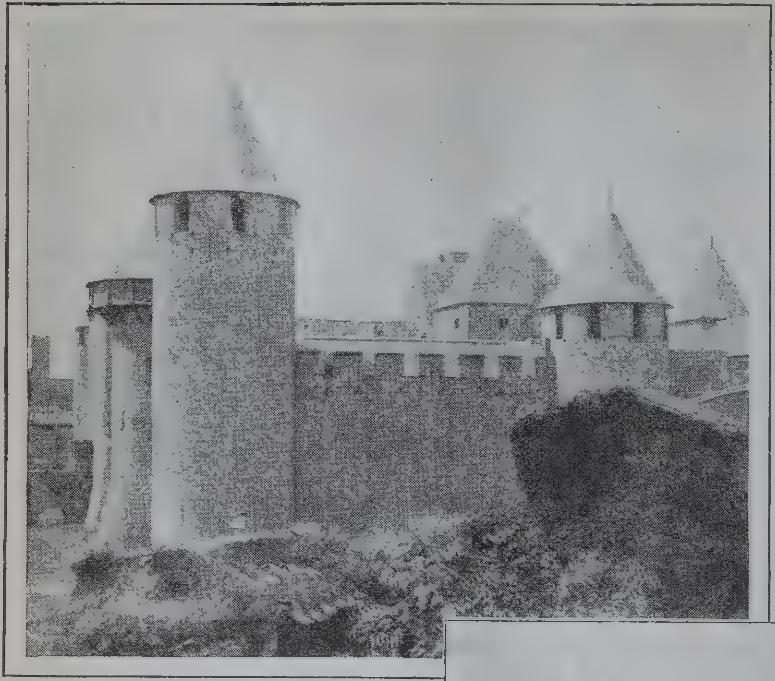
The story of Amy Robsart's acceptance and rejection at Kenilworth is brief. She comes to escape her doom and is taken back to meet it in less than two days. During that time she sees Leicester for but two short interviews. The first is in the presence of the Queen. It puts an end to his hopes of kingship. Amy does what she can to shield him from Elizabeth's displeasure as soon as she realizes how much she has betrayed.

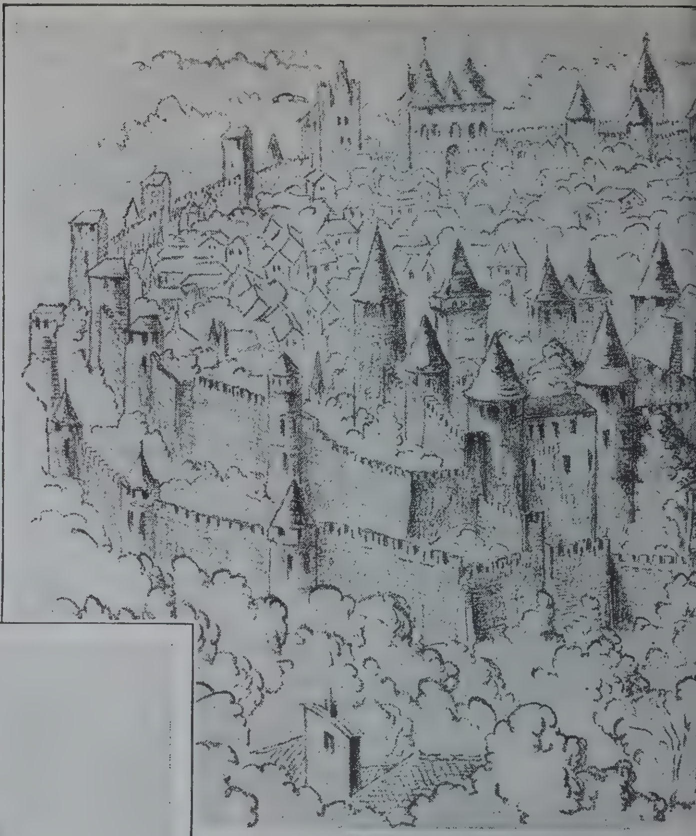
When she has been dragged back to Cumnor, she does not despair. She still believes that Leicester will save her. At what she thinks is his familiar whistle she joyfully opens the door out of which she has been warned not to pass. One step she takes over its threshold, and the treacherous footing that has been prepared for her gives way. She plunges into the oblivion that is forever.



'Wayside,' Concord, Massachusetts, and its master, Nathaniel Hawthorne.

For a long time *The Scarlet Letter* has been accounted the greatest of American novels. I have no doubt that finer work in fiction has been done by other American writers, but that is only one phase of the matter. Is there any other novel so central to American life? It would be difficult to name one, and it is doubtful whether there will ever be a single novel so fully representative. We are now too complex, too various, too many-sided, for any novelist of the present or the future to bring us with any adequacy within the compass of a volume of fiction. The United States was never wholly one. Hester Prynne represents, however, not New England Puritanism, but our break with the past. She is of the New World and the new order. She denies the right of established authority, as such, and asserts her faith in moral law as a guide to conduct. (*Continued on page 20*)





Historic structures give way to modern skyscrapers of more or less type design. It is therefore the more refreshing to come upon such splendid architectural gems as the walled city of Carcassonne here pictured. Primarily a fortress, it came to serve also as a residence, and consequently has characteristics of both.

Above—

Inner and outer walls together boast more than fifty towers, almost equally distributed but of varying shapes and heights. Here is seen a cluster of these towers.

Right—

Between these towers is the entrance, protected by heavy iron gates raised and lowered from within. Should an enemy pierce these gates, it was so arranged that he was greeted with arrows and heavy stones which were rolled down through openings above the gates. Specimens of these stones are still preserved; their effects were telling.

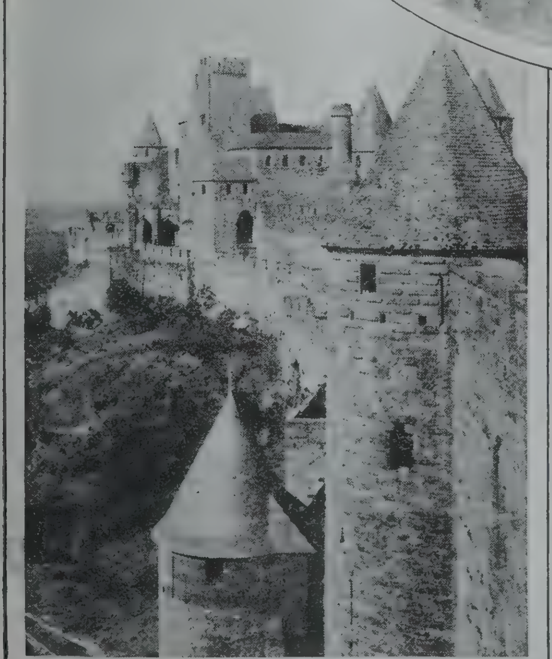
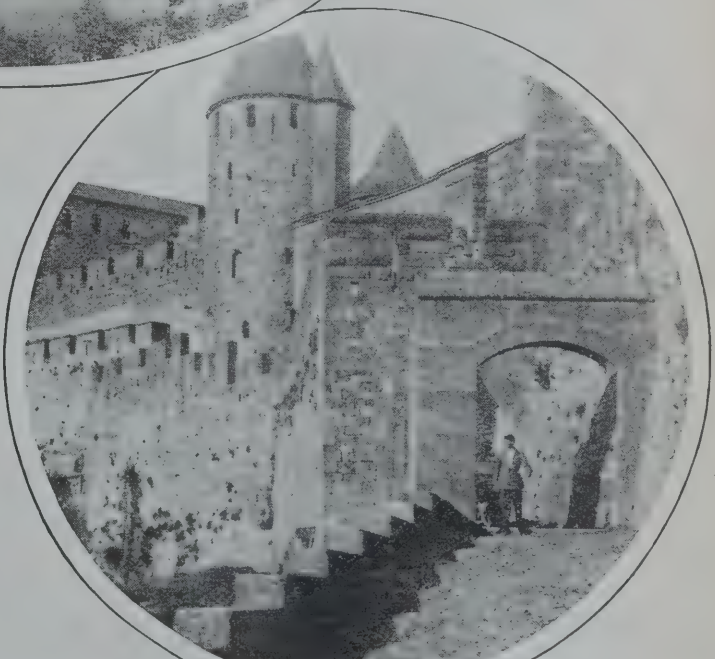
The Cathedral of St. Nazaire, within the walls of the fortified city. From St. Martin's Tower in the castle wall one looks down upon the Cathedral roof, getting a fine view of its buttresses and minarets.



A strategic site for defense, commanding unexcelled view. Within these towers are numerous large chambers for residence purposes, useful in case of siege.



Entrance gate within high Moorish tower. Breast-high parapet served defenders of old as lookout.

In the Hour of the Tiger

(*Continued from page 4*)

like drums, beaten with mallets when the drums were large and with the hands when they were small. From a rack-like structure hung twelve gongs of different and not unmusical tones, which were beaten with mallets at intervals, and there were smaller instruments that gave out scraping, rasping sounds so dear to the Celestial, so trying and nerve-racking to the foreigner.

The choir consisted of sixty voices, each voice sounding like that of the youth who has reached the 'cracking voice' stage of his existence. They chanted something which was probably verse and which threatened to be never-ending. On came the dancers. To the beating of drums and to signals from the master of ceremonies the dancers executed their steps. There was no poetry of motion, no wild freedom of woodland performers. The dancers moved but a stiff step or two out of their tracks. That was all. Their dance was more like the calisthenics of long-ago school days than anything else that would describe a dance. After the dancers, came sixty-four small boys, dressed in rich blue satin robes, elaborately embroidered in gold. Each boy carried what looked like a battle-ax of a bygone day, and a straight and narrow shield, decorated with gold dragons. These boys went through their drill and were followed by thirty-six young men dressed in black robes, trimmed in blue. Each carried a wand tipped with one single golden pheasant tail feather, the feather at least a yard long. Theirs was a more intricate drill than that performed by the small boys.

ALL these songs and drills, all the orchestral music, was but an accompaniment to the entrances and exits of the governor while performing his ceremonial rites. Five times was his excellency escorted from the lower court, where he stood, up to the altar where he offered sacrifice. Incense was offered first, as a welcome to the spirit of Confucius; then he offered food; the third time, cloth, stamped with the official seal. When the cloth was offered his excellency read an official tribute to Confucius. The fourth time he offered the sacrifice of meat, and the last, he bowed profoundly, and bade the spirit of Confucius farewell.

After the last offering, when the governor returned to the lower court, attendants, marching single file, carried the sacrificial offerings, except the animals, to a place in the temple yard where they were burned, thus translating them to the spirit world that Confucius might have use of them. The animals were afterward used for a feast. Thus the ceremony ended.

It was the 'hour of the dog' (six o'clock in the morning).

But weird as was the ceremony of the equinoctial sacrifice it was less weird than the Buddhist ceremony of ordination which we witnessed at midnight, in a Wuchang temple shortly after.

This ceremony is known as 'sheo kiai,' or taking of the vows. Its chief feature is the burning of a certain number of spots deep into the shaved heads of men about to be ordained as priests in the Buddhist faith. Nine spots in all there usually are, three rows of three spots each, and each spot the size of the nail on a grown man's thumb, but more nearly square in form. These nine holes are representative of the nine vows taken by each Buddhist priest. The cauterized marks are indelible and remain on the scalp a lifetime.

Close to the east gate of Wuchang is a hill; Hung Shan is its name. On its peak rests the Pau Tung Shin pagoda, or the Monastery of the Pervading Preciousness. The pagoda is perhaps a thousand years old. The Chinese claim it was built at the beginning of the Tang dynasty, something like A. D. 630 to 907. Perhaps it was. It is one of the temples in the Yangtze Valley still kept in repair. Until China became a republic the historic buildings, temples, drum towers and pagodas throughout the empire were kept in repair. Many are today in ruins, impossible of salvage. The Pau Tung Shin pagoda is one of the few notable exceptions. It is kept constantly in repair, thanks to the earnestness of the monks there, and also to the fact that the holding group is said to be one of great wealth.

Through the frosty midwinter night we made our way to the temple; ice crunched under our feet as we went along the little-used road which was barely a trail up the steep mountainside to the Monastery of the Pervading Preciousness. The low-hung deep velvety blue of a China winter sky was studded thick with gold stars, and a waning moon made almost superficial the dim-lighted lanterns we carried.

We climbed the steep slope to the first court of the pagoda, our feet slipping on the frost-covered stones. Through the first court, up another hill, winding in and out among trees made weird with grotesque, crooked limbs, stumbling along, panting and short of breath, we made our way. At last we found ourselves before a little wooden door of the temple. We could see dim lights within, as we looked through the cracks of the door. Faint sounds of voices reached us borne on the frosty night air, but too far away to be attracted by our pounding on the door. We almost gave up hope of entering, when one of the party thought of a way, a little door at the far side which opened into the monastery woodshed, thence into the kitchen and then into the refectory and into the very heart of the temple.

SEVERAL of the senior monks received us there, and were gracious. We might remain to witness the ceremony, which they assured us was most impressive. The conversation, of course, had to be carried on through a Chinese-speaking missionary who acted as our guide. The monks were friendly, served us tea, and seemed to enjoy a bit of conversation with some one from the outside world, while we awaited the hour for the ordination ceremonies.

At the 'hour of the tiger' the temple gongs sounded. The ceremony of ordination had begun. A large chorus of male voices chanting was heard in the distance. Nearer and nearer it came to the room in which we waited. As the voices drew near we entered a dimly lighted hall. Weird and mysterious it looked in the feeble light of a few tall wax tapers. Down each side of the hall were ranged nine gilded images—the eighteen Lo Hans, the earliest disciples of Buddha. In the center was a great gold image of Buddha, sitting cross-legged. In front of this image had been placed a table. Three cowled monks sat on each side of it. Standing at the head of this table was a young-looking monk, with a scarlet tiara-shaped hat upon his head. Each monk held a great book in front of his face. From it they read, sometimes in turns, sometimes in unison, reading in a singsong chant, every pause being filled in by the clashing of gongs and the beating of wooden drums. In one dim corner was a box-like structure, on which a monk sat, cross-legged and silent, performing his duty of meditation.

IN AN adjoining room the sixty candidates for ordination were kneeling, awaiting their ordeal. They knelt about the three sides of the room, robed in the long loose gray robes of their calling, heads shaved, pale faces showing in the dim light looking for all the world like so many death's-heads. The chanting and the beating of gongs had been continuous and it was over an hour before we returned to the first temple, which had been cleared of its tables.

Before the great idol where had stood a small table was now placed a long high wooden bench, with a row of kneeling-cushions made of straw in front of it. Behind this bench stood the officiating monks. Upon the bench were the instruments to be used to burn the holes in the scalps of the candidates for ordination—thick sticks of incense, a bit of wax and slices of raw white turnip.

The initiates entered, kneeling upon the straw cushions. The officiating monks marked upon each shaved head the nine spots to be burned into the flesh during the ceremony which was about to begin. The sticks of incense were fixed with wax at the places marked and the taper of incense was lighted. It took two minutes—two lifetimes it seemed to us—for the incense to burn down to the scalp. Pieces of raw turnip were placed between the burning patches to keep the surrounding skin cool. Monks in the background beat continuously upon wooden drums, with heavy mallets.

The initiate monks who were undergoing the torture knelt like so many graven images. They must have been suffering agony but not a lip quivered, not a facial muscle twitched. As each stick of incense burned down to the scalp, the live ash was pressed down into the head. When the newly ordained men were led out by the older monks, the air was pervaded with the odor of burning flesh.

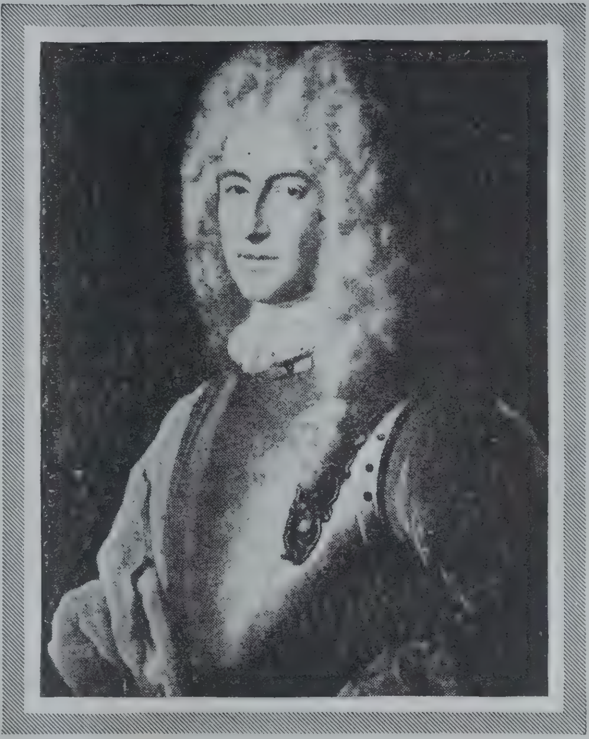
It was again the 'hour of the dog' and we went out into the fresh morning air. It was cold and crisp and welcome.

It was an experience such as one cannot forget. That these men were sincere in their faith and the sacrifices they were making there could be no doubt. It made one wonder if, after all, the world and its so-called pleasure lay in the path of real happiness. For these simple monks, the night had gone.

An Original of Scott's WAVERLEY

By VICTOR MITCHELL

EVERY year thousands of Americans pay homage to the genius of Sir Walter Scott by visiting Abbotsford, Melrose Abbey, and the Trossachs, and following his footsteps throughout the country whose beauties he revealed by his magic touch. Americans also remember that Scott was a warm and intimate friend of Washington Irving, himself of good Scots blood, whose writings have had a powerful influence in pointing the way to literary pilgrims to 'the land of the mountain and the flood.'



Alexander Forbes,
Lord Pitsligo.

But there is a part of Scotland as yet almost unknown to admirers of the 'Wizard of the North' and his works, and which hitherto has not been given its rightful place in the 'Scott country'; this is the northeast or Buchan district of the county of Aberdeen, anciently known as 'the Kingdom of Buchan,' where many castles, hoary and gray, remain as memorials of the stirring and romantic deeds of Old World heroes.

It is therefore not surprising that in such a country Scott found the prototype of the Baron of Bradwardine in *Waverley*, his first, and some consider, his greatest, historical romance. Not only this, but there are other links which connect the author of *Waverley* with this part of his literary kingdom, as we shall hereafter find. But, first of all, let us see what Scott has to say of the Baron of Bradwardine, that stanch old Jacobite, whose indomitable spirit withstood the privations and hardships that overtook those who participated in the ill-fated risings on behalf of the royal Stuarts in 1715 and 1745.

In the introductory chapters of *Waverley* we first hear of 'Cosmo Comyne Bradwardine, Esq. of Bradwardine,' as a gentleman who 'had been in arms for the exiled family of Stuart in the year 1715, and was made prisoner at Preston in Lancashire. He was of a very ancient family, and somewhat embarrassed fortune.'

After 'the '45,' we find the old Baron a fugitive, spending his days in hiding in his 'cove,' and his nights in the cottage of old Janet Gellately. It is in this humble abode Captain Waverley finds him, 'a tall, bony, gaunt figure in the remnants of a faded uniform and a beard of three weeks' growth, with a cocked pistol in his right hand, and his left in the act of drawing another from his belt.' Waverley spends the night at the hut with his unfortunate friend, and, 'at the dawn of day,' accompanies Bradwardine to his cave among the rocks. The Baron, leading the way, 'began to ascend the rock, striding, with the help of his hands, from one precarious footstep to another, till he got about halfway up, where two or three bushes concealed the mouth of a hole, resembling an oven, into which the Baron insinuated, first his head and shoulders, and then, by slow gradation, the rest of his long body.'

On a wild and picturesque part of the Buchan coast, about a mile west of the ancient burgh of Rosehearty, there is a similar rift in the rock, known as Lord Pitsligo's Cave, which likewise afforded refuge for one of the adherents of Prince Charlie, during the troublous times that followed Culloden.

The personality as well as the remarkable career of Lord Forbes of Pitsligo—the massive ruins of whose ancestral castle stand on the slope of a hill overlooking Rosehearty—make it clear that he is the original of Cosmo Comyne Bradwardine, the grizzled old hero of *Waverley*. The entrance to the cave in which Lord Pitsligo found shelter is halfway up the face of a steep basalt cliff rising from a secluded cove known as the Redcows Haven, and is approached by an extremely narrow and rugged path affording but a precarious footing.

Alexander Forbes, Lord Pitsligo, the circumstances of whose eventful life closely conform to those of the Baron in *Waverley*, was born in the year 1678. His mother was a daughter of the Earl of Mar. Like another of Scott's heroes, Quentin Durward, he was attracted to the continent of Europe in quest of learning and in the pursuit of arms, and spent some years in Paris.

Pitsligo was a man sixty-seven years of age when Prince Charlie landed in Scotland, in his futile attempt to retrieve the fortunes of the House of Stuart. Asthmatic and otherwise broken in health by his former campaigns, he mounted his horse and, with a hundred men of Buchan at his back, set off for the rallying point of the Jacobite forces. When the old man was leaving his castle, a

GREAT NORTHERN LAND IS ADVENTURE LAND

Visit the New

PRINCE of WALES HOTEL

in the Canadian Rockies adjoining Glacier National Park

This summer will mark the opening of the beautiful new Prince of Wales Hotel in Waterton Lakes National Park—adjoining Glacier National Park on the north across the international boundary in the Canadian Rockies.

Now you enjoy in one memorable visit the fascinating outdoor sport of lake-bejeweled Glacier National Park and the awe-inspiring panoramas of the Canadian Rockies. Mail coupon today for full information.

GREAT NORTHERN
a dependable railway

GREAT NORTHERN

A. J. Dickinson, D. I., 7-9
Passenger Traffic Manager
Great Northern Railway,
St. Paul, Minn.
Please send me free books about the new Prince of Wales Hotel in Waterton Lakes National Park and about Glacier National Park.

I am particularly interested in:
☐ General Tour of the Parks ☐ Alaskan Tours
☐ Pacific Northwest Coast Tour
☐ Burlington Escorted Tour

TRACE 'That Undiscovered Country' back to the days when it was the frontier.

NEXT WEEK'S ISSUE

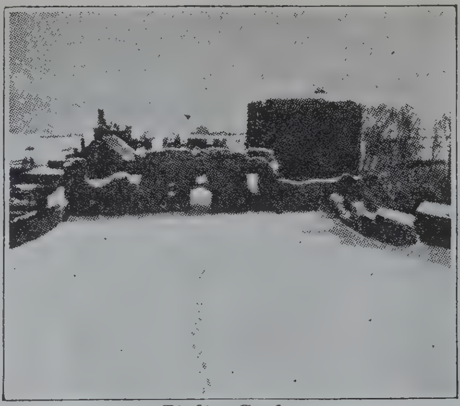
neighbor's boy brought a stool and set it beside his charger so that he might mount without difficulty. But the veteran's fighting blood was up, and disdaining the proffered help he sprang into the saddle, remarking somewhat sadly: 'This is the severest rebuke I have yet received for presuming to go upon such an expedition.'

When the hopes of the Jacobites were forever shattered on Drumossie Moor, the lands of Pitsligo were seized by the government, and the old laird became a fugitive from the redcoats of 'Butcher' Cumberland, hunted like the red deer among his native wilds. His most secure hiding place was the rocky cave which still bears his name, a lonely retreat where the only sounds that break the silence are the murmur of the waves, the weird cries of the seabirds, and the bleating of the lambs that crop the green herbage on the verge of the frowning cliffs. About a quarter of a mile inland from Lord Pitsligo's Cave is the farmhouse of Powkburn, and from here and other places in the vicinity food was brought to the cave, and a truckle bed, a table, and a few simple necessaries, provided for the use of the fugitive.

Lord Pitsligo's Cave, Rosehearty.

For many weary months the redcoats diligently searched the whole of the neighborhood, but, although rich rewards were offered, 'there was nane that wad betray' the stanch old laird. Nevertheless, he had many hairbreadth escapes. When warned by the faithful peasants that 'the coast was clear,' he would issue from his hiding place and wander over the estate that was once his own, disguised as a beggar, passing from door to door like a veritable 'Eddie Ochiltree.' At every cottage he was welcome, and invited to the coziest corner by the peat fire; and when he left to resume his wanderings, the guidwife would fill the beggars' 'poke' which he carried, with some of her oatcakes and home-baked scones, or a few handfuls of meal. If the soldiers came around, he was pointed out to them as 'juist a puir aul' man; a hairmless craiter stravaigin' aboot the country.'

Lord Pitsligo spent his last years in the home of his only son, the Master of Forbes, who had bought back the attainted estates, but resold part of them in the year 1759. In course of time, the remainder came into the possession of Sir William Forbes, the banker, who was a close friend of Sir Walter Scott, and on the death of the banker, they were inherited by his son, William Forbes the younger of Pitsligo, who was Scott's successful rival for the hand of the beautiful Williamina Belches, the great novelist's early love, whom he is supposed to have had in mind in his characterization of Di Vernon in *Rob Roy.*



Pitsligo Castle.

Lord Clinton, the great-grandson of Scott's first love, is now proprietor of this part of the Pitsligo estates, but the old castle is no longer inhabited, except by one of the employes on the castle farm, whose cottage is built on part of the ruins on one side of the courtyard, and by the jackdaws and wild pigeons that nest on the summit of the crumbling keep.

On one of the ruined walls, near the round tower, there is a carved panel containing the coat of arms of the Forbeses of Pitsligo, the supporters of which are two bears.

The Baron of Bradwardine had also two bears as supporters of his shield, and it will be recollected that on Captain Waverley's advent in the great dining-room of 'Tully-Veolan,' he was introduced to 'the Blessed Bear of Bradwardine,' which formed a golden goblet filled with wine, which was quaffed by each of the company in turn.

The lands of Pitsligo were anciently owned by the Comyns, Earls of Buchan, one of which family was rival with Robert the Bruce for the Scottish crown; and here again Scott evidently derived inspiration for the full name of his immortal hero—'Cosmo Comyne Bradwardine.' Lord Pitsligo, like the Baron of Bradwardine, was a classical scholar, but it is not generally known that he was the author of a little religious work—*Thoughts Concerning Man's Condition and Duties in This Life, and His Hopes in the World to Come*—which passed through four editions, and a review of which, contributed by Scott, appeared in *Blackwood's Magazine* in 1829. He also was the writer of *Essays Moral and Philosophical*, published in 1763.

Within less than a mile of Pitsligo Castle is the farmhouse of Braco, which was for years the residence of the favorite daughter of James Hogg, the Ettrick Shepherd, Scott's literary contemporary and intimate friend.

The Jacobite Baron of Pitsligo, notwithstanding his strenuous life, died at the age of 85, and his dust lies in the family vault in the old parish church not far from the castle. The natives of the district to this day are proud of the traditions attaching to the memory of this brave and charitable old man, whose unselfish heroism Scott declared was 'above all Greek and Roman praise.' His memory is revered among the Rosehearty folks, and they are ever ready to guide the inquiring stranger to the lonely cave, which, in circumstances similar to the Baron of Bradwardine, became Pitsligo's 'Patmos' during a time of political storm and stress.

Great Figures in Fiction

(Continued from page 15)

She had become in England the unloving and in part the unloved wife of Roger Chillingworth. He is much older than she, and he has had the indiscretion to send her to the New World before him. It is now more than two years since she has been left to her own devices. The instincts of youth are strong in her. She has not escaped the need of a sincere love, and a lover has been drawn to her. In one of the most moving scenes in fiction she stands before the matrons who have come to see the execution of the sentence pronounced upon her by the magistrates that she shall wear a scarlet letter emblazoned upon the bosom of her dress.

She has steadfastly refused to name the father of the child she carries in her arms; she faces the gathering unyieldingly. Into the number of those who look upon her hard humiliation comes suddenly her husband, Roger Chillingworth. Across the sea of rebuking faces they look into each other's eyes, but neither then nor later do they make their old relation known. From this time on the child, Pearl, and two men, her unforgiving husband and her pastor and betrayer, Arthur Dimmesdale, almost completely fill her horizon.

It is the distinguishing thing in Hester Prynne that she exhibits in herself at once that break with the past and that faith in a moral order of which I have already spoken. Her marriage with Chillingworth was not of her own making. To her mind therefore its validity is not unimpeachable. At the same time, she recognizes that she has assumed obligations and has not met them, and she sees this as a moral default for which she should properly pay a price.

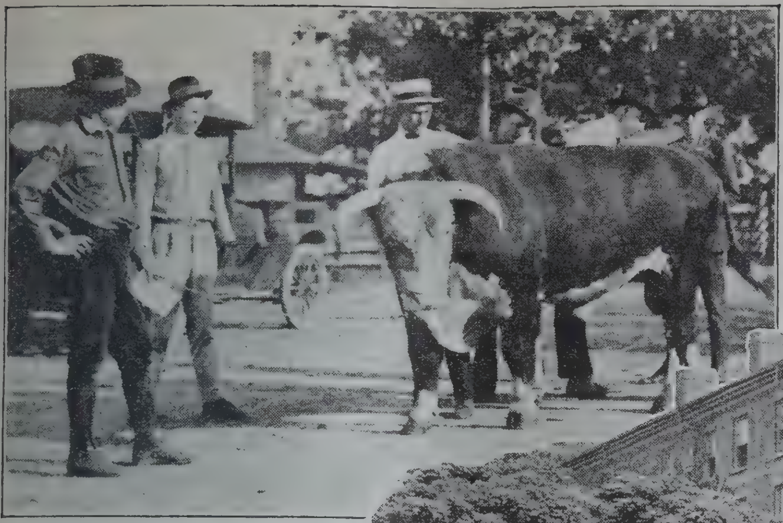
Possibly Hester's judgment was at fault. She might have escaped. But that is not the question. She is a notable woman in fiction, not for her wisdom, but for the integrity of her inner nature. She has the courage to face issues and to fight them out alone.

There could hardly be two more sharply contrasted figures than that of Amy Robsart at Cumnor, her beauty most beautifully adorned and robed, and that of Hester Prynne, hard-visaged with shame and terror, in a gown not without a splendor of its own, but catching the eye chiefly by the blaze of the letter 'A' with its rich gold embroidery. Amy hopes to avoid the penalty of daughterly disobedience, of confidence and trust too vainly placed, and her brief hour of uncertain happiness plunges pitifully into oblivion.

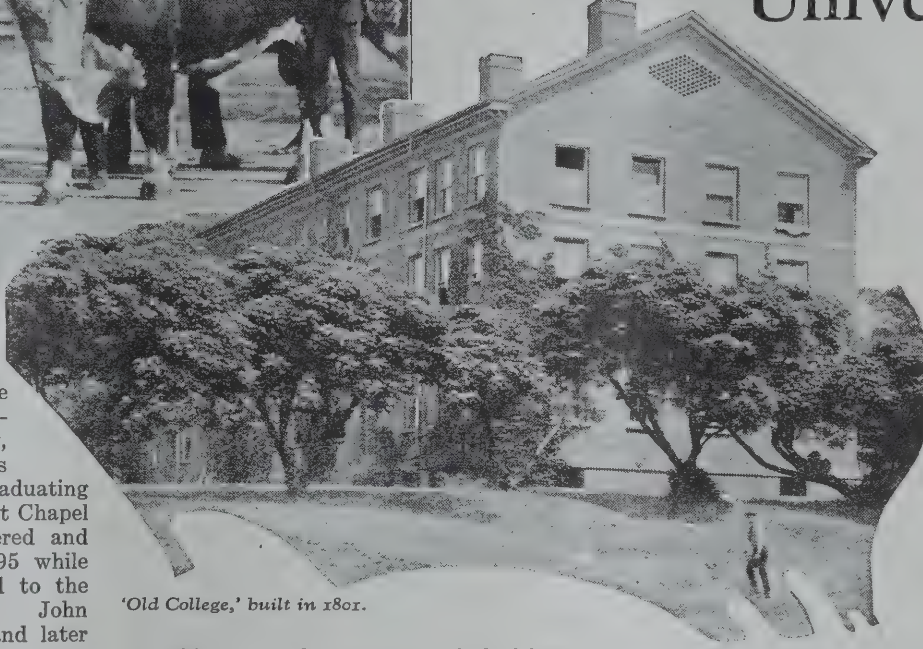
Hester Prynne asks no favors of the Eumenides, and, having paid scot and lot as she goes, in the way of Emerson's advice, comes through the unfolding of long years to a beautiful serenity. She has had the belief, as Hawthorne reports, that 'a new truth would be revealed, in order to place the whole relation of man and woman on a surer basis of human happiness.' That hope has burned from her day to ours, perhaps rather more brightly now than then. The *Scarlet Letter* lives.

GEORGIA—the Oldest State University

By GEORGE H. DACY



Agricultural students learning about beef while it is still on the hoof.



'Old College,' built in 1801.

ALTHOUGH Georgia is the first chartered state university in the country, North Carolina antedates her in the matter of the first graduating class. The Tar Heel institution at Chapel Hill, North Carolina, was chartered and instruction actually begun in 1795 while Georgia was not officially opened to the students until six years later. John Milledge, soldier and statesman and later on one of the governors of Georgia, paved the way for the inception of his state's famous university by a gift of 663 acres of land which was accepted as a site for the state school. Georgia proselyted from Yale University two prominent professors who thereafter, in turn, occupied the president's chair at the new southern school which was the first of its kind established in Dixieland. Andrew Baldwin of Yale drew up and formulated the charter of the University of Georgia while Josiah Meigs planned and supervised the construction of Old College, the first building erected on the Georgia campus in 1801. This structure is an exact replica of Connecticut Hall, one of the earliest buildings constructed at New Haven.

Subsequently supported by the income from $100,000 that was received from the sale of the land which was given the university by the state, Georgia prospered up to the outbreak of the Civil War. Seven additional buildings were added to the campus assets of the institution. The school gained fame throughout the entire country and drew her students from all sections. She ranked as one of the leading educational institutions of the New World. Then the war between the states intervened.

In 1863, the university had to close her doors, the campus and buildings thereafter being used as places of refuge for supporters of the Southern cause who were rendered destitute by the ravages of war. In 1865, the University of Georgia recommenced instructional activities despite the fact that she was branded with the marks of suffering and privation, wretchedly poor and handicapped in her operations by depleted equipment. From that day to this, graduates who have worked with a purpose and spread the fame of this southern university to every section of the country have annually issued from the venerable ivy-covered halls at Athens.

The history of a state university is something more than a mere recital of facts and figures. The most dependable measure of the greatness is the account of the accomplishments of her sons and daughters. Out from the pillared halls and ancient buildings of Georgia have issued a steady stream of alumni that have won many pages of comment in that popular volume, 'Who's Who in America.' Georgia University has furnished 37 national congressmen, 10 United States senators, 2 United States supreme court justices, 11 governors of Georgia, 33 college presidents, 110 college professors, 37 supreme court justices, 13 military generals, 4 United States ambassadors, 1 secretary of the National Treasury and many bishops, men of letters, historians, scientists, and the like.

The undergraduate life of the University of Georgia is full and varied, stimulating students to well-rounded development. Enriched by a century of tradition, an institution has been builded which will be as permanent as cotton production in that region south of the Mason and Dixon's line. For the most part, the students rule themselves. Student government successfully deals with all matters of conduct, discipline and other forms of collegiate insubordination. The Georgia faculty has ascertained positively that the undergraduates are well qualified to sit in judgment on their fellows as the heads of the university have never been obliged to reverse a single decision of the Men's Student Council or the Student Government Association of Women since the inception of the unique system of running campus affairs at Athens. Six men students are selected by popular vote as members of the student council while the girls select their leaders in a similar way. Each student pays an annual tax of fifty cents to aid in the support of the student self-government bodies.

Athens is the educational center of Georgia, for in addition to the state university, it also boasts the state normal school, the state college of agriculture and a private institute for young ladies. At Athens is the only tree in the world that really owns itself. It is a big oak, 250 years old. W. H. Jackson played under this tree as a boy and loved it so much that he dedicated the plot of ground on which it stands to the tree, drew up a formal deed to that effect and had appropriate markers erected and an iron fence built around the tree. Although this man died many years ago, the tree that has clear title to itself still lives and is carefully preserved by Athenians.

The only double-barreled cannon ever built is also an ornament of the public square in Athens. It was invented by a man named Gilliland during the Civil War. It was so designed that it would shoot two cannon balls attached together by means of a long stout chain. The idea of the inventor was that as the big balls sped from the gun, they would straighten out the chain so that the extraordinary missile would mow down an entire regiment of the enemy at a single shot. It probably was lucky for the Union forces that this device of warfare was never perfected so that it could be used successfully out on the firing line.

Mary Harden, the sweetheart of John Howard Payne, the author of 'Home Sweet Home,' lived in Athens all her life. Payne presented her with the original copy of the famous song. She lived to be eighty-six years of age. No one has been able to locate the old music manuscript following her death. The general surmise is that the venerable lady either lost or destroyed the relic.

The State College of Agriculture became a separate school of the University of Georgia in 1906. It has one of the largest enrollments in agriculture and home economics among southern institutions.

Woman *in* Politics

Has Not Turned Out a Gold Brick

By G. W. BARRINGTON

THE most narrow-minded of us will not contend that woman, as a political factor, has turned out to be a gold brick. She is not an absolute blue-sky investment, nor has her performance to date wholly complied with the prospectus. Most persons will admit this publicly; the women and the candidates will do so in their own chambers.

She was to clean up politics.

Leavened by her enlightening presence, the international dough was to rise to flaky pristine whiteness and bake to delectable perfection.

The dove of Peace was to coo contentedly in a world which knew no strife, countenanced no racial jealousy, feared no turmoil.

But—

The crazy old world still persists in remaining an armed camp, with the sighing voices of dreaming altruists smothered by the vociferous yammering of hard-headed persons who contend that we must deal with human nature as it is, rather than as it should be, or expect to wake up some morning to find uncouth foreigners riveting brass collars about our craven necks.

Can any human being, even one who is neither a woman nor a candidate, justly lay any or all of this at the door of the feminine voter?

No.

When woman decided to bathe in the political pool, she didn't go in backward, holding to willows on the bank and dabbling tentatively with her toes to try the temperature. She just took the big plunge. Mere man, swimming placidly about, as he had been doing for centuries, heard a splash, and there she was. Contrary to all expectation, and in direct conflict with the statements of her enthusiastic press agents, her presence failed to buoy him up; he still had to swim, tread water, or drown. Therein probably lies the oft-sought reason why Congress spends so much time treading water of late—the astute solons are waiting to see which way the women are going.

But if, as a sociological asset, the woman voter fell short of the promises made by her sponsors, she also proved a monumental disappointment to those prophets of evil, those dour-faced croakers, who opposed their weak forms to her line of progress, strewed her pathway with roseless thorns, and predicted sudden and dire disaster to the misguided country which should set her running amuck armed with a two-edged ballot.

We were to have a petticoat government, sisters and sissies in the forum and council chamber, strong men nowhere about.

The kitchen was to be deserted, masculine shirts were to flutter buttonless, and the babes were to cuddle each other and cry in loneliness on caucus night.

Somebody said these things. I heard 'em; you heard 'em.

But you can't find 'em now.

Like the scientist who wrote tracts showing that man never, never would fly in a heavier-than-air machine, they have dropped one subject from their lecture program.

If woman, as a voter, has justified neither the fulsome, and ofttimes hypocritical, praises of her pre-emancipation advocates, nor the dread prophecies of those base detractors who would have kept her a shackled slave, what then has she actually done?

What, particularly, have the blonde voters done?

What, especially, have the brunettes done? Has the freedwoman proved more worthy of citizenship, or less, than the great mass of her fellows?

Silly classifications, of course. Yet fully as justified as the assumption that women will move *en masse* in any given direction, politically, any more than they will wear uniform gowns or select the same model of car.

The male specimen of the *genus homo* who has not yet learned that woman has unsexed herself, so far as affairs of state are concerned, and who still wonders who will get the 'women's vote' may make a success as managing editor of a filling station or conductor of a baseball team, but he is out of his element in politics.

Like their husbands, brothers and sweethearts they vote for the man whom they deem best qualified. The candidates get no greater proportion of them, and no less, than they do of the men folk of similar political faiths.

So far as the record of the women to date is concerned, here is a little anecdote.

An old colored man in our neighborhood was a regular subscriber to a weekly paper which he had some difficulty in reading. One day in the fall of 1920, a glaring headline on the front page caught his eye, and he waylaid me in search of enlightenment.

When informed that the reason for the box-car type was that the women had been given the vote, he looked dolefully at his boots, said it right out loud:

'Dem legislators may be pow'ful smaht men, but dey shuah is done riz hell dis time! De wimmin'll jess nach'ly run us men ragged!'

Some weeks ago, when passing the old place, I called Uncle Ed from his garden and asked where he thought the women's vote would go this year.

'Oh! Scatter'n like, Mistah Gawge, Scatter'n.'

The English Folk Song

(*Continued from page 13*)

At first she showed him a ripe yellow apple,
And then a gay gold ring,
And next a cherry as red as blood
To entice the little boy in.

She took him by his lily-white hand,
And drew him across the hall,
Down in the dark cellar she went with him,
Where no one could hear him call.

And there she laid him upon a table
Beside a great bow knife,
And called for a basin all lined with gold
To catch his heart blood in.

'Lay my Bible at my head,
My prayer book at my feet,
And when my playmates call for me,
Pray tell them I'm asleep.

'Lay my prayer book at my feet,
My Bible at my head,
And when my parents call for me,
Pray tell them that I'm dead.'

The Ohio community in question has yielded fifteen different English ballads all older than 1765, the date of the publication of Bishop Percy's *Reliques of Ancient Poetry*. The list includes many favorites, such as 'Lady Margaret and Sweet William,' 'Lord Lovel,' 'Barbara Allen' and 'The House Carpenter.' It includes, besides these serious ballads, such nonsensical ones as 'Our Goodman':

Our Goodman

Home came this good old man,
Home came he,
A-crying to his loving wife,
'O loving wife,' said he,
'How came this horse here
Without the leave of me?'

'You old fool, you blind fool,
Can't you plainly see,
It was a milk cow my mother sent to me?'
'Miles I have traveled,
Five hundred miles or more,
And milk cows with a saddle
I never saw before.'

Home came this good old man,
Home came he,
A-crying to his loving wife,
'O loving wife,' said he,
'How came this man here
Without the leave of me?'

'You old fool, you blind fool,
Can't you plainly see,
It's a baby my mamma sent to me?'
'Miles I have traveled,
Five hundred miles or more,
But babies with whiskers on
I never saw before.'

In addition to these older ballads, I have found forty-four other ballads traditional in England, not to mention many of distinctly American origin, a group of curious old Irish songs, and many others possessing an interest of a different sort. Such a harvest from one community leads one to conclude that we have not made diligent search for traditional songs. Other communities would doubtless yield as rich returns if effort were put forth to rescue the old songs. The singers generally belong to a generation rapidly passing away, and delay in recording their songs will contribute to the passing of a mass of interesting and valuable oral tradition.

An American—Unafraid and Unashamed!

(*Continued from page 6*)

have anything to do with England.'

The few English friends of the Union who had appealed to him for help were desperate. They said: 'We have been counted as the offscouring because we have taken up the part of the North.' They showed how urgent was their need and the North's need of his support. They made it plain that unless he stemmed the tide of governmental hostility by direct appeal to the common people of Britain, it was probable that the government would unite with France in active intervention in aid of the Confederacy. At last he yielded. So was brought into the service of the Union, on English soil, one of the most eloquent of all Americans.

Theodore Cuyler, writing after Beecher's death, thus describes the wonderful quality of the eloquence that now became a mainstay of the Union cause: 'It was something to dream about. His voice was as sweet as a lute and as loud as a trumpet. In its tenderest pathos, that witching voice touched the fount of tears. When it rose into impassioned sublimity "they that heard it said that it thundered." Now that the marvelous voice is stilled in death, we will all confess that we shall not hear its like again.'

The genius that finds expression in eloquence can receive only ephemeral recognition. The painter's work remains, as does the sculptor's. Their fame does not rely upon tradition for its maintenance. Posterity can judge for itself. The score of the composer still delights successive ages and the printed book preserves the poet's songs to the generations that follow him. Shakespeare lives in his works in our century as in his own. But the eloquence of the orator, like the art of the actor and the voice of the singer, is only of its one brief day and vanishes with it.

Beecher, preparing for the platform, counted with seeing eyes the odds against him, but he did not flinch. He knew the enmity he had to meet, he knew how difficult that enmity would be to overcome. A detached observer, the late George F. Edmunds, has appraised for us the situation Beecher faced.

HIS visit to England,' Edmunds wrote, 'and his work there, in a dark and critical period of the rebellion, when the government and the great body of the ruling classes of that country were exerting all their power (just short of alliance with rebel government) to effect the destruction of our Republic—when, as related by Justin McCarthy in his history, Lord Russell was saying that the struggle was one "in which the North was striving for empire and the South for Independence," and when William E. Gladstone was declaring that "the President of the Southern Confederation, Mr. Jefferson Davis, had made an army, had made a navy, and more than that, had made a nation"; when the Duke of Argyll and John Bright and a very few others were our only open friends—were a conspicuous example of the lofty and persistent moral courage that seemed to grow more and more bright and daring in proportion to the number of foes he overcame.'

Moreover, the Trent case had greatly inflamed preëxistent hostility. Captain Wilkes, of the U. S. S. *San Jacinto*, had stopped the English mail steamer *Trent* on the high seas and taken from it James M. Mason and John Slidell, sent by the Confederacy to negotiate with the governments of France and England. But for the forbearance of Abraham Lincoln and the restraining influence of Queen Victoria's husband, Prince Albert, war might have resulted then between Britain and the United States. The envoys had been released before Beecher visited England, but in both countries excitement was intense and the war spirit ran to dangerous extremes.

It was under such conditions that dates were arranged at Manchester, Glasgow, Edinburgh, Liverpool and London for speeches by Beecher, to be delivered in those cities in the order named. At Manchester, as the time drew near, the walls were covered with placards in aggressive preparation against Beecher's coming. They flamed alike in their blazing color and their no less blazing mendacity. They were phrased to incite the people to physical demonstrations against the champion of the Union cause.

Here, as elsewhere, declarations were attributed to him he never made. Word of them was passed from mouth to mouth. Nothing was left undone that hatred could devise to intensify the passions of a community upon which the war had imposed serious hardship by cutting off the supply of American cotton.

When Beecher reached the hall in Manchester wherein he was to speak he found it crowded beyond capacity with a hostile throng. It is true that a considerable number of workingmen who sympathized with the North succeeded in gaining entrance, but they were vastly outnumbered by the partisans of the Confederacy, who 'packed' the meeting. Beecher's appearance on the platform was the signal for a terrible din. From every section of the hall he was showered with abusive epithets. Catcalls, curses, groans, yells and shouts of derision flooded the air with clamor, and drowned the voice of the American orator. If in some lull of the tempest imposed by weariness, Beecher attempted to resume his speech, there descended on him a revived Niagara of vituperation. While the storm was at its height, he bent over the press section and calmly, as if in his pulpit, continued his address to the reporters.

Throughout this amazing scene Beecher never lost his temper or his courage. Again and again his resourceful wit enabled him to fling back in response to jibes and insults answers that drew upon the heckler the laughter of his fellows. It must, however, have been a tremendously trying experience. 'No one,' wrote Beecher, describing that battle of one man against thousands, 'who has never seen an English mob can form any conception of one.'

At length Beecher's pluck began to gain recognition. Some manifestation of the under-lurking British sense of fair play came in slow response to that fine exhibition of courage.

There was a winning appeal in the very appearance of the man. There he stood; great, even bulky of body; virile in every fiber, rich in overflowing vitality. His forehead was high; his mouth firm, large and singularly expressive of emotion; his blue eyes were brightly bulbous, a characteristic of many who have the gift of oratory. There he stood like a rock and preached to the unwilling ears of a hostile mob the cause of the Union.

He gloried in his country. No mean apologies slipped in shame from those lips. They sounded in pride his love of America.

So at last he won. His rising eloquence, conquering interruptions, swept his auditors from their enmity. When, as was the custom of British public meetings, the judgment of the audience was taken at the conclusion of the address, then, as Beecher described it, 'you would have thought it was a tropical thunderstorm that swept through that hall, as the "Ayes" were thousands, while the "Noes" were in an insignificant and contemptible minority.'

At Liverpool, Beecher's Manchester experience was repeated in multiplied intensity. His own account of that meeting has been preserved. He wrote: 'Liverpool was worse than all the rest put together. My life was threatened and I had communications to the effect that I had better not venture there. The streets were placarded with the most scurrilous and abusive cards.' Among these cards was one that charged Beecher with expressing the wish that London might be sacked and destroyed. All manner of accusations were flung at him. Possibly none expressly charged that he had lost his soul. Perhaps that form of attack had not then been perfected.

THE Liverpool audience was responsive to the incitements wherewith it had been stimulated. There were men, says Beecher, 'in the galleries and boxes who came armed and some bold men on our side went up into these boxes and drew their bowie knives and pistols and said to these young bloods, "The first man that fires here will rue it."' Beecher had else perhaps been slain on the platform.

As it was, the mob was resolved he should not speak. He fought the angry thousands of roaring men for an hour and a half before he could get even partial control of the meeting. He faced them unflinchingly, with as superb courage as was ever shown. Having compelled some measure of attention, he then spoke for an hour and a half, subject, however, to constant interruption. 'I sometimes felt,' he said afterward, 'like a shipmaster attempting to preach on board a ship through a speaking trumpet, with a tornado on the sea and a mutiny among the men.'

Again he triumphed. Again he victoriously preached America, great-hearted, splendid and glorious. Successfully he vindicated the policies of the Union and showed forth the nobility of the Republic. Enmity could not make head against such courage. So in Liverpool, as in Manchester, Beecher carried a hostile meeting to a declaration in support of the North.

Beecher's speeches were printed all over Great Britain and were of extraordinary value in fortifying the common people in their stand. He built up in them a moral strength Parliament did not dare antagonize.

His last address was delivered in Exeter Hall in London. There he had a good reception, but he had already won his fight. He had made it impossible for the ruling classes to put the strength of Britain behind the cause of slavery. His patience, his courage, his resourcefulness, his love of freedom and his faith in America, boldly asserted and maintained, had been worth to his country in England more than would another army corps on the Potomac.

IT WAS in this parting speech at Exeter Hall that Beecher bore final witness before all Britain that the Union would be preserved, 'at all hazards and at any cost,' however long the war might endure. This fragment of his speech reveals its whole spirit:

> Standing by my cradle, standing by my hearth, standing by the altar of the church, standing by all the places that mark the name and memory of heroic men who poured their blood and lives for principle, I declare that in ten or twenty years of war we will sacrifice everything we have for principle. If the love of popular liberty is dead in Britain, you will not understand us; but if the love of liberty lives as it once lived and has worthy successors of those renowned men who were our ancestors as much as yours, and whose examples and principles we inherit to make fruitful as so much seed corn in a new and fertile land, then you will understand our firm, invincible determination—deep as the sea, firm as the mountains, but calm as the heavens above us—to fight this war through at all hazards and at any cost!

Contrast what one American then nobly did with what the thousands of American expatriates now ignobly do!

Contrast Beecher's courage with their cowardice; his proud Americanism with their apologies for America; his patriotism with their disloyalty; his faith in America with their impeachment of her faith; his assertion of her nobility with their squealings that she is a thing of shame; his pride in her glory with their charges that she has lost her soul.

When they voice their judgments condemning the meanness and greed of America and the shamefulness of her conduct, warning her that the hatred of the world is the penalty of her offending and that all nations presently will come to despise her, let loyal Americans take courage to their hearts from opposing truths and be what Beecher was.

Never did Americans have larger reason to be proud of their country!

Never did any nation display a nobler magnanimity or generosity than did America during her participation in the war and in the years that have followed. Never did any reveal itself as more unselfish.

She did not seek acquisition of territory and she scorned indemnity. The 'mandates' taken by her associates reach out acquisitively over hundreds of thousands of square miles of the earth's land surface.

America dedicated herself to the cause of freedom and offered the lives of millions of her sons to seal that dedication.

She spent her substance in relief of the distress of the starving upon whom the war had brought ruin. Even her enemies came to know the healing touch of her benevolence. Her whole course of action has been glorified by purposes in which there was no thought of gain or taint of self-seeking.

If it is thus that nations lose their souls, then were it well for the world should every other nation suffer a like loss.

About Books and Reviewers

(Continued from page 3)

of a secret force, quite impossible in every way, but, nevertheless a good piece of work. It stands miles high above a silly story about a very unconvincing centaur put out by the same publishing house, too silly to say anything about.

There are a couple of books with a religious background on the market, both very good indeed and without theatricality. They are *Brother Saul*, by Donn Byrne (Century Company) and *Figures of the Passion of Our Lord*, by Gabriel Miro (Alfred A. Knopf). Byrne has strong, imaginative powers which, coupled with an intimate knowledge of his subject, have enabled him to make a book not likely to be neglected. The Miro book, a translation from the Spanish, is strongly suggestive of the work of Walter Pater. It has a quiet and unostentatious perfection of finish about it.

Turning to new poetry, there is a thin book by a young man named Glenn Ward Dresbach who works for a living and only writes for the sheer love of writing and when his faculties are at the best. Harold Vinal publishes the book. All of the poems are short, but have melody, color, enthusiasm. Dresbach never echoes other poets. He is himself, always sane, never obscure. Allied to poetry we have a collection of *Canadian Folk Songs*, selected and translated by J. Murray Gibbon and published by J. M. Dent and Sons of Toronto. It is a unique piece of work, one in which the compiler has been at pains to let nothing but the real thing appear.

Of detective fiction I've seen nothing of value lately. Of genial biography, we have Van Wyck Brooks' *Emerson and Others*, the others being Yeats, Bourne, Bierce, Melville, Upton Sinclair and two essays. When I say genial, I mean that it is not one of those books in which the author aims to startle by obliterating all white from his statue and making his subject of ebon hue. Brooks' book is kindly and human, and the author has done his work with businesslike efficiency. So, cordially recommending it and those others mentioned, I clear the deck for later action.

Fire From Heaven

By WILLIAM E. BARTON

MANY elements entered into the production of the first locomotive. Chief among them, perhaps, was the need of better transportation facilities for the great English coal mines and for the woolen industry. In 1814 Stephenson devised an engine named *My Lord* for the coal mines owned by Lord Ravensworth, but his most important work did not come until another decade had passed. The Pease brothers at Darlington, woolen manufacturers, needed a more direct outlet from their factory to tidewater, and in 1821, it was agreed to proceed to build a road of rails on which wagons might be drawn by horses.

George Stephenson deemed it a great mistake for a railway fifteen miles long to content itself with horses for motive power. He told Edward Pease that he would equip the railway with better means of traction than horses could provide.

On the day set for the trial trip, September 27, 1825, great crowds of people assembled to see the 'Iron Horse.'

The crowd was visibly disappointed in the appearance of the locomotive. It bore very little resemblance to a horse. But when the wagons were opened for passengers, the crowd rushed the gates, and the seats were more than filled. Not all the ticket holders got in. Only a very few in the crowd really believed that the thing would work.

And truly George Stephenson had set for himself a task that was not small. He proposed to convince the most outspoken sceptic. His directors, though permitting him to go on with his scheme, had instructed him in submitting his estimate to include provision for stationary engines at the grades. There were many who believed that his salary of fifteen hundred dollars a year was far too much to spend upon a man who was wasting the company's money in a visionary scheme. To convince all these doubters at a single venture was Stephenson's plan. His train consisted of thirty-eight carriages, and the estimated total load, including freight and passengers, was the enormous total of eighty tons. He proposed to pull that entire train up the grade for which his directors had insisted on estimating the cost of stationary engines. Truly, he had not shrunk from a mighty testing of his iron horse.

The morning was occupied with preparations of many kinds, and it was noon before the fire was ready to be lighted. Then a discovery—there was no fire at hand! In all that vast crowd there was not a spark nor a tinder box. It was some distance to a house where fire might be found. Stephenson ordered someone to go for a lighted lantern.

A canal digger in the crowd said that he often lighted his pipe with a burning glass, and carried one for that purpose. The sun was shining. Stephenson accepted the suggestion. A bit of frayed oakum was found, and the sun's rays were focused upon it. It smoked; it burst into feeble flame; it burned briskly. It ignited the kindling under the boiler of 'Locomotion Number One.'

At two o'clock George Stephenson opened the valve. The long train moved; it gathered speed upon the level and it climbed the incline where the directors had insisted on the necessity of stationary engines. It was a success!

The Westward March of Settlement

(*Continued from page 2*)

equally wild and fierce is certain, for to survive he was forced to become as a savage. Dressed in buckskin, carrying a long knife and a heavy rifle, he walked forever on his guard. He won the Ohio valley by fierce heroism, by daring, aided by the patient endurance of his women, who toiled hard, suffered silently, and fronted cold and hunger and solitude with Spartan courage. They endured all that their husbands endured, and put up with their grim and unlovely aspect besides! While the men were cheerily killing Indians, hunting deer and bears, or rolling logs in 'bees,' the women were wearing out long days in small, rude cabins, rearing their children in constant fear of snakes and wolves, far from doctors, schools and churches. Without the basic necessities of life, they grew old and died in the front ranks of the battle line. Few of the books dealing with these days give even a casual word of praise to the heroic wife and mother of the border.

The settlement of Kentucky, Tennessee and part of Ohio was the work of settlers from Virginia, the Carolinas and Maryland. New York and New England, moving along more northern parallels of latitude, came later. Vermont and New Hampshire and other New England states moved into northern New York and thence along the Great Lakes, settling northern Ohio, northern Indiana and southern Michigan. Pennsylvania with its Conestoga wagon helped to people northern Kentucky and southern Ohio, and the Ohio River carried passengers as well as freight to southern Illinois and Missouri.

It was like the slow march of an army, filing through various separate hill passes, cohering into camps and clustered outposts, but always advancing. The trails became roads, the main roads grew into pikes with bridges and taverns, and the stagecoaches made infrequent trips, as one by one the comforts and conveniences of life were brought to the older and more favored of the settlers, while farther west the line of explorers was moving, constantly recruited by those to whom a settled community was a place of dull routine.

As the entire eastern half of the new continent was an almost unbroken forest, it follows that for two hundred years, from 1620 to 1820, our pioneers were essentially foresters, and that little change in the methods of settlement and of farming took place. The axe, the yoked oxen, the rude log hut, the long rifle, and the immemorial sickle, all remained typical not merely of the border, but of farm life in older states. Settlement continued to be mainly a process of felling trees, burning logs and planting amid stumps. Only the fortunate few were able to secure farms in the genial oak openings or on the river banks where pools of sunlight cheered the gloomy wood, and then suddenly—suddenly as years are counted in the history of a nation—the westward moving line of foresters came out upon the level fields of Illinois and saw the prairies rolling illimitably to the western horizon, a glorious pasture land on which millions of wild cattle fed—a land all cleared for the plow, a paradise from which the red marauders had been driven, a veritable garden of the Lord for those who were weary of the savage-haunted wood.

Almost instantly the psychology of the pioneer changed. Relieved of the tyranny of the tree and the menace of the savage, the men of the prairie developed swiftly as farmers and mechanics. Losing the habits of the hunter, they took on the qualities of the inventor. As the acres of their farms increased and their need of labor-saving machinery sharpened, they became pathfinders in another field.

For thousands of years the methods of planting, the tools for reaping and threshing, had remained almost unchanged. Even the Yankee, inventive as he was in other ways, continued to sow his seed by hand and to beat it with the flail in threshing time.

Furthermore, in their century-long march across the Alleghenies and through the woodlands of Ohio and Kentucky, men had built their houses of logs or of stone and roofed them with slabs rived laboriously from logs of oak and pine. But now, stimulated by the wide acres of the prairie, the settler devised new ways of cultivating the soil. Dreaming of broad fields of wheat and corn, he invented new ways of seeding and more expeditious methods of harvesting.

He improved his plow and his wagon. He originated the mowing machine and the reaper. He contrived the horse-power thresher and the fanning mill. On his ever expanding farm the self-rake reaper and the broadcast seeder became necessities. He discarded the ox and the cart. His movements took on the speed of the horse. Steamboats on the Mississippi made travel north and south easy and cheap, and the southward flowing rivers brought down to his hands planks and shingles from the pine lands of Michigan and Wisconsin. His log cabin gave place to a house of sawed lumber, with shingled roof. Roads improved and towns arose almost in a night. Less lonely, less perilous, life rapidly lost in severity.

Until the year 1849, the national expansion which I have just outlined was due almost entirely to a desire for free land or cheaper land. 'For Uncle Sam is rich enough to give us all a farm,' a refrain in an old song, expresses the conviction which peopled the prairie. There were no mines in the Allegheny Mountains and none of any account in the great Mississippi Valley; therefore no thought of gold entered the minds of any of the migrants till the discovery of gold in California took place, and the rush, great as it was, was only an incident, an episode in the mighty story of western settlement. The desire for land remained the dominant motive of the grand army, whose thousand miles of skirmish line remained unbroken by the defection of the few.

It may be argued that the hunger for land is, at bottom, a hunger for gold, and in a sense this is true, but mingled with the madness of the land seeker was the psychology of the home builder. Something nobly creative was in the mind of the boomer and plowman. The prairie settlers, as I have tried to define their actions, were always in search of wider, better farms. Their dreams of a 'free land' were associated with visions of game-filled valleys, of flowering savannas swarming with wild fowl, of sunny streams alive with fish. Something akin to poetry was in their passion. Without precisely defining it, I would simply say they were all responding to a lure as old as the race, for the migration of their European forbears had always been toward the sunset.

Along with these vaguely defined hopes of a more abundant life on the part of the pioneers went the keen joys of discovery. They had in them the spirit of the riflemen and the trail makers, but at the same time they were home builders. In this characteristic they differ from the miner, the buffalo hunter, and the trapper of the far border. The plow and the scythe went with the prairie settler even when he explored. Davey Crockett objected to near neighbors, but Richard Garland and his companions rejoiced in the increasing comfort of their communities. It is true that they were always moving from the settled to the unsettled, but they did so not because they despised their neighbors, but because they could not quite content themselves to end their days in an ever deepening rut of commonplace routine. As the charm of the new community wore away, they pulled up stakes and set forth once again, always seeking a fairy world the beauty of which would insure content.

Mistaken as all this may seem to us today, the hope which led these farmers was also potent in the action of town builders, railway engineers, and all the other 'boomers' of the new country. A love of untraveled regions combined with the hope of unearned increment is the force which built our inland cities and founded our inland states.

Pathfinding is the characteristic action of the American inventor as well as of our pioneer farmers. Dauntless exploration represents the mood of our inventors, our best architects, our noblest bridge builders. Sons of land seekers, grandsons of trail makers, our inventive geniuses are naturally inheritors of a desire for exploration, a love for the unknown.

Meanwhile, contemporaneous with this discovery of the prairies and the utilization of the pine forests of Michigan and Wisconsin, a corresponding conquest of mountain and plain was taking place. The domain of the buffalo and the red man was narrowing. The dominion of the cattle king was at hand. The settlement of the coast, the establishment of the Overland Trail, had opened a new industry. As the Civil War and the increasing demand for flour had stimulated the prairie farmer to sow more wheat and to invent machinery for harvesting it, so the increasing demand for meat had led to the discovery of the value of the short-grass pasturage which the open plains offered. With the defeat of the Comanche and the Kiowa the production of cattle on a grand scale began. The settler in Texas had discovered that herds of long-horned cattle could be bought very cheaply in old Mexico, and that these herds could be fattened as they moved to the north, feeding on the more bountiful grasses of Oklahoma, Kansas and Nebraska, and that they could be sold in northern markets at the end of their long trail.

AS EARLY as 1857, herds of cattle, driven by men of southern type, had begun to feed along the Chisholm Trail, and by the close of the Civil War three great rivers of long-horn steers were moving northward along these winding ways, on their journey toward the markets of Kansas and Missouri.

This amazing development of herding and driving cattle brought a new type of borderman. The cowboy, 'the centaur of the plains,' took the center of the stage. For more than fifty years he was to be the most picturesque, the most romantic, figure in our plains' history, and a stock actor in all our fiction. He displaced the forester, the rifleman, the axeman. Mexican in the derivation of his costume and his phraseology, he appeared alien to the northern farmer. Spanish in his 'outfit,' and essentially southern in his quiet drawling tone, he was nevertheless as typically American as Daniel Boone. He was the son of the plains, as Boone was the son of the forest.

The reign of the cattle king was short, for the westward-moving farmer, the man of whom my father was a type, drove his plow and his reaper athwart the long trail, and fenced the free range over which the cowboy rode. His vast, wasteful industry stood in the way of the westward march of the plow, and as the government free grass vanished, the cattle herder disappeared almost as swiftly as the buffalo had disappeared before him. The cowboy slid from his horse, hung up his spurs, and laid his hand to the plow or to the hoe in the ditch of an irrigating stream. He rides now only in the silent spaces of the silver screen. Soon he will be as traditional as the hunter with the coonskin cap and the long Kentucky rifle. Like the Sioux, he gave color and drama to our border but he was only a transient figure. Gallant and resourceful as he was, he was forced to give way to other less romantic men.

In this short sketch of the thrust of the pioneer and the steady expansion of the nation's plowed lands, I have avoided any account of the political changes to which the settler was exposed, for the antislavery war, colossal as it appeared at the time, is only, to my thinking, an episode of the westward march of settlement. The indirect aftereffects of the Civil War were greater than its immediate influence, for it led to land laws which enormously increased the army of homesteaders and preëmptors—veterans whose resolute action speeded the building of cities and hastened the admission of states.

Our material pioneering is done, but as we look back along the trail already dim in the gloaming of the past, we see the camp fires sparkle. We hear the call, 'Hello, the house!' and catch the hearty answer, 'Come in, stranger!' We see the white-topped prairie schooners slowly toiling through the river beds, and we thrill to the power and poetry of these border wars, now almost forgotten. Dark and bitter as those experiences sometimes were, they were rich in days of hardihood, of action, of self-sacrifice.

I am glad that I was born early enough to catch the dying echoes of their songs, to bask in the failing light of their fires.

Healing *the* Scars *of* War

THE real father of the Monroe Doctrine was George Canning, an English prime minister; for it was he that suggested to President Monroe through Mr. Rush, then our minister plenipotentiary in London, that such a move would not only tend to define the Republic's position as the preëminent power in the Western Hemisphere and to solidify sentiment between the peoples of North America and South America, but would also go far toward healing the scars left by our own War of Independence and toward checking the drift in the direction of absolutism in Europe.

In this, Canning—who had already earned the nickname of 'the Fox' in European diplomacy—undoubtedly had as his more immediate object the strengthening of Britain's own influence by obtaining for her a winning card in the great game of 'balance of power' which swayed the foreign offices of Europe. This balance was threatened by the Holy Alliance which, if carried out successfully, would have worked disaster to Britain, perhaps relegating her for centuries to a subordinate rôle to that played by France, Spain and Austria.

That Monroe did not originate the idea of the policy (miscalled 'doctrine') associated with his name need not lessen the credit due him for heroic boldness and marvelous sagacity in announcing as a fundamental attitude of the great Republic its firm opposition to any attempt to extend the European monarchical system over any part of the American Continent. His action might have plunged the still new and struggling nation into war with Spain and with all Continental Europe.

This contingency was, indeed, foreseen by Thomas Jefferson, whose advice Monroe sought in the emergency. And it says much for his really deep appreciation of British love of liberty that this archrepublican who had worded the American defiance of British tyranny should have spoken with so great gratification of this aspect of the situation. 'Nothing,' said Jefferson, 'would more perfectly reunite America and Britain than to have their sons fight side by side for the world's freedom'—a dream that waited until our own day for fulfillment.

In all these countries to the south of us the names of Canning, Cochrane, O'Leary, Brown, Edwards, Mac Namara, Beresford, and Whitelocke are household words. More than 9,000 British volunteers crossed the Atlantic to fight for the revolting Spanish colonists.

We are told by an eminent Argentine historian, Dr. Francisco Moréno: 'Without the Irish, English and Scottish sailors, who formed almost the whole of the officers and crews of the first Argentine squadron, it is possible that independence would have been delayed for many years . . . On land the roll of the army of the Andes is full of British names.'

Two great names among them are those of General Miller and Admiral Brown. The latter arrived in Buenos Aires as a poor Irish lad and later started the first regular packet service between Buenos Aires and Montevideo, a service carried on almost continuously since his day by British companies and British capital.

The first stockmen who established their homes on the remote Indian frontiers were Welshmen. In the settling of the country, large colonies of Scotch and Irish immigrants had important part. Mulhall, the famous statistician, counted 25,000 Irish in the province of Buenos Aires alone in 1877.

The records show that these early Irish colonists and their descendants, now merged in the Argentine population, often under Spanish modifications of Irish names, have had almost as large a part in building up the country as men of Irish blood have had in building up the agricultural and industrial wealth of the United States.

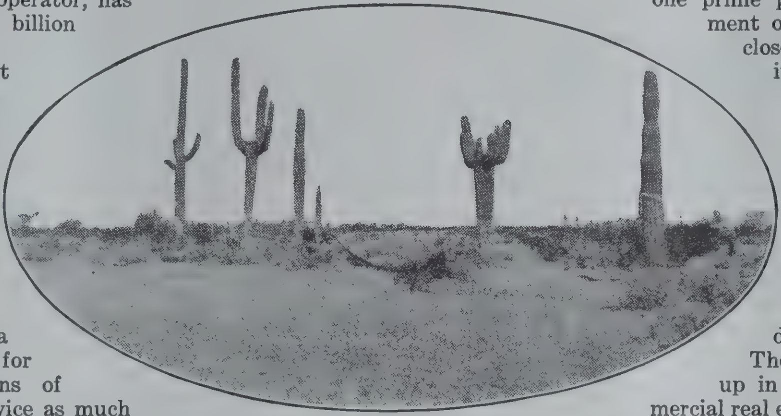
British engineers built the first railway in the Argentine, opened up trade with Paraguay, introduced large-scale farming, brought in blooded Durham cattle and merino sheep to improve the native breeds, set up the first meat-freezing establishment and put up the first wire fences.

Long ago, Argentina passed the United States as the largest exporter of frozen beef and mutton, and its wheat harvests run close to those of the United States and Canada in the feeding of the world.

Free Land *for the* Land Hungry

Uncle Sam *Has Disposed of a* Billion Acres *But Considerably More Remains*

By AARON HARDY ULM



Land like this is available in abundant free parcels.

WITHOUT advertising or artificial booming of any kind on his part, Uncle Sam, as a real estate owner and operator, has to date disposed of around a billion acres of land.

A billion acres! You will get some notion of what this amounts to when reminded that the vast State of Texas contains only 167,000,000 acres, or not much more than one-sixth as much land as the Federal Government has sold and given away.

Uncle Sam is still disposing of five to ten million acres a year, and has on his books for future transfer many millions of acres more. There is about twice as much land available in Alaska. These figures do not include what has been set aside for more or less permanent retention in the form of national forests, parks and other reservations. These reserves now comprise about the same aggregate area as, in the country proper, is still considered public land.

By *public land* is meant area that is at least potentially open to acquirement by citizens of the country for personal use or for exploitation. Much of it is actually open for such acquirement and can be had for the asking.

Are land prices high or rents exorbitant? Well, you may escape both by settling down on plots of this land, which may now be found in all states west of the Mississippi, except Iowa and Texas; and in the more easterly ones of Michigan, Florida, Alabama and Mississippi. Would you like to farm? If so, 160-acre plots in virtually all of the states indicated await you. Would you like to establish a cattle or sheep ranch? You may select a 640-acre tract in almost any of the Rocky Mountain, Southwestern or Pacific Coast states. Would you like to make a garden spot in the desert regions of Utah? The Government will be glad to give you 320 acres of land as naturally rich as any in the world, to use for that purpose.

But before you yield to the yearning which practically every American has sometimes felt for a homestead on the public domain, look into the facts with care. For though it still goes on—more than 13,000 persons entered upon it last year—homesteading is not what it was in the days of the covered wagon. But more as to that later.

Much land like this is open to homesteading.

In the past the Federal Government has owned in the country proper more than a billion and a half acres of land. This was acquired in various ways: by transfer from the original Thirteen States; by purchase, as in the case of that which comprised the great Louisiana Territory; and by conquest, as in the case of the large area taken over from Mexico after the war with that country eighty years ago.

How did the Government dispose of the billion acres for which title has passed to other hands? In various ways.

It is a long story, being in great measure the history of the country. One might say that land hunger, which these vast areas fed, really brought about the development of the United States as it now is; or, rather, that the people of the country have been engaged in practically one basic enterprise alone, which is the real estate business. For the development and exploitation of the vast land resources of the nation has been the foundation for virtually every other endeavor up to the present time.

Millions trekked to the West—for land. Railroads were built through uninhabited areas on account of land. For a long time immigrants poured into the country with one prime purpose in view—the acquirement of 'free' land. But that era is closed, because the land that made it is now almost gone.

Except in the case of gifts made for military service, Uncle Sam for a long time looked upon his possessions of land largely as a source of revenue only. Great blocks of it, as in the Northwest Territory, were sold to individuals and corporations who looked after the details of distribution and settlement.

The General Land Office was set up in 1812 substantially as a commercial real estate agency. Its only business was to sell land. By an act passed in 1807 persons were forbidden to settle on land before sale. But regardless of the law, thousands streamed into the uninhabited areas and settled down and established homes on lands to which they had no shadow of title. Laws were then passed that in substance condoned these violations of the act of 1807. These laws made it possible for the squatters to secure titles by purchase, which was made easy for them.

It was not until 1841 that Congress, in shaping the land policy of the Government, positively recognized the act of settlement as of more importance than the revenues derived from sale. Under the preëmption act a more or less uniform procedure was set up whereby persons who settled without warrant on public lands could procure title by paying into the Treasury a nominal purchase price and giving proof that they were settlers in fact and not mere land grabbers. They had to show, as under the homestead laws at present, that they meant business. That is, improvements such as the erection of buildings and the cultivation of the soil constituted the essence of the transaction.

Then came railroads, which eased and simplified—but which also complicate to this day Uncle Sam's real estate business. To them were given grants, for their own use and for exploitation, totaling more than 125,000,000 acres. More than 3,000,000 acres were disposed of for wagon roads.

In 1862 was passed the homestead act which made settlement and citizenship almost the only prerequisites to the securing of public lands. Under it settlers might procure tracts of 160 acres by living on the land for three years and making reasonable improvements. The only revenue returns to the Government were nominal fees. Persons who had only declared intention to become citizens might enter upon homesteads, but, as is true today, they had to be citizens when final title was procured.

In 1909, Congress provided for enlarged homestead entries on lands not considered as first rate for farming, and in 1916 provision was made whereby 640 acres might be homesteaded in areas more suitable for stock-raising than for crop-raising purposes.

A homesteader's shack.

Provision was also made whereby one might take over as many as 320 acres of certain desert lands and might acquire final title without living for any period on the tracts.

There are several other laws bearing on homesteading, such as those relating to entries on reclaimed lands and those under which special allowances are made for artesian wells set running in arid regions of Nevada.

The main laws, however, are those relating to 160-, 320- and 640-acre tracts of agricultural, homestead, desert and grazing lands.

Under the homestead act approximately 1,350,000 final entries for land, aggregating about 215,000,000 acres, have been made. In addition, about 33,000,000 acres of desert lands have been transferred in a similar way.

From all of its disposals of land to date the Federal Government has collected approximately $555,000,000.

The Government's real estate business, though in some ways not so large as in former times, is still vast and exceedingly complex. The General Land Office collects about ten million dollars a year in fees and from sales and leases.

The Government still sells, at auction or otherwise, considerable real estate. Every year, for example, tracts suitable for town sites are auctioned off in the form of lots to highest bidders. One on the Florida coast, near Miami, yielded a total of $386,000 recently. Five thousand persons attended the sale.

Indian lands, too, are frequently taken over and sold, the funds derived being held in trust for the red men. Sometimes an opening of rich Indian lands causes a repetition in miniature of the dramatic land rushes which used to take place on the turning over of attractive areas to settlers.

The last big rushes took place in the latter years of the past century in what is now Oklahoma. In 1889, 30,000 people lined up on the Kansas border and on the firing of cannon rushed into what is now Oklahoma in a frantic race for choice locations. The city of Lawton, which was the center of the scramble, had a population of nearly 10,000 and an organized government before a single house was erected.

A stop was brought to these dramatic occurrences by the 'first-there-first-claim' rule being supplanted by a system of drawings, which is sometimes used even now when there is much rivalry.

There are not likely to be any mad mob rushes for public land any more, for the reason that there are not likely to be any more openings of the kind which inspired those movements; that is, not in the country proper. Some day there may be a repetition in Alaska, where millions of acres of rich land await settlers, though now no great desire for it is manifest. Only 84 homestead entries were made there last year.

'The day of the old romantic kind of homesteading is about passed;' says William Spry, former governor of Utah and now commissioner of the General Land Office. 'If adventure and the overcoming of difficulties are the making of romance, the kind of homesteading which goes on now may be more romantic than was that which marked the development of the Midwest.

'For, though no one has to travel hundreds of miles afoot or in wagon through uninhabited and often hostile territory in order to reach lands now open to homesteading, the difficulties in the way of making a go of it after one has settled on a tract are greater ordinarily than ever before.

'This is because most of the land that is good for the old type of homesteading has been taken or has been reserved permanently by the Government.

'However, there is plenty of land that is good for some purpose open to those who want to homestead. That the difficulties are beginning to surmount the attractions is shown by the fact that there were fewer original homestead entries during the last fiscal year than during the preceding one.'

The land still available for homesteading is in great part on mountain slopes or in desert areas, much of it uninhabited regions. Much of it is good for grazing, but when taken for that purpose both experience and funds are needed. Hence most of the homesteading of this kind is now done by Westerners who already know the stock game.

Some of the lands available as so-called enlarged homesteads are adapted to 'dry' farming, which also calls for more funds and experience than the homesteader of old needed to possess.

For all Uncle Sam cares, anybody who meets the requirements of law can homestead on any of his land that is open for the purpose. And as public lands are surveyed and found not to be of the kind that is reserved or withdrawn, as, for example, rich mineral lands which are held or leased, they must be made open to entry by homesteaders.

Despite its increasing difficulties, homesteading will go on for many years to come.

For the remaining millions of acres still potentially available for the purpose in the country proper will long prove an enticement to the land hungry.

In the acquiring of homesteads on these lands there are being lived today stories of hardships overcome, of loneliness, of endurance and persistence that are as thrilling as any that were lived in the heyday of the American pioneer.

Some day a new trekking of pioneers will turn toward Alaska, where millions and millions of acres of fine farming lands that are as attractive naturally as were those of the northerly plains of the country proper await them.

The Duffer

(*Continued from page 7*)

professional league to be organized. The promoters decided that since nearly every boy in the country either plays basketball or watches it being played, he will become enthusiastic about the game, an addict to it. When he grows up he develops into a cash customer. And the best customers are the fellows that never were successful players as boys.

I have heard football coaches remark that not five per cent of the people who attend football games have any more than the most superficial knowledge of the game. They carry nothing more than a hazy idea. But if football depended for support upon those who are experts in their knowledge of the game you could load them all into one hall and this country would not boast a single football stadium.

'If the spectators had a thorough grasp of the technique of the various sports, I am afraid that they would soon cease to attend,' the late Walter Camp once told me.

'If they knew all the fundamentals and the technique they would probably be bored with most of the contests. Only the highly polished performances would interest them. Since they lack this knowledge they continue to be enthusiastic, for to them something new is always bobbing up and it holds their interest.'

One day I heard a conversation between two major league ball players.

'I never saw so many dumbs as you find in a ball park. Why those saps ain't got no idea what this is about,' said one.

'That's where we're lucky. If they had a good idea what it was about they wouldn't be saps enough to pay their money to see us play,' replied the other.

As long as we have the duffer with us so long will we have sports and the more duffers that engage in sports, the larger the field will be. It is estimated that more people play golf in the United States than engage in any other two sports combined. And golf, as we have already observed, has twice as many duffers as any sport you can mention offhand. The duffer, above all, should be encouraged; he keeps the game going.

CHATS WITH OFFICE CALLERS

'There's a great deal of talk going the rounds,' said the ***Jurist,*** 'concerning the necessity for abolishing the grand jury and the petit jury systems. It is argued by some that trial juries are inefficient, unskilled and unable to investigate and determine the facts, and that the grand jury is archaic and useless. There is no doubt that many lawbreakers escape deserved punishment through the stupidity and ineptness of jurors. Every case in which a jury returns a verdict that does not agree with articulate popular opinion furnishes an excuse for the denunciation of the jury system. But I, for one, believe that the grand jury and the petit jury deserve a support based on tradition and buttressed in experience. Neither of them is entirely efficient, but both have proved practical instruments. The average citizen drawn on a jury is still good and true and able to apply sound judgment and common sense in weighing evidence in ordinary cases. Attacks on the jury system are often due to ignorance of the facts. Every citizen who has ever served at least a month on a panel knows from his own experience that the mixed body of individuals it brings into temporary intimacy is creditable to the community which produces it, and that its members are generally anxious and able to perform the tasks intrusted to them with thoroughness and disinterestedness.'

* * *

'When the average Latin American draws water from a tap he makes use of a utility owned and frequently managed by persons foreign to his land and race,' remarked the ***Northern Investor.*** 'If he rides to work on a car he is carried by a corporation whose proprietorship lies abroad. If his work is industrial, his employer is likely to be a European or a citizen of the United States. A substantial proportion of what he produces will be exported to meet dividends and interest and to pay profits enjoyed by persons who never put foot in Latin America.

'When he pays taxes a large part of the payment goes to outsiders on account of public loans. When he takes a trip by railway he is likely to travel on a road whose very name connotes more of foreign lands than of his own country. If he deals largely with a bank, it is with the branch of one whose headquarters are in the United States or Europe, usually the latter.

'Still this Latin America is rated politically as a free citizen who lives under an independent government; and, in common with other natives, he is the nominal possessor of lands extraordinarily rich in natural resources.

'But, aside from the political equation, his possession amounts to little more than an "equity."

'On account of financial penetration the bulk of Latin America is divided up into "spheres of influence," somewhat as is the Far East outside of Japan. We of course dominate in Cuba, and to a fair degree in Central America. We also seem to hold the strongest hand in Chile, around which, some say, we are developing a relation similar to that of Great Britain with Japan in the Far East. Other "spheres of influence" in Latin America are dominated by Europe.'

* * *

'In every republic in this hemisphere there are groups of men who regard the institutions of the United States as ideal and and who believe Americans desire to help them without exploiting them.' So spoke the ***Man from Porto Rico.*** 'Unfortunately, Latin America has great multitudes who think that the main concern of the people of the United States is the making of profits. Therefore many Latin American politicians serve their own ends by promoting the idea that the North Americans are greedy and unscrupulous. They continuously blow breath into that figure labeled "The Colossus of the North," putting upon it new and hideous faces.

'The publications of Spain are regarded by the Latin Americans as the London *Times* has been regarded by the provincial Englishman for generations. They are largely anti-American. This means that throughout Spanish-speaking America there is a constant stream of suspicion and frequently of hatred against the United States. Always there is ridicule and just enough of fear to nurture the tradition that the United States loves to feed on Latin America.

'In every Latin American nation there is the feeling that sooner or later the United States will come with men and ships—first with the bankers lending money, and then with the army and navy to collect the money and the country along with it.

'Spanish America sees an army of capitalists advancing, followed by an army of soldiers. That this is not an entirely true picture does not change the belief. Nor does it banish the part of the picture which is true.'

* * *

The ***Columnist*** was supposed to be on a vacation; but he couldn't help talking shop. 'A mother-in-law may be an affliction, or she may be a blessing,' he remarked; 'but after the many years she has been the target of fun-making, I'm convinced that she is no joke. Either she is good, if she happens to be on your side of the house; or she is bad, if she belongs to the other party. If she happens to have both sons and daughters married, she has a dual personality—she is a sort of Dr. Jekyl or Mr. Hyde, depending on whom she happens to be visiting.

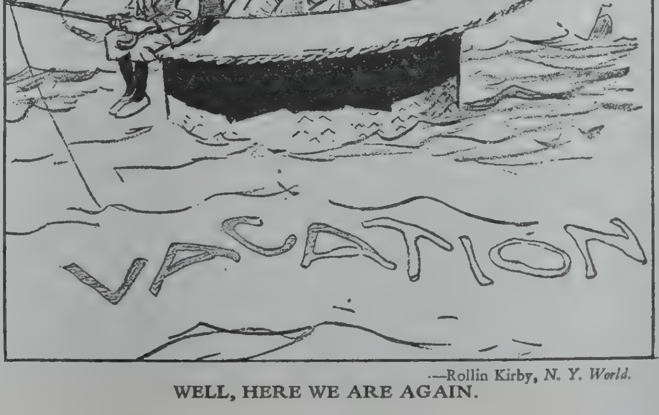
'But what would we columnists do without her? Years ago Walt Whitman used her; Bill Nye found her helpful—so have Cobb, Abe Martin and lots of others. The thought of a mother-in-law makes us smile unconsciously. I wonder why. It is not because in real life she is funny. Often she is very sweet.'

* * *

'The modern student can tell you more about chemistry than about the Creed,' said the ***Chaplain of a Great Western University.*** 'A friend of mine who had visited Oxford a few years ago told me that at an afternoon service at old St. Mary's, the university church, he had seen only four undergraduates present. Yet the mass of students are not irreligious. College students are queer, shy birds. It was once said of the American undergraduate, "There is no one quite like him." He is the most lovable and the most exasperating creature God ever made—an extraordinary combination of perversity and promise, genius and childishness.

'And the co-ed? She is not the "pious" type. She is as wholesome and charming as one could imagine, but frankly neglectful of church life. And while there is an apparent indifference to the social expression of religious consciousness in public worship, still I find a native reverence for religion among students.

'Halls, fraternities, private homes and sororities are the chaplain's hunting ground; and after the first shock the freshman becomes accustomed to the college minister. The place of religion in a modern university can be strengthened by the addition of schools of religion, and studies appealing to the intelligence of the students. The first great reason why there is so little religious fervor among undergraduates is the difficulty of squaring an inherited religion with the new and overwhelming succession of fresh views and facts which the college course brings.'



—Rollin Kirby, *N. Y. World.*

WELL, HERE WE ARE AGAIN.

CAN YOU TELL ME?

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

Question. What was the amount of income tax collected in 1926 and the cost of collecting it?

Answer. The income tax collections for the fiscal year ending June 30, 1926, amounted to $1,094,979,734.17 from corporations and $879,124,407.16 from individuals, making a total of $1,974,104,141.33, compared with $1,761,659,049.51 tax collected from incomes for the fiscal year 1925, an increase of $212,445,091.82, or 12.1 per cent. During the first six months of the fiscal year 1926 the collections embraced payments of the third and fourth installments of the tax due on incomes in the calendar year 1924 and additional collections on assessments made for previous years, all of which amounted to $844,649,733.47. During the last six months of the fiscal year 1926 the collections embraced payments of the first and second installments of the tax due on incomes in the calendar year 1925 and additional collections on assessments made for previous years, all of which amounted to $1,129,454,407.86. The miscellaneous collections arising from objects of taxation other than income taxes amounted to $861,895,750.86 for the fiscal year 1926. The expenditures in administering the internal-revenue tax laws for the fiscal year 1926 were $34,948,483.37 not including expenditures for refunding internal revenue collections and taxes illegally collected; the aggregate receipts of internal revenue were $2,835,999,892.19. This makes the cost of operation for the fiscal year 1926 $1.23 for each $100 collected, compared with $1.44 for each $100 collected for the fiscal year 1925, or a reduction of 14.6 per cent.

Q. Will you please tell me something about the Sultana catastrophe?

A. The steamer *Sultana* carrying home paroled prisoners of war was burned on the morning of April 27, 1865, in the Mississippi River near Memphis, Tennessee, as a result of the explosion of one of her boilers. Paroled prisoners of war to the number of 1,259 perished in the explosion, and 931 survived the disaster.

Q. What was the amount of duty on tea and other articles laid by England on the Colonies?

A. Townshend's revenue act of 1767 which went into effect November 20, 1767, provided the following rates of duty:

For every hundredweight avoirdupois of crown, plate, flint, and white glass, four shillings and eight pence.

For every hundredweight avoirdupois of green glass, one shilling and two pence.

For every hundredweight avoirdupois of red lead, two shillings.

For every hundredweight avoirdupois of white lead, two shillings.

For every hundredweight avoirdupois of painters' colors, two shillings.

For every pound avoirdupois of tea, three pence.

For every ream of paper usually called or known by the name of 'Atlas fine,' twelve shillings.

On March 5, 1770, the tax was removed on all save tea.

Q. Please give me the names of General John J. Pershing's staff during the period of the World War, and the official position of each.

A. The following officers served at various times in the American Expeditionary Forces at general headquarters in the positions indicated:

Commander in chief
General John J. Pershing
Chiefs of staff
Major General James G. Harbord
Major General James W. McAndrew
Brigadier General Fox Conner
Deputy chief of staff
Brigadier General LeRoy Eltinge
Secretaries of the general staff
Colonel Frank R. McCoy
Colonel James L. Collins
Colonel Thomas W. Hammond
Lieutenant Colonel Albert S. Kuegle
Assistant chiefs of staff
First section
Colonel James A. Logan, Jr.
Brigadier General Avery D. Andrews
Colonel Charles S. Lincoln
Second section
Brigadier General Dennis E. Nolan
Third section
Colonel John McA. Palmer
Brigadier General Fox Conner
Fourth section
Colonel W. D. Connor
Brigadier General G. V. H. Moseley
Fifth section
Colonel Paul B. Malone
Brigadier General Harold B. Fiske
Adjutant generals
Brigadier General Benjamin Alvord
Brigadier General Robert C. Davis
Inspector general
Major General Andre W. Brewster
Judge Advocate
Brigadier General Walter A. Bethel
Chief of artillery
Major General Ernest Hinds
Chief of tank corps
Brigadier General S. D. Rockenbach
Senior chaplain
Chaplain Charles H. Brent

—Donahey, *Cleveland Plain Dealer.*

AFTER CAREFUL THOUGHT, JONES DETERMINES WHERE THE OIL IS NEEDED!

Q. When and for how long did Daniel O'Connell serve in the British House of Commons?

A. Daniel O'Connell was elected to Parliament for the County of Clare in 1828 but could not take his seat because he refused to take the preliminary oath (it being contrary to his conscience as a Catholic). In 1829 the Catholic emancipation bill was passed and under its provisions O'Connell took his seat and became the leader of the Irish party in the House of Commons where he continued to represent Clare until his death, which occurred May 15, 1847, at Genoa, Italy.

Q. Please tell me the family name and the dynastic name of King George V of England.

A. By the marriage of Queen Victoria to Prince Albert of Saxe-Coburg-Gotha, the House of Hanover came to an end and the dynasty became the House of Saxe-Coburg-Gotha with the family surname of Wettin. On July 17, 1917, King George issued a proclamation as follows: 'We, having taken into consideration the Name and Title of our Royal House and Family, have determined that henceforth our House and Family shall be styled and known as the House of Windsor'; he also determined 'to relinquish and discontinue the use of all German Titles and Dignities.'

BRIEFLY TOLD

In the last presidential election out of sixty million men and women privileged to vote, less than thirty million placed enough value upon the right of suffrage to drop their ballots in the box. Those who failed to vote outnumbered those who voted.

The fourth of March, 1789, was the day set for the opening of our first Congress, but the inauguration of our Government was delayed until April 6—over a month—before a quorum was found and the votes counted which made Washington President.

America's dentists are said to lead the world. George III had a Yankee dentist. Dr. Thomas W. Evans, the distinguished Philadelphia dentist, treated Emperor Napoleon III of France and sheltered the Empress Eugénie after the monarchy's fall.

The only thing in the four Gospels to which Hindus invariably take exception is the killing of the fatted calf. This is because they regard the cow as sacred.

An old English couple dwell undisturbed in a completely furnished rent-free house from which, twenty years ago, the owner was scared by the appearance of a 'ghost.'

A decree giving Mexican women equal civil rights with men has been prepared by President Calles and will be promulgated soon. Though not giving the right to vote, it will revise the civil code which at present gives women an inferior status to men.

In early Saxon marriages the father of the bride delivered one of her shoes to the the bridegroom, who touched her head with it as a symbol of his authority. Today only the idea of luck is associated with the custom of throwing shoes at both bride and groom.

Recent discoveries at Mount Sinai, Arabia, have brought to light new fragments of the mysterious Sinai inscriptions, which are stone carvings believed to be at least 3,000 years old.

According to the United States Treasury, the largest supply of monetary gold ever accumulated by any country in the history of the world, a total of $4,598,782,795, was held in American vaults on April 1 of this year. This is about half of all the gold in the world.

A drug called santonin, which has the strange effect of making an individual see yellow, has been discovered by a Scottish scientist. It is prepared from the dried flower heads of European wormwood.

A survey made by the bureau of railway economics indicates that American consumption of fruits and vegetables is twice what it was ten years ago.

The term 'highbrow' is said to have been first used by Will Irwin, the writer.

Clay tablets from ancient Babylonia and Assyria show that banking transactions, not so different from those of the present time, were carried on four or five thousand years ago. Checks and notes were made of clay, which was then hardened. Modern banking originated in Italy.

The demand for ostrich feathers has declined to the point where they are being used for dusters.

Appearing before a recent session of the Cantonal Tribunal of St. Gall at Geneva, a tradesman asked a divorce on the sole ground of 'abnormal obesity.' All his savings, he declared, were used to buy food for his wife, who ate as much as four adults. The jury gave a verdict of no cause for action.

Tapioca is a product of tapioca flour, which comes from the root of the cassava, a tropical plant similar to our sweet potato plant. Most of our supply is imported from Java.

Attired in a military jacket and waving a white baton, a woman recently stepped in the center of a crowded Paris boulevard, ordering all vehicles to stop immediately. Attracted by the unusual traffic jam, police hurried to the rescue. The self-appointed cop calmly explained, 'I read in the papers that women soon will be taken on the police force and I thought I would get some practice.'

Although the printed calendar or almanac was produced on the Continent in 1472, it was not until 1497 that the first one in English appeared. Like our present almanacs, the dates and divisions of the year were freely interspersed with prophecies and astronomical predictions.

The mother of Hume, the historian, considered him weak-minded as a youth.

Contrary to the common impression, most actual villains are not tall, dark men, says Francis Carlin, a one-time famous Scotland Yard detective. Records of the Yard show that 76 per cent of the criminals convicted are blonds, usually tall.

Hundreds of sacks of wild rice have been scattered by airplane over the marshes in the Manitoba northland to increase the food supply for ducks and muskrats.

Athens, Greece, is known as the 'City of the Violet Crown,' in reference to the beautiful effects of sunset light on the Acropolis.

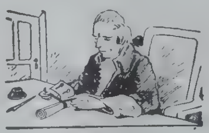
During the past 100 years the population of the world has increased from less than 1,000,000,000 to about 1,700,000,000.

The use of anesthetics was taught to other medical professions by dentistry. The use of nitrous oxide, laughing gas, in the extraction of teeth, was first attempted by Horace Wells in 1841.

A survey of tea and coffee imports shows that more than 73,000,000 persons in the United States are tea and coffee drinkers. Per capita consumption of coffee for 1926 was two cups a day or 14 pounds a year, while that of tea averaged one-half cup every 24 hours, or three-fourths of a pound for 12 months.

A savings bank in the form of a closed urn of baked clay with a slit in the top has been found in the ruins of Utica, an ancient Phoenician city on the African coast. It is believed to be at least 2,500 years old.

Woodbridge, Suffolk, is the home of a unique water mill which, although nine miles inland, obtains all its power from the tides of the River Deben. Rental records show that a mill, probably this water mill, was standing on the same spot 740 years ago.



Red tape, an expression signifying official formality and delay, owes its origin to the red tape usually employed in tying up public documents.

It is said that Anatole France, the great French writer, would go to any lengths to avoid the use of a semicolon.

Commercial frauds cost manufacturers and wholesale firms more than one thousand dollars a minute for each business day. These frauds consist of obtaining credit on false statements of assets, of concealing assets from creditors or referees in bankruptcy, and of other misrepresentations.

The discovery that the fiber of the cocoon spun by the silkworm could be made into cloth is ascribed to Se-Ling-She, a Chinese queen who lived about forty-seven centuries ago.

It has been estimated that there are 20,000,000 radio listeners in this country.

During the recent visit of the Duke of York at Auckland, New Zealand, the Maoris presented him with eighteen carved canes.

The tuna fish was not originally hunted for food but as a means of protecting the sardine interests of the Mediterranean, as the little fish were devoured in large quantities by the tuna.

According to Pliny, Cato believed that husbands started kissing in order to determine whether their wives and daughters had been drinking wine.

According to the latest estimate, every third person in the United States works for a living.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S Page this week discusses the limitations of education.

* * *

There is a poem on the second page of the cover, called 'Heat.' It is by Lizette Woodworth Reese, the Maryland author and poet whose most notable poem, 'Tears,' was inscribed on a bronze tablet erected in Western High School, Baltimore.

* * *

Than Hamlin Garland, author of the Middle Border series, and chronicler of the red man and the pioneer, there is no one better able to tell how the westward march of settlement began, how it continued, and what it meant to the country as a whole. It is well not to forget these things, and men like Hamlin Garland will not allow us to forget them. He presents us in this article with an epic of endeavor such as has made this country what it is. (p. 1)

* * *

Charles J. Finger makes books and therefore he knows books. In a tabloid article he reviews both the book reviewers and the books. Mr. Finger scarifies those writers whose lucubrations will not stand the test of intelligibility. (p. 3)

* * *

Sincerity is a virtue that seems to be getting rarer and rarer. It is to be admired in whomever found. L. M. Cramer, long resident in China, has given a vivid picture of the ordination of Buddhist monks in a temple in China. It was 'in the hour of the tiger' when the young men one by one submitted to having the symbols of their vocation literally burned into their heads. (p. 4)

* * *

Henry Ward Beecher had to face the hostility of Confederate sympathizers when he visited England during the Civil War, but he was 'an American unafraid and unashamed' and dauntlessly faced his critics. Albert Miller, noted magazine writer, gives a clear-cut sketch of Beecher's powerful personality which finally swept prejudice aside. (p. 5)

* * *

According to H. G. Salsinger, sports editor and writer, the duffer has too long been held up to ill-considered scorn. He contends that the duffer has his place in sports as well as the champion, particularly in golf, and this may be summed up in the words, 'Take away the duffer and where would the game of golf be?' (p. 7)

* * *

Just how an actress feels when she marries a title is piquantly presented by Lady Cynthia Asquith, herself the scion of a noble house and a London society leader. It would appear that the principal ordeal of the lady of the footlights is getting acquainted with the 'in-laws.' (p. 8)

* * *

It seems a strange thing to talk about 'eating in many languages,' but in such cities as New York you can do this. The process is simple. You merely choose a restaurant run by Chinese, Portuguese, Hungarians or —to use Thackeray's phrase—'Everythingarians,' and eat what the gods provide. A. R. Pinci, newspaper correspondent and magazine writer, also a cosmopolitan, assumes to advantage the double rôle of gastronomic guide and reviewer. (p. 9)

* * *

The folk songs of a nation redeem it from sheer and sordid materialism. It is among the mountain people that these songs mostly survive. It is generally thought that the mountaineers of Tennessee and the Cumberlands are the only real exponents of these lyrics of medieval times. But that the English folk songs also survive in Ohio is manifest from the typical specimens that Mary O. Eddy has collected from aged folk in outlying parts of the country. Carl Sandburg gives a few words of introduction and commendation. (p. 12)

* * *

An entirely new aspect of Mexico is presented by William L. Stidger, the well-known Methodist preacher and traveler. He says that the people get all that they ask for by asking for it in their own way. The methods used may not commend themselves to the average American citizen, however. (p. 14)

* * *

Hester Prynne and Amy Robsart are the 'great figures in fiction' which Lewis Worthington Smith presents in this article. There is a good deal in common between Hawthorne's heroine and the beautiful creature of Scott's *Kenilworth.* The writer of this essay is professor of English in Drake University, Iowa. (p. 15)

* * *

One of the most picturesque walled cities in Europe is that which contains the castellated residence of the Counts of Carcassonne. There is a fine double-page series of pictures of this feudal stronghold. (pp. 16-17)

* * *

Scott's *Waverley* would be like Shakespeare's *Hamlet* without the Prince of Denmark were it not for the Baron Bradwardine. The story of his prototype will be new to our readers. (p. 19)

* * *

Georgia is our oldest state university. Its story as told by George H. Dacy is worth reading. (p. 21)

* * *

It may not be generally known that 'fire from heaven' started the first locomotive. Dr. William E. Barton, biographer of Lincoln, relates this incident in telling of the triumph of George Stephenson. (p. 24)

* * *

Aaron Hardy Ulm, publicist and magazine writer, tells how Uncle Sam has millions of acres to give away to the land hungry. (p. 27)

REMARKS BY OUR READERS

Klamath Falls, Oregon.

A few years ago, I believe it was in *The Saturday Evening Post,* I read that science disputed the fact that Franklin discovered electricity with a kite.

I will say as a layman having just the average knowledge of electricity, that Franklin could have discovered electricity without the kite as well as without the silk attached if he had had a key or any other piece of steel in his hand.

My wife and I were homesteaders in Lake County, Oregon, and finally developed our homestead into a small cow ranch. When we first located there fishing was a necessity as well as a sport. We had been fishing in the river which was a short distance from the ranch (three miles, which in those days we did not think was anything) when a mountain thunderstorm came up and we got soaked, and of course had to hurry right home to find out how many chickens had been drowned.

We were on foot. On the way home I noticed a piece of wire, about No. 8, 9 or 10 and about two or three feet long. I picked up the wire for two reasons, one was curiosity as I wondered where it came from, and the other was that a piece of wire was always handy. I was carrying the wire in my right hand and was walking fast. At first at regular intervals I would hear a slight buzzing sound which I could not locate. I finally noticed that when I swung my arm to a certain position a noise came from the wire I was carrying. But I could feel nothing.

The sky was clear, the sun shining, and there was a gentle breeze such as generally follows a summer rain. My wife and I as we walked along fooled with the wire: when holding it in a certain position it would sing like a piece of metal vibrating. We were very wet and were probably acting as a ground contact, but the electricity was not strong enough for us to feel.

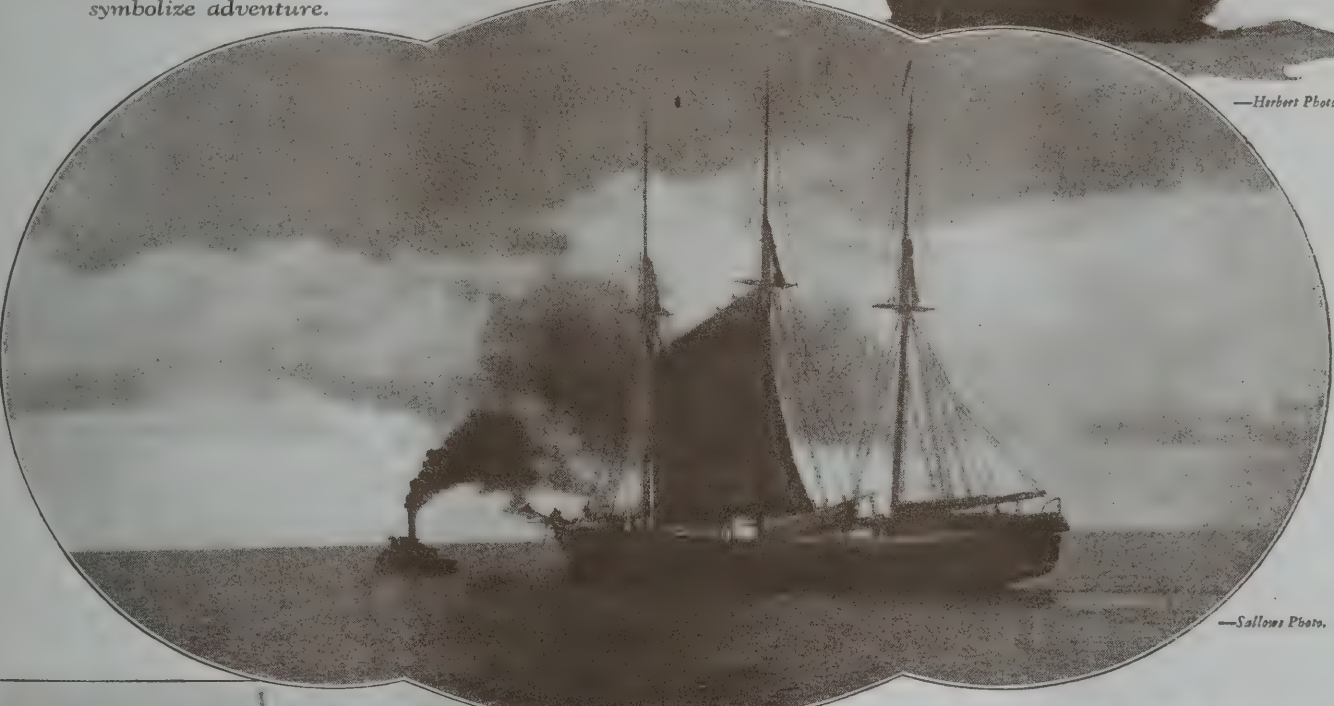
We had an acre of garden ground fenced in with five-foot close-woven stock wire. When we got home I made a crook in one end of our piece of wire to hang it on the garden fence for future use. I reached out to hang it on the fence but before being in contact with the fence it began snapping like a parlor match being scratched down a wall and I received a very faint shock.

T. J. EVANS.

SAILERS *of the* DEEP

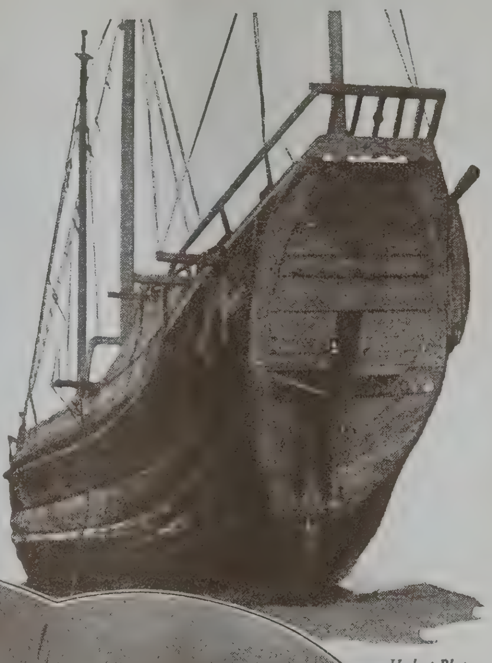
Afloat and Aground

Familiar sight on our Eastern Coast—a three-master being taken in tow on a calm day when the sails hang limp and the boat, without tow, stands a helpless thing—as Coleridge has aptly described it, 'like a painted ship upon a painted ocean.' Such useful carriers of freight, manned often by typically hardened seamen, have about them an atmosphere of romance and picturesqueness; they somehow symbolize adventure.

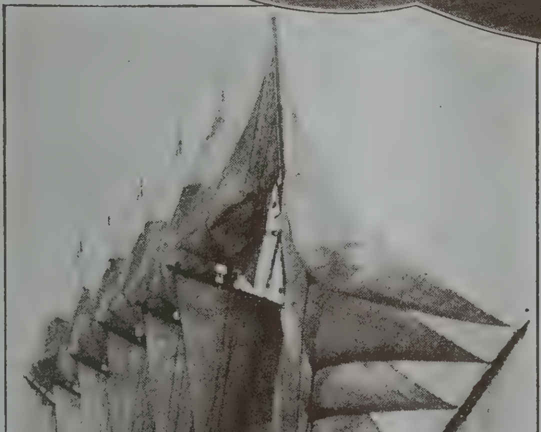


—Sallows Photo.

The famous Chinese pirate junk, Ning Po, reported to be the oldest ship in the world. This ancient 'ark' was launched in 1769 and brought to this country for exhibition purposes in 1911. The ship is of solid teak; her masts, solid tree trunks.

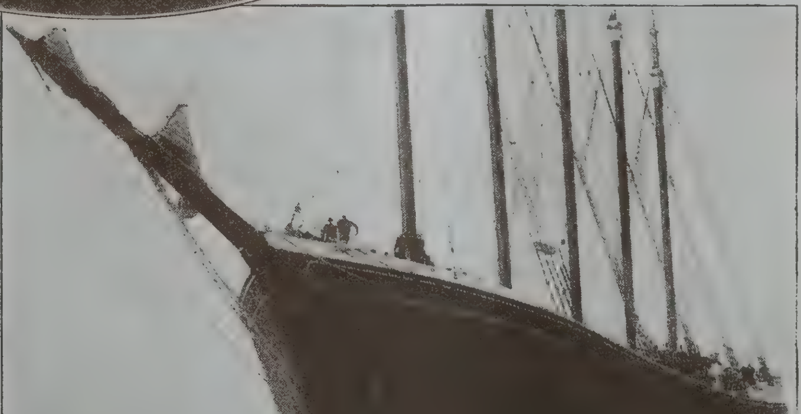


—Herbert Photo.



—Thompson Photo.

The last of the six-masters, *with all sails set.*



—Herbert Photo.

Nancy, *a five-masted schooner, was driven on the sands off Nantasket Beach, Massachusetts, by a raging storm; subsequently she was left high and dry. Crowds thronged to see her, and an arrangement whereby a charge was made to go aboard proved highly satisfactory.*

THE great word of life is Use. Some would say Economy. Not so. The word economy represents a half-idea born of fear. Economy is the rule of half-alive minds. There can be no doubt that it is better than waste, neither can there be any doubt that it is not so good as Use. Everything was given us to use. The principle of Use is the main guidepost. Use is positive, active, life-giving. Use adds to the sum of good. Start out on that principle.

FOWEY, Sennet, Newquay, Ives,
Jeweled with years;
Listen to the sound of them;
Music and tears.

Toppling down into the sea,
Or tight on the fells,
Gritting hard upon the wind,
And the heather smells.

There I know an old house,
Where the rooks stay,
In the moody long trees,
Day after day.

How they call across the town
In the early spring!
How they cry at fall of leaf,
Each forgotten thing!

The Definition of the Middle West

By VACHEL LINDSAY

I am Anne Rutledge who sleep
beneath these weeds,
Beloved in life of Abraham Lincoln—
Wedded to him—not through union
But through separation.

—EDGAR LEE MASTERS.

A BEAUTIFUL friend that I hold very dear, who knows little of the Middle West, has suggested for the title of this article, *That Undiscovered Country.* Of course, by this title is implied the complete quotation—'from whose bourne no traveler returns'; that is, the land of the grave. I am willing to accept even these limitations to my title and point of view, and work out. I think you may like the process.

The Middle West is one of those regions calculated to act as a unit in great presidential campaigns when real issues are afoot; and it is a unit of expression in our attempts at national literary criticism. A novelist from Wisconsin or Ohio is called a middle western novelist. William Allen White, editor of the Emporia *Gazette*, Emporia, Kansas, is called a middle western editor.

I remember once drawing a map of the various regions of the United States in which I called the Middle West 'The Bryan Farms.' It is sometimes called 'The Chautauqua Paradise,' because of the great multitudes of Chautauquas there; though they may be found all over this United States.

First, let us approach the task of naming the states which have a chance to get into the middle western list: they are the states of what Hamlin Garland calls *The Middle Border;* that is, the region west of the Appalachians, and east of the Cordilleras, not south of Mason and Dixon's line. 'The Middle Border' was, in the time of Andrew Jackson and of Johnny Appleseed, the frontier. In that day, 'Mason and Dixon's line' was slowly being drawn by the reiterated phrasing of those words, in the speeches of John Randolph of Roanoke, the Virginia leader in Congress. The northern and southern halves of the Old West were being divided by the slavery issue, and finally were dramatized by Eliza's crossing the ice in *Uncle Tom's Cabin.*

In *Uncle Tom's Cabin* days, the Middle West was *the* West. Mississippi was developing a powerful oligarchy, which culminated in the rule of Jefferson Davis, of that state, in Washington, D. C., as Secretary of War, just before the War of Secession. The far South was the center of solemn, self-conscious authority, and the prairie country was the West, 'wild and woolly,' where most anything might happen. What was the list of states, then, of which Abraham Lincoln ultimately became the representative? Ohio, Illinois, Wisconsin, Michigan, Minnesota, Iowa, and Kansas.

The western borders of this region were developing the tremendous range system whereby, over unfenced lands, free to all, great herds were driven north from Texas for the yearly slaughter. And the cowboy was being evolved.

The Middle West then was the region east of the cowboy, west of the forests on the western slopes of the Appalachians, and north of the slave country bordered by the Ohio and the Missouri. But it was not then 'Middle,' it was 'West.' And Lincoln was elected as a far western man.

VICTORY came to the North. The black dirt of the prairies, six to twenty feet deep, began to produce taller and taller corn; the Rockies began to develop a miners' West; barbed wire came, and the cowboy began to disappear; and so the Old West was pocketed and became 'Middle.' It became what it is today in its essential character.

But before we cease naming the states, let us say that the general Middle West state of mind spreads beyond the seven states we have listed.

Tobacco has gone farther north than the Ohio River; corn has gone south into Kentucky and Tennessee, and into Missouri; wheat has moved west through the deserts of western Kansas, Nebraska, North and South Dakota; more and more land that seemed arid grows deep-rooted winter wheat from its winter snows; and the Middle West may be, in general, any prairie-corn, or prairie-wheat country between the Rockies and the Appalachians.

It is the first character of this country that, because the Indians burned its forests centuries ago to capture game, it is a treeless plain for the most part. In western Kansas, Nebraska, and North and South Dakota, the hasty settler has planted the cottonwood along the streams as the quickest growing windbreak. Nevertheless, the hot and rainless wind sweeps across the plain all summer; and the wheat seems to bake into its climax of harvest. The cottonwood still awaits the slower growing trees it hopes to shelter, and one must have a passion for the sky line; one must have an inevitable instinct for the horizon, such as that of Willa Cather, to understand this land.

But the far eastern borders of the Middle West were planted long ago. Forests were still there in many places, and the word 'backwoodsman' was synonymous with 'Westerner' before men plowed the plains.

The word 'Hoosier' was developed in the woods. The forests of the western slope of the Appalachians stretched long fingers into the plain. In these great reaches of forest, Johnny Appleseed planted his first orchards. It is natural that the borders of the Middle West which most closely touch the east of the United States should be best understood by the men of the seaboard.

Therefore, Ohio is the most popular middle western state, with people on the seaboard. They can get there in one night's run from any place on the Atlantic Coast.

When it becomes necessary in the routine of national party organization to give the Middle West its due, a presidential candidate is often picked from Ohio, the most endurable and understandable middle western state from the eastern standpoint; hence, the honor roll of Ohio presidents, and defeated presidential aspirants.

Let us get a little bit beneath the surface called politics. We find that the Middle West goes as far as the black-dirt prairie goes; a land on which it is almost too easy to build railroads and automobile highways, the grading and financing is so simple. It is not like finding one's way through terrible mountains. The prosperity which makes this so easy makes every other type of unification easy; and newspapers like the Kansas City *Star* and the Chicago *Tribune* speak for the whole region on many issues that are seemingly paramount.

But my beautiful friend, who reads much and well in the world of letters and thinks deeply, gives this region the title *That Undiscovered Country*, and gives it ironically. She means that if any man can get any fun out of a red-hot cornfield in July, let him. What do corn and hogs mean to Edmund Spenser or to Spenser's *Faerie Queene?* She means that all America is given to a pillowy-billowy smothering of those who aspire; and that free speech and aspiration are smothered by people of the middle western and Chautauqua point of view, wherever they may be in the United States.

Overeating is indeed a dangerous thing; and, on the whole, middle westerners have too much to eat, too many automobiles, too easy communication, too rich soil, and often an outrageous complacency: they often have the blinking expression that comes after a pious Sunday dinner.

BUT the Middle West is a mixture of streams of immigration; and there is a legend there so great that the present cannot down it, and the future is written in pages of flame. There first mingled younger sons and daughters of the Original Thirteen States; and the peculiar pride of the South mixed with the iron mind of the Emersonian. The result was a standard of self-reliance and freedom and dignity, which finds its ultimate hope in the tradition around Springfield, Illinois, and in the legends that haunt that place.

There are in my dreaming mind two pictures of the Middle West which have nothing to do with state fairs too prosperous, and Chautauquas too complacent.

I remember a nipping day, the first of January, when I walked with a lovely friend of mine to the Sangamon, just a little outside Springfield. We were there for the afternoon on a high bluff surrounded by a forest that was a contradiction of the formula of the Middle West. Such forests line all the rivers, now, of most of the middle western states, except in the cottonwood belt. On this bluff, in the snow, in the biting frost, we built the tiniest fire imaginable, of leaves and twigs, for our incantation above that river. The smoke went straight to the sky in a thread of blue. It was all a mystery and a hope; and the dreams around that fire it will take me a hundred years to tell. I could tell you twenty legends now, some literally true according to the schoolbooks, some born of the smoke of the gray leaves, all of them from that fire by the Sangamon, all of them as deep as life or death or love to me.

THOSE legends and those chronicles haunt me day and night; and they have nothing to do with hasty definitions of the Middle West. They stretch as far into the future as the speculations of H. G. Wells; and as far into the caveman past as the speculations of Clarence Darrow, the Chicago lawyer. And they have far more to do with the smoke and flame of life than men of this realistic type can know. Fires like these are built on many a bluff of the Sangamon, on many a gray day by little lovers, in forests that are as primeval as any forest of the newer West, and as far from the automobile and the filling station as the moon itself.

Such people as these at least have courage and free speech. The general assumption that there is neither courage nor free speech in the Middle West leaves out fire builders of this sort.

I can name twenty men of national position who say just what they please. Several of these men are of middle western origin. But this is not the issue of my article, the title of which is '*The Definition of the Middle West.*' One can never really define anything; one can only illustrate it. For quite an elucidation of that thought, read Matthew Arnold on 'The Grand Style.' For a humble illustration of this same thought let us point to the lovers and their fire, and then let me give you a most realistic narrative which may become another symbol, greater than a definition.

(To be concluded in an early issue.)

Passing Impressions of Famous Frenchmen

By
ELEANOR
LEWIS

IN LOOKING back to my life in Paris in the early eighties, I see four events which stand out in memory as landmarks: A glimpse of Victor Hugo in life; another of his funeral; the funeral of Leconte de Lisle, and a sermon by the once famous Père Hyacinthe.

In the words *once famous*, no derogation is implied. Not only was Père Hyacinthe noteworthy for his qualities, among which he had also most assuredly some defects, but he had the good or ill fortune to become the center of a violent controversy the bitterness of which did not permit impartial judgment. My remembrance of him, however, is one of pure gratitude for the revelation he afforded me of the beauty and power of the French language.

It was during a rather aimless Sunday ramble that I found myself in the little Rue d'Assas before an insignificant building surmounted by a cross. As it seemed to be a church of sorts, and as the doors were open, I went in. The room was small, but even so the worshipers did not half fill it. A short preliminary service was being held, neither Catholic nor Protestant, but, rather, a hybrid version from the two. The officiating priest did not seem at all unusual until he faced his audience and began his discourse. Then one realized the fine, even impressive, type of his features, and yet more the beauty of his voice.

Up to this time my French had been that of the average college graduate: I spoke it 'a little,' listened to it on the streets and in shops, attended occasional lectures at the Sorbonne and tried to converse about them with my teacher. But I was decidedly indifferent to the language. Now all in a moment I was shaken out of this indifference. The man speaking, whom I did not yet know as Père Hyacinthe, was using his native tongue as a past master of its possibilities, with the golden voice, the exquisite inflections, of the great orator. It brought instantly to mind our own Wendell Phillips. There was the same clarity of intonation and phrasing, the same full pure syllabification, the same accelerating intensity of thought and utterance which gripped the audience and held it in harmony with the speaker.

Circle—*Pere Hyacinthe.* Center—*Victor Hugo, reproduction of the last portrait made of him.* Left—*Leconte de Lisle.*

Père Hyacinthe may not have been a great man, and he certainly failed to stamp his impress upon the intellectual world, but those who have once heard him can never forget the experience.

In the late fall of 1884 I saw, briefly, Victor Hugo. With me, as with Little Billee in *Trilby*, it was Paris and youth—unsurpassable conjunction! the freshness of one's early impressions, the famous city for background, and against it in clear relief both great historic figures of the past and great figures of the present, notably among them that of Victor Hugo.

The young people of today can hardly realize how his majestic figure towered above his contemporaries or how deeply *Les Miserables* impressed his own long day and generation He was the idol of France, and hardly less worshiped in other lands. If in my personal impression of him there is a touch of comedy, it is more than compensated by the impression of his last triumphal march through Paris when, dead, he received more than royal honors. And as to the former—I saw him only a few months before his death; he was already in failing health, and not at all fond of Americans, or so I have been told. However it may be, this is what happened, or rather did not happen.

A friend of the poet was to attend a reception at the latter's house and very kindly sought and obtained permission to bring with him 'two young admirers of Victor Hugo,' one being myself, the other an eighteen-year-old lad who was thought to have considerable literary promise, in addition to being an almost rabid 'Hugolater.' I still recall clearly the long reception room with heavy curtains at the far end, and chairs arranged symmetrically on both sides. These for the most part were already occupied, but we found seats near the entrance door.

No one spoke except now and then in whispers, and it was only after some ten silent minutes that there was a little rustle of anticipation. Then the heavy curtains were drawn back by two footmen, and through the archway walked slowly, rather feebly, a figure crowned with a shock of white hair. All rose as he proceeded down the room, addressing a few words to each guest. He finally reached our little group of three. Upon the kindly gentleman who had brought us he smiled, and

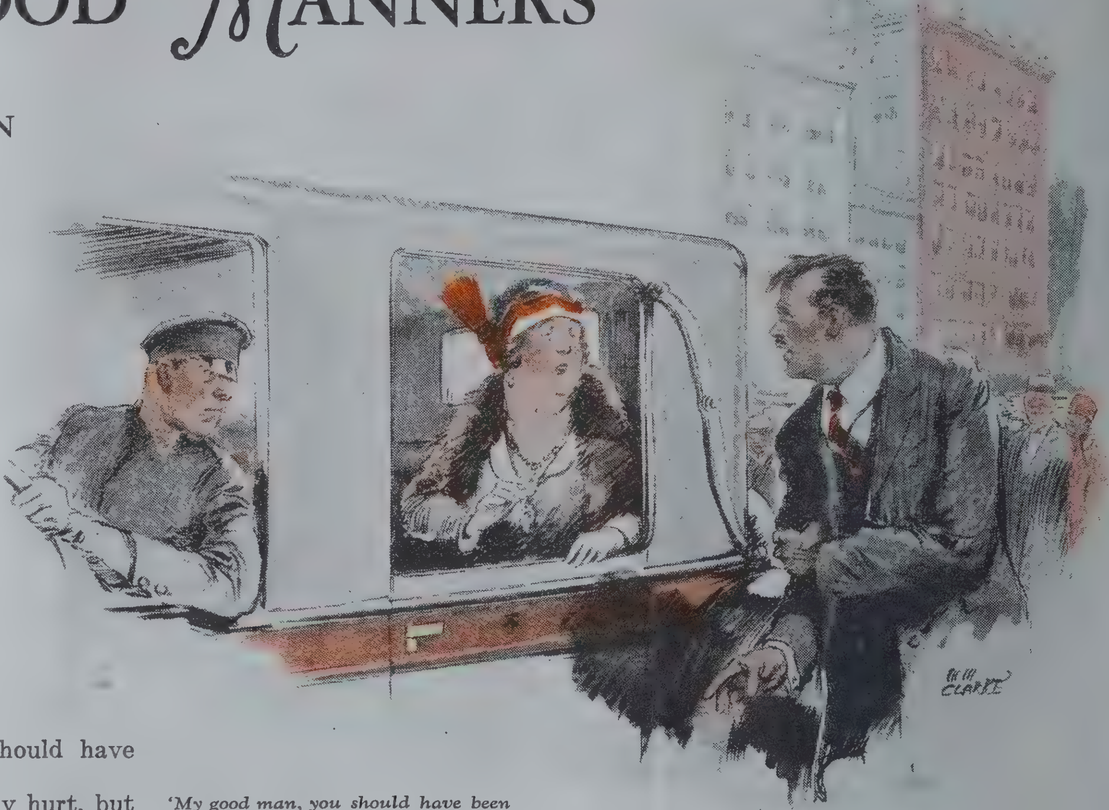
What It Means *to* Have GOOD MANNERS

By
THOMAS L. MASSON

Illustrated by
W. W. CLARKE

A MILLIONaire friend of mine, head of one of the largest corporations in America, was crossing Fifth Avenue in New York, when he was struck by the mudguard of a large limousine and knocked down. As he picked himself up, the car having stopped, a stout, flashily dressed woman on the inside, looking him over to see how badly he was hurt, said to him:

'My good man, you should have been more careful.'



'My good man, you should have been more careful.'

My friend was not badly hurt, but he was quite shaken up. The patronizing and offensive words, 'My good man,' to use a slang term, got his goat. He employed the best lawyer in town, brought suit, had the chauffeur of the car put in jail for ten days and made the woman pay a fine of a thousand dollars. And all because of her bad manners. If she had expressed the slightest sense of courtesy, he would have met her halfway.

Bad manners are always the result of ignorance, and this kind of ignorance is generally due to heredity, or lack of education. Yet with all the advantages of a cultured existence, bad manners are quite frequently obvious.

Another friend of mine, this time a woman, gave a party and invited a certain college boy, at the request of her daughter who knew him slightly. This boy came from an excellent family. He was intelligent, being at that time a student in one of the three largest universities in the country. He came with a girl of his own choosing, danced with this girl all the evening, ignored completely the hostess and her daughter, and left without saying good night. This instance is by no means exceptional. I know of a number very similar.

You may recall the well-known story of the woman who was standing at a social function in the presence of a Yale, a Princeton, and a Harvard man. She asked the Yale man for a chair; he told the Princeton man to get it; when the Princeton man brought it, the Harvard man sat down in it.

A very pointed but ably replied to instance of bad manners was shown when a medical man, at a meeting where all the members were very tall, turned to Oliver Wendell Holmes, who was short, and said to him:

'Doctor Holmes, how does it make you feel to be among so many big men?'

He replied:

'Like a three-cent piece among a lot of pennies.'

Wars have frequently been brought on by a display of bad manners at a critical moment. It is not too much to say that in this country hundreds of millions of dollars are lost by individuals through bad manners. It is, therefore, of considerable importance, not only to everybody in general, but to you and to me in particular to know what bad manners are.

Bad manners seem wished upon some persons by fate. Kindly at heart, indeed, genuinely unselfish and wishing to be always correct, they invariably say the wrong thing at the wrong moment.

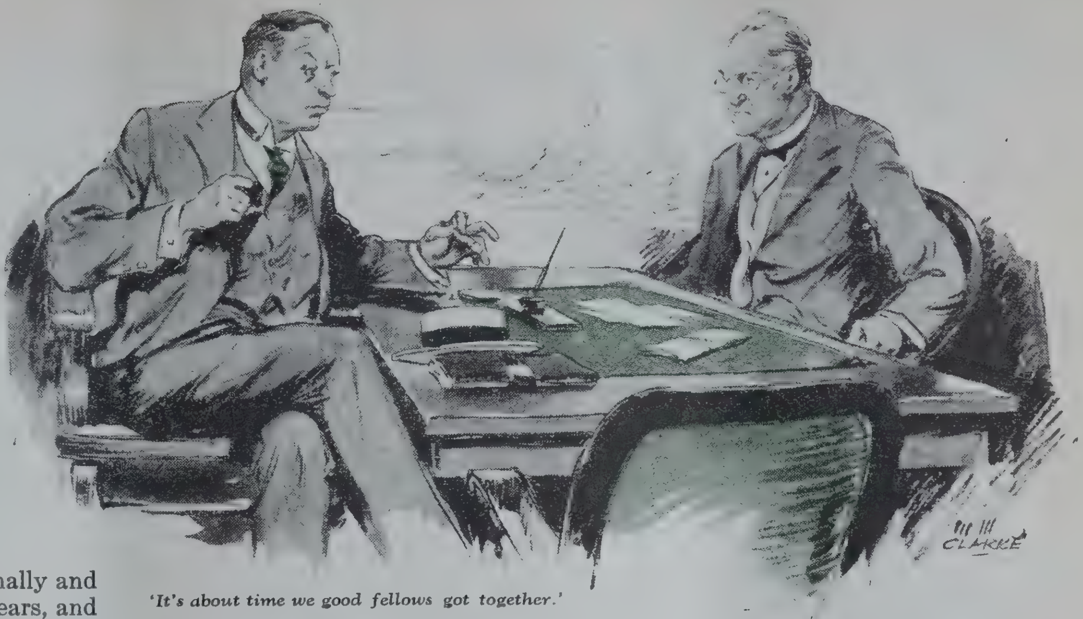
Bad manners are the cause of a large number of divorces. For example, a man came to me and said he and his wife were on the point of parting. He had been a good husband. They were not compatible. I suggested that he try being polite. At first he scouted the idea but when I convinced him how bad his manners really were, he agreed, and in two weeks his wife and he were reconciled.

Too often bad manners are caused by pure thoughtlessness. Another friend of mine, who had gone through a great grief, was staying in the same house with some young people. They knew of her trouble but their manners were so wretched that she was obliged to leave. After she had gone they inquired why. When the thing was explained to them, and their actions detailed, they were horrified and very remorseful. They simply had not thought.

Indeed, it may be said confidently that bad manners are never intentional. No one is so deliberately cruel as intentionally to hurt the feelings of another, or to do himself an injury by being discourteous to another. But the matter is much deeper than appears on the surface, because an offensive politeness may in itself be a form of bad manners.

I was one day talking with a woman who expressed a fondness for a certain kind of poetry. I offered to lend her a book of poems on this subject. She returned the volume to me with expressions of great enthusiasm and the remark that she had got so much out of the poems, was extremely grateful, and so forth. Yet she had neglected the slight duty of cutting the leaves. Was this bad manners? Well, it was thoughtless, it was ignorant; it was insulting my intelligence with obvious flattery at the expense of her own.

It is often said that you cannot tell the truth and have good manners. In my experience the reverse is the case. You can always tell the truth. When it is not expedient to tell the truth you can say so.



'It's about time we good fellows got together.'

A man whom I knew personally and indeed intimately for twenty years, and who was always putting himself out for others, committed the following *faux pas.*

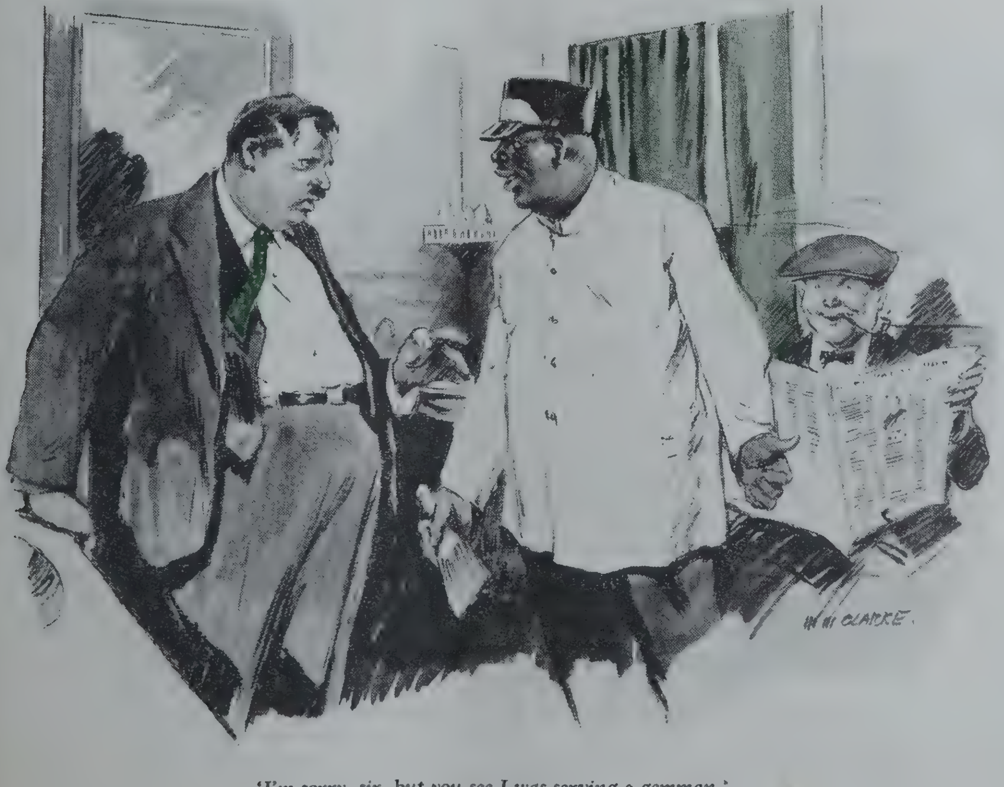
The business in which the man was engaged, and where over a long period he had been employed at a comfortable salary, was suddenly bought out by another company. The president of this company, and the new owner, was an old-time gentleman of unblemished character. When my friend learned of the sale, he called upon this gentleman, who never smoked, and lighting a cigar, he moved his chair up to where he sat and puffing the smoke in his face, remarked:

'It's about time we good fellows got together.'

My friend lost his job. The old gentleman in telling me later of the experience (he shuddered at it) said he was aware of the good qualities of my friend, but, as he expressed it, he was 'impossible.' Such an incident as this seems almost incredible, yet it actually happened.

There are three kinds of bad-mannered persons the roughneck, the boor (in England called the bounder), the egoist.

The roughneck is often found, however, to be a man of good qualities. He may easily be a hero. He may conceal the distinguishing marks of a true gentleman. Such a man is the one I described above. A roughneck is unacquainted with the niceties of life.



'I'm sorry, sir, but you see I was serving a gemman.'

It is useless to describe him further for he is recognized immediately. And he is a roughneck only in the presence of more sheltered people. A forest guide, therefore, may be a roughneck in Long Island society but in a forest settlement a gentleman.

The boor, on the other hand, is always a boor. Put him anywhere and he never changes. He will be a boor in dress clothes or plus fours. Once a boor, always a boor. And a boor is not necessarily a bore. A bore may be a gentleman, and still be a bore. While he is a gentleman he does not know that he is a bore. I know several of this type. While boring you, they will pay you all sorts of attentions, small courtesies, and the like. Of course, in a sense their manners are very bad, but only because they are inevitable bores and not because they are essentially bad-mannered.

The egoist is the really and truly bad-mannered one. His bad manners are a perfect fruit of his temperament. He is selfish, conceited, self-centered. He tacitly assumes that the world was made for his special benefit. He looks at everything from the standpoint of Himself.

And he is of two kinds: First, he is frankly selfish, frankly thoughtless. His ignorance of the relationship between himself and others is so profound that nothing can separate him from it.

Second, he achieves his results by a kind of deception that in the most advanced form is nothing less than wonderful.

A man of this sort will outwardly be the very quintessence of courtesy. He will overwhelm you with his attentions. And it is not until later you will discover that

MR. CANDIDATE, *Are You Subject to Accidents?*

A Presidential History *Not Found in* Schoolbooks

By EARLE C. REEVES

ON THE balcony of a Philadelphia hotel in 1860 a young man named Albert Edward Prince of Wales stood and looked down upon a seething mob which had just learned that a shock-haired, gaunt giant named Abe Lincoln had been elected President.

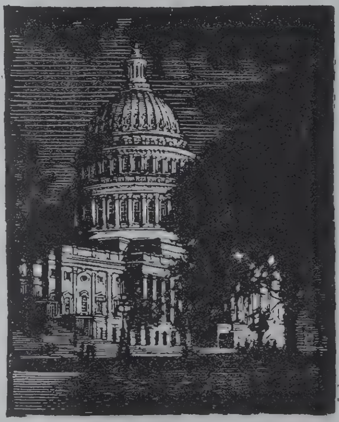
The feelings of that conservative city were decidedly mixed. So was its population. To the royal watcher it seemed that one-half had its fingers on the other half's throat. There was a grim reality to the rioting which put many partisans out for days; but no brains were spilled on cobblestones.

The handsome chap who waited forty-one years to be king might have been excused for sending a post card home announcing that red ruin was descending upon these unruly Colonies.

But we recovered quickly. We always do.

I have watched two general elections and four years of parliamentary maneuver in England, and so far as my observation went there seemed to be only three high peaks of unexpectability; these were Nancy Astor, American; Winston Churchill, half American; and Lloyd George, who is extremely Welsh.

Over here on the American side we have learned to expect the unexpected.



An impartial observer might have explained to that earlier prince—grandfather of the present Prince of Wales—that Lincoln had little logical right be to even a nominee of his party. William H. Seward was the first great leader of the young Republican Party, but he was blessed out of the White House by his friends. He had been elected governor of New York through the influence of an archbishop. That was count number one against him in some pivotal states.

His managers went into the Chicago Convention claiming assurance of two-thirds of the votes. Tasting the glory of impending victory, they staged a great parade through the streets. But while the parade was on, the 'sidewalks of Chicago' surged in and packed the convention hall. under the management of Colonel Medill and others who had arranged to puncture the Seward boom with a lank rail-splitter from downstate Illinois. The galleries were as noisy for 'Abe' as they were more recently for 'Al'—but with a different result.

A certain perversity seems to run through the great American game of stalking the White House. Sometimes it seems as if an intelligence test for political candidates should contain only such questions as:

Are you subject to accidents?

Do they happen for or against you?

What is your mistake average?

Do your enemies make mistakes in your favor?

Are you adept at arranging little things for opponents to stumble over?

We began learning the importance of such things as these about the time George Washington decided that being the richest man of his time was a more pressing job than a third term—since John Adams was perfectly able to carry on anyway. 'Politics' got its real start when Washington retired to look after his land and his slaves.

In the campaign of 1796 Adams was a 'despot' and Jefferson a 'demagog' (familiar term!), and defamation of character was a political pastime; but because the rules then in force made it so, these two unfriends had to serve four years as President and vice-president respectively!

Adams then thought he'd end this defamation of sacred officeholders, and so he had a law passed making it a crime. That was the first big mistake that cost a Presidency. Even at this early date the American public registered its determination that cussing out officeholders was an inalienable right: they defeated Adams next time.

By this time it had been decided that a presidential candidate should make the race with a vice-president of his own picking; so when Jefferson beat Adams he had a lack-sport named Aaron Burr as a running mate. But as they forgot to change the rules, November found Jefferson and Burr with equal electoral votes and Burr unready to admit that the 'father of democracy' was President. For the first time, the election was thrown into Congress, and was not decided in favor of Jefferson until mid-February. Burr had committed political suicide. Later, he was tried for treason, killed Hamilton in a duel, and dragged out a long life in poverty.

Adams drove another nail into his political coffin by getting angry and sneaking out of the Executive Mansion the night of March 3, leaving Jefferson to ride on horseback, in homespun, alone, to the Capitol to be sworn in; and to come home, tie his horse to the hitch-rack, scrape the mud off his boots and stride into his new house without so much as a handshake from the departing tenant. Stirring times, these.

Aaron Burr must have put the curse upon the vice-presidency, for during the next century only one vice-president was elected President. Secretaries of State became heirs apparent for a time—Madison, Monroe, and John Quincy Adams being promoted for services rendered—and then for nearly a century only one 'premier' succeeded to anything higher.

Those two posts of honor constitute two 'errors' wise aspirants for White House residence aim to avoid to this day. As early as 1812, one John Langdon, of New Hampshire, declined the vice-presidency—but no stronger lightning ever struck him.

Another 'don't' for presidential candidates, distilled from the mists of time, is: 'Don't be too eloquent'; the glaring illustrations being Clay, Webster, Blaine, and Bryan, each the Demosthenes of his generation—but none of them President.

The grand old Federalist party of Washington received a blow when Adams tried to make sedition out of political blah; and it was virtually sunk without trace when the charge was made that prominent Federalists signaled with blue lights enabling a blockaded British fleet to escape during the War of 1812. And that little 'mistake'—whether true or not matters nothing now—was what put Monroe into office with an 'era of good will,' and gave him a reëlection that escaped being unanimous only because a New Hampshire gentleman said nobody except Washington should receive the whole electoral vote. Peace prevailed because no opposition was left.

Another little happening connected

with that disagreement with Britain helped make political history. Though peace was signed on December 24, 1814, at Ghent, General Andrew Jackson didn't learn about it for a month. Two weeks after peace was signed he captured New Orleans and became a national hero. Had there been cables or wireless, or even fast ocean liners, he would have ended his life as the senator from Tennessee.

Even so, he did not collect his heroic due on the first trial, because, though in 1824 he led in popular and electoral vote, he did not have a majority and the election was thrown into Congress. Henry Clay was fourth man in this election. He knew John Quincy Adams to be the real author of the so-called Monroe Doctrine and a statesman and scholar of rare merit. Moreover, Jackson hated Clay; so Clay elected Adams. Hates can be expensive.

But fate dogged Adams' footsteps. He was too scholarly and too much of a gentleman—and, furthermore, he let Government expenses climb to the horrible total of $14,000,000 a year; so Jackson came home in a lope four years later, bringing with him a corncob pipe which he smoked in the White House.

The breaks were for Jackson, and against Clay.

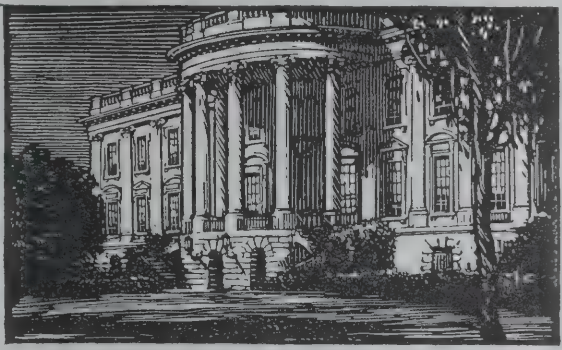
Henry Clay became the 'great Commoner' of the nation when, as a Congressman, he furnished the backbone that saved the Madison Administration in the face of the approaching War of 1812. Through the so-called Missouri Compromise, he saved Monroe when the slavery question threatened disruption. He elected Adams—a President-maker, who was nevertheless unable to help himself.

DIMMED by distance are two events that kept Clay out of the President's chair. In 1830 an Antimasonic party was formed, after violent popular outbursts over a charge that one William Morgan had been killed for revealing Masonic secrets. In 1832, Jackson and Clay faced each other in a bitter campaign—imperious in their leadership, and idols of the people, both. But Jackson won, and the fact that Clay was a royal arch Mason ruled him out of the presidential race for eight years.

In 1839 an insignificant 'abolitionist party' was formed, and though it was still comparatively insignificant in '44 it was active enough in New York to hold the balance of power and to swing the state and the national election from Clay to Polk. Though Clay was a dominant figure in national affairs for nearly forty years and was three times a candidate, some fatalistic trick seems to have cheated him of the first honor his country was able to bestow upon him.

Twenty-five years after the escape of the British fleet, that same Daniel Webster who is the hero of our schoolbooks could be incapacitated for the Presidency by the charge that he was a 'blue-light Federalist.' Was it destiny, or sheer chance?

The political gods who cast mistakes haphazard into men's arenas were kinder to General William Henry Harrison. The leaders for Whig favor in 1840 were General Harrison and General Winfield Scott. Each moved in a halo of military victories, but Scott was conceded to be the foremost soldier of his time. However, Scott having written a letter conciliating the New York antislavery faction, that letter was dropped in Virginia headquarters at the Harrisburg Convention, and the slaveholding 'old dominion' made Harrison the candidate forthwith.



After Harrison was nominated, the Democrats spread the terrible slander that he lived in a log cabin and drank hard cider; and they were greatly amazed when some political seer of the Harrison management took up the tale with great glee and made it a feature of the campaign. There were log cabin banners at every rally. Harrison won, largely because of two mistakes made by his enemies.

When Polk, the first 'dark horse' in convention history, won the nomination from Van Buren in '44, an experimental telegraph line had been set up between Baltimore and Washington by a certain Mr. Morse. To reunite the party, the managers nominated Senator Wright of New York. Wright was angry over Van Buren's defeat and lost the vice-presidency because, for the first time in history, a means of instantaneous communication was at hand by which he could obey that first impulse and reject the nomination. The telegraph unmade Wright; it made Jackson.

Envious of his success in the Mexican wars, certain powers in Washington removed Zachary Taylor from supreme command and sent General Scott to Mexico. Scott took most of Taylor's men and pushed on to further conquests; but Taylor fought a series of desperate engagements with a handful of troops, and came home as 'Old Rough and Ready'—an inevitable White House tenant.

When Scott was nominated four years later he took the stump and became the first presidential candidate to appeal directly to what we have since come to know as the 'hyphenated' vote—and got trounced for his pains. He won but four states, and so appeared in the picture for a second time holding the wrong end of a political mistake.

Then there was Samuel J. Tilden, of New York. Having brought Boss Tweed to justice, he moved as a conquering hero upon St. Louis in 1876 to claim his reward, which he got on the second ballot. Indiana proved the political value of a grouch by sitting glum and silent until the tumult and cheering ceased, when the vice-presidency was awarded to Hendricks as a Hoosier pacifier.

Henry Watterson averted a duel between General Morgan of Ohio and Colonel Breckenridge of Kentucky, by taking the latter out to dinner and working on his better nature—presumably with something wet.

The Republican Party had been having something wet too—namely, the Whisky Ring scandals—and it looked like a good year for the man who had tied a knot in the tiger's tail.

BUT it so happened that sundry fluent Democrats of Colorado had come east to tell the party bosses that if they would only admit Colorado as a state three new electoral votes would be delivered into the Democratic column. Colorado *was* admitted, and straightway had an election, which proved her to be not Democratic at all, but Republican.

Though Tilden had a plurality of a quarter-million popular votes, he lost by a single electoral vote because of this mistake about Colorado.

That year Blaine was the strongest personage in the Republican ranks, but on the eve of the Cincinnati Convention he collapsed on the church steps as he was going to service; his enemies made the most of the fact that no party can afford to nominate a sick man. Except for this same reason, Franklin D. Roosevelt might have been Democratic nominee last autumn.

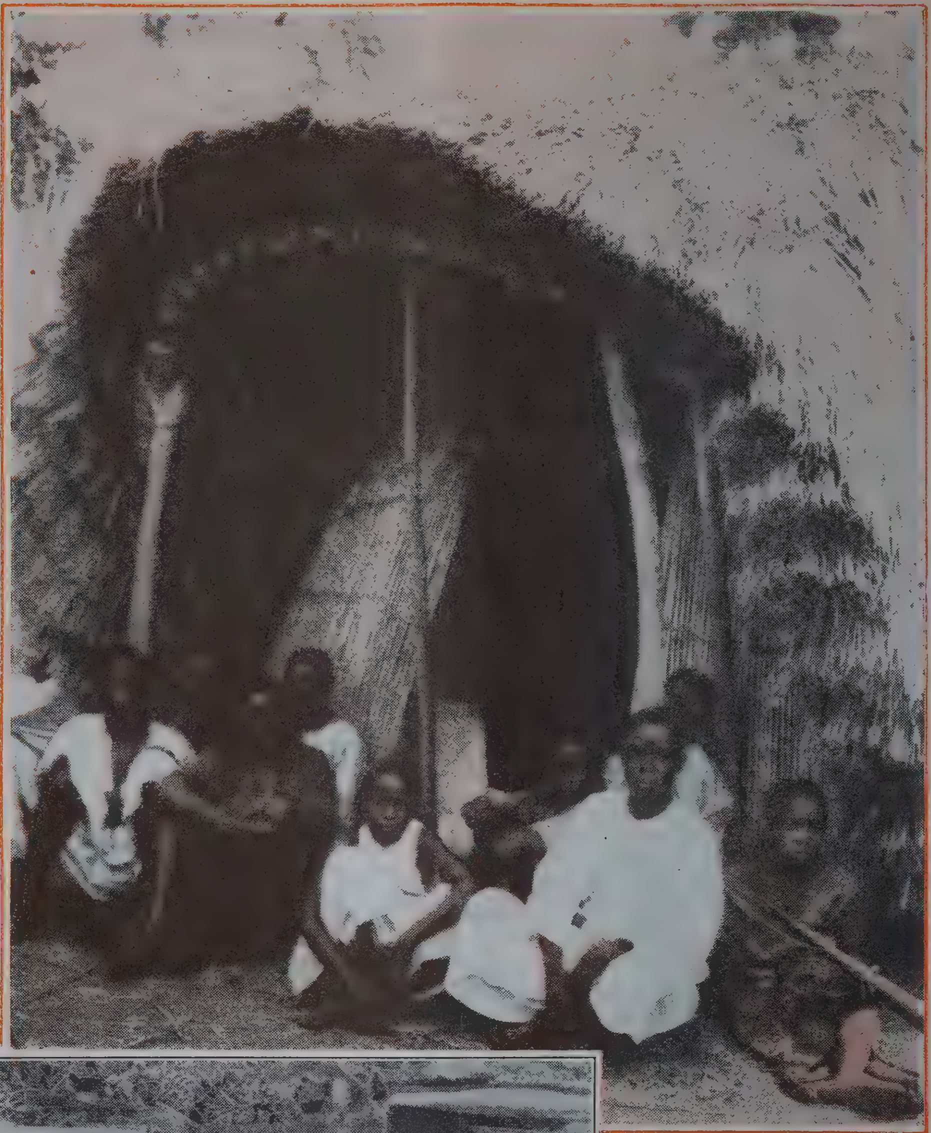
Also Blaine had telegraph wires strung from the convention hall to his house—and that seemed to portend undue eagerness. Today a candidate can get it all by radio and none need know.

There followed then a Republican swing to Governor Hayes of Ohio, a comparatively

(Continued on page 24)

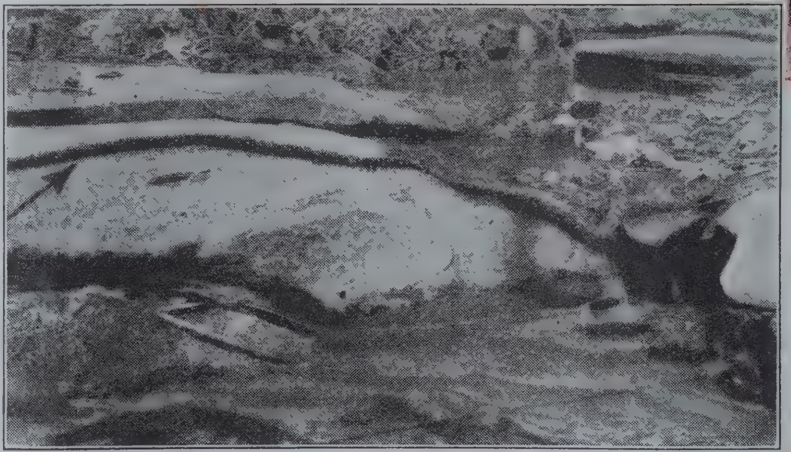
MAIOLI *and* ANTS

By PAVEL BOULIGIN



—*Ewing Galloway Photo.*

A family in front of their grass hut in darkest Africa. A sliding screen in the doorway adds protection at night.



Red ants on the march. They have formed a bridge three inches wide, two inches thick and eight inches long.

ONE of the serious troubles of Abyssinia and of all Africa is the *maioli.* I think that of the troubles invoked on the inhabitants of Egypt by Moses, the leader of the Hebrews, in revenge for Pharaoh's refusal of visas for the journey to the Promised Land, one plague must have been turned loose, and that is the *maioli.*

A long time has elapsed since those Biblical days, the *maioli* have multiplied, and are now on the march for the conquest of Africa. Anyway, for the first time they have invaded the Abyssinian province of Morocco, coming up from the direction of the British Sudan. That was two years ago while I was living on a coffee plantation in that province and experienced their victorious attack myself.

Two years have passed and now the first detachments have appeared in Feluga, a suburb of Addis Abeba, covering within this period not less than 150 kilometers, through stony deserts and over numerous creeks as well as across the broad deep river Auach, habitat of the toothed Azou, the crocodile and the fat-muzzled *goummara,* or hippopotamus. One year more and I predict that the demand for carbolic acid will take a leap in Addis Abeba, it being the only remedy for the wounds inflicted by these insects. They are impossible of escape—those bites; and the *maioli* are inevitable as fate, for which reason I surmise that they took their beginnings from the time-honored family of 'the plagues of Egypt.'

But what are they, these vanquishers of the black continent? They are insects many times smaller than a pinhead, and that is all I can say about them. As to their physical being—what kind of feet they have and what their facial appearance, I cannot say because I have never examined them through a microscope. I have felt them many times, however, quite unmistakably.

They usually attack the foot, though I once had a sharp skirmish with one on my elbow. In Africa it is very difficult to protect the foot from direct contact with the ground. One may wear high boots and hang them at night from the ceiling, but his night slippers sitting on the floor near his bed are sure to be occupied.

The presence of *maioli* in the skin can usually be detected the second or third day when the wound swells and begins to itch. Energetic measures must be taken for their removal. The best course of all is to intrust this operation to the native servants who exercise wonderful skill in the use of a plain needle. The tiny wound must be made many times larger than the insect which is removed, because it has already had time to surround itself with several hundred larvae. The wound should then be cauterized with carbolic acid; otherwise in the low damp localities so common in Africa, abscesses and running sores will result.

At night one must either stay in bed or wear his slippers; but if the latter, a dozen of the pests will surely need to be removed the next day, and bed for one week is the sure sequence . . . while time goes . . . also the rains . . . and the precious days for work on the plantation during the *cremt,* or rainy season! One's absence from the fields is meanwhile causing irreparable loss as the natives unwatched make no

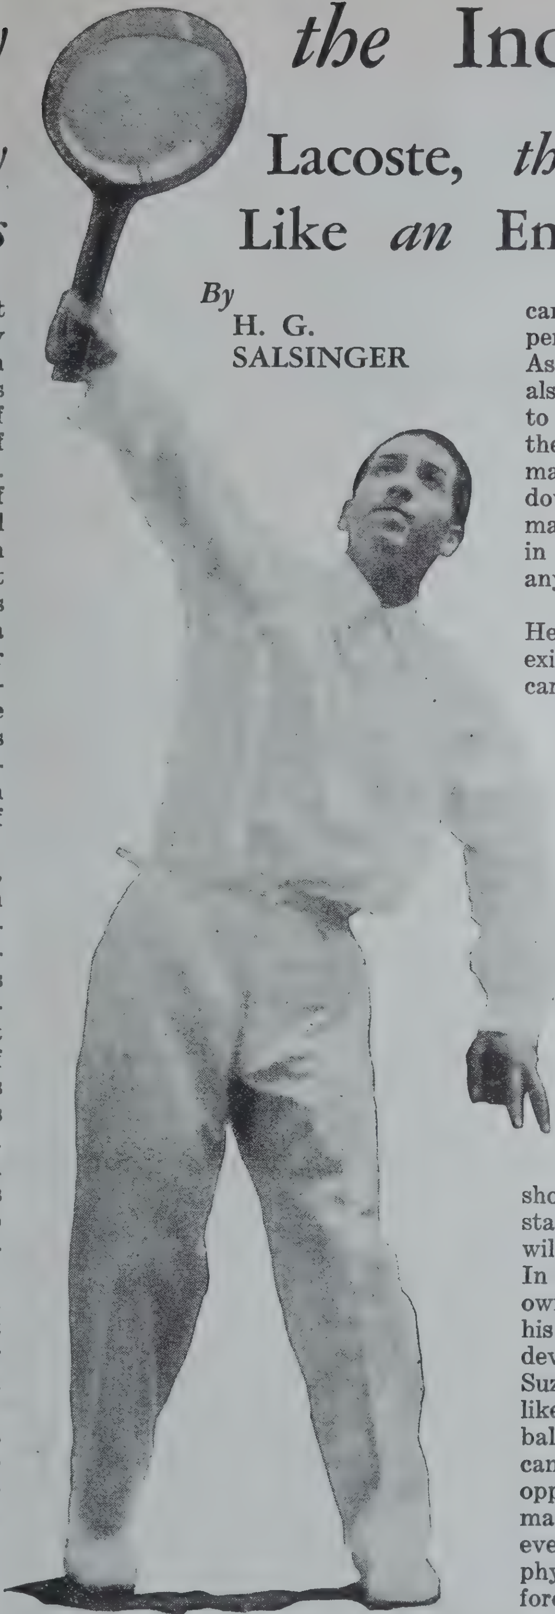
TENNIS *by the* Index System

As Played By Lacoste, *the* Frenchman *Who Looks* Like *an* Englishman

By H. G. SALSINGER



IF YOU met this man on the street and took a guess at his nationality you would put him down as an Englishman. If you observed his nature you would suspect him of belonging to Finland, Sweden or one of the other countries of northern Europe. If you were told about his system of operating you would immediately call him an American. Studying this man from any angle you would never suspect him of being a Frenchman but that is just what he is—René Lacoste, son of a wealthy French manufacturer, holder of the United States singles championship in tennis, the first man to take the American singles title to foreign shores since Hugh Doherty and the only invader who ever managed to win both indoor and outdoor championships of the United States in a single year.

Lacoste, as you may have surmised, will answer to almost any description except that accorded the typical Frenchman. He is unlike his average countryman and he is unlike the other members of the French Davis Cup team who carried the United States to the finals last year and who have an excellent chance of lifting the trophy this year. He is as much unlike Jean Borotra, his famous team mate, as two persons can be. Borotra, who had a better reputation than Lacoste among American tennis followers before the championship tournaments of 1926 started, is typically French. He is enthusiastic, nervous, excitable, quick, voluble, fiery. Soon after he made his American début he was nicknamed the 'Bounding Basque,' a descriptive term that fitted admirably. But, when it came down to the final stretch of title play it was Lacoste who went through while Borotra passed out with the pick of the American competitors. A curious mixture, as you may have guessed, is Lacoste but the characteristics that make him seem so foreign to his race are the characteristics that enabled him to break the grip that the United States had on the world's honors in tennis. He beat the Americans at their own game and by their own methods.

Lacoste's father wanted to see his son develop into one of the leaders of big business. René did not want to go into business; he wanted to play tennis. 'All right,' said his father, 'play tennis if you like but quit playing if you feel that you cannot win the world's championship.'

Lacoste went at tennis the way he would go at business. He copied the American system of paying attention to details. He even went the Americans one better; he kept books on tennis. He instituted a filing and index system and in this he carefully kept all records of individuals, including himself. He studied all the leading players and while studying them he made notes, recording their strength and weaknesses. These notes were all transcribed. They became part of his file. He set down their personal habits, their likes, dislikes. As he discovered their weaknesses he also made notes on what he should do to take advantage of them. If he saw them on succeeding dates he would make fresh notes, carefully setting down what improvement they had made, what changes had taken place in their play. If they went back to any degree that, too, was noted.

He was his own severest critic. He tried to find all the faults that existed in his own game. These he carefully recorded and then set about to overcome them. Wherever he went his files and books accompanied him. He kept his records up to date.

HIS attention was not devoted solely to stroke, as far as he himself was concerned. He studied self-control. It has been said that he modeled after Norman E. Brookes. Whoever he set as his example has nothing on Lacoste. He is not mercurial and he is not emotional. He was probably so at the start of his career but no longer. He has conquered these characteristics of his race.

Lacoste is sallow and stoop-shouldered. He does not suggest stamina. He is not a strong man but he will outlast stronger men on the courts. In his intensive study he considered his own physical shortcomings and built his game to take care of them. He developed control. In this he resembles Suzanne Lenglen. He went at it in a like manner. He learned to put the ball where he wanted it to go. He became adept in the art of making his opponent do the running. He, himself, makes every move count. He saves every possible ounce of nervous and physical energy. He has the trick of forcing his opponent's shots to come to him and of sending his own as far as possible from his opponent.

There are few times when Lacoste is forced to run and when he does run it is with a little hop that gets him to the desired spot at the precise moment.

William T. Tilden, the man whom Lacoste succeeded as national singles champion of the United States, remarked a few years ago that the man who succeeds in tennis must be equipped with a chess brain. Unless the mind is particularly adapted it is impossible to reach

Working and Doing

THE whole secret of a successful life is to find out what it is your destiny to do, and then do it.

When we speak of what we 'do' we usually mean what it is we 'do' for a living. 'What are you going to do when you are a man?' we sometimes ask the children.

We all have to work, but most of us have something to 'do' as well. If all that a man has to 'do' in the world is the mechanical operations he performs during working hours, then it would follow that if machinery should be invented to perform that operation for him, he would have nothing to 'do.'

We toil because we have to square our debt with the earth—we have to pay for the wealth she lends us in every material thing we use. But what do we do with the life that we thus buy? That is the true form of the question as to what we 'do.'

But there is something besides our toil—there is also our work. Our toil is what we have to do to bear our part of the work of production in which mankind is engaged, and the fruits of which are essential to our well-being. That is our toil. But our work is that which we would do all the time if we could. Happy is the man whose toil and work are one. There are many, however, not so happily situated.

Most of us are doing two things: that by which the body is kept alive, and that by which the higher part of our nature lives. We go to the job to pay expenses, and then we indulge ourselves in what we like to do, and maybe were meant to do.

BY HAVING something to 'do' is usually meant that one has the means of earning a living. But a man's real work is frequently something quite different. He may be mending shoes in order to make a living, but his real work may be in the region of science or literature. Burns plowed the soil for a living; but his real work was the writing of undying verse. A man's appointed toil may not be altogether in harmony with his tastes, but his tastes will show themselves in the work to which he has devoted the best hours of his life. It is through this work that his fellow men will be benefited.

But some day there may come to one the duty to do a disagreeable task, to take up a cause which will yield no reward—a cause which will at first surround one with misunderstanding and abuse, which will make one look like a fool before men. One naturally shrinks from it, but it will make itself known to one as a serious proposition regardless of likes and dislikes.

The appointed task may be less in harmony with a man's tastes than he expected. A man's real work is not always what he would have chosen to do. There is all the difference between choosing and being chosen. Sometimes our choices are our destruction.

But when a man is sure of what he has to do—and unselfish sincerity, simple willingness to do what is right, are the only compasses by which he can be sure—then he may also be sure of this: he is not the only one. Others have been notified and called out too. But maybe not to initiate the work. Maybe just to form the silent background, the receptive soil for the effects which your work will bring out.

No man ever stands alone in any cause, if it is a righteous one. When he calls his voice will be heard and answered. He will be made aware by a thousand means that what he trembled before as a stern, forbidding task, is really the silent interest of many people.

If a man is right he can afford to go ahead full steam. To be right means mainly to be in tune with destiny, and willing to obey. It does not necessarily mean to be agreeable, nor to be agreed with, nor to be popular, but it does mean to be useful in the purpose which destiny is trying to achieve. If a man is right he need not fear about standing alone. He is not alone. If he seems to be, it is only a test of his mettle and sincerity. Every idea that is right has many silent adherents. Destiny is kind; it never asks a human being to do anything alone.

There is a great deal of nonsense spoken about 'the lonely heights.' They are not lonely though they may be silent. The loneliness comes when a man settles within himself whether he is to be a mere form following a conventional routine, or whether he is to listen and obey the voice of changeful life. It is lonely for him while he is deciding. If he decides to do what duty bids him, then he is no longer lonely; he comes at once into the fellowship of all liberated souls. The only liberated souls are those dedicated to perpetual obedience.

Most of us will never get fame. In a way this is to be regretted, for if we could get it we should know how well off we are without it. Most of us will never shine as the captain-leader of great movements; but the real success and achievement of life is to be one of the foot soldiers of those great silent movements which, like the motion of the sea, keep humanity from stagnation.

There was a man whose toil was really that of a cobbler but whose work was the compilation of a monumental volume on the history of the civilization of the country to which he belonged. At the rear of his store he mended shoes all day, at the close of the day he took up the work which was to confer a lasting benefit on the minds of thousands of his fellow men. His book is to this day a standard of reference among students and teachers. He had to 'do' shoes for a living; his real work was the task of a lifetime.

Why War?

HERE is a definition of war and its causes:

> War does not originate from time to time simply in a sudden and uncontrollable impulse on the part of one great national mass to go out and slaughter another. War is possible, no doubt, because these masses are willing, under conditions, to fight. But these conditions are themselves an integral part of the problem. And that issue, broadly speaking, is the outcome of a series of maneuvers by which the masses concerned are brought into positions of opposition. Obviously, this maneuvering is not done by the masses themselves. Collectively and as individuals they have little if anything to do with the subtle and gradual shifting of international relationships. Their interests are directed to the more humble and prosaic task of earning a living. *The maneuvering is done by little groups of men called governments.* These little groups seek constantly and naturally to gain supposed advantages of one sort and another for their own nationals. Out of their efforts to enlarge or to strengthen or to maintain the interests intrusted to their charge, the masses they represent are gradually maneuvered into positions which, to say the least, cannot easily be surrendered. If the process continues, sooner or later, a situation arises in which an agreement between these small groups becomes impossible. Then, on the ground that their lives and families and property are somehow involved and endangered, these great masses of men and women, roused by every power of organized appeal and propaganda, are ordered under arms, and war follows. *The entire process is in control of the smaller groups. They make the issue. They declare the war. The masses they control simply obey.* Having put this power or left this power in the hands of their governments, they find themselves at the critical moment substantially helpless. And so, as individuals, they merely accept the decision and go out to pay the bills of war with their bodies, and perhaps with their souls, in the hope that if they cannot reap, then those who come after them may reap a benefit in some measure proportionate to its cost.

That definition was not delivered from a curbstone; it was delivered from the rostrum of Harvard University. It does not come from a soapbox orator; it comes from the man who holds the highest diplomatic post in the scope of the United States Government—Alanson Houghton, Ambassador to Great Britain. Ambassador Houghton is neither an alarmist nor a demagog. He is credited with being one of this nation's best diplomatists.

But Ambassador Houghton does not stop with merely outlining the genesis of war. He proposes a method for ending war. On some specified day in the near future, he suggests that the citizens of all self-governing nations vote on two propositions:

> First, that a declaration of war against other nations entering into the agreement shall be made only after the question has received the affirmative sanction of a majority of the qualified electors of each; and,
>
> Second, that in return for such reciprocal pledges, each nation shall agree not to attack the others for some specified term, say one hundred years.

Such a world-wide balloting day would be, probably, as significant in the history of the world as that on which Magna Charta was signed.

Where Talk Is Not Cheap

SIMPLICITY and directness are the fundamentals of good business. Yet they are lost arts in many of the nation's courts. Criticism has been uttered that if there is any way to make the path of justice more devious, complicated, confusing, and subject to verbosity, the props of legal procedure will be amended to do it. Five justices of the New York Appellate Court attest to that in their rebuke to other judges for allowing useless talk during trials. 'This was a simple robbery case,' they say, in referring to a particular instance. 'There were no intricate or difficult questions involved. The issues should have been tried and the case disposed of in a day or two.' But the case consumed a fortnight and the record contained 938 pages of printed matter, 'filled to a great extent with irrelevant colloquy between the court and counsel.'

Take a Ride

THE old suspicions of flying are passing. Aviation is beyond the thrill stage. People are becoming air-conscious. Recent flights have given them dramatic visualization of the extreme safety and controllability of modern aircraft. They are learning that planes can be landed at any time and almost anywhere.

The greatest need of aviation today is that the public get first-hand information about flying. Only by personal experience can the prevalent scarey opinion of aviation be wiped from people's minds. Once they know what flying really is, the matters of airports and navigation facilities will take care of themselves. A distinction must be made, of course, between military and commercial flying. Military flying is necessarily dangerous, and will become more so as better planes are developed which will be called upon to perform harder tasks. But commercial aviation has been raised to a level of safety comparable to the other great branches of transportation.

One of the outstanding men in the field of aviation gives this advice to those interested in its development: By all means boost for a real airport in your vicinity, a mile square in size if possible. Use the Air Mail; do everything in your power to increase its volume for the benefit of flying. But first of all select a safe ship (with the Department of Commerce inspection numbers on its wing) and a safe pilot (with a Department of Commerce pilot's license) and go up in the air for a ride. Do not ask him to do stunts, for you are studying a means of transportation, not seeking a thrill. By the time you have experienced what flying really is in a modern inclosed-cabin plane, with air-cooled engine, wide landing gear, brakes, automobile vision and limousine equipment, you will decide that you have discovered not only a comfortable but a thoroughly safe method of travel.

Their Imperial Majesties, the Czar and the Czarina of Russia, with their family.

The Abdication of the Russian Emperor NICHOLAS II

By GREGORY SHINKARENKO

TEN years have passed since Czar Nicholas II left the throne of Russia, one of the most pitiful figures in history.

From the ashes of his throne have arisen two pictures of the man: one painting him a persecutor of his people; the other showing him a ruler who lived out of his time, kindly, generous, trusting.

It is the latter view—the royalist view—that is presented here. It is a view frankly partisan. The author, a lieutenant in the Imperial Navy, was attached to the Czar's private yacht, Polar Star.

EMPEROR NICHOLAS II was Russian throughout. He loved Russia and the Russian people and believed in their essential loyalty and good character. Nobility and chivalry were the chief traits of his character, but at the same time he was extremely modest; and it was in this spirit that he exercised that high duty which was his, being the autocratic monarch of the great Empire of Russia: in his voice there was always heard the tone of polite request instead of command.

He was born May 19, 1868, the second son of the Emperor Alexander III. The first son and Heir, George, died in his youth of tuberculosis. Through his mother, Maria Feodorovna, the former Danish Princess Dagmar, sister of the British Queen Alexandra, Nicholas was cousin to King George V of England, with whom he spent many of his youthful days on terms of the closest boyhood intimacy and whom he loved tenderly. He acceded to the throne on the premature death of his father, November 2, 1894.

He possessed a calm and even tenor of character and was well disciplined in self-control. Composed in moments of stress and able to conceal soul anguish, he created an opinion among many that he was heartless; he really was not. Moreover, he was kind and just, but being cautious and deliberate also, he never made quick decisions for fear of doing some one an injury. He abhorred quarreling and sharp talk. These qualities created an impression of indecision and disregard for truth. Surrounded as he was with all kinds of people, among whom were those who intrigued against him, it was actually difficult for him to make a decision. Out of modesty he often doubted the correctness of his orders and consulted with those who were near him. But it was noticed that his first decisions were usually correct.

The Emperor did not like high-sounding speeches, parade balls and pompous receptions—hence the reports of capriciousness, love of power, despotism and of unwillingness to yield any part of his autocracy. That this judgment is absolutely false is proved by his abdication, which he acceded to only desiring the welfare of his people and country, with absolutely no concern on the other hand for himself.

Practically speaking, the nature of Emperor Nicholas II was not suited to the post he occupied, considering also the times in which his reign fell. Simplicity and quiet family life were for him preferable to all else, and for them he would gladly have exchanged the throne if sense of duty to country had not kept him at his post.

The Emperor was very industrious. He usually rose at 7 in the morning, took his bath and from 8 until late at night was busy with his work. From 9:30 to 10:30 the Emperor received Grand Dukes, court dignitaries, the chief marshal of the court, the palace commandant, the superintendent of his chancery and the commander of his compound regiment. From 10:30 to 1 in the afternoon the ministers made their reports, each minister being assigned certain days and hours. At 1 o'clock or sometimes 1:30, luncheon was served, after which the ambassadors and foreign guests were received or short tours of inspection were made. At 5 o'clock tea was served. The reports of ministers continued from 6 until 8 o'clock. Dinner was served at 8 after which the Czar spent the time up to 10 in the circle of his children in the Czarina's boudoir. From 10 till late at night, sometimes till long after midnight, he would be busy alone in his study.

Loving his motherland, Nicholas II, called in the Russian revolutionary press 'the Bloody,' ruled calmly and modestly its 160 million people, loving and trusting them boundlessly, though ever surrounded with endless intrigue, gossip, jealousy, plot, denunciation and treachery. Observing all this and feeling his solitude, the Emperor confided many of his thoughts and plans to the faithful friend who shared his fate to the end—the Empress Alexandra. Knowing this, wicked people made every attempt to sully the honor of the Empress, spreading sedition and dissension among the Russian people by connecting her name with all that was depraved. It was rightly said by one: 'If Raspoutin had not been, it would have been necessary to create him.'

The next greatest pleasure to the Czar after peaceful life in his family was the old army and navy, to which he devoted a large share of his time, trusting firmly in their faithfulness and strength. But the greater part of those old warriors fell on fields of battle during the war and were replaced by those of another stamp.

The Emperor was sincerely religious, and was a fatalist. He believed that nothing could happen if it were not God's will. And so he often laughed at any increase in guards and at other precautionary measures.

He liked a modest meal with only a small quantity of wine. He drank one or two wine glasses of Madeira at dinner or a part of a glass of champagne on official occasions or during some celebration. His favorite pastime was hunting, for which sport he went to Finland or Poland nearly every summer.

The Empress Alexandra Feodorovna could not have been better suited to the taste of the Emperor. She was born June 19, 1872. Before her marriage she was a Princess of Hesse and had the name of Alice. She was a daughter of Princess Alice of Hesse, who in turn was daughter to the British Queen Victoria. One of her sisters, Irene of Hesse, was married to Henry of Prussia, brother of the German Emperor Wilhelm; her second sister, Elisaveta Feodorovna, was married to Grand Duke Sergei

In the Wake of the Flood

By PIERCE CUMINGS

THE greatest peace-time health battle in the history of the United States is being waged in the water-soaked valley of the Mississippi.

It is a battle of men against microbes—a battle to save the 700,000 victims of the flood from the further ravages of disease. Its seriousness cannot be overestimated. No one dares predict what will happen, if disease once gains the upper hand.

So far men have been successful. Not only has there been no trace of epidemic; *the health of the people has been kept above normal.* The greatest problems, however, are now being encountered.

Never before has the nation faced such hazards to health. Problems a hundredfold greater than those met during the construction of the Panama Canal are daily encountered. Water supplies are universally contaminated. Thousands of bodies of dead animals are rotting under the blazing sun. Flies and mosquitoes, dread carriers of death, are breeding in incalculable numbers.

The flood waters which covered twenty thousand square miles of land are gradually giving way to slime. Houses are soaked and filthy, wells defiled. Vegetable matter is decaying. Thousands of persons who have been crowded in concentration camps, or huddled on levee tops just above the swirl of the flood, are returning to their ruined homes to take up life as best they can. But life now is a grave matter.

Food supplies are scarce; reserves were wiped out by the muddy waters. Fresh milk is difficult to obtain. Myriads of stagnant pools form a menace not only to returning refugees but to livestock and wild animals. Sewerage has been destroyed.

With refugees gathered in camps and central points, a supervisory eye could be kept over them. Scattered, they offer new opportunities to the cohorts of disease.

The emergency work of the flood is almost over. Everywhere the waters are receding. Only a few thousand victims are left in camps, of the 600,000 once cared for. The rest are returning to barren homes, each with a two weeks' supply of rations, and such seed for the ground and feed for surviving stock as the Red Cross can provide.

With the return, the health battle enters into a new phase—the 'clean-up' campaign. But the work which was carried on before is as vital as any ever undertaken in this country. On its success, and that of the present clean-up program, will depend the health of thousands of citizens, not only in the flooded territory, but throughout the country.

On April 28, a conference was held at Memphis. It received little newspaper publicity, for many conferences were being held at the time, and the Mississippi torrent was still rising to its climax. But for the victims of the disaster, and for medical men of the entire nation, it was a conference fraught with significance. Present were state health officers, presidents of state medical societies, representatives from the American Medical Association, the U. S. Public Health Service, the Army and the Navy, as well as from the Red Cross.

'This is the most important meeting of health officials and physicians ever held,' declared Dr. William Allan Pusey, chairman of the disaster relief committee of the American Medical Association, 'for it is the first time representatives of Government departments, state health departments, and medical societies have ever assembled to coördinate their work with that of a voluntary relief agency working out emergency health and sanitary problems.'

From the meeting there came a comprehensive program. Dr. W. R. Redden, national medical officer of the Red Cross, the man about whom the entire campaign revolves, declared that the policy of his organization was one of coöperation rather than supervision. It would furnish supplies, physicians, nurses and sanitary engineers upon request; but the actual work was to be carried on under direction of the various state health officers and their subordinates. In this way conflict was avoided, and responsibility was centered. The camps were maintained under direction of Red Cross officials but medical work throughout the flooded areas was supervised by the different department heads.

Typhoid, malaria and dysentery are the most dreaded of all diseases in the South. Dysentery, considered minor in other sections, kills more children there than any other disease. Medical men, therefore, focused their energies on these three. The skeletonized program included as essential:

Purification of water supplies.

Protection of food supplies.

Disposal of sewage and garbage.

Reporting and isolating of communicable diseases.

Immunization of the greatest possible number of persons against typhoid and smallpox, and of all 'contacts' in diphtheria cases.

To carry out this program in the concentration camps was comparatively simple. So it was, likewise, in the larger communities where the people remained by their homes in spite of the flood waters. But in the more remote regions, and in those localities where the victims took refuge on levees or on isolated spots of high ground, it was far more difficult.

On the rolls of the Red Cross are 42,000 nurses, subject to call for emergency work. There are also physicians, sanitary engineers and health officers, as well as volunteer medical students. But they by no means mark the limit of the organization's resources. When the Mississippi flood first assumed the proportions of a major disaster, Dr. Redden telegraphed to Federal and state health officials, asking what help he might expect. The response was magnificent.

'I will strip the service in order to meet the needs of the states in this crisis,' Surgeon General Hugh S. Cumming said, and his reply was typical of the others. He proved as good as his word, promptly assigning Senior Surgeon John McMullen to Red Cross relief headquarters as liaison officer, and Senior Engineer J. A. LePrince as malaria adviser. (Dr. LePrince had served under General Gorgas in Panama and is considered one of the best informed experts in the world on tropical diseases.)

Offers of men and supplies came from the Army and Navy, and nearly every state health department in the country. Only a few of the men were needed, but the supplies were gratefully accepted.

First efforts were directed toward maintaining health at the concentration camps. Temporary hospitals and dispensaries were established. Screens were thrown around all places where food was prepared. Water supplies were chlorinated. Adequate bathing and laundry facilities were provided. All milk that failed to comply with the minimum requirements of the Public Health Service was boiled. But these precautions were merely preliminary. Disease can usually be detected, isolated, and checked, when it occurs in a large community which is under careful medical supervision. Disease in outlying districts is another matter. And it was this latter that the medical men had to guard against.

Automobiles in temporary haven atop a levee.

Inoculation was decided upon as the best preventive. In a period of eight weeks 340,000 persons were given the complete typhoid immunization—the greatest number in the entire history of disaster relief service. Additional thousands received the first and second inoculations. Smallpox vaccinations totaled 161,000.

—Herbert Photo.

Dinner time at a refugee camp. Above—Overboard to make minor repairs on a rescue craft.

Many of the refugees had no knowledge of even the fundamentals of sanitation. They had to be taught that polluted water brings typhoid, that flies and mosquitoes carry malaria, that dead bodies are ideal mediums for the spread of disease. A program of education was carried on at the camps by means of motion pictures, lectures and the distribution of pamphlets. By the time they were ready to return to their homes, nearly every camp refugee had at least a smattering of what he should do to prevent illness.

Then began the 'clean-up' campaign—a campaign which is still under way and will be for weeks to come. As soon as the water begins to recede from a locality, clean-up units are sent in. The program calls for purification of water supplies through chlorinization, for disposal of sewage, for materials for burning and otherwise disposing of dead animals, for screening for malaria districts, and spraying oil for marshes and pools.

Burning is considered the best method for disposing of dead animals; so the inhabitants are supplied with large quantities of crude oil, and are told how to use it most effectively. Wells are tested by the medical units. The men are instructed how to clean them and to keep them clean; and chloride of lime is provided for purifying the water. Quinine sulphate is furnished virtually every family, because of the danger from malaria. The refugees are taught how to fight the mosquito peril by spraying stagnant pools, and spraying cans and oil are given them. Immunization is carried on at central points, in the effort to reach all those not inoculated at camp.

The supplies for the clean-up campaign alone (for a period of thirty days) include 44 barrels of crude oil, 2,480 barrels of spraying oil, 1,440 barrels of hydrated lime, 40,000 pounds of unslaked lime, 7 tons of dynamite for use in burying dead animals, 318,180 cans of chloride of lime, 210,750 yards of mosquito netting, 19,975,000 grains of quinine. A maximum force of 267

A Free Fantasia *on* PEASANTS *and* Their ARTS *and* CRAFTS

By CHARLES J. FINGER

ONCE a lady of title and her party chose me as guide when they wanted to see something of southern Patagonia. It was no great trip and nothing of importance happened, though the lady wrote a book about it, making much of the killing of a puma, a guanaco hunt, and one or two similar incidents. She and her friends imagined that it was a tremendous adventure and that they were riding phenomenal distances every day; the truth is that a ride of twenty miles between sunup and sundown was as much as they could do.

You see, they wanted adventure, wanted something to write about and to talk about, and, as they instructed me carefully to see to it that they camped out every night—'heaven's vault for my bedroom ceiling,' was the way the lady put it—I contrived that they were always out of sight of whatever shanties might be handy, on the other side of the hill, or down the *vega*, for instance. However, on the third day they were dead beat. So, at sundown I led them to my own shanty, which was a one-roomed place with an indifferent roof. But I had hides and pelts aplenty, to say nothing of sheepskins on which, after a good meal, they slept soundly. Our supper, I recall, was roasted wild goose, fish, ostrich-breast soup, wild celery, and bread which my chum and partner had baked that day; and better bread maker than Jock never kneaded dough. Jock McLeod was his name, and he hailed originally from the Isle of Skye.

When the travelers were ready to start, which was quite late in the morning, eight o'clock or so—with Jock full of fidgets 'to be well shut o' them a',' as he said—what did my lady do but go poking about our shanty; presently she was full of 'Ohs!' and 'Ahs!' as she admired Jock's feather duster. Jock, you must understand, was as excellent a shanty chum as ever I had, neat and orderly, in spite of the rough looks of him. So he had made for himself a feather duster from the tail plumes of ostriches; for feathers in time became a nuisance when every week or so one of us caught an ostrich for food. Anyway, there was my lady all full of enthusiasm about the feather duster, offering to buy it; Jock was willing to sell for a quarter, or a plug of tobacco, for that matter. But the trade being ended, my lady became more curious.

She discovered, outside the door, Jock's mat. Jock, with his passion for cleanliness and order, had taken a sealskin, for we had plenty of them, and had trimmed off the edges to make a doormat. So there was another trade. The lady, becoming more keen on the scent for curiosities than ever, found that Jock knit his own scarfs and socks; so she wanted, and took, specimens. She wanted a bottle of the ink I had made from berries, and a rawhide whip which I had plaited. Also a round of cheese that Jock had made. And a loaf of Jock's bread, and other things 'too numerous to mention' as the bills of sale say. Nor did we ride that day, for my lady found that I played the bagpipes and knew old tunes, and that Jock knew old Hebridian songs. So we had a pleasant day.

THE moral of it all was voiced by Jock later. He expressed himself to the effect that it is a strange thing for the world to hold in high esteem those common things which have been gathered by others, and yet to neglect the common things at hand. For instance, many a man will be filled with enthusiasm over a book of old ballads collected by some one interested in such things, but will scorn songs and tales of old men around the fire-glow, though the ballads and stories are of the countryside and are quite as important as those on the printed page.

Let us take Jock's preachment a step further: many of us will pay high prices for a set of fire irons, or a hand-made linen cloth, or a candle mould, or a spinning wheel, never realizing that these, and other similar things, are in daily use; though, to be sure, to see them used we must leave the beaten track and step out on foot over hill and dale. Of course we must become simple ourselves if we are to know simple people, taking to Shank's pony in good old-fashioned way, for common people are too busy to loaf around railway depots or automobile filling stations; whereas with many people a notion of travel is sitting in a Pullman car or riding in a high-powered and very glittering machine.

All of which brings to mind a necessary and important question. It is this. Have you been stung by those waspish fellows who go about poisoning truth by injecting prejudice against country folk into the veins of those whose ordinary affairs keep them close to cities? If so, you have something

Spinning wheels are in daily use, though to see them we must leave the beaten track.

—*Associated Screen News Photo, Canada.*

to learn. And of that something there is this—that there are arts and crafts and ways of making a living still in practice which are likely to go on for generations, just as they have already gone on and on for generations; they will remain unchanged in spite of all new inventions. Machinery may become so perfected that man will fly around the world swiftly enough to get into tomorrow; he may find a way by which he not only can hear and see by wireless, but can taste and smell and feel too; but, for all of that, the simple arts must survive because they are as fundamental as the human backbone.

Man can no more dispense with them than put aside the golden rule as a good, common-sense philosophy which has stood the test of experience everywhere and at every time. The simple art of sewing with the needle is instance; or knitting; or work with the axe; or woodcarving; or shaping logs with an adz; or bread making. Take that last item. To be sure, there are millions of people who, because of their sad ignorance, would suffer the pangs of indigestion had they to make their own bread; but tens of thousands of families eat bread that is a pleasure to taste, sweet and wholesome, crisp and golden-brown, each baking just the slightest bit different from another and the variation a real delight. Or what of cheese and butter?

There are women unequaled in the art of making both these kinds of products. Did some of them choose to go to a city and sell their bread and butter and cheese as dainties, they might ask their own price and make a good income selling what is eaten at many a farm table. I know a man in the mountains who makes a living much more easily even than if he made bread to sell; one who has started a growing business with no more capital than a pair of sharp eyes, a pair of stout legs, and a pair of able hands. He digs up wild flowers and sends them to flower fanciers living in all parts of the country; his descriptions of the plants are little poems. But reverting again to what was said about going off the beaten track, I would say this.

Over the hills from where I live, not so very far away, unless you go by the proper mountain road over which no automobile has yet traveled, there are people who make their own candles; others who weave baskets which would sell for a good price as handsome ornaments; others who fashion wicker chairs which, comfortable to sit in, and pleasing to the eye, will last a lifetime. There are still others who weave, who spin, who turn pottery from native clays, who do their own blacksmithing.

And mark this, because it accounts in some measure for the permanence of these simple arts and crafts. There may be panics in the money market; there may be economic disasters and strikes and disorders and hard times brought about largely by the stupidity of those who call themselves masters and governors, or by the untrustworthiness of those elected to manage, but still the folk that I have in mind will go about their usual ways quite untouched. This is why the simple arts have survived while nations have decayed and dynasties fallen.

—Associated Screen News Photo, Canada.
The meek inherit the earth because they are fit.

The meek do, in very truth, inherit the earth. They survive because they are fit. They are fit because, their code of honor being high, they refuse to take anything remotely resembling an advantage of their fellows. Also, I would have you observe that, while our current literature is full of deeds of violence and darkness, the majority of people actually do lead lives of comparative blamelessness. Country folk know this fact, realize it to their advantage; which is why any old citizen who has led a long life of usefulness and has a reputation for sound honesty may spend his sunset days filling all requirements as village policeman.

As for economics, the countryman is safe and sound. 'Borrow when you have,' runs one countryside saying. Another, 'Interest milks the cow while you buy the feed.' So borrowing is confined to asking for the use of a plow or a harrow, with neither rent nor interest expected. To sum up, take country folk as a whole: you will find them well-equipped for any exigency of ordinary life. War, however, is not one of those exigencies. So, when I speak of waspish people who talk slightingly of simple folk of the countryside, it is with something like wonderment at the ignorance of such critics, for I have found those who live in what has been scornfully called the 'hinterlands' to be the very salt of the earth. They are preservers of the worth-while.

Let me tell you something of what I saw recently when many simple folk were gathered together. The meeting place was the city of Quebec, and the people came from the shores of the lower St. Lawrence, the Gaspé peninsula, which is that part of Canada touching Maine. Many of them were fisher folk, clear-eyed and sturdy, knowing nothing but life in its simplicity. There were lumberjacks too, and farmers, and makers of fishing nets, and wood carvers. It was not solely because they were craftsmen and craftswomen that they were brought together, but also because they knew old songs and old legends, and had the pleasant habit of singing at their work. J. Murray Gibbon of Montreal, an enthusiastic folk-song student, was active in organizing this convention, which was held under the auspices of the national museums of Canada.

There they were: women and girls at looms and spinning wheels; fashioners of rugs and blankets and linen cloth; flax beaters; net makers; wood carvers of great skill. They were dressed in their homespun, in full skirts, black-and-red checkered shirts, oilskins, blouses. They were workers doing exactly what Greeks and Romans did when they made their tapestries and damasks, the same mechanism being all-sufficient. Thus and so were Indian muslins made, and the shawls of Kashmir, the fabrics of Italy and the Netherlands, the Highland tartans, and the Irish linens. They spun as Penelope did, and, like Penelope, they sang as they spun. But their songs were not of the life of our day, nor of the place where they lived. That is the curious part of it all. The songs were of old France, the France of Louis XIII, and of earlier times. They were songs about barons and counts and dukes and princes of the blood. When they told of battles their references were not to war machines as we know them, but to musketeers and pikemen and archers

The simple arts must survive because they are as fundamental as the backbone.

and swordsmen. Listening, one had visions of men in glorious uniforms, of peasant women who wore bodices with colored sleeves, and skirts trimmed with velvet, of well-cultivated fields, and fat pastures, of solid farm houses, and of maidens in distress.

This, for example:

Ah! Who Will Guide Me Thro' the Wood?

(*Translation by J. Murray Gibbon*)

Ah! who will guide me thro' the wood?
I am so small to wander.
Maybe that gentleman so proud,
He looks a brave defender oh!
Are we now deep in the wood?
Are we at the end here?
Are we now deep in the wood?
Are we at the end here?

Maybe that gentleman so proud,
He looks a fine defender!
When we were in there deep in the wood,
He started off to scamper—oh!
Are we now deep in the wood?
Are we at the end here?

And this:

The Swallow, Messenger of Love

(*Translation by J. Murray Gibbon*)

Ah, thou so lovely swallow that flieth there,
Have you seen within these islands Alexis dear?
He went away, he went a-voyaging a long sojourn,
He'll make you sure a kindly messenger of his return.

The bird who is so friendly has flown away
All afloat on airy feathers wafted away,
Across the water and the ocean nor ever stay'd;
Upon the masts of a flotilla a rest he made;
And there perceived a vessel with high topsail;
Alexis was lamenting there at the wheel;
'Speak to me then, O faithful lover, speak to me then,
I am an envoy of thy fair one across the main.'

The lover all astounded to hear this said,
To obtain so strange a message of his fair maid,
'O say to her, my lovely swallow, as I have sworn,
I shall be ever chaste and faithful till my return.'

These songs they had not learned in any school, nor read from any book. Indeed, until recently, when such students and scholars as Ernest Gagnon, Marius Barbeau, J. Murray Gibbon and Edward Sapir commenced to gather them, they were not in print. Therefore the hearing of them opens as widely speculative a field as would be if, in an Ohio tobacco patch, one heard a farm lad without education of the school kind singing Ben Jonson's 'Hymn to Diana,' or some such ballad as 'Chevy Chase.'

Or as if some good-natured colored man, instead of singing 'The Coon Can Game,' suddenly burst forth with, 'Kua! Tau e Tona!' the song of greeting with which the Africans of central Africa greeted Livingstone, the first white man they ever saw.

And suppose you asked the colored man when he had read Livingstone's *Travels*, only to find he could not tell one letter from another.

Then suppose further that on questioning him you found that he had learned the song from his father's father who had been a slave, but who remembered the old jungle songs. The case would be roughly similar to that of the singers from the Gaspé peninsula.

(*To be concluded in an early issue.*)

Our Western Mail Carriers

By **ROBERT KEMPIS**

THE majority of people who enjoy the convenience of having their mail delivered at certain hours each day are unaware of the harassing and sometimes fatal circumstances that attend this work, particularly in some of the remote and wild sections of the West.

In many sections of the scantily settled Western States, bears, cougars, and wolves frequent the mail routes, tempted by the scent of the carrier's grub sack.

In the winter, fierce blizzards rage for days at a time, making the route of the carrier laborious and dangerous, taxing endurance, whether he goes on snowshoes, by team or by saddle horse.

For several years a lone woman carried mail through a densely timbered country, twenty-eight miles between terminals—border mining towns—twice a week, crossing a mountain pass of seven thousand feet altitude.

Part of the time she traveled on snowshoes, for the soft snow would not permit of her horse's treading it. Snow falls in this section to depths of six to seven feet in the valley and ten to fifteen feet on the mountainsides. Faithfully and fearlessly this woman delivered the mail to the waiting ones in their isolated camps.

During a terrific storm, a Pacific sou'wester, the worst since the memorable one of 1861, a mail carrier was bringing the mail to the coast from an interior town nearly one hundred miles distant.

For four days and nights, without a moment's lull, the wind blew a deluge of rain at a terrific gale, driving the huge breakers up over the tide limits until the lower streets of the town were deep under water and the boardwalks made floating rafts for daring youngsters.

Great, tall trees were uprooted and blown across the roads, streams overflowed their banks and the surrounding country became a great lake, on which floated many uprooted trees and various débris from ranches.

The short winter days brought early night and the postmaster grew very anxious, for he was aware of the dangers of the route, and that anxious watchers awaited him.

At six o'clock the mail was due, the watchers became alarmed; at 6:30 their fears increased and many were the conjectures for the delay; some feared the carrier was crushed under a fallen tree. Gloom settled over all as time crept on—seven o'clock; then eight, and when eight-thirty came, excitement became rife. A group of them gathered a crew of men, with saws, axes, bars, and chains and a four-horse team, to look for the carrier, but just as they were ready to start on their perilous trip (it was nine o'clock), someone shouted, 'There he comes riding a horse, and with the mail sacks piled high on its back.'

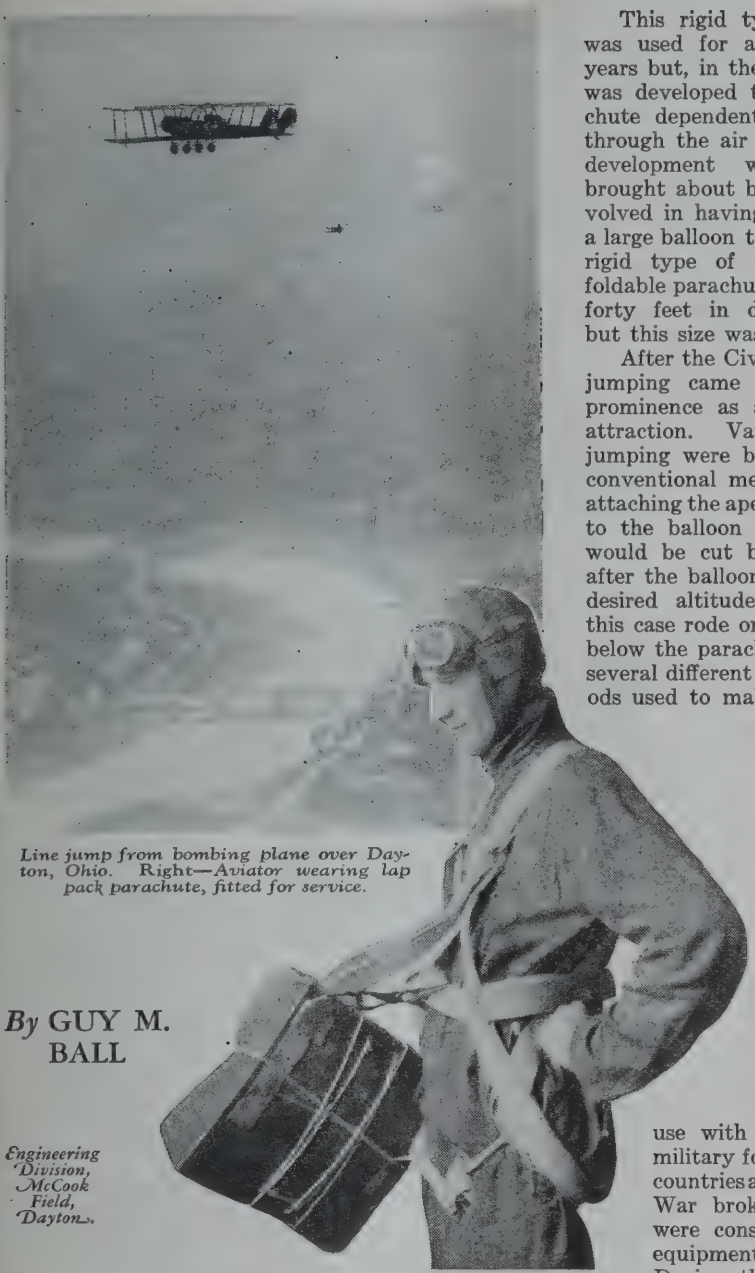
Wearily the postman dropped from the horse's back to answer his many inquirers.

He had came to a rocky part of the road, where the shaley rock had been loosened by the rain, and, directly over the river, the horses suddenly came to a stop; unaware of any possible danger, other than of fallen and falling trees, he dismounted from the stage and went to the front of his team; there he saw a yawning breach in the road only a few feet from their heads and seventy-five feet above the roaring river.

Unhitching the team, he loaded the mail on the younger horse and led it safely over the breach. Old Tom he led by a long rope. He followed on the upper side, and just as the horse stepped over the center of the breach, without a warning, the rock slipped from under his feet and over he slid, rolling down to the rocks at the edge of the river. The rushing waters caught his body and carried it on down to the ocean.

The carrier then mounted the younger horse, mail sacks to the front and back of him, and slowly made his way around the fallen timber, the nine miles into town.

PARACHUTE JUMPING



Line jump from bombing plane over Dayton, Ohio. Right—Aviator wearing lap pack parachute, fitted for service.

By GUY M. BALL

Engineering Division, McCook Field, Dayton.

THE name 'parachute' is descriptive of its purpose, being a Latin derivative and meaning 'to prevent a fall.'

The first parachute of which authentic information is at hand was constructed and used by a Frenchman about A. D. 1784. The first descent was made from one of the highest buildings of Paris at that time. The parachute itself was of a great size, built of heavy materials, and was of a rigid construction; thus, it was open at all times. Shortly after this, there were some jumps made in England, from a hot-air balloon, by men who had parachutes which were very similar to the first one used in France. Some were inverted saucer shape, some flat, and at least one was funnel shape, with the large end up; all of these were built to be open at all times. The records show that fatalities were frequent with this type of construction due to the parachute structure collapsing in the air.

This rigid type of parachute was used for almost a hundred years but, in the meantime, there was developed the type of parachute dependent upon its travel through the air to open it. This development was, no doubt, brought about by the expense involved in having to provide such a large balloon to carry the heavy rigid type of parachute. The foldable parachute averaged about forty feet in diameter at first, but this size was reduced.

After the Civil War, parachute jumping came into considerable prominence as a circus and fair attraction. Various methods of jumping were brought out. The conventional method consisted of attaching the apex of the parachute to the balloon by a rope which would be cut by pulling a cord after the balloon had reached the desired altitude; the jumper in this case rode on a bar or trapeze below the parachute. There were several different devices and methods used to make the jump more spectacular. Parachute jumping was not confined to human beings. From time to time, various animals were dropped with parachutes by the man before he jumped, the animals used in these drops varying from rabbits to horses.

Parachutes were adopted for use with balloons by the military forces of the various countries and when the World War broke out parachutes were considered as regular equipment for all balloons. During the World War, it became a common sight to see the observer jump from a blazing balloon. Black parachutes were also used to drop spies at night into enemy territory.

Parachutes were used for exhibition purposes from airplanes in 1912, but it was not until the summer of 1918 that they were used as life-savers. Early in the summer of 1918, the German airmen began using parachutes whenever their plane was disabled or set afire. It has been estimated that at least fifty German aviators' lives were saved by their parachutes.

With the present Air Service parachute, as developed at McCook Field, descents have been accomplished from as low as 100 feet. The altitude record for parachutes was made by Lieutenant A. W. Stevens, with this parachute, from an altitude of 24,000 feet.

The strength of the Air Service parachute is so great (approximately 10,000 pounds—total strength) that it is impossible for one of them to be damaged in a jump so that it would be dangerous for the jumper.

A Schoolmate *of* Lincoln
By WILLIAM E. BARTON

℄ Katie Roby was the schoolmate of Abraham Lincoln, and his very firm friend. She admired the tall, awkward, diffident lad, in spite of his grotesque attire and lack of grace. He admired her and liked to be with her at parties and on similar occasions; 'but they were not lovers,' says Dr. Barton.

LUCK, *and the* Bedside Manner
By JOSEPH COLLINS

℄ Joseph Collins, one of the most brilliant neurologists in the country, in our next issue discourses on the 'bedside manner' as an asset of the family doctor. It is now well established that psychology plays an important part in governing a patient's condition.

Little Essays *From a* Northern Cottage
By HUGH WALPOLE
No. 2 of Series: '*An* English Lady'

℄ 'An English Lady' is the next of Hugh Walpole's series of Little Essays from a Northern Cottage. It is a lovingly constructed character sketch of the writer's mother.

Passing Impressions

(Continued from page 3)

they exchanged several sentences. Then it was my turn. I was presented as an ardent admirer from the United States, who felt that merely to see Victor Hugo would be the crown of her French visit.

This mere gaze is precisely what I got. Bowing deeply I looked up to find the poet's still-piercing eyes fixed upon me with an expression of extreme distaste. He removed them almost at once, muttering something which sounded like the French equivalent of a grunt, turned quickly to my companion, and my interview was over. In the boy's torrential outpour of eloquence I was only too thankful to feel myself forgotten.

To this outpour of praise, rapture, devotion, the Master listened mildly, even, it may be, with some amusement—it was so grandiloquent, so ineffably youthful. At last came the apostrophe, like a concluding burst of fireworks: 'O glorious Master, how I have dreamed of this moment! O how great thou art! This is indeed a great age (un grand siècle), but thou art incomparably the greatest in it.' To me, the American, the situation was fraught with comedy, but the Great Man's answer saved it:

'*Sans doute, mon ami,*' he said gently; '*mais le siecle s'en va, et moi aussi.*' (No doubt, my friend; but the age is passing away, and so am I.)

On May 22, 1885, he died, and all France mourned him. He lay in state under the great Arc de Triomphe, and for hours the people passed his bier in orderly procession, and later followed it in ever-lengthening file to the Panthéon, his final resting place.

As I look back upon this scene of nation-wide love and grief, I ask myself: Will Victor Hugo in the future hold the same high place as when he died? Already the dissonant note is struck, not only abroad but in France herself. M. Léon Daudet considers him both a poor specimen of a human being and an immensely overrated author, 'boundlessly rich in words, poor in the highest kind of imaginative faculty.'

Our English Henley said of him that it was 'attitude, attitude, and again and always attitude; in the beginning as in the end, attitude, and an almost unnatural mastery of rhythm and of speech.' 'That,' he adds, 'is the secret of his success.' A saner and surely a kinder judge is Kenyon West, who declares that 'as long as the heart has passions, as long as life has woes, Victor Hugo's best work will last.' This at least can be said: It has been given to few to impress so deeply their own age.

His successor in the French Academy was the poet Leconte de Lisle, only sixteen years his junior, and destined to survive him only nine years. He died in July of '94, and by an odd coincidence I was again in Paris at the time of his funeral. This time there was no mass tribute, but the mourners though comparatively few were undoubtedly most fit.

The services were held in St.-Sulpice, and the last tributes to the man, the poet and the friend were given beside his grave in Montparnasse. With indescribable interest I watched his associates of the Academy come into the church, and mentally fitted to them their well-known and famous names.

World's Farthest North College

Schoolma'ams *in* Alaska Get Married Before *the* End *of the* Second Term, *But* Men Teachers Do Not Stay

By THOMAS B. DRAYTON

THE hoary witticism that a thousand dollars' reward awaits the man who can produce two Alaskans in perfect agreement on any given subject has lost its point. We are all at last a harmonious unit in one matter. The basis of that harmony is our new university, and the unity of opinion now prevalent touches its importance as a factor in dissipating the more harmful fallacies current in the outside world concerning the general character of our country and people. Not that we really expect ever to overtake and confound the disseminators of these cruel libels touching our excessive temperatures, the number and ferocity of our mosquitoes, the pitiless rapacity of our tradesmen, or the periodical mad orgies of our untamed mountain waters.

President Charles E. Bunnell.

Long since, we abandoned hope of correcting these traditional errors—denials proving fruitless, and likewise embarrassing upon the arrival inauspiciously of observant strangers. But in many respects we have suffered unjustly and even grievously; albeit, singularly it seems, the world has ever been ready, and gladly, to revise its opinion in our behalf when given proof of our genuine sincerity, or, indeed, even when offered proof of higher type than transparent evasion of the issue.

Alaska recognized the actual need of a local institution of higher learning. In the aggregate we have a very considerable number of Alaska-born boys and girls who are passing beyond high school age, and many of them yearn to venture into fields of advanced learning not hitherto accessible nearer than some thousands of miles from their Alaskan homes. Each recent year has witnessed an ever-increasing number of our young people going out to colleges and universities in the States. A considerable percentage of these students form business or professional connections outside and never return to us.

While a collegiate training used to be, and in a diminished degree is even yet, given an importance in the general public mind somewhat in excess of its actual value, Alaska could well employ a larger percentage of college-trained men and women. Even our school-teachers in past years have been mostly recruited from the States; the men chiefly of the adventurous roving type and the women teachers being mainly interested in promoting matrimonial interests not successfully prosecuted in their former and perhaps more exacting homeland; but, as a rule, all of them capable enough and otherwise worthy enough.

Among these imported teachers a man seldom remains more than a year or so, and a woman usually snares some eligible Alaska bachelor during the first six months of her residence, but in any event almost invariably marries and quits teaching by the end of her second term.

In addition to the teaching profession, the country affords opportunities to the engineer, particularly the mining engineer. These also, like our teachers, we have been compelled to import, and the same is largely true of all other functionaries of any particular technical training. Our new university is expected to supply these deficiencies in Alaska's civic life.

Its legal name is the Alaska Agricultural College and School of Mines; the precise reason for which nomenclatural designation, as intimated above, will be readily apparent to any reasonably nimble-witted investigator that bothers to read the Acts of Congress of 1890 and 1907 relative to the support of state and territorial colleges of agriculture and mechanic arts. But we Alaskans call it the university, and resent any other designation as being misleading and also as rather less consequential than the dignity that the institution needs and deserves. It is everything the legal name implies, but that is only a part of what the university now is, and but a fraction of what we Alaskans believe it will eventually be.

In addition to regular four-year courses of study leading to the bachelor's degree in agriculture and mining engineering, the university also offers courses in general science and civil engineering quite equal in breadth and thoroughness to those generally available in the higher educational institutions of the States. Business administration and home economics are other established courses leading to degrees, while a feature of great local importance is a series of short courses of study adapted to the needs of the mineral prospector, dairyman, housewife, and the active farmer and stockman.

If there is about the university any vague shade of conceit or self-sufficiency or superiority it lies in the purpose of the faculty and the growing consciousness of the mining students that they are going to be mining engineers indeed, and that the imprint of Alaska University training will eventually be accepted as evidence of their preëminent qualifications wherever the mining craft obtains.

The university buildings are located on a large tract of land on the outskirts of Fairbanks, or, to be technically exact, at North Latitude 64° 51′ 21″.

The large body of land upon which the university is situated was set aside for the purpose by a special act of Congress in 1915. Two years later the Alaska legislative assembly accepted the provisions and met the requirements of the United States laws relative to state and territorial colleges of agriculture and mechanic arts and appropriated $60,000 as an initial fund with which to begin operations. With this fund available the first building was begun in 1918. The assembly of 1919 failed to make an appropriation but the assembly of 1921 provided the funds for equipping and organizing the institution. Thereupon the board of trustees tendered the presidency to U. S. District Judge Charles E. Bunnell, and, as subsequent events amply demonstrate, made a tenstroke by inducing him to accept the job.

It is the last of the land-grant colleges, and, having become an established going concern, is now receiving annually $50,000 from the Federal treasury. The Alaska legislative assembly supplies its further financial needs if and as it has the money.

The university laboratories are equipped with the best obtainable scientific apparatus, and its library contains 5,000 volumes selected with special regard to the needs of an advanced student body.

On the opening day, September 18, 1922, six students were enrolled; more, by the way, than many other American colleges now great and prosperous had upon their opening days. Six professors and the president then comprised the faculty. Before the end of the first year sixty-two students had enrolled.

Fighting Disease

(*Continued from page 15*)

physicians, health officers, sanitarians and nurses is engaged in the campaign.

Although the work is not yet ended and will not be for weeks, Dr. Redden is of the belief that it will terminate successfully.

'We believe we shall be successful in protecting the health of the people until they are again in their homes,' he declares. 'In fact, five weeks have passed since refugees began to return to their farms, plantations and villages. Probably more than 300,000 have returned to the homes of which they were dispossessed by the flood. They have gone back to filth-laden houses, mosquito-infested pools and ponds, to contaminated wells, to destroyed privies, to land strewn with dead animals, moist deposits of animal and vegetable matter plastered with flies. In other words they have gone back to conditions fraught with danger of epidemics and to health hazards increased a thousandfold, and yet, there has not so far been a single outbreak of disease and only a slight increase in the usual types of disease.'

Chautauqua Lake, midway between New York and Chicago.

The Most American Thing *in* America

Chautauqua Movement *Was Initiated to* Make *the* Routine *of* Daily Life *a Little* Brighter

By WILLIAM L. STIDGER

THEODORE Roosevelt called it 'the most American thing in America.' More than 300,000 persons have enrolled in its courses since 1874; approximately 75,000 diplomas have been awarded to those who completed its four-year course. Last year this course had 4,000 graduates.

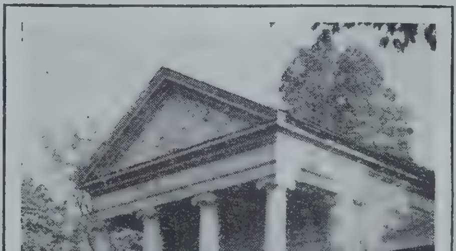
Lake Chautauqua, from which the 'idea' obtained its name, is located in southwestern New York and is only eight miles from Lake Erie. From this idea have sprung several other typical institutions: the summer schools; the summer Chautauquas; the traveling Chautauquas; and the independent assemblies.

Many historic personages have appeared before it; and numerous literary lights have first gleamed in its halls. President Grant, Susan B. Anthony, Theodore Roosevelt, James Bryce, British Ambassador; James Whitcomb Riley, Hopkinson Smith, Thomas Nelson Page, former United States Ambassador to Italy; General Lew Wallace—a few of those who have graced its programs.

Bishop John H. Vincent is credited with being the founder of the movement. The first Chautauqua Literary and Scientific Circle, which he organized, had for its aim: 'To promote habits of reading and study in nature, art, science, and in secular and sacred literature, in connection with the routine of daily life, especially among those whose educational advantages have been limited, so as to secure to them the college student's general outlook upon the world and life, and to develop the habit of close, connected, persistent thinking.'

There are several slogans mentioned in connection with it today which express something of its purpose. 'A school for out-of-school people' is one. Another is: 'Everybody reads nowadays; don't read at random.'

'Recognition Day,' which corresponds to Commencement Day at college, is always in August. The exercises are held in St. Paul's Grove, and the 'graduates,' gathering from all corners of the earth, pass through a 'Golden Gate' which is unlocked but once a year and used only on Recognition Day. The 'Gate' is at the end of a lane which is marked by four arches of evergreen, representing History, Science, Philosophy, and Art. Only those who have completed the four-year course are permitted to pass through the 'Gate.'



The 'Hall of Philosophy.'

A Master at Knot-tying

By JOHN L. VON BLON

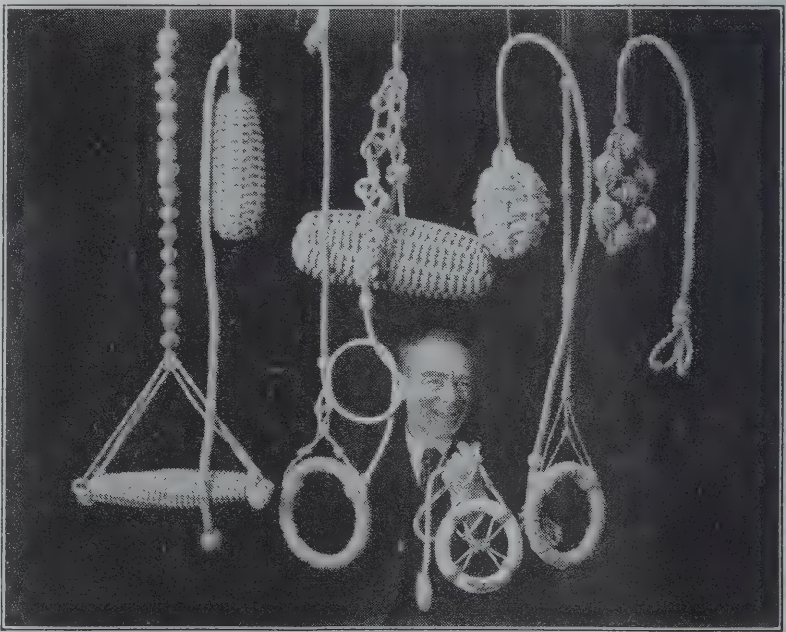
MARLINSPIKE craftsmanship, hallowed by romance and age beyond reckoning, is doomed soon to become a lost art. Older than civilization, this fine craft of the mariners seems swamped in the maelstrom of modern rush—a tragedy of progress. But a solitary figure looms as its temporary preserver.

Michael Colbert Long of Los Angeles is the man, and a personality of world interest by virtue of his unique accomplishment. As rope expert of the California Yacht Club he has completed the best display collection of marlinspike work extant.

Born in Portland, Connecticut, forty-eight years ago, Long when a lad of seven was taken under the wing of Herb Lindsay, a former pirate awaiting life's sunset in a shack beside the Connecticut River. Lindsay had been the premier marlinspike seaman of his day, the last of the matchless old school, and for ten years he unfolded to his apt pupil the unwritten ritual of the rolling deep, teaching him more than all others knew; and the boy, fascinated, grateful, eager, never ceased to advance.

Lindsay's career, though sadly checkered, had been romantic, amazing. Captured at seventeen in the China Sea by the notorious pirate Pablo Penaro, he was saved from death by his dexterous manipulation of the rope—the only soul aboard the scuttled prize not sent to the bottom. Eleven years he was held a privileged captive by reason of his prowess, meanwhile acquiring every subtlety of marlinspike art from the strong crew of adepts. Penaro's big ship, the *Luna Llena* (Full Moon), terrorized the unprotected commerce of the Spanish Main and the Atlantic and Pacific, attacking and sinking even men-of-war and essaying a murderous raid on the coast of Lower California. Finally escaping, Lindsay turned pirate on his own account, becoming a blockade runner during the Civil War and smuggling arms to the Confederacy.

Long kept up his odd, interesting artistry. He has made more than three hundred articles for dressing ship and other purposes. They include things useful and ornamental, from huge fenders weighing almost a quarter of a ton to the tiniest necklaces and other objects of personal adornment. Fearful weapons and instruments of fiendish torture, now fortunately obsolete in enlightened lands, are among his works.



Some of the dozens of types of fenders made by Long.

Long, of Irish fighting stock, was bred to the sea. His granduncle, Morris Long, a petty officer in the British Navy, was one of the party picked to bury Napoleon Bonaparte on lone, barren St. Helena. John Clarke, another granduncle, was captured with Admiral Farragut, then a midshipman, when Britain took the U. S. S. *Essex* in the War of 1812. His kin have fought for America in every conflict. Impelled by patriotism and love of adventure and travel, Long enlisted in the Navy in 1895.

After the close of the Spanish War, at the behest and through the influence of Lieutenant Commander Felton Parker of Boston, Long went to Hemenway Gymnasium, Harvard University, as student instructor in physical training under the celebrated Dr. D. A. Sargent. Here Dr. Fitz used him in giving psychological demonstrations and tests before his class. Some years ago he went to Los Angeles, became a physical training instructor in the city schools, and remains so engaged.

The marlinspike's original, a wooden tool called a fid, was only less essential than the crude loom with which the sails were woven. The fid, generally large, is still more or less used. Then came a smaller iron of similar shape known as a pricker and used for fancy work and taking stitches out of canvas, followed by the real marlinspike of finest tempered steel. For heavy cable work this assumes the proportions of a crowbar and is driven with a sledge. When rope and iron were introduced marlinspike seamanship must have undergone a revolution comparable to that of the textile industry with the invention of the power loom.

The ancient art is believed to have originated off the coast of China through stress of necessity. Eventually, however, the Spaniards beat the Celestials at their own game and maintained the lead always because of extreme pride in the appearance and worthiness of their galleons and other ocean carriers. It attained its highest perfection two to four hundred years ago, began to decline with the advent of steam and the virtual elimination of sails from all but minor traffic, and now is on the verge of being forgotten.

Every seaman worthy of the noble profession became a skilled rope worker in those days. Some attained to a perfection marvelous in the eyes of landlubbers. Their daintiest handiwork rivaled Valenciennes lace in its exquisite beauty. When the ship was becalmed, sometimes in the doldrums for weeks upon weeks, the sailor sprawled on deck with his marlinspike and wove, knitted and tied the trimmings that made her the wonder of every port. It was his pet pastime, the one esthetic side of his rough calling, and he found therein a keen joy and satisfaction. His boon companions were a pipe and a bottle of rum.

Mr. Long found in his art a medium for the expression of the most pious sentiment as well as the most shocking cruelty, as witness the holy joe, a good-luck knot in the shape of the cross, designed to shield his salt-blown body and unshriven soul from harm by enemy or storm; and the true lovers' knot, the inspiration of admiration, affection and devotion; then look at the diabolical cat-o'-nine-tails and the hideous gee whiz and other scourges that bring a shudder.

There isn't a knot that wasn't tied by the sailors of Cook and Captain Kidd and the jolly sea rovers of Drake and Sir Walter Raleigh; and it is likely that most of these were easy for the Chinese pirates a thousand, perhaps ten thousand years before. And they are all as an open book to 'Admiral' Long, who regrets that they cannot be perpetuated; but the art is difficult to learn, requiring mental capacity and effort, years of application, diligent concentration and thoroughness. Like poetry it must be born in the blood. It can be compared to nothing else, having intricacies all its own. Few can master it—and now nobody has time to take it up. Many sailormen of 1927 can scarcely splice a line.

Fancy fenders, says 'The Admiral,' are difficult and consume time in the making. Putting a good point on a rope end takes several days, especially when whipped in. The dress parade represents a week's task.

The holy joe looks easy but isn't, for it must stand squarely on its own base and be a true cross. Necklaces mean many hours of exacting endeavor. Sailors going to the South Seas in the olden days carried these as gifts to the native island girls, who danced for them until they dropped from exhaustion.

Among seafarers the true lovers' knot is equivalent to an engagement ring and when a maid accepts it she pledges her heart and hand.

Money *as* Maker *of* American History

Banks, Banking *and* Currency Control Political Policies and Party Programs

By M. T. WOODRUFF

ONE of the causes of the War for Independence was the passage of an act of Parliament prohibiting the Colonies from making their paper money a legal tender. The instigation of this measure is attributed to English merchants, but there is little doubt that the trouble could be traced to the growing power of the banking interests, which though first becoming a force in business in the 17th Century, even then had become arrogant. Nations had become obligated to the financial kings of the time, and the British Government was in their power and under their dictation. The blame may rest with business men, but it is known today how business men are forced to shoulder the burden of the usurer.

The Articles of Confederation, ratified finally in 1781, gave Congress the power to fix the weight and fineness of all coins, whether minted under its authority or by any state, but did not delegate to it the power of making its bills of credit a legal tender, hence the Continental currency was dependent for its standing with reference to gold and silver upon the faith and credit of the new nation. The right of a state to make its own paper a legal tender in its own jurisdiction was not interfered with.

The money question as it exists today seems not to have been a vital issue in the early days. It was more a question of banks. The prevalent idea seems to have been that the peculiar function of the national government was to coin money for owners of bullion as requested, and to provide subsidiary coinage. In the original draft, that section of the Constitution empowering Congress to coin money originally read 'coin and issue,' but the two words were stricken out. The reason must be surmised. It makes little difference, however, since judicial decisions have confirmed the right to issue.

It is positive that Jefferson was not in favor of a paper currency. His references to the Morris notes assure one of that. He considered gold and silver the only money, and was opposed to national banks. He was purely a Democrat, he believed in the common people.

WITH the single term of President Adams the Federal party ceased to exist. The old leaders attempted reorganization as 'National Republicans' and the Republicans adopted the name 'Democrats' which their opponents had fastened on them as a mark of disgrace. From this time may be traced with a fair degree of accuracy the progress of the Money Question as professed by the rival parties.

At the beginning, the general attitude of the parties on the Money Question may be set down as *pro* and *anti* banks, the Federals having established both the North American and the first United States national institutions. The control of the latter by Government ownership of a majority of shares was thought to prevent the danger of a money monopoly which most of the statesmen of the day feared.

The words of Jefferson may be taken as the Republican attitude. Jefferson declared: 'I sincerely believe the proposed banking system to be more dangerous than standing armies.'

In reality, the Money Question was then the dividing line between the general policies of the Federalist and Republican parties. The basic Federalist principle was, has been, and is, that a pure democracy is impossible; that the common people are not fitted for self-government; that authority must be invested in a special class equipped for the task. On the other hand, the Republicans of that day believed in the participation in government by the masses through a choice of representatives.

It was not until 1832 that either of the dominant political parties adopted a platform. The Democratic platform of 1832 is barren of mention of the money question, but in 1836 the Locofoco Democrats declared their 'unqualified hostility to bank notes and paper money as a circulating medium, because gold and silver is the only safe and constitutional currency; hostility to any and all monopolies by legislation, because they are violations of equal rights of the people; hostility to the dangerous and unconstitutional creation of vested rights and prerogatives by legislation because they are usurpations of the people's sovereign rights; no legislative or other authority in the body politic can rightfully, by charter or otherwise, exempt any man or body of men, in any case whatever, from trial by jury and the jurisdiction or operation of the laws which govern the community.'

The Democrats in 1840 reaffirmed the strict construction of the Constitution and declared that 'Congress has no power to charter a United States bank; that we believe such an institution one of deadly hostility to the best interests of the country, dangerous to our republican institutions and the liberties of the people, and calculated to place the business of the country within the control of a concentrated money power, and above the laws and the will of the people.'

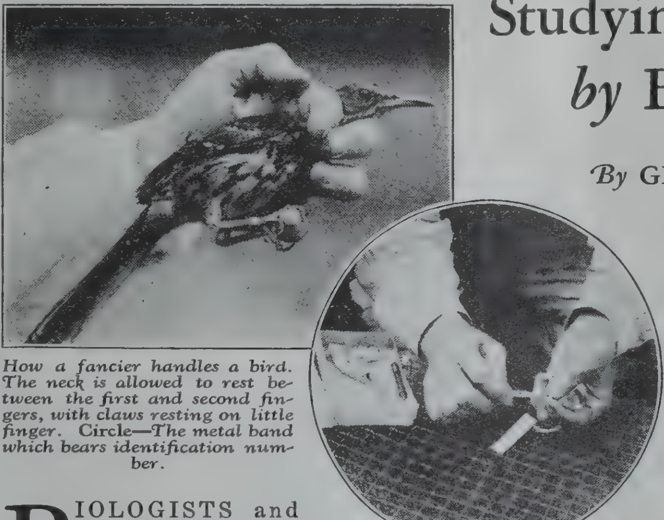
This was the celebrated 'log cabin' or 'hard cider' campaign, in which General Harrison defeated 'Mattie Van.'

In 1844 the Democrats reasserted the stand taken on money and banking, and the party seems to have been committed to the bimetallic base and the limitation of the power of the Federal Government to the coinage of gold and silver on private account. This would confirm the right of the state to charter banks of issue, a practice which continued until the creation of the national banking system during the Civil War.

From this point to the Civil War there was little thought in politics but to dodge the slavery question.

Studying *the* Birds *by* Banding

By GEORGE H. DACY



How a fancier handles a bird. The neck is allowed to rest between the first and second fingers, with claws resting on little finger. Circle—The metal band which bears identification number.

BIOLOGISTS and naturalists are studying birds by banding them to find out the secret systems of the fowls of the air that sow not, neither do they reap, yet they know when the summer is nigh.

Bird lovers in all parts of the country place nesting boxes and cages in isolated spots to which they attract the migratory birds with food bait. If the birds that are caught carefully and tenderly in this manner bear leg bands, the amateur biologists record the number, and report to the United States Biological Survey at Washington the variety and sex of the bird, the place and date of catching and the leg band number. After being fed, the flier is released.

In this novel way Uncle Sam is gaining first-hand information about the haunts, habits and journeys which the different families of domestic birds make annually. Such problems as whether migratory birds follow the same routes north and south each year are being answered by the birds themselves by means of their leg band records. Studies are in progress to find out whether cock robin, dickcissel and company return and use the same nests year after year. The scientific accuracy of the birds as weather prophets and storm forecasters is under detailed scrutiny.

The outstanding feature of the work is that the peculiarities of the birds are being studied without frightening or injuring them. You will note the proper way in which to hold a bird, as shown in one of the accompanying photographs. You will also observe the leg band on the right leg of this bird.

These bands are furnished free of charge by the United States Biological Survey to all amateurs who will agree to use them in banding birds in the prescribed manner.

To Have Good Manners

(*Continued from page 5*)

this is only a screen whereby he invariably gains his own ends. What is this screen? A large part of it is the most obvious flattery—flattery so evident that, even while he is laying it on, you know how raw it is; yet a good deal of it sticks. He knows that not all of it will stick, but he also knows that he is safe, for some of it does stick. Besides, there is nothing to be done in the face of raw flattery. If you disclaim it, then it makes it appear you are disclaiming it because you believe it.

Bad manners, no matter how you view them, are this if anything: They injure. They may hurt your feelings, and this only. They may rob you of something. They may just devastate your sentiments, your sense of beauty or your leisure. It makes no difference what the form; they always injure.

Strange as it may seem, bad manners frequently result from an injured sense of justice. Indeed, I am inclined to think that what we term righteousness causes as many kinds of bad manners as any one thing we have mentioned. I am, of course, for righteousness as a principle, but not as an appropriation. I respect righteousness but when a righteous man imposes his righteousness upon me, even if I need it, I resent it. For example:

ONE day I tried to get into a place with my car where a woman had parked her car in a wrong position; she had actually parked it against the law. Now, being in a pernickety mood, my sense of justice was outraged. And moreover, I was right. Impelled by this impregnable rightness, I lost my temper, and said to her, brusquely: 'Don't you know you have no business to do that?'

She happened to be the right kind of woman. She replied:

'If you had spoken to me like a gentleman, I would move my car. Now you can't get me to.'

There I was, in a regular row with a woman, she being legally wrong, and I being legally right, and I had actually spilled all the beans there were by being bad-mannered.

Now her manners were undoubtedly bad in that she parked her car so thoughtlessly, but mine were worse in that I did not offer her a way out. I injured her by assuming that her intention was deliberate when she was merely thoughtless. Essentially I was in the same class with the limousine woman who said, 'My good man.'

I recently witnessed an exhibition of good manners on the part of a colored Pullman porter that impressed me greatly.

A roughneck who had been drinking came into the smoking compartment. He immediately pressed the call bell, not once but twice, and then held it. The train had only just started and the porter, as fine an old-school darky as I have ever met, was busy. The roughneck rang and rang, then subsided moodily. After a respectable interval, the porter came. Immediately he received a torrent of abuse. He was called about every bad name in the calendar. When the roughneck came to the end of his expletives, the porter smiled and said:

'I'm sorry, sir, but you see, I was servin' a gemman.'

I do not mean to imply for a moment that one should necessarily be servile in one's attitude toward others, or take unnecessary punishment in order to be polite. Good manners mean essentially a sense of the fitness of things; bad manners the reverse. Not only can the truth be almost invariably told, as I have stated, but the truth is the only thing to tell, and I am convinced that in truth lie the finest manners.

Let me give two parallel cases.

A woman friend once asked me for one of my books. The only copy I had was one which I had inscribed to another friend, but I gave it to her telling her it was for another but that she could take it temporarily, and when more were printed I would give her another copy. A little later she came to me and said, 'I think your book is wonderful. I am reading it with the greatest interest.' Still later the person to whom the book really belonged and to whom I had inscribed it asked for it. So I went to my enthusiastic friend and said, 'I am sorry but I must ask you for my book.' She looked at me in astonishment and said: 'Why you wrote in it for me.' When I showed her the other woman's name she was very much confused. She had not even taken the trouble to read the inscription although she had praised the book.

The woman to whom the book really belonged kept it for several weeks and was silent about it. One day, inspired by a bursting conceit, I asked her how she liked it. She said promptly:

'I'm sorry but I don't. I mean this: I realize it is good, but it doesn't suit me so well as some others of yours.'

Which woman had the better manners? I claim the second one, for the reason that she respected me enough to believe I would understand the truth, while the first woman really injured me, or would have done so, because she tried to give me a false impression. The answer to the question, What are manners? it seems to me, is quite simple.

GOOD manners are merely the ability to put yourself in the other fellow's place, and the perfection of this ability lies in the speed with which you can do this. Good manners, like bad manners, are generally instantaneous. If you choose, you may term them spontaneous. My bad manners in the case of the woman and the badly parked car were a spontaneous outburst of righteousness. If, instantly, I had been able to put myself in her place, I would thus have been willing to help her out of the situation she had made for herself. I would have said something like this:

'Madam, I hope you will not mind if I ask you to move your car.'

One reason—and almost invariably the best one—for this attitude is that nearly always people know when they are wrong.

In a situation between two persons involving doubt, ask yourself what you would do if you were the other fellow. The object should be, not to put him wrong, but to set him right, and you can do this only when you see the thing from his point of view. The ideal of all material justice is first to give the person you deem guilty every opportunity to show he is not guilty.

This does not mean, however, that you yield anything on your own account. You can rebuke another and still do it with good manners, if you do it in the proper way. If I say to you, 'You are wrong!' my manners are bad. If I say to you: 'Are you wrong?' my manners are better. But even this depends somewhat on my manner of asking, the sincerity and understanding with which I ask.

Taken as a whole, our national manners are on a higher level than a decade ago. People as a rule are more tolerant of one another. There is more widespread courtesy.

We have still some paces to go, but we are on the road.

Mr. Candidate

(*Continued from page 7*)

unknown compromise choice. But Hayes became a one-termer chiefly because:

In three states of the South there were rival Democratic and Republican legislatures and two sets of presidential electors. Hayes agreed to concede southern Democrats the control of the state governments provided they would deliver him the presidential electors. In Louisiana, notably, this could only be done by buying off Republican legislators, and the Democratic Party had no money. So the Louisiana Lottery Company furnished the vote-buying money in exchange for a twenty-five-year charter to operate a lottery in the state.

Hayes himself did not make this deal, of course, but when next Ohio entered a Republican convention she sent a delegation instructed for General Sherman, but headed by General Garfield, who spoke so eloquently and who was so handsome that when the convention had gone thirty-six ballots deadlock over Grant and Blaine, it turned to 'John Alden' and forgot the 'Miles Standish' of the piece.

Consider further James G. Blaine, the 'plumed knight' of Republicanism, whose tongue was purer silver than Bryan's and who radiated magnetism of such intensity that he made you a lifelong friend in ten minutes and remembered your name forever after.

Scandal rumors being rampant, fifty prominent divines were to sanctify the Blaine candidacy by a visit and congratulations. The oldest minister was to talk, and did. Blaine was so busy thinking up his own extemporaneous reply that what the minister said went in one ear and out the other. He let it stand until the racket started the next day, when he 'issued a statement.' But the correction never catches up with the error. Though his sister was mother superior of an Indiana convent, the Commoner of the eighties was branded 'intolerant.'

Blaine lost New York, and with it the Presidency.

Cleveland forgot to invite Dana to dinner, and so lost an election though he had won a popular majority. Harrison brought in six new states, five of which turned Democratic on him. The accident of an eloquent speech gave Bryan a nomination and introduced him as the Commoner of modern times. A boss kicked T. R. into vice-presidential oblivion, most unsuccessfully. You can write your own book on the later part of this story

The first test for any aspirant to political honors should be: 'Mr. Candidate, are you subject to accidents?'

Abdication of the Russian Emperor

(*Continued from page 13*)

Alexandrovich, uncle of the Czar, who was Governor of Moscow and was murdered by a bomb thrown under his carriage on February 4, 1905.

The Empress was brought up by her grandmother, Queen Victoria. The only tie which bound the Empress to Germany was love for her brother, Duke Ernst of Hesse, and for the small town of Darmstadt. A little more than one month after the Emperor Alexander III's death she was married to the Emperor Nicholas II. In 1895 Olga, their first daughter, was born. And May 27, 1896, in accordance with the tradition of the Russian Emperors, the celebration of the Holy Coronation took place.

The Empress Alexandra Feodorovna did not like the pomp of balls, receptions and presentations, having been brought up modestly according to the severe etiquette of the British Court. But as Empress she was compelled to be present on such occasions in the Russian Court, which was considered the most pompous of all and which was rife with gossip, trouble, intrigue and denunciation. Unaccustomed to such ostentation, she was criticized behind her back by the court dignitaries for mistakes in one rule of etiquette and another until she shrank away from court functions, preferring the calm of family life to the noise and glitter of the court. This accounts for the rumors which were spread that the Empress was proud, cold, hating the Russian people and inattentive to their wishes.

But in fact the Empress Alexandra Feodorovna was a kind and sympathetic woman and gave a wealth of moral and material assistance to those who had need of it. As a proof of this stands her work as a nurse during the war, when many soldiers and officers were comforted by her efficient nursing and tender care. She was solicitous and mindful also of the poor. And she fondly pampered her children. In the relations in general between parents and children it would be difficult indeed to find a more congenial, united and patriarchal family.

The Empress Alexandra Feodorovna was well educated. She was an artist, designer, musician, embroiderer, and she spoke several languages fluently; to all these accomplishments should be added her beauty, grace and imperial bearing. On adopting the Greek Catholic religion, she studied it in detail and gave herself to it with all her heart and soul, even to the extent of bordering sometimes on the mystic.

The Emperor and Empress had three daughters besides Olga: Tatiana, Maria and Anastasia; and at last on August 25, 1904, was born the long-hoped-for son, who was given the name Alexei. There was no limit to the joy of the imperial parents. But soon their gladness was darkened by great sorrow. The boy was afflicted with the hereditary disease of the Hesse family, hemophilia, from which the Empress' uncle, brother and two nephews had died. This very sickness led to the introduction into the Imperial Family of the Siberian moujik, Gregory Raspoutin, by the Grand Duchesses Anastasia Nikolaevna, wife of the Grand Duke Nikolai Nikolaevich, and Militza Nikolaevna, wife of his brother, Grand Duke Peter Nikolaevich, these sisters being daughters of the Montenegrin King Nicholas. They, with the assistance of Anna Alexandrovna Viroubova, the lady-in-waiting of the Empress, persuaded the Empress of this Raspoutin's mysterious power of prayer.

Medical treatments of all kinds, doctors and professors were tried without success. The only hope remaining was—God; and as a drowning person clutches at a straw so did Alexandra Feodorovna as a mother clutch at this last hope of saving her beloved child and as Empress of preserving his life to the country and to the throne. This sickness is said by medical authorities to cease being dangerous to boys after the age of sixteen or seventeen years; so that the heir Alexei Nicholaevich might indeed be living today had not the Imperial Family been murdered in 1918.

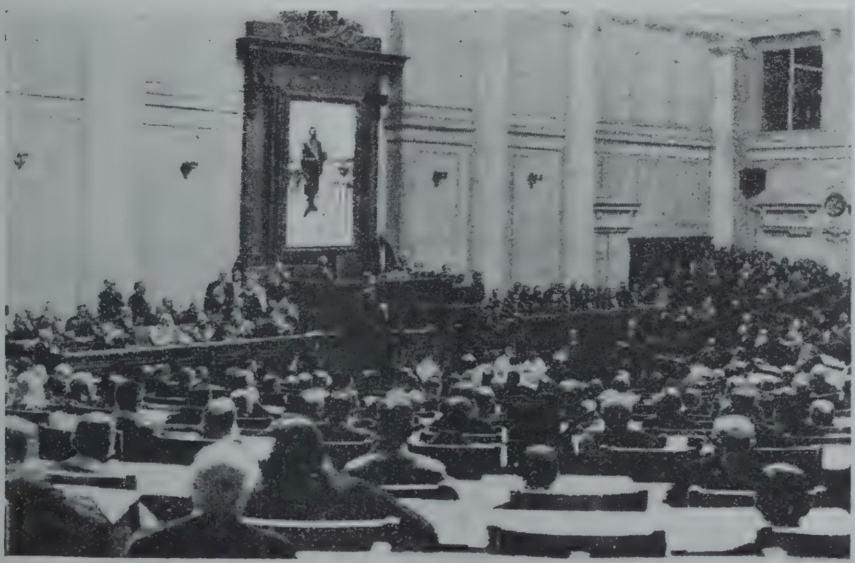
Hating and opposing war, the Czar made every attempt to adjust the trouble between Serbia and Austria by peaceful measures. But being the protector of Serbia, he could not allow Austria to crush her, and so he answered the artillery attack of the Austrians on Belgrade, the Serbian capital, by partial mobilization of the Russian troops. As an answer to this mobilization Germany, the ally of Austria, declared war on Russia. The Czar himself then announced the formal declaration to the people from the balcony of the Winter Palace.

After this announcement he changed greatly, and he and the Czarina gave themselves up with all their hearts to the needs of the war. He saw the enthusiasm of the people and was reassured in his trust of them as the whole assemblage fell to their knees and sang the national anthem of 'God Save the Czar.' Even more enthusiasm was shown by the people in Moscow when the Czar and the Czarina arrived in the middle of August to pray in the Moscow cathedrals, according to the tradition of Russian emperors. The streets of Moscow were crowded with people. The Czar and the Czarina, their daughters and the heir Alexei Nikolaevich, who because of his sickness was carried in the arms of a Cossack, passed through the crowds. The people fell to their knees, many of them kissing the ground on which their feet had stepped, showing thus their sincere affection for the Little Father and the Little Mother.

The years 1914, 1915 and 1916 were full of various changes, successes and losses. The most important among them was that the Emperor Nicholas II became himself the supreme commander in chief of the Russian troops instead of the Grand Duke Nikolai Nikolaevich, whom he relieved and sent to the Caucasian front.

But then came the year 1917. In the spring a general Allied attack was to be made on Germany who would not have the strength to resist it. Germany would fall. Germany would disappear in the process of partitionment. But Russia was not desirous of German territory. Russia wanted an exit to the ocean from the Black Sea, closed to her since the treaty with Turkey in 1856. Victory in this war would open great seaways for Russian trade. A battalion of brave and fine-looking seamen of the Imperial Naval Guards was waiting in Odessa, ready to be loaded on to the ship which would transport it to the opposite shore of the Black Sea for the victorious march on Constantinople. The orchestra of this valiant regiment was already practising the new march which was designated as yet only by the three stars, * * *, but which was soon to be named 'The March of the Entry Into Constantinople.' Erzerum, the strongest Turkish fortress in the way of the Russian troops, was captured. And beyond . . . an open road to Constantinople!

(*To be concluded in an early issue*).



—*International Newsreel.*

The Duma in session, the Lower House of the Russian Parliament.

Maioli and Ants

(Continued from page 8)

more than a pretense of working.

The natives of course are also attacked by these *maioli*, but they have a different thickness of skin and a different sense of feeling—of this I am certain, for I have myself seen an *ashker* extinguish a charcoal fire with his heels.

The *maioli* are one great pest of African life, but I have promised to tell about two. The second is the ants and their love of moving. Comes the time when the ants decide on a nomadic life. This usually happens during the changeable weather before the rainy season, though I have seen such a migration after the *cremt*, when the dry season was already well advanced. The weather was even drier than we like. During such spells all the grass becomes burned and it is difficult to save the flowers and kitchen gardens; the soil cracks, and if your *ashkers* neglect for a single day to sprinkle the plots (which they are sure to do unless watched) the plants will at once begin to die. So I have found that there is something other in nature than rain which impells this migration.

When the march finally begins, the night can seldom be spent in peace. When you return from town on horseback and see the open door of a hut with the red eye of a bonfire within, you must know that the ant tribes have arrived, and that the tenants are trying to smoke them out. During the night you may be awakened by a neighbor begging for your matches, for it is only the rich and traveled Abyssinian who has a match in his own house.

The following night again you may be awakened by the neighing and stamping of horses and mules in the stables, the cackling of hens, and at last by the cries and oaths of the servants. Cursing everything in sight, half-naked *ashkers* jump around, frantically tearing dozens of large insects from their bodies. Screaming monkeys rush out scratching and grimacing with pain; they run into your lighted doorway looking for protection from man and master against the fierce insects, and trying to shield the sore spots under their little hands.

My small monkey 'Gouki,' a lemur, terrorized by bands of ants attacking her, broke her strap loose from the wooden partition in the stable where she was sleeping, rushed to my open window and skulked under my blanket. I rid her of the villains . . . inspecting every fold and wrinkle of my bed carefully afterward!

I awaited the attack. In the evening my *ashkers* banked the thresholds of doors and window sills with fresh eucalyptus branches, the peculiarly penetrating odor of which the ants dislike; it will often turn them aside from entering. But if it is decided at headquarters to pass through your house, nothing whatever will stop them . . . and you will learn it indeed very soon! Your small house has a great many inhabitants of which you were never aware. Before you know it, spiders, multipeds, grayish-colored beetles, are rushing pell-mell across your walls, sometimes falling from the low ceiling to your bed prudently moved out from the wall; mice race squeaking about the storeroom—it means that the ant scouts, looking for a way where the unpleasant eucalyptus does not block them, have entered their little burrows by passages leading from the outside through the earth walls.

Now is the time for you to move to the tent, which you have providently pitched the evening before . . . but I in my ignorance did not know these signs and, satisfied with my ramparts of eucalyptus inside and out and about my bed, I lay and read by the light of my candle. My book absorbed my thoughts. I did not notice anything alarming going on in my room till suddenly a huge ant with a white head and an unpleasantly thin waist dropped to my page. I snapped it off and began to listen to strange crackling noises from some place nearby.

I lighted a second candle, raised it —and ahemmed! The wall was covered with ten thousand ants moving in solid phalanx across the weathered wall paper of my room. The same moment I felt the bite of one . . . two. I reached my clothes with great difficulty—my luck! They were not yet occupied by the enemy—and hurriedly retreated from the house. I called my servants and for two hours we struggled to sweep the uninvited guests from walls and floor, but to no avail. New bands came marching from somewhere, with never an end to their swarming obstinacy!

Since then I never fight, but always quit the field immediately—a disgrace, but what can you do? It is not Paris . . . By morning's dawn the army is leaving and if only one detachment is marching, your next night may be slept out in peace. But if there is a rear guard, it too will pass through your house . . . inflexibly!

Tennis—Index System

(Continued from page 9)

the first rank in tennis. The game is not played with the body alone; physical work is only part of it; mental work is more important. The tennis player has to think two and three shots ahead, like the chess player. He, like the chess player, must always try to outmaneuver his opponent. Combine the chess brain with perfect control and you have a winning tennis player. It is the combination that made Lacoste champion of this country.

Tennis games are lost, rather than won. Lacoste discovered this by studying the box scores. He collected hundreds of scores, carefully listing and filing them. He soon learned that the man who makes the fewest errors generally wins. Errors, and not earned shots, decide matches. Lacoste decided that the best way to win matches was to let the other fellow beat himself. If he could continue driving the ball into his opponent's court then the opponent would, sooner or later, err.

The Frenchman developed a safety-first game. He refused to take a chance. He would not risk a shot that might carry the ball beyond the boundary lines of the court. He makes probably fewer mistakes than any other man playing tennis.

His form is perfect, a model that all tennis players could well copy. His strokes are made precisely according to the book. Every shot that he uses shows thorough mastery. He continued practising until he had each down to perfection. He executes them with no apparent effort. Some critics have observed that Lacoste lacks speed. His returns are too soft, they say. More zip, according to a number of observers, would make them more effective. But, Lacoste would not have the marvelous control that he carries if he put more power behind the ball. He could develop speed in his shots but he would sacrifice a certain amount of control and thus offset any advantage that the speed might give him.

Lacoste can anticipate shots. His ability to do this saves him steps and energy. He can conserve his stamina thereby. He constantly outguesses his opponents, moves in the right direction and is set for the ball when it arrives. He rarely has to move fast to reach a ball because he starts so much sooner than other players. He hardly ever offers at a ball that is not returnable and he does not chase these balls.

As soon as a point is decided Lacoste forgets it. The only shots that concern him are the shots ahead. He shows no emotion over a point won or a point lost. He never makes a gesture to indicate a tough break.

Those who have played against him say he is without a weakness. He rarely comes to the net but it is not that he is weak at the net. He can volley with the best of them but he believes that his base-line game will carry him further, and who is there to dispute this with him? You cannot easily argue a point with a man who lifted the national singles championship of the United States and whose game is based on years of observation, systematically recorded in alphabetical order and carefully kept in a huge filing cabinet. His game is based on cold figures and calculation.

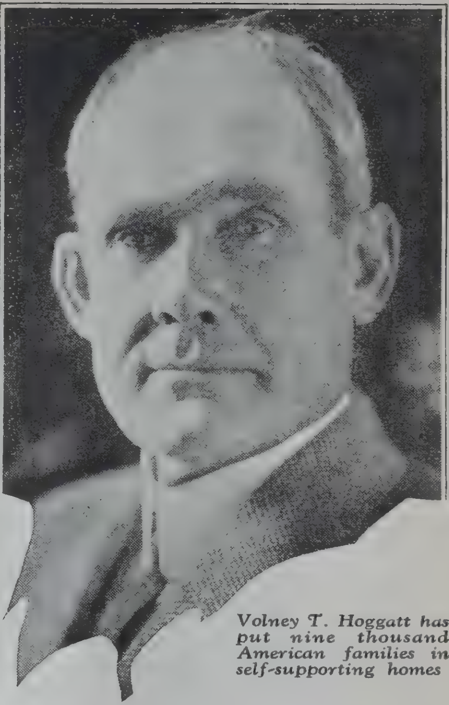
Three years ago a reporter, on the hunt for a feature story, asked William T. Tilden to name his successor. Tilden did. In brief, his prediction was this:

'The next champion will be René Lacoste. I may be wrong but I believe that Lacoste will become greater than any man playing the game today. I pick him because of his remarkable analytical mind. He can think a stroke ahead all the time, and you have to do that to win a tennis title. Lacoste, when playing, is able to forget the score. He concerns himself with the stroke to come. And, incidentally, he is more anxious to learn than anyone I know.'

Few agreed with Tilden. Both the United States and France had tennis players of higher rank than Lacoste. But, early last year Lacoste proved Tilden a good prophet at Tilden's expense. He defeated Tilden to win our national indoor championship. In that match Lacoste let Tilden beat himself. Tilden made ninety-two errors to Lacoste's forty-seven, but Tilden is again on top.

Putting Americans *in* Self-Supporting Homes

By HARRY H. DUNN



Volney T. Hoggatt has put nine thousand American families in self-supporting homes

VOLNEY HOGGATT was born at Ames, Iowa, where his father was one of those who founded the famous Ames College, which the young Hoggatt attended until he was graduated with honors. From Ames he went to Huron, South Dakota, where he was admitted to the bar, then to Oklahoma, where, in 1889, he became the first mayor of North Guthrie and first city attorney of Guthrie. Wandering eastward, he practised law in New York City, but, even a quarter of a century ago, it was not his type of city, and Volney Hoggatt moved northwestward to Nome, Alaska, where, on his birthday, June 10, he became city attorney.

He distinguished himself there by attaching the cash registers and receipts of more than one hundred saloons which refused to pay the tax imposed for the planking of the streets of the Alaskan city. The planks were laid, and—without any 'logrolling'—he has been laying planks for other people to walk on ever since. From Nome he went to Denver, where he became—fortunately for the people of Colorado—registrar of the state land office. There began one of the most amazingly American careers which any man outside of politics ever has had in this country.

Immediately on entering the state land office, Mr. Hoggatt discovered that there were hundreds of thousands of acres of fertile valleys, in the mountains and elsewhere, belonging to the state, but which were being used by the cattle interests as grazing lands, without payment of any rental to the people of the state. Through his instrumentality, Colorado followed the lead of Iowa and adopted a law under which no one can obtain state lands except by actual settlement and agricultural development.

The cattlemen, however, fought the law from every angle, but the state's highest court upheld Mr. Hoggatt's measure and he offered 400,000 acres of state lands, lying between Denver on the west and Limon on the east, for sale to actual settlers at $5 per acre. In the contracts under which these lands were sold, the farsighted Hoggatt wrote the agreement that each settler must build a pit silo, to cost not less than $25, and a habitable home. He must keep at least three milch cows and two good mares, while he must be able to show at the end of three years at least 40 acres planted and producing a profitable crop. The tracts offered were of 160 acres each.

'THOSE nations always have been the most stable in which the land is most widely divided, or where the largest number of people have a personal concern in it.'

So said James Anthony Froude, noted English author, high churchman and lecturer, born in 1818, died in 1894, who visited the United States in 1872.

How many real American citizens have a personal concern in every known and potential oil field in the United States today? It can be proved that every acre of oil- and gas-bearing land is owned or dominated by one artificial person—'the oil trust.' One of our fictions of the law, 'the coal trust,' dominates all the coal lands. Likewise, all the merchantable timber lands of the United States are controlled by the 'timber trust.'

If the trust deeds are foreclosed on our agricultural lands by the big loan companies, trust companies and banks, all artificial persons, what will be our future? The interest, the loyalty, the patriotism of the United States never can be found in money and in riches. The sovereignty of the United States can be found only under the roof of the paid-in-full American home.

If the concentration of wealth and land continues to flow into the artificial hands of the artificial persons called corporations and trusts in the United States, what stake will the natural human being, with a heart, soul and conscience—but without a roof of his own over his head—have that he should fight to defend?

This was the beginning of the idea which resulted in the placing of more than 9,000 American families in self-supporting homes on the so-called 'wild' lands of Colorado, Wyoming and New Mexico—probably the greatest back-to-the-land movement the world ever has seen since the westward migration of the sixties in this country. Though he received no return for it, Mr. Hoggatt personally guided these settlers to the public lands, helped them pick out their farms, select their town sites, and even showed them how to proceed with the first steps in farming without irrigation.

When this task was well under way, the realization came to Mr. Hoggatt that, as long as he was in public office, he could not accomplish as much as he could if he had some means under his control whereby he could reach the hundreds of thousands in large communities who knew nothing of the vast area of the public domain, fertile but untilled, awaiting the plow in the Western States. With this end in view he became editor of *The Great Divide* of Denver, which he at once turned into an instrument for the restoration of the American soil to the American people.

Sunshine Valley in 1922, as Mr. Hoggatt first saw it, a sheep pasture. Today its 20,000 acres grow thriving irrigated crops and are the homes of 200 settlers.

The Conqueror *of* Difficulties

George Rogers Clark's Work *in* Winning *the* Northwest

AS A YOUTH, George Rogers Clark left Virginia and settled among the frontiersmen of Kentucky, the 'hunters of Kentucky,' as they styled themselves. There he was a companion of Daniel Boone, and a recognized leader, which implies that he excelled as a woodsman, a hunter and an Indian fighter. His diary of this period is replete with records of scalpings and Indian outrages.

It was at this time that the British, through Commander Hamilton, at Detroit, hired the Indians to fight for them against the settlers, furnished ammunition and gave rewards for scalps. As a consequence historians are coming to fix on the English much of the blame for the brutal massacres and depredations on the defenseless.

The Northwest was not, like Kentucky, debatable hunting ground, but the seat of powerful and warlike Indian confederacies, French hamlets and British garrisons. It was foreign land.

Disguised as hunters, in 1777 Clark, with two others, went into the Northwest to spy out the land of the Illini. They discovered that the French disliked the English rule, and that the country was not heavily garrisoned. So it was that a plan for the defense of Kentucky settlements grew to a scheme for the conquest of the whole Northwest.

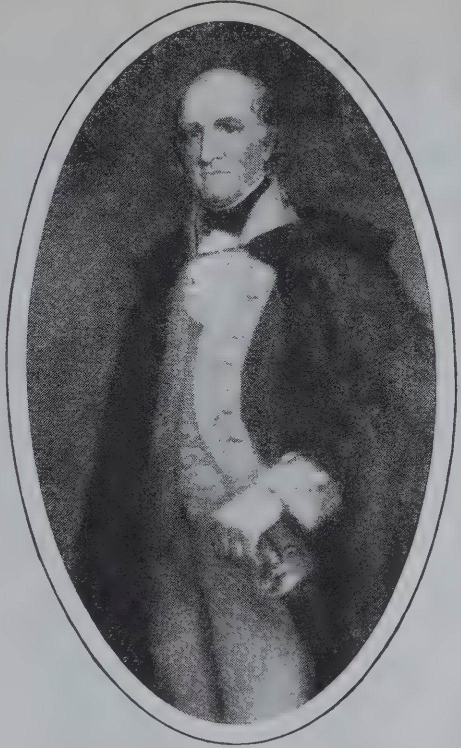
ALONE, Clark went to Virginia and finally succeeded in obtaining from Patrick Henry, then governor of Virginia, a commission to raise seven companies of fifty men each, ostensibly for militia duty in Kentucky, secretly for an expedition to capture the British post at Kaskaskia. Only 1,200 pounds could be raised, but each soldier was promised three hundred acres of land if the undertaking was successful.

Difficulties that seemed insurmountable loomed up in raising these troops. Men were scarce, and were needed in those new settlements. However, Clark finally gathered together his men, secured provisions and fared forth. There were further complications when the men learned their true destination, but a sufficient number were won over by Clark to make the attempt.

A surprise attack on Kaskaskia threw the population into a panic, and that post was easily captured. The French were glad to pledge allegiance to the Americans, and the Indians were also won over.

The victorious army then proceeded to Cahokia and captured that place without resistance.

Thoroughly aroused, the British dispatched a force from Detroit to Vincennes to recapture the territory. One man and one officer were holding that fort, but it was captured in approved military style, and the vanquished two marched through the line of the victors.



General George Rogers Clark. Portrait for the Indiana Society of Sons of the Revolution, painted by Otto Stark.

News of this unfortunate turn in events spurred Clark to action. In spite of floods then raging, he led his valiant little band on a discouraging expedition, fighting hunger, cold, and well-nigh constant danger from floods. As F. A. Ogg points out: 'There were no boats; provisions were running low; game was scarce; and fires could not be built for cooking. But Clark could not be turned back by such difficulties. He plunged ahead of his men, struck up songs and cheers to keep them in spirit, played the buffoon, went wherever danger was greatest, and by an almost unmatched display of bravery, tact, and firmness, won the redoubled admiration of his suffering followers and held them together.'

But there was an end even to that apparently endless journey, and, arrived at Vincennes, his men were marched and countermarched among the trees to give the appearance of large numbers. The habitants furnished fresh supplies of ammunition, and gave a good, hot breakfast to the men. In a comparatively short time Vincennes was taken, Hamilton imprisoned, and British sympathizers forced to take the oath of allegiance to America. A relief expedition was subsequently captured, and the much-needed supplies confiscated by Clark.

Forty men were left to garrison Vincennes, and the others returned to Kaskaskia to plan an expedition against Detroit. After much urging, Kentucky promised three hundred men, and Virginia was induced to promise aid; but Kentucky sent only thirty men, and other promises failed to materialize. In face of such disappointments, Clark led an attack on Detroit, but his forces were insufficient and the attack was unsuccessful.

Clark subsequently was appointed commissioner of Indian affairs, and proved most successful in his dealings with the Indians. The Miami Treaty, negotiated by Clark, was the first surrender of lands to the United States by Indians west of the Alleghenies, and the first acknowledgment of the sovereignty of the United States by any Indian.

Our National Guard

By MYLES D. SAVELLE

Captain of Infantry, U. S. Army

IT IS safe to say that if the reader of this article should ask the first man met on the street the name of the National Guard unit in his city the answer would probably be, 'Idunno.'

There is a perfectly good reason for such an answer, because the mission and purpose of the Guard is but little known and understood by our people. The Guard is poorly advertised and is seen only on such days as the Fourth of July, Armistice Day, and the like. It has no press agents and the service it renders is inconspicuous until it is called in time of need. Yet in several thousand communities over this United States there are companies, troops and batteries in our midst of which we know little and apparently care less.

The National Guard is composed of able-bodied men and citizens, between the ages of eighteen and forty-five, who render to the state and country military service part of the time. In addition to their civilian pursuits they voluntarily give part of their time to military training.

The system is based on the National Defense Act and men enlist for three years and officers are commissioned for life for good behavior. Promotion is by competitive examination in all ranks. Any man may become a commissioned officer if he qualifies before an examining board.

THE Guard is paid, equipped and clothed by the United States Government. Instructors are detailed from the Regular Army to aid in training men and officers.

The rate of pay of the National Guard is based on the rates of pay for the Regular Army. For each drill of one and one-half hours the guardsman receives one day's pay of the corresponding grade in the Regular Army. Units are required to hold one drill or exercise each week and may hold five during one month.

The National Guard is governed by its regulations during time of peace, but comes under the articles of war and the army regulations when called into the service of the United States. The guardsman has a dual rôle, in that he may be called to service by the President or by the governor of the state. If called by the President he may be sent anywhere; if called by the governor he may be used only in the state. His oath of enlistment or acceptance of a commission provides that he 'obey all lawful orders of the President of the United States and the governor of the state' of which he is a citizen.

In 1919 the National Guard was nonexistent. Since then the strength of the Guard has increased every year. The test and qualifications required for officers have grown more severe, so that only the best may hold commissions and assume the responsibility that rests on the shoulders of a commissioned officer.

If the leaders in the community properly understood the importance of having the young man under discipline, obeying and upholding the law, and gave their support to the Guard, it would add immeasurably to good citizenship.

CHATS WITH OFFICE CALLERS

'Action of our Government in increasing the cost of passports in 1920 from two to ten dollars cost the American tourist ten times the amount spent previously for visas,' declared the retired **Consular Service Man.** 'The increase was levied by foreign governments as a sort of reprisal, and it was most effective.

'Many persons still do not understand why we increased the cost of passports. The war was over and there was no longer the necessity of resorting to extraordinary measures to keep out spies. If it was intended as a check on immigration, it failed. No immigrant, after planning and saving for years to go to America, would let eight dollars prevent him.

'The real result was that every government in a spirit of retaliation found it necessary for the American traveler to spend ten dollars almost every time he crossed a frontier. Belgium and Switzerland abolished the tax in 1922, but that was because of their desire for tourist business. Germany recently reduced the charge on American visas partly for the same reason.

'You can readily see who paid for the increased cost of passports. I frequently saw passports of American tourists which had visa stamps whose value totaled as high as $200. Each tourist, in fact, paid for the passports of several immigrants; and I myself figured the annual visa payments at about twelve million dollars. The sad thing about it is that so many of our tourists are not wealthy and this added imposition prevents many from enjoying Europe as they should.'

* * *

The **Old Practitioner** was on his way home from a national convention. 'All this hue and cry about new ways to safeguard our health amuses me—sometimes,' said he. 'I'll confess that medical science has brought forward many new things since I went to school. Many of them are beneficial. But much of your present-day advertising is being overdone.

'One reason I object to it is that the nostrums which are advertised are directed at relieving the symptoms rather than the underlying causes. If I were to speak broadly, I should say that a nostrum never cures anything, although it is often claimed to cure about everything.

'As a matter of fact, I do not believe there is a drug on the face of the earth that is capable of curing any serious disease. My objection is not to the relief, but to the claim of cure. After a period, the relieved symptom returns in full force, and another dose of the drug is required for further relief, and so on, *ad infinitum*.

'That's how the trade is built up. Every time a nostrum relieves a symptom for a new patient, the promoter has another permanent customer. It is this commercialized exploitation of a supposed cure that we old-fashioned doctors resent. Perhaps I am somewhat of an old fogy, belong to the old school, and all that—but plenty of fresh air, sunshine, water and plain food are still the best medicines in my humble opinion.'

* * *

'Speaking of French writers,' remarked the **Returned Traveler,** 'I come back from Europe with a greatly increased admiration for Gustave Flaubert, and particularly for that little-known play of his, *Le Chateau des Coeurs*—The Castle of Hearts.

'I had always regarded him as one who wrote depicting a character that "suffered from a pale cast of thought—ever bruising itself against humanity." He, as is well-known, allowed himself to be interested in nothing in life, unless it gave him material for writing. Accordingly, the dainty touches in this *Castle of Hearts* were particularly delightful.

'One expression will explain what I mean. The fairies near the end of the last act are trumpeted off the stage in haste; and a wee voice from the rear is heard to pipe up: "Wait, ah, wait for me! I have caught my foot in a ray of light!" Surely a beautiful conception . . .

'And there were such typical expressions . . . as when the Professor's wife, who has loved almost everyone else in the play, steals up behind him and winds her soft arms about his neck; and he exclaims with a start: "*Voila!* My *wife!* That loves me!"

'Even so when the city youth, seeking to win the sympathetic interest of the innocent country lass, asks her what her thoughts are; and she dreamily and unemotionally replies: "I think of the cows!"

'The whole play was such a surprise that we could not help wondering why it was withheld from publication until five years after his death. Perhaps there was some hidden reason. In some unguarded moment before the shadow of his dread nervous malady had overspread his heart, perhaps the tiniest of fairies unlocked it and let in that very ray of light over which she stumbled.'

* * *

'The plan to convert the House of Lords in the British Parliament into a body partly elected and partly hereditary and bearing the same name as the American upper house is expected to be submitted during the lifetime of the present Parliament,' said the **European Tripper.** 'This is an interesting step in the development of the British Government. The British Government never stands still, though a slow-moving body, the changes so slow they are scarcely noticeable; it has been constantly changing since the 13th Century, the date that marks its first formation.

'Called first by the king merely for debate, then for formal conference, Parliament, the House of Lords holding the commanding position, gradually took the reins of government into its hands. After Parliament had gained possession of the government, the House of Commons, first merely a body of petitioners with little confidence and overawed by the king and nobles, step by step through the centuries gained the upper hand.

'The Lords have lost the foremost place, have been pushed into the background, until today they feel they are little more than a figurehead and that a change is necessary, and they take as an example the United States upper body.'

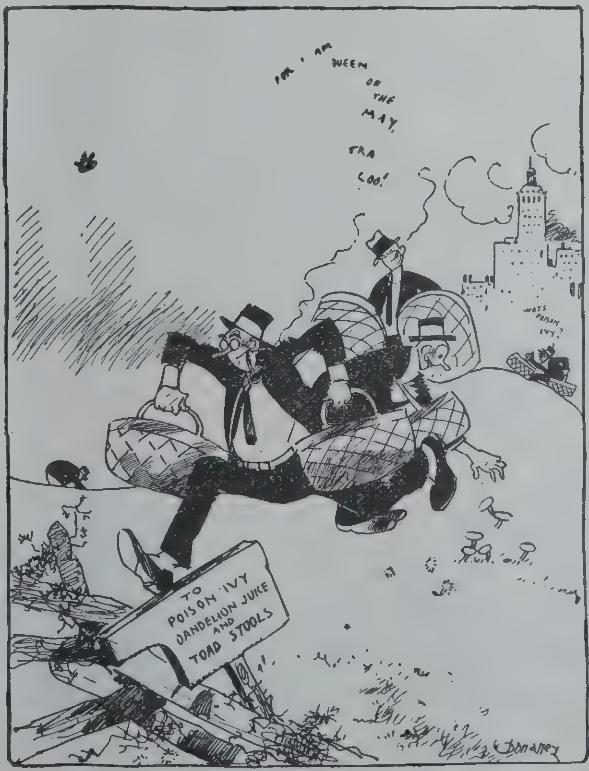
* * *

'Japan has not been injured seriously through the working of our exclusion law,' the **Man From the Coast** declared, as he read the latest headlines from the Geneva conference. 'While it may seem strange, it is none the less a fact that she has benefited her position while we have lost.

'Japan realizes now that there can be no such thing in the United States as the cry of Japanese propaganda; no fear that those who write favorably concerning her will be discredited on that score. She also realizes that a great and generous people must inevitably experience a reaction in favor of any other nation, especially a less powerful nation, to whom they have a suspicion they have done a wrong.

'The problem of the world's races and their relations is becoming rapidly one of the world's greatest. It is not so much a question of today as of tomorrow. Today we are only touching its outer edges and the most urgent demand of the times is that there should be brought to its solution, not fear or prejudice, but the utmost good will.

'A better understanding between the various races is the world's greatest need today.'



FOR I AM QUEEN OF THE MAY, TRA LOO!
WOTS POISON IVY?
TO POISON IVY DANDELION JUKE AND TOAD STOOLS
Donahey

—Donahey in the *Cleveland Plain Dealer.*

THE GLEANERS FROM THE CITY.

CAN YOU TELL ME?

Question. Can you tell me the city in which the late Theodore Roosevelt was wounded when on a speaking tour in the Northwest, where he was taken for treatment, and the date of the occurrence? Was the would-be assassin ever apprehended and convicted?

Answer. On October 14, 1912, Roosevelt, while in Milwaukee on a speaking tour of the West as the Progressive candidate for the Presidency, was shot and slightly wounded by John Schrank, a half-crazed fanatic. Roosevelt was shot on his way from his hotel to the hall where he was to speak. He rode at once to the hall and delivered his speech. Later in the evening he was taken by special train to Chicago where he was placed in a hospital; a thorough examination was made. He remained at the hospital until October 21, when he went to his home in Oyster Bay. The bullet was never extracted. Schrank was caught immediately. When arraigned in court in Milwaukee, on November 12, 1912, he showed signs of mental aberration. The court appointed a commission of five alienists to examine him. The commission reporting on November 22 that he was insane, he was committed to an asylum for the insane for an indefinite period.

Q. Please give me the vote of our Senate on the League of Nations proposal.

A. In the vote taken in the Senate on March 19, 1920, on the question of the ratification of the Versailles Peace Treaty of which the League of Nations was the chief issue, 57 senators voted in favor of ratification and 37 against it.

Q. Is there a reward offered by the United States Government for the process of hardening copper?

A. There is no reward offered. The Bureau of Standards recently issued a report on this subject, which may be obtained by writing direct to the Bureau for it.

Q. For how long a term is a copyright issued?

A. The original term of copyright runs for twenty-eight years; a renewal may be secured for another twenty-eight years within the year preceding the expiration of the original term.

Q. How many children did President John Adams have?

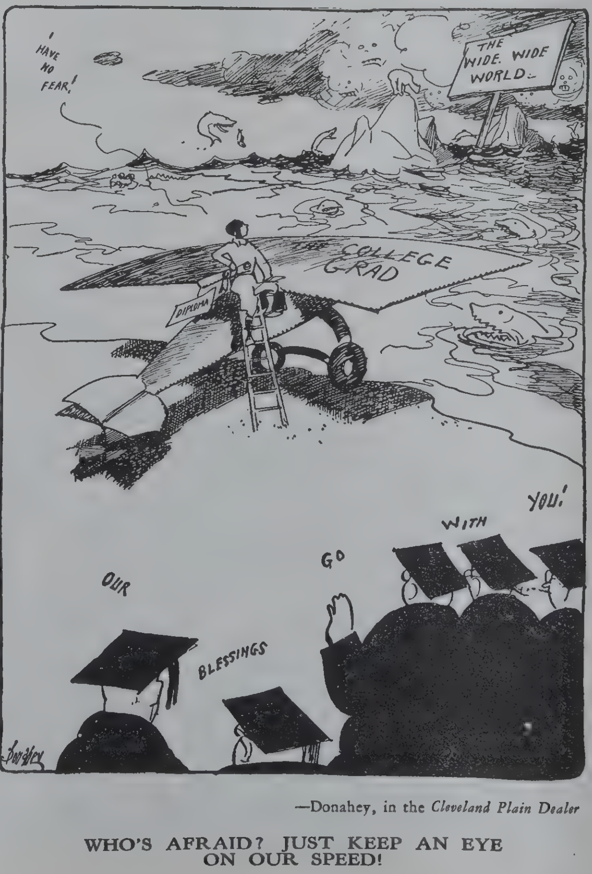
A. President John Adams had five children: three sons—John Quincy Adams (sixth President of the United States), Thomas and Charles; two daughters—Abigail, who married Colonel William Stephen Smith, a Revolutionary soldier, and another daughter, who died in infancy.

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

Q. Will you give me the flowers emblematic of the various states?

A. The flowers for the various states are as follows:

Alabama	Goldenrod
Arizona	Sahuaro cactus
Arkansas	Apple blossom
California	Golden poppy
Colorado	Columbine
Connecticut	Mountain laurel
Delaware	Peach blossom
Florida	Orange blossom
Georgia	Cherokee rose
Idaho	Syringa
Illinois	Wood violet
Indiana	Tulip tree blossom
Iowa	Wild rose
Kansas	Sunflower
Kentucky	Trumpet vine
Louisiana	Magnolia
Maine	Pine cone and tassel
Maryland	Blackeyed Susan
Massachusetts	Mayflower
Michigan	Apple blossom
Minnesota	Moccasin flower
Mississippi	Magnolia
Missouri	Hawthorn
Montana	Bitterroot
Nebraska	Goldenrod
Nevada	Sagebrush
New Hampshire	Purple lilac
New Jersey	Violet
New Mexico	Cactus
New York	Rose
North Carolina	Goldenrod
North Dakota	Wild prairie rose
Ohio	Scarlet carnation
Oklahoma	Mistletoe
Oregon	Oregon grape
Rhode Island	Violet
South Carolina	Yellow jessamine
South Dakota	Pasque flower
Tennessee	Passion flower
Texas	Bluebonnet
Utah	Sego lily
Vermont	Red clover
Virginia	American dogwood
Washington	Rhododendron
West Virginia	Rhododendron
Wisconsin	Violet
Wyoming	Indian paintbrush



—Donahey, in the *Cleveland Plain Dealer*

WHO'S AFRAID? JUST KEEP AN EYE ON OUR SPEED!

Q. How many officers were killed on the firing line during the World War and how many of them were West Point graduates?

A. Altogether 2,214 individuals lost their lives in battle while serving as commissioned officers in the American Expeditionary Forces in Europe, of whom 33 were graduates from the United States Military Academy at West Point.

Q. Will you kindly tell me the approximate present white and colored populations in the former slave states?

A. The 1920 census figures for the white and colored populations of the states which belonged to the Confederacy are:

	White	Negro
Alabama	1,447,032	900,652
Arkansas	1,279,757	472,220
Florida	638,153	329,487
Georgia	1,689,114	1,206,365
Louisiana	1,096,611	700,257
Mississippi	853,962	935,184
North Carolina	1,783,779	763,407
South Carolina	818,538	864,719
Tennessee	1,885,993	451,758
Texas	3,918,165	741,694
Virginia	1,617,909	690,017

Missouri and Kentucky, which were disputed territory during the War of Secession, show white populations of 3,225,044 and 2,180,560 respectively and colored populations of 178,241 and 235,938 respectively.

Q. What present member has served in the United States Senate for the longest time?

A. Senator Francis E. Warren has served for the longest time. He was elected as a Republican to the United States Senate, November 18, 1890, and served until March 4, 1893; he was reëlected for the terms commencing 1895, 1901, 1907, 1913, 1919, 1925, his present term expiring March 3, 1931.

BRIEFLY TOLD

GUTTA-PERCHA WAS unwittingly discovered by Dr. Thomas W. Evans, a Lancaster, Pennsylvania, dentist, while looking for a substitute for gold foil for tooth fillings.

THE FOOT OF THE modern girl has within the last decade outgrown the 4B size which for generations was the average size of the foot of the American woman. Athletics and dancing are said to be the cause.

BIRTHS EXCEEDED DEATHS in Japan by 940,000 last year.

BLUEBERRY OR HUCKLEBERRY leaves are the source of the latest extract to be successfully used in the treatment of diabetes.

ACCORDING TO NATURALISTS, many birds die each year of bronchial pneumonia because of too early migration.

STATISTICS COVERING A five-year period of a dental dispensary in the public schools of one American city show that diphtheria was reduced from 36.6 per cent to 18.7 per cent; measles from 20 per cent to 4.1 per cent; and scarlet fever from 14.1 per cent to .5 per cent among the school children.

BREEDERS AND TRAINERS OF canaries claim that both the voice and the temper of the songsters are spoiled by jazz music.

IT IS ESTIMATED THAT automobiles to the value of $300,000,000 are stolen annually in the United States.

CHINESE CRICKETS ARE trained to fight duels.

THE TERM 'WHIP' APPLIED to certain members of parliamentary bodies is derived from the 'whippers-in' of a hunt—men whose job it is to whip up lagging hounds and so to keep the pack together and obedient to orders.

AN ANCIENT TOLTEC POEM depicting the splendors of the city of Tula in its golden age has been unearthed in Mexico. It is known as 'The Song to Quetzalcoatl,' and was put into written form by the Spanish historian, Sahagun, at the time of Cortes' conquest.

THE DAILY BILL OF FARE for Peter, a hippopotamus in the New York Zoo, consists of 150 pounds of hay, 15 loaves of bread, 5 heads of cabbage, and 60 pounds of cornstalks.

IF THE WATER IS NOT cold an oyster drinks about eighty quarts of water daily but if the water is below forty-five degrees he is believed to go on a thirst strike.

INDIANS ARE GIVEN FREE tuition at Dartmouth College. Three full-blooded Indians will matriculate at Dartmouth this year.

A BED OF LIVE CLAMS WAS unearthed by a steam shovel excavating in the side of a bluff twenty miles south of Eureka, California, and about the same distance inland from the Pacific Ocean. The bluff was 120 feet above sea level and 80 feet above the Eel River. Placed in water the clams exhibited unmistakable signs of life.

AN OLD CIRCUIT RIDER of Michigan tells of receiving as his pay hay, oats, socks, mittens, and cash, to the amount of $59.56 for one year.

ROMANS OF WEALTH PAID as high as $5,000 annually for a good cook.

THE RECORDS OF AN OHIO court show that a man convicted of theft was cured by the sentence that he be 'divested of his apparel, tied to a tree and subjected to the bites of mosquitoes for one hour.'

FORTY THOUSAND ROSES are required to produce one ounce of attar of roses.

GEORGE WASHINGTON, A great lover of fish, refused to eat a shad that cost three dollars because he did not want it said that his table, as President, set an example of luxury and extravagance.

JERRY, BLACKEST OF ALL black sheep, has just betrayed his one-millionth victim. Trained to lead a procession of sheep through the long runways of the Chicago stock yards, upon reaching a certain pen he sidesteps and the rest proceed to their death.

WESTERN INDIANS USED cactus spines for needles.

EDMUND KEAN, THE NOTED English actor, valued the opinion of the common people in the pit more highly than that of aristocrats and dramatic critics.

AN ITALIAN WOMAN, NAMED Toffana, who lived in the 17th Century, was the world's most famous poisoner. She had more than 600 victims to her credit before she was apprehended and executed.

A LONDON SNUFF MANUFACTURER says that 65 per cent of the snuff now sold is bought by women of all classes.

ON ALL RAILWAY JOURNEYS the King of England pays full fare for himself, the queen and every member of the royal household in attendance.

THE MINIMUM AGE OF FOURTEEN years for employment in industry adopted by the Washington conference of 1919 has been ratified by fifteen nations.

A RETIRED RAILROAD locomotive, with its wheels removed, heats a Norwich, Connecticut, passenger station. It performs efficiently, supplying heat to the train shed, station and cars in the yard as required.

THE 'CHRIST OF THE ANDES' is a bronze statue standing on a 12,000-foot elevation above the sea. It was cast from the cannon of Argentine and Chile and the inscription on the monument reads: 'Sooner shall these mountains crumble into dust than the people of Argentine and Chile break the peace which they have sworn at the feet of Christ the Redeemer.'

LEWIS WAKEMAN, A TEACHER in a school near Troy, Kansas, offered a stick of gum to the pupils for each mouse caught in the schoolhouse. The children responded with seventy-five mice.

SILK IS THE CHEAPEST OF all fabrics in Madagascar and women of all ranks wear it.

AS A MEANS OF REDUCING surplus stock, coöperative stores of Lukoyanovsk, Russia, have introduced a 'safety-pin currency,' returning small change in safety pins, one for every kopeck.

MADE IN ENGLAND IN 1751, the bell which was to become on July 8, 1776, our famous Liberty Bell, had to be twice recast after its arrival in America before it could be hung in the new statehouse in Philadelphia.

THE VOCAL CORDS OF women being shorter than those of men less energy is required for a woman to talk than for a man.

JOHN EVELYN, AN ENGLISHMAN, makes mention of the salad in his diary 220 years ago. An excerpt reads: 'Sallet is a particular combination of certain crude and fresh herbs, such as usually are, or may be, safely eaten with acetous juice, oil, salt, etc., to give them a grateful gust and vehicle.'

THE COOLEST FABRICS ARE those which allow the most rapid passage of air and perspiration vapor through them. In tests conducted by the United States Bureau of Standards, a sample of the cloth is clamped on the end of a cylinder, into which air is pumped. A gas meter measures the quantity of air escaping through the fabric in a certain length of time.

JACK SMITH, A COLLIE DOG of Lincoln, Nebraska, is a most consistent churchgoer. Each Sunday morning, rain or shine, he departs for church, six blocks away, getting there in time to welcome members at the door, although he refuses to go inside. When services are over, he returns to his home.

AN ELEPHANT'S BATH requires 150 pounds of soap and more than $100 worth of the purest Indian oil.

NOTES & COMMENTS & CRITICISMS

MR. FORD'S Page this week discusses the relation between working and doing.

* * *

The cover design is an old mill in the glory of the afterglow of a summer sunset. There is a fascination about an old mill and a picturesqueness that cannot be explained. One of the most interesting of these is the old mill at Wayside Inn, Sudbury, Massachusetts.

* * *

Lizette Woodworth Reese, the Maryland poet and essayist, gives us some more of her delightful verses on page 2 of this cover. This time it is 'Cornwall.'

* * *

Vachel Lindsay is very much at home when he defines the Middle West, and this definition is not so easy as one thinks. Vachel Lindsay says in fact that one can never really define anything; one can only illustrate it. What is now called the Middle West was once the West, and it is as the West that this writer mainly deals with it. An epilogue about a hidden log cabin comes later. In it is the story of Lincoln's love, Anne Rutledge. (p. 1)

* * *

What happened to a young American lady who went 'lion' hunting in Paris is the theme of Eleanor Lewis. The biggest game was Victor Hugo. Was the venerable *litterateur* drawn by the youth and beauty of his fair young visitor? No indeed. He looked at her with 'an expression of extreme distaste, muttered something like a grunt, and passed on.' It was Eleanor Lewis who gave the interesting essay on Queen Margherita of Italy in this magazine a few months ago. (p. 3)

* * *

That manners make the man may be an old and trite claim—or bromidic if you prefer it—but that man makes the manners sounds different. All people have the privilege of using good manners if they so wish, but many don't wish; they think bad manners are smart and that the other kind is old-fashioned. Thomas L. Masson discourses on this subject with lots of anecdotage, and illustrations. (p. 4)

* * *

There is a kind of history that is not found in the schoolbooks. It is often the most interesting. This particularly applies to presidential campaign history. There are several might-have-been Presidents. Something happened, of course; accidents, they may be called. There's many a slip 'twixt nomination day and the White House. Earle C. Reeves, a Washington correspondent and syndicate writer of experience, reviews the unwritten record. (p. 6)

* * *

Pavel Bouligin was an officer in the Russian Imperial Army, and when Czar Nicholas II abdicated and Red revolution set in he joined the White Army of Admiral Kolchak. With the dispersal of this force Bouligin sought sanctuary in Abyssinia. There he has been ever since, acquiring a first-hand knowledge of the country and its people, not to mention its wild animals and insect pests. Chief among the latter are the ants. They eat anything not actually made of glass or tempered steel. (p. 8)

* * *

Experience teaches lawn tennis as well as other things. Lacoste, the tennis champion, 'the Frenchman who looks like an Englishman,' can vouch for the truth of this. He benefits not only by his own experience but by the experience of others. He makes a careful note of methods used in play—their success or failure—and from this index system he can check up on the play under almost all conditions. H. G. Salsinger, a writer on sports who is widely known, gives a study of Lacoste and his methods. (p. 9)

* * *

The main story of the abdication of the Russian Emperor, Nicholas II, has never been told until now. Gregory Shinkarenko, formerly an officer in the Russian Imperial Navy, who did duty on board the Czar's yacht, now gives the Royalist side. He also supplies a picture of the Czar's personality which will be new to most people. That he was not the tyrannical despot that some people thought he was is evident from Mr. Shinkarenko's narrative. (p. 12)

* * *

The story of the great Mississippi flood would not be complete without something about the vigorous campaign against disease that is being carried on by doctors and nurses. Many gallons of quinine and tons of disinfectants have already been used. The flooded area does not look anything like what it did before the waters rose. It is a sea of slimy mud punctuated with dead animals and polluted by decaying matter. Typhoid inoculation and other weapons are being used. It is the Panama Canal Zone fight against disease magnified a hundredfold. (p. 14)

* * *

The arts and crafts of the French Canadian habitants are not so well known as they ought to be, for, after all, these people were the Pilgrim Fathers of British America. Charles J. Finger, along with some literary friends, recently took part in a gathering of artists, literary men and peasant handicraftsmen held in Quebec, Canada. The exhibition of arts and crafts indicated that, amid the advancement of modern things, all that was good and beautiful about the medieval has not been forgotten in certain byways of the world today. (p. 16)

REMARKS BY OUR READERS

Pasadena, California.

The following was recently received from Inez Marks Lowdermilk, whose articles on China have been so much appreciated by our readers:

The reports from Nanking are most encouraging. Although there is not a foreigner in Nanking the University courses are being carried on with splendid spirit by the loyal Chinese faculty who did such very commendable work in preventing a general massacre of Americans on that terrible March 24. More than half of the former students are in attendance at classes and Chiang Kai Shek is very friendly. He removed the soldiers from University buildings, apologizing for their actions. If only the moderates can stay in control long enough to put down the Communists as Chiang Kai Shek is doing, there will be hope for a stable China.

INEZ MARKS LOWDERMILK.

Philadelphia, Pennsylvania.

Many of your articles touch too briefly on subjects which deserve serious consideration in these days of skimming the surface. One thought arises after reading your editorial, 'In No Man's Land.' Especially the reference to the merchant class. It is my opinion that the prices charged to the consumer for most of the supplies needed are far out of proportion to the amounts received by the producer or manufacturer, and that some effort should be directed to the reduction of so-called handling charges. I have tested some lines, by purchasing through jobbers staple goods which I have priced in general stores, and in many cases it showed 100 per cent for the retailer. Therefore the question arises, Is labor using the higher wages carelessly? Observation leads me to believe that a fat pocketbook destroys one's judgment of values.

If I have conveyed a thought of interest my purpose is accomplished.

HARRY G. WILLIAMS.

Seattle, Washington.

I can unhesitatingly say that I have never taken a magazine that I appreciated more. I hope that in the endeavor to improve, the happy simplicity of style may not be left behind. I do not think that editors as a rule realize the value of simply stated facts and general simplicity of diction. Brisbane, who writes often the most arrant nonsense, is read by enormous numbers who positively dislike him. But his extreme simplicity in stating his opinions and his generally easy-to-read style attracts them all. Your page of Briefly Told has this attraction and certainly it is the one page read first and always. We seem to be living in an age when mankind hates to take trouble—hence movies, funny pages and Brisbane.

JOHN G. BOULTON.

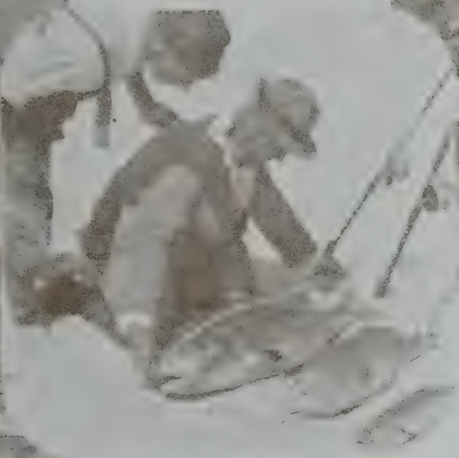
The fish story: 'No exaggeration, he was that long. He wound ten feet of line around that old snag at the bend and snapped off the leader close to the line.' —H. Armstrong Roberts.



The conquest of the fighter, and the verdict—forty-eight inches over all. A tapeline is as necessary in the tackle kit as are hooks and lines. It is invaluable in case of arguments. —H. Armstrong Roberts.

While the coffee boils, the fishermen admire their catch, and contemplate the coming feast—five Dolly Vardens and Rainbows from Jacques Lake in Alberta, Canada. For two hungry men who have tramped the headwaters all morning, this is a 'consummation devoutly to be desired.' The early evening promises more booty from the shady swamp stream where big ones lie, head upstream, awaiting the luckless insect. —Herbert Photo.

A beautiful stream, much like others of its kind, winding through untouched woodland, but of vast possibilities and import, is Lake Itasca, in northern Minnesota, the true source of the Mississippi River. It is not a devastating giant here, but a quiet, rippling brook, leading from lake to lake and abounding in game fish. —Northwestern Photo Service.

IF TIME be of all Things the most precious, wasting of Time must be, as Poor Richard says, the greatest Prodigality, since, as he elsewhere tells us, Lost Time is never found again; and what we call Time-enough, always proves little enough. Let us then be up and doing and doing to the Purpose; so by Diligence shall we do more with less Perplexity. Sloth makes all things difficult, but Industry all Things easy, and He that riseth late must trot all day, and shall scarce overtake his Business at night. While Laziness travels so slowly, that Poverty soon overtakes him, as we read in Poor Richard, who adds, Drive thy Business, let not that drive thee; and Early to Bed, and early to rise, makes a Man healthy, wealthy, and wise.

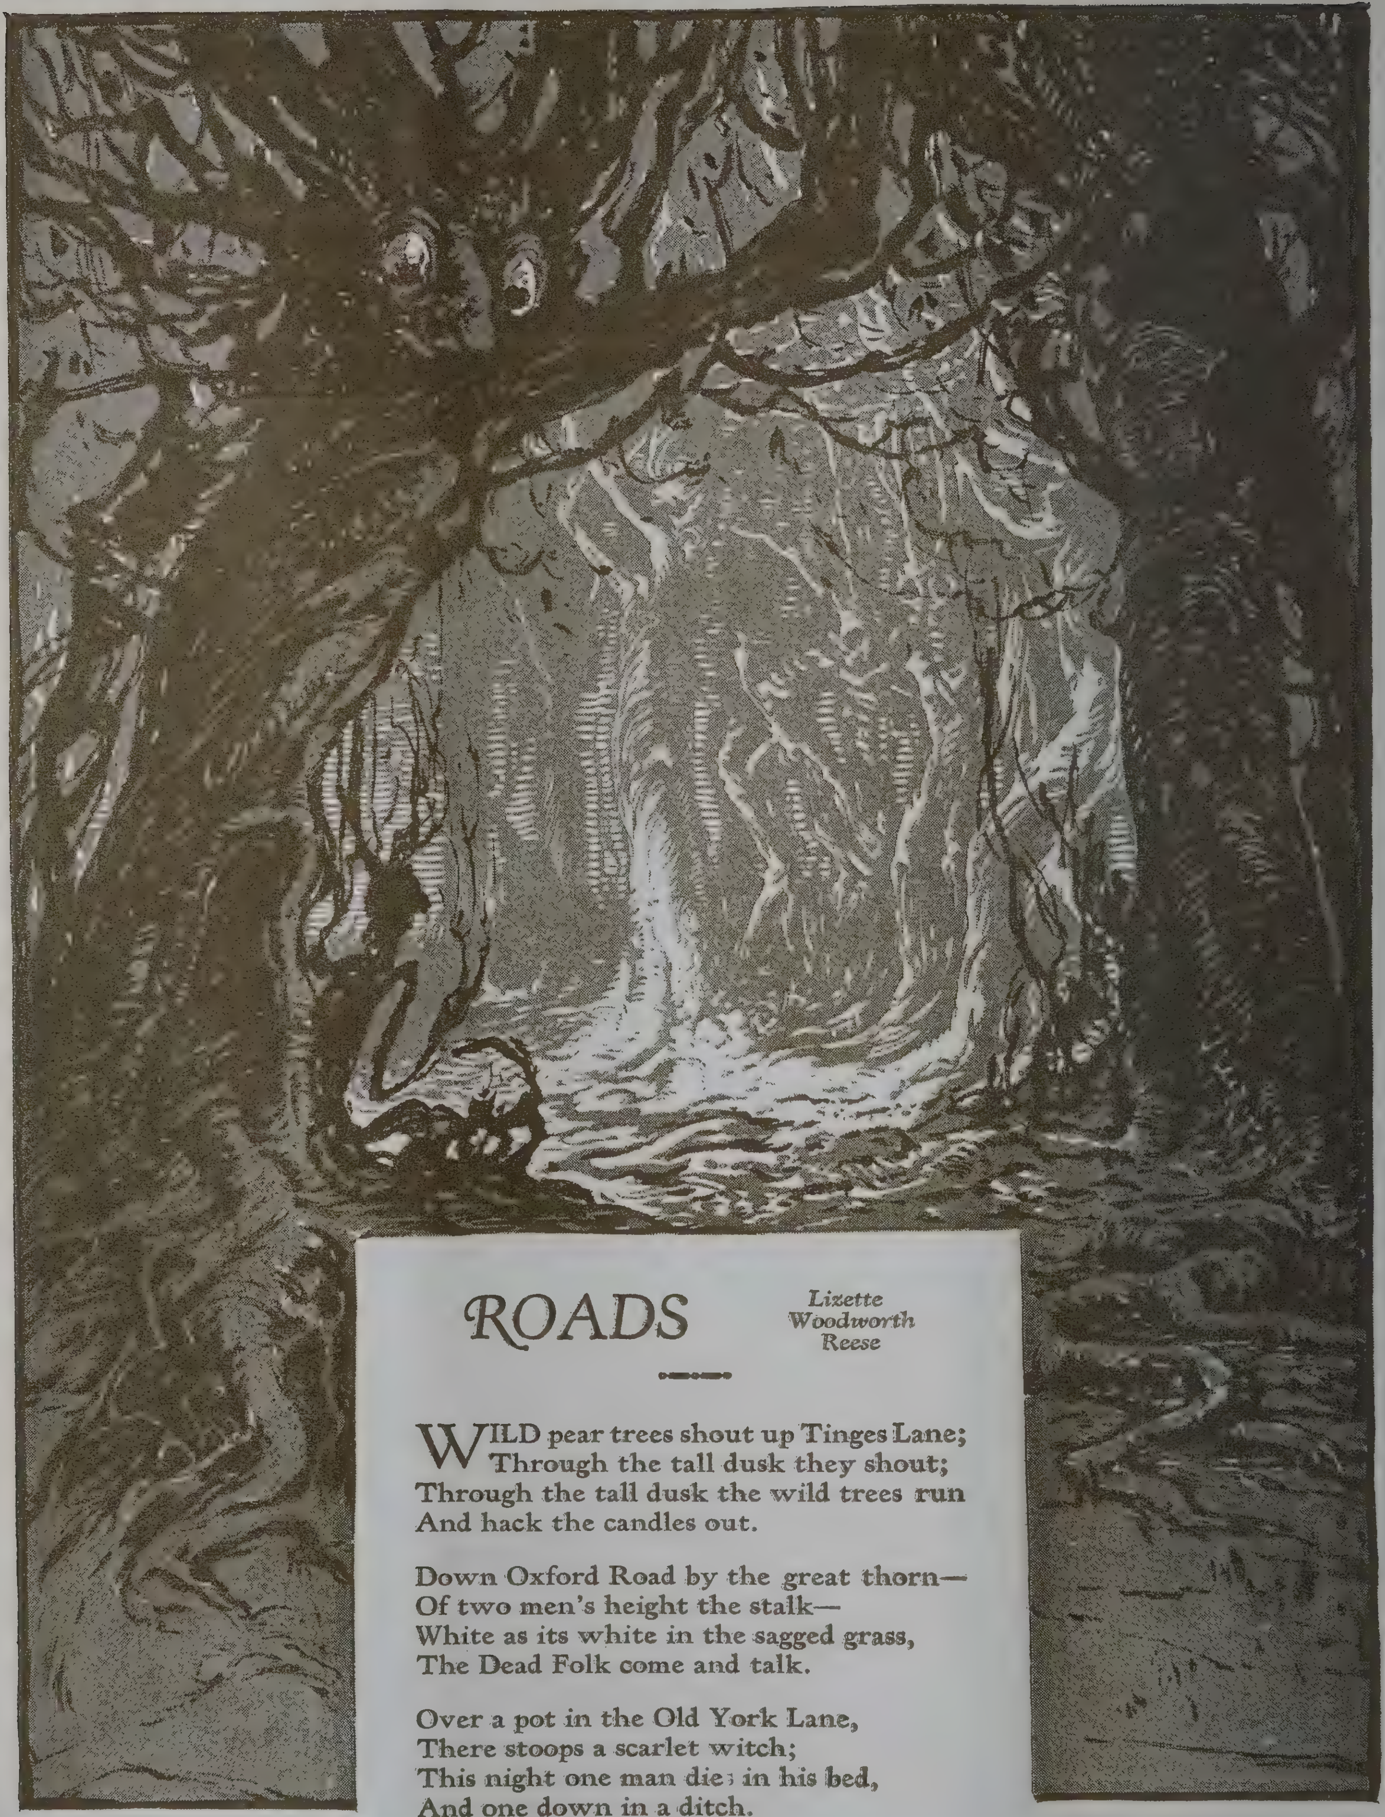
GERMAN RHEIN-PFALZ PEASANTS ON THEIR WAY TO THE FIELDS



ROADS

Lizette Woodworth Reese

WILD pear trees shout up Tinges Lane;
Through the tall dusk they shout;
Through the tall dusk the wild trees run
And hack the candles out.

Down Oxford Road by the great thorn—
Of two men's height the stalk—
White as its white in the sagged grass,
The Dead Folk come and talk.

Over a pot in the Old York Lane,
There stoops a scarlet witch;
This night one man dies in his bed,
And one down in a ditch.

LUCK, *and the* BEDSIDE MANNER

By JOSEPH COLLINS

ANYONE who has observed or experienced success will agree with Bacon that accidents contribute much to fortune. The relationship between success and virtue has been dwelt upon so insistently and articulately by moralist and uplifter that luck and manner have not had opportunity to present their claims.

Many things go to the making of a successful physician. Qualities of head and heart constituting character and personality are the most important. No matter what 'behaviorists' say he owes those to his forbears. Success stands in close relationship to two other factors: luck, over which he has no control and the 'bedside manner' over which he has some control.

I fancy that the majority of those who have had 'their day' may trace it to a stroke of luck, but none more unerringly than myself. The incident was so trivial, and so wholly beyond thought, plan or deliberation that no one will accuse me of egotism or conceit, I am sure, for telling it.

I had received the medical education available in this country in the latter years of the last century. It did not take many months of practical application of it to convince me of its gross and lamentable inadequacy. As soon as I could, I supplemented it by a year's study in laboratories and clinics of Germany and Austria. There, the mysteries of the nervous system were revealed to me, and there I experienced for the first time the lure of its disorders. On my return, I took an office in a more select neighborhood than that in which I had taken my first flight. The neighborhood was all right, but the neighbors were not very neighborly, at least from the viewpoint of one seeking patients. Worse still, nearly all of them had gone away for the summer. My escapes from the heat were limited to Coney Island, which had not yet been turned over to noisy vendors of hot dogs, raucous barkers of anatomical curiosities, greasy Levantines searching prey, and bearded Russians, Poles and Galicians, all celebrating liberty. One particularly hot afternoon spent in the outpatient department of Bellevue Hospital had reduced me to a state of depression and exhaustion which clamored for the reviving atmosphere and refreshing surf of that attractive island.

I made ready to go. Indeed, I was on my way and was passing the drug store on the corner, when the proprietor, an amiable, alert, ambitious American with whom I sometimes took refreshment after he had closed the shop for the night, hailed me to say that someone in the next street was seeking a doctor. Would I go? I would and I did.

I found a man of about forty, obviously living as a bachelor. He had the symptoms of what is popularly called 'summer complaint' but the pain was intense; he sought relief with calm and dignity despite his manifest suffering.

Instead of whipping out a hypodermic syringe and giving him an injection of morphine, I heard either a good fairy whisper to me: 'Examine him,' or the echo of what I had often heard in European hospitals: 'The only way to discover a patient's trouble is to use your senses and your sense.' Possibly, it was one of those flashes of intuition, the most precious of the physician's possessions.

He assured me that he could tolerate the pain while I heard his story and made the examination. His suffering was not dependent upon disorder of the digestive tract; it was due to one of those explosions that attend locomotor ataxia, called 'gastric crisis.' When that was ascertained, relief was given him promptly. He interpreted the visit made at midnight as solicitude for his comfort and well-being and asked me to become his medical attendant. I gladly accepted, not only because I was seeking patients but because I realized from the first that I had come upon an exceptional human being.

Without apprising him of the nature of his disease, or the necessity of vigorous, intensive, continuous treatment, I told him that I should like to talk to his family. The next morning, it was suggested to his brother, a man of prominent position in the educational and intellectual world, that in view of the seriousness of the disorder and of the fact that the person who made the diagnosis was quite unknown both as individual and as physician, some physician of distinction should be asked to corroborate or deny the diagnosis.

The patient consented and the only medical consultant who at that time had any knowledge of nervous diseases was summoned.

THAT there was only one seems astonishing now, but in those days, physicians admitted ignorance of nervous diseases without sense of shame or humiliation. Students were not required to study them and rarely had opportunity to observe cases save those the nature of which was so obvious that a layman could recognize them. It was a time when the psychoneuroses were largely 'imaginary,' other functional nervous diseases 'just nerves,' and organic disease of the nervous system 'incurable.' In no branch of medicine has such complete transformation taken place in one generation as in the neurological.

The consultant was a man who for years had chummed the wards and laboratories of Bellevue Hospital with the insistence and assiduity with which Colonel House chummed Wilson. He was a wizard and he looked the part.

He corroborated the diagnosis and congratulated the young doctor. My future was assured, my fortune was made. The patient became my mentor, counselor, friend, benefactor. I had not seen his like before, nor have I since. He had all the possessions of a man and many of those of a god. Handsome and distinguished, he was at once courtly and urbane, kindly and humane. He was generous, appreciative, understanding, just. It does not seem possible that a man could have keener sense of honesty, deeper comprehension of justice, livelier recognition of fitness or propriety, more compassion or less bigotry than he had. In college he was called 'Judge' and that is what his friends—and he numbered them by the score—called him all his life. His decisions were rarely questioned, never repealed. Friends loved him, acquaintances admired him and those who came in casual contact with him respected him. He took his punishment from Pluto with the courage and contempt that T. E. Lawrence displayed when he was attacked by the unspeakable Circassian, Bey Nahi, and his perverted servitors.

FOR twenty years and more he contested the progress of the disease, and though he was blind long before he yielded, his head was still unbowed.

Friends rallied to his moral and material support with the alacrity and enthusiasm of crusaders. That gesture was not necessary to testify their bigness, for the majority of them were leaders in the world of finance and business. A few of them became my patients, many my friends, and to a dozen or more of them was submitted later the conception and plan of the Neurological Institute. They became its sponsors and supporters and gave it distinction and the appearance of solidarity from the start. To them this community is indebted for its usefulness, this country for its example.

It would be difficult to invent a better example of pure luck than this. One may say the trap had been carefully and adroitly baited and the trapper had been giving it an attentive eye, but in reality the trapper was a hedonist, bent on pleasure. Had it not been for conditions which he neither planned nor prepared he might never have known that prey had even nibbled at the bait, let alone sprung the trap.

It requires no stretch of the imagination to see my professional career paralleling that of dozens of colleagues, with far greater native endowment, fuller education and more fertile background who find themselves approaching the last decade of life confronted with the necessity of earning their bread in the sweat of their brows and at the expense of their souls, and who when they pass on, get four lines in the newspaper, and that paid for by their families!

Luck comes to everyone. The person who denies it is one who has been so obtuse as not to recognize it and so stupid as not to avail himself of it. Sometimes what is seemingly misfortune turns out to be fortune.

'THE greatest piece of luck I ever had,' said one of my young colleagues, 'came to me in the guise of a blow, and what I considered at the time to be an injustice. I took the examination for a position on the house staff of the Massachusetts General Hospital and one of the questions was, "Give the treatment of acute rheumatism." Only the day before an assistant physician had shown us a case and told us specifically what to do. I put it down in my notebook and therefore was able to answer the question practically in the words the assistant used. I was "plucked" because of that answer. The examiner, a man who has now gone into that indefinite field that stands between medicine and applied theology, told me that he did not want a man on his staff who knew so little about his methods of treatment as I did. I felt that I was the goat and that the tin cans of Boston would not provide nourishment for me; so I came to New York and took the Joint Medical Board Examination, got ninth place on the list, and selected —— Hospital for my service, and here I am.'

His face was radiant and his chest distended when he finished his narrative. This man permitted me to see that his haberdashery was of a pattern affected by rich Americans, and I knew that he was prosperous. Years of intimate association had convinced me that he was inventive, resourceful and reliable.

* * *

I SHALL not attempt to estimate the relative value of luck and the bedside manner, save to say that the latter is a valuable asset in the practice of medicine and, to borrow a phrase from finance, a much more fluid one than the former. It has the advantage over luck that it is not wholly beyond the individual's determination.

A really first-class bedside manner cannot be acquired, but an indifferent one can be enormously improved. However, it must be said at once that its value diminishes proportionately to its artificiality. The best kind is an integral part of the possessor's personality, like the shape of his nose. It may be dolled up a bit, but like finger nails too highly polished, or lips too deeply colored, overdoing detracts instead of beautifying. The physician who has it 'naturally,' that is, who has it as an endowment and who has the discernment to adapt it to time, place and person, is bound to be a winner in the professional race.

What I have to say of it, both as an attribute and as an asset, is based upon observation and not self-revelation. I have carefully studied and estimated many examples of it, and many varieties also, for neither in material nor pattern is there much uniformity.

In a general way, all bedside manner is one of the following varieties: the brutal and mandatory, the suave and conciliatory, the meticulous and explanatory, the solicitous and hortatory, the casual and cachinnatory, the optimistic and nugatory.

There are the 'also-rans' who occasionally win a race though nothing in past performance or appearance suggests the chance of winning. Also there is that considerable number of doctors who are called either 'just in time' or 'too late.' All are members of the 'He-Saved-My-Life-Club.'

I FANCY the first group is less numerous than it was a generation ago, but I saw it frequently in the dying years of the 19th Century. The example I recall most vividly was a deep-chested German with hair combed pompadour fashion, who wore a white foulard tie and a swallow-tailed coat, dark in winter, light in summer. His voice had some of the qualities of a steamboat foghorn; each of his questions ended in a semichuckle which he always answered himself.

He would enter the sick room, head up, chest out, a half smile of personal contentment and self-appreciation on his face, sit down by the bedside, half-close his eyes and say, '*Nun, wie geht es Ihnen heute* (semichuckle); *besser ja?*' Should the patient attempt to say that he did not feel better, but worse, he was promptly sat upon, squelched and subdued; the doctor knew. The patient may have known he had a soul, but he did not dare admit ownership, and

NEW ALBION—*for the* Explorer *De Luxe*

By ADAM SIMONDS

THREE days after stepping on board one of the crack transcontinental trains steaming westward from the Mississippi Valley, you can disembark at salt water and find stretching before you one of the bays of the mighty Pacific. Or if you prefer a more leisurely journey by motor car, and if you loiter en route to visit this or that national park, you can still reach the west coast within a very few weeks and after practically no hardships.

Exploring in 1927, especially along those western trails which only yesterday were filled with constant peril, discloses the transformations which an advancing civilization has brought in the wake of the pioneer.

Instead of the circle of covered wagons at night about a common camp fire, the modern adventurer finds a tourist camp, tiny cabins centering about a municipal cookstove. Instead of the whiz of the arrow, he fears the bang of the blowout. The old-time dread of running out of water and dying from thirst has been superseded by the dread of a dry radiator, and consequent disaster.

The years which such dauntless navigators as George Vancouver and Robert Gray, such daring scouts as Meriwether Lewis and his friend Clark, required to reach the far Northwest, correspond now to days, if train is used; or to weeks, if auto is used; or to hours, by airplane—to reach the same destination. It is interesting to note that once you have reached this destination, you can easily lose yourself in a wilderness of beauty still unexplored. It is still a 'last frontier.'

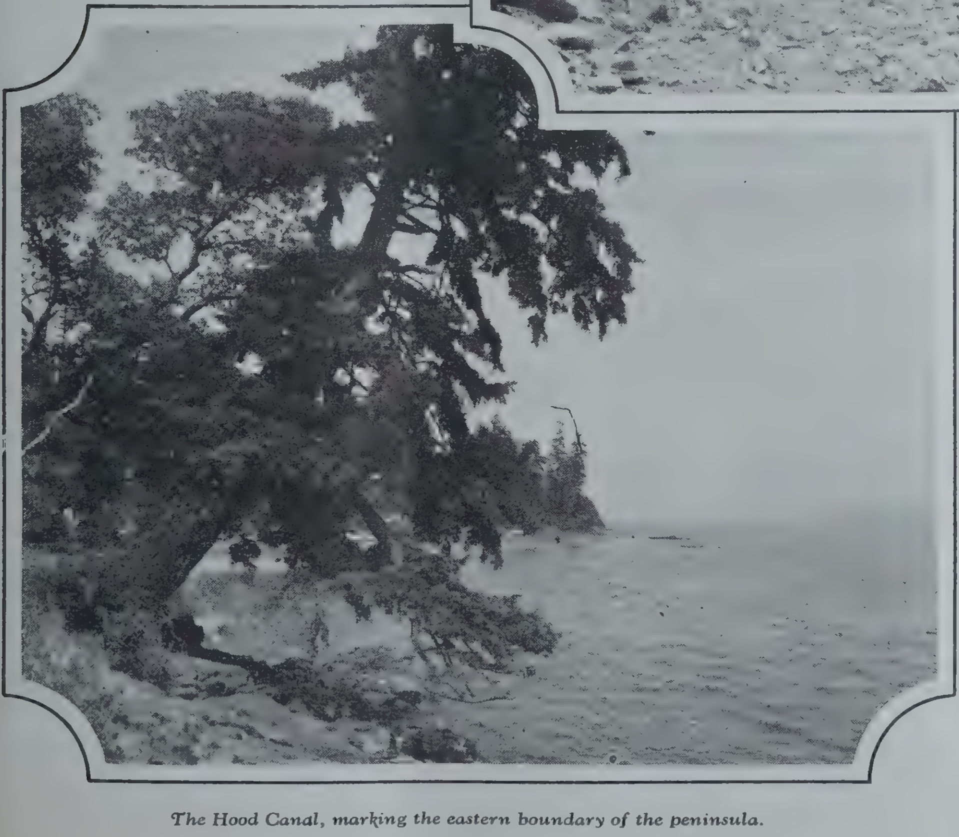
It was in May, 1792, that Captain Vancouver began his discoveries in what was called by him 'New Albion.' It was in May of the same year that Captain Gray, after accidentally meeting the British explorer in those waters, returned southward and sailed up the wide river now called the Columbia. That meeting between Gray and Vancouver off the Northwest coast, each taken unawares by the sudden encounter, must have been as thrilling as it was historic.

—Asahel Curtis Photos, Seattle.

On the trail with horse and pack north of Mt. Olympus.

Unknown to each other, Vancouver and Gray in that early summer were charting the three water boundaries of a great rectangle of land that jutted northward and westward, like a thumb, from the United States mainland. It is this rectangle, this 'Olympic peninsula,' that is almost as wild in its grandeur today as it was in the days of those early navigators.

Around its shore line on the east and north a modern highway runs.



The Hood Canal, marking the eastern boundary of the peninsula.

Along its western side another ribbon of road is being laid amid tremendous obstacles. But in its heart are spots where man has yet to penetrate. There are mountains yet to be named; lakes yet to be fished; streams yet to be traced. Stories of mineral deposits back in the mountains; of rich, rare ores and of precious stones, are whispered in cabins and hunting lodges.

Along the north shore is the wide blue channel of the Strait of Juan de Fuca, historic waterway which once seemed the mysterious Northwest Passage. Along the east side is Hoods Canal, a deep, seemingly endless arm of salt water which reaches down into the very heart of the Olympics. On the west side the ocean beats against lofty cliffs, except far to the south where there are wide sandy beaches.

To enter this outdoor playground, the explorer de luxe could not do better than follow up Hoods Canal from the south. A perfect highway just touching the shoreline leads along the base of the Olympic range. One cannot leave this highway except afoot or with pack horse, until the end of the canal has been reached. On the left the foothills shoulder skyward. At each bend in the road a turbulent stream dashes underfoot, sometimes almost a continuous waterfall from its source high up on the divide.

In this enchanted borderland one finds a blending of Indian and white man. On the right is the smiling, sunlit channel named by Vancouver. In the background far to the left is Mount Olympus, grand patriarch of the range. Between the canal and the mountains are such glorious streams as the Hamma Hamma, the Dosewallis and the Duckabush. And in that mountain glen the Hamma Hamma Falls splash their silver against a rampart of green and gold.

It is on the high side of the Dosewallis that you—if you know your Olympics and the season is right—can feast on bear steak done to a king's own taste. The log cabin is large and hospitable. At its very threshold the swift mountain torrent rushes by with an endless roar. Here on a summer evening one learns the magic of the woods and, perhaps for the first time, hears the vespers of birdland.

It is hard to resist the temptation to pack one's back and take the trail up to Alpine meadows; to snow fields; thence across the range and down the west slope to sea level again. The trail is safe enough and the climb is not arduous. But there is so much to be seen along the way that the time can hardly be spared.

Comes at length a turning where Hoods Canal reaches its outlet, and just ahead is the strait. On the right is Puget Sound and nearby, Whidby Island. If the day is clear you can discern to the northward the low hills of the island which bears the name of Captain Vancouver. Something tells you that Whidby also was given its name by the British explorer in honor of a capable assistant, Joseph Whidby. As you gaze at its yellow cliffs you reflect that it is second in extent in the United States only to Long Island.

Through the giant trees on the Olympic Highway.

You may also, if you are fortunate, catch a glimpse of Mount Baker, towering against the sky far to the eastward. That was the way it was first seen by that Englishman Baker, who brought the honor of its discovery to the Vancouver expedition. You turn westward toward the setting sun, past Dungeness and across the Elwha; and almost before you are aware, you are standing on the shores of an inland fresh-water lake set like a crescent amid the storm kings.

It is such a lake as you have read about in the poets. Its waters reflect its shadowy walls, the firs and cedars. In the far corners there are quick splashes—circles eddying from the spot where some trout has leaped. Nor are these ordinary trout. At least one variety is found nowhere else in the world.

Beyond Lake Crescent you realize for the first time some of the untapped riches of the peninsula. Huge spruce trees uprooted by some devastating gale are piled like toothpicks on each side. As far as the eye can see are great forest monarchs awaiting man's axe. It was from here that Uncle Sam got much of his spruce for airplanes during the World War. The trails again lure you; Sol Duc with its hot springs; the pack train and the wild game just beyond civilization. Ahead, you come suddenly to the end of the road, where mist and a distant boom warn you of the proximity of the ocean. Just a few miles down the river is the Indian village, 'La Pysht.' (*Continued on page 24*)

LITTLE ESSAYS *From a* NORTHERN COTTAGE

By Hugh
Walpole

An English Lady

A Little Portrait

SHE was born in the late fifties in a little western town and was brought up until her marriage in the very sanctity of Victorian domesticity. How secure and complete that was we are forever today being told, but in this case at least it was the security of geographical as well as sociological remoteness.

Truro, the town where she was born, was, seventy years ago, almost as cut off from the rest of the world as any of Jane Austen's villages. There was, it is true, the railway but travelling in the train was still an adventure, costly, rather dangerous and above all not necessary because it was felt that the town itself had in it resources enough for any human being. There was of course the magical adventure of London very, very occasional and rare, but in the main the small narrow streets, the high lanes thick in the spring with primroses and violets, the stir of the market days, the thrills of the county balls, the local garden parties, the many little private dances, the expeditions to the sea, Newquay and Perrenporth and The Lizard and Penzance, these were enough for anyone's lifetime.

SHE was the daughter of the principal doctor of the town, one of its leading citizens related to every family in Cornwall and cousin to the Barham of *The Ingoldsby Legends*. In those days Truro was simply a nest of relations, a family affair: Barham and Carlyon and Trefusis and Grylls, a very close and intimate society. There was at the time of her growing up a vast company of young people, there were no easy avenues of escape, and so they found all the possible pleasures and excitements in one another's company that there were to find. She was herself a member of a large and loving family; I saw her mother first and last when I was six years of age with thoughts centering in the main on food; I see her as a very old lady in a white lace cap in my memory rather like Queen Victoria and dispensing sweet curly biscuits known as lemon biscuits out of a round silver box. She gave me a Bible on the only Christmas day that I spent in her company and she comes back to me whenever I think of her in a mingled essence of Russian leather and sugary lemon.

The children were brought up strictly but by the hand of love; there was a real intense family life in which everyone was excited by the doings of everyone else. It should have been absolute security here but no one is safe and, if that generation was free of the alarms of all our modern progress, they were attacked on the other side by ignorance, old-fashioned ways and a tendency to place too much reliance upon an unfailing Providence.

The lady of whom I am writing was my mother and her world, which must have seemed utterly secure in its atmosphere of little tea parties, readings round the fire, lessons in Italian and water-colour painting, was suddenly broken up by a devastating epidemic of scarlet fever which swept the town, carried off a brother and a sister and left almost every house in Truro a place of lamentation and mourning. I suspect that my mother never quite recovered from this. All her life long there was to be in her a note of apprehension; she seemed often to be summoning her courage to meet some terrible catastrophe. After that epidemic she was never to feel quite secure again and I think, out of that very apprehension, she built up her character so that by the end there was simply nothing she was not able to face.

I have a little yellow photograph and from this, both prettier and shyer than any girl is allowed to be today, she looks out into a world that can, she knows, be terrifying. Nevertheless those early years must have been delightful; she was, I imagine, one of the belles of the town, everything that came her way was exciting and the very fact that in those days the fun was concerned with little things, that outside the excited circle of the adventures that you might have was always the vast dark unknown world of the adventures that you must not on any account have, added zest and spice to everything. My mother never lost that exultation over small pleasures; when she was over seventy I took her to *Saint Joan*, the last play in fact she ever saw, and it seems as though it were only yesterday that I watched her delighted pleasure and heard her little sigh as the curtain fell. 'Oh, I have enjoyed that, oh, I *have* enjoyed that!'

And yet I think there were great dangers in the inexperience of that time. It seems to have been the rule with parents of that day to tell their children nothing and to frown on every sort of question. It was my mother's fate in life always to be mentally honest; she could not conceive a lie whether to herself or to others and with that mental honesty there was an urgent never-ceasing longing that life should be of the finest; nothing would do for her but that. Some people shut their eyes and make of life what they would have it but my mother could never do that and as shock after shock of realization came to her her courage grew, but it was always a battle. She was no sentimentalist but intensely romantic in her ideal dream.

Indeed, I think that everyone who came into contact with her felt that she was a little 'fey.' Even in that early childish photograph she looks as though she had been lost, stolen or had strayed from her own country; that country had been beautiful and marvellous and this one was something quite other; she would never be altogether a citizen of it.

MY FATHER was the first Precentor of Truro Cathedral, coming there with Benson, afterwards Archbishop of Canterbury. He fell in love with my mother and she with him and he in his way had had as remote and isolated an upbringing as she, but he could always make terms with life, having a faith and trust in it which he has never lost, believing implicitly that it was of such and such a kind. They were married in Truro Cathedral and the day after the wedding left for Auckland, New Zealand, where he was to have a church. The journey to New Zealand in those days was no easy business and their honeymoon apparently was spent in one of the worst of ships on a succession of the roughest of seas. Here was real life for my mother with a vengeance; she who had never ventured outside Cornwall, who had been surrounded by people who wanted nothing but to give her every comfort and pleasure, found the wide world stormy and terrifying. She had, I suppose, no realization of the suspicions and hostilities of other people; all her life until then had been based on the belief that people wished one well and would rather be kind than unkind, but the Colonial society of Auckland, rough and good-hearted and pioneering, interpreted her shyness perhaps as pride and her breeding as arrogance. She was so young and inexperienced as to charge herself with every fault. Before she left Auckland she understood their good intentions but those first years there shook her self-confidence; she was never again easily to believe that people liked her or wanted her and at the first suspicion of her own inadequacy she would withdraw feeling that she had made another failure.

Moving then to New York, where my father was a professor in a theological college, she met again another kind of startling experience. The noise and confusion of that life, a certain inadequacy of means, three small children and a persistent homesickness that would never leave her, homesickness that was of something behind and beyond her early Truro life, these things were forever forbidding her tranquillity.

THE Americans were then and are now more kind-hearted than any other people; she made some warm friends who persuaded her almost in spite of herself that her lovely gentleness of character, her integrity, her generosity and her quiet unexpected humour were possessions that they would value all their days. But when she came back at last to England she was sure of what when she had left it she had only dimly suspected, that she would never learn the ways of this strange foreign world.

We lived in Durham for seven years and became during that time a family. We became it partly in self-defense because my father was head of a college that was considered by the Durham Upper Ten to be slightly outside the pale. My mother was the least snobbish of all people alive, but her sensitiveness, her distrust of her own power of attraction, made her, if the world showed a rough face, withdraw into her own security. She began at this time to live only for us; she was most happily married, sharing all my father's interests and ambitions and achievements, but she did not care for these things at all in comparison with our own individual happiness. The rest of the family were happy; I was very unhappy and entirely by my own fault. We lived in an odd house hacked out of the college buildings as it were by accident and surrounded by an overgrown garden and orchard. I considered myself misunderstood and neglected; I read novels insatiably and told myself stories with Cinderella-like themes, mooning up and down the orchard and thinking how fine it would be to throw myself into the river if only I could at the same time survive that I might hear the universal lamentations. Now my mother never either then or later had much patience with moonings of this kind. She had a tremendous sense of duty and a queer ironic humour. I was always at the bottom of every class at school and appeared to her to be forever wandering lazily about doing nothing. Moreover, I was clearly very unhappy and for no very definite reason; so during those years we misunderstood each other and yet the very thing that separated us was the thing we had in common.

SHE knew that this funny world with its snobbish Cathedral society, the odd uncouth young men of the college, the queer untidy garden, the cold rainy winds of the north, the occasional rudeness of unimaginative people, the perpetual housekeeping (which she always hated, did beautifully and never until the days of her last illness would relegate to anyone else), these things were not real, and beyond them was some beautiful place where she once had been and whither again she would go. I too had my sense of an unreal world—bullying stupid schoolmasters, impossible torturing mathematics and Greek accents, untidiness and bodily discomfort and everyone apparently engaged about things that were stupid, and waste of time. I could not explain, I was dumb, and my mother because of her essential shyness also could not explain. I wrote endless romances to which no one would listen and I must say in my own defense that I didn't care a hang whether they listened or no. This again seemed to my mother a dreadful waste of time; the writers whom she at that time loved were the heroes and heroines of her Victorian youth—Browning and Tennyson, George Eliot and Mrs. Gaskell. I wanted to be romantic, mysterious, unusual, and my mother, loving me, was distressed that I should be so absurd.

IN THE years that followed I broke away and sought adventures in London and it was with the publication of my first book that my mother and I suddenly began to understand each other. She perceived that this driving urge in me was real and determined and I began dimly to perceive the splendid development of character that was in her. She had to fight against numberless things: against allowing the longing for her own real country to become too strong in her, against a rather sharp ironic sense that was, she saw, quite plainly, mainly destructive; against an intolerance of people's gaucherie and bad manners. She detested bad manners and failures of tact; she had been brought up in a world where everyone was courteous, where servants were devoted to their masters, where people had time to think of small kindnesses, where there was a sort of gentle etiquette of good conduct. A new world was now around her, better in many ways than the old, but lacking many of the things she loved; she had to fight herself into acceptance of this. Then she had to fight against her shyness, her sensitiveness to what she thought were rebuffs, her shrinking from intimacies in which she could not wholly play her part.

She took all her relationships with intense seriousness, she had a conscientiousness that I have never seen equalled in any human being save her daughter; there was nothing casual about her word or her promise and when she loved she loved with all her heart. I myself, growing much happier, began to have more understanding and I dimly perceived how splendidly my mother's character was developing; but it was not until the middle of the war that I realised her.

WE HAD always said in the family that mother could stand better than any of us a big crisis; but it was the little things that worried her—a stupid maid at a dinner party, something said that seemed to her in retrospect false or liable to be misunderstood, somebody in trouble whom she was not able to help, reports of some cruelty or meanness, these things disturbed her terribly, but with many another woman of that time the war brought out all the grandeur that was in her. She had no meanness of view nor desire for revenge; she was intensely patriotic without hating the rest of the world and she watched over her family with the utmost care and tenderness and understanding and yet had thought and care left for everyone else who was in distress. I was abroad during most of the war but was conscious through it all of a growing intimacy with her. When it was all over I came home (home being then Edinburgh) and we had a walk one day up and down round Arthur's Seat and finally found each other. I had developed during those years a kind of religion of my own which, when I spoke of it to anyone else, was so vague as to be useless. She led me to talk about it. We had never discussed religion before; many of the dogmas that meant so much to her were meaningless to me, but I found that, more than anyone else I knew, she could understand almost any religious point of view. Her own faith was the most enviable thing in the world,

Getting Story *of* Lindbergh's Flight

—Wide World Photo.

Three flyers who have beaten the Atlantic: Lindbergh, Byrd and Chamberlin.

Bottling Up News *for* Private Use

From a
PARIS CORRESPONDENT

THE history-making flight of Captain—now Colonel—Charles A. Lindbergh from New York to Paris demonstrated in the realm of aeronautics that the yawning, water-filled space between the two cities on different continents could be spanned by heavier-than-air machines. But this great flight gave proof of another thing, while shattering other theories.

When Captain Lindbergh drove his way from New York to Paris and landed at Le Bourget air field, there began a test of extreme importance to journalism. It was *whether news of great magnitude could be isolated and bottled in such form as to become an exclusive marketable commodity in the hands of one newspaper organization.*

A powerful New York newspaper attempted to purchase the story of Captain Lindbergh's achievement as one might buy a rare collection of antiques to be marketed quickly and neatly.

Before the American flier had filled the tanks of his *Spirit of St. Louis* with gasoline and had tuned his motor at Roosevelt Field, Long Island, that newspaper had completed a dicker with him to deliver over to its representatives in Paris his complete account of the flight. The aviator agreed, conditionally upon success, to deliver a signed account of his experiences, for which story he was to receive an honorarium worthy of the achievement. There was no wrong in this and, in fact, there was none in what followed—but it contained the proof that preconceived plans do not always work.

When Captain Lindbergh left Roosevelt Field he perhaps had little idea of what was to happen when he arrived in France. Little did he realize that almost overnight he was to become the most famous aviator in the history of aeronautics, an international hero and the best-known American citizen. Others realized in advance, however, that if the American youth succeeded, alone, cooped in the tiny cockpit of an airplane for more than thirty hours, brushed by the wings of the angel of death throughout a day and a night over the roaring waves of the Atlantic—he would be what he proved to be, a world hero. Consequently, representatives of the New York newspaper in Paris began, from the time of Lindbergh's departure from American shores, to build a strategic plan to isolate the flyer and to 'sew up' his account of the epochal flight, to bottle his impressions and emotions—figuratively to gag him until one metropolitan newspaper had been able to publish the 'cream' of the great news development. Such was the plan and it was, incidentally, an ambitious and legitimate one. Did it work?

Upon Captain Lindbergh's arrival at Le Bourget flying field, five miles from Paris, the newspaper's representatives were to be stationed at various strategic points, according to plan. One was to rush to the cable with the news of his arrival. A party of three were to hurry toward the *Spirit of St. Louis* as it landed and to beckon Captain Lindbergh to hurry out and follow them. Still another was to remain near a high-powered automobile, ready to hide the flyer inside once the field party had succeeded in beckoning him from the scene of his historic landing.

Safe in the high-powered car, Lindbergh was then to be whisked miles away to Paris and effectively hidden until his priceless narrative had been procured and rushed, bit by bit, over the cable to New York. Rival newspapers in the American metropolis were to be reduced to publication of little on this most important journalistic event since the war except pitifully meager crumbs of information which would pale into insignificance in comparison with the exclusive narrative.

Ludendorff and the German general staff once planned a great battle designed to end the war. What happened to Ludendorff's big offensive of July 15, 1918, was exactly what occurred to the other piece of strategy at Le Bourget air field and at subsequent points, on the night of May 21, 1927. The plan did not work. Alas!

The high-powered automobile which was to carry Captain Lindbergh back to Paris and into isolation was itself bottled by hundreds of other cars parked around it by owners who went to Le Bourget at the call of curiosity—so thoroughly bottled that it became wholly useless as an instrument of quick transportation.

Lindbergh arrived on schedule at Le

Bourget field, but the field party rushing forth on the mission of beckoning him out of his ship had not taken into account that a mass of spectators numbering some 50,000 would rush out at the same time, breaking down a steel fence and trampling a thin line of police before them. Consequently, when the field party arrived at Lindbergh's plane, it was very effectively accompanied by tens of thousands of extraneous persons, all beckoning to Lindbergh.

Lindbergh was lost, the car was bottled, the plan had failed—an admirable plan except for these unforeseen events.

What actually happened to the intrepid young flyer upon his arrival at Le Bourget was that a group of French aviators had proved superior strategists and had rescued him while the crowd was mistaking another blond youth, who seemed to look like the Captain, for the Conqueror of the Atlantic. Lindbergh was isolated, not by the newspaper representatives, but by the French aviators who took him to a nearby hangar and later motored him into Paris. They did not deliver him to a secret rendezvous but took him directly to the American embassy.

Captain Lindbergh landed on the French air field at 10:21 p. m. It was between three and four hours later that the representatives of the newspaper in question were able to 'unbottle' their automobile and thread it through thousands of other cars on the congested Le Bourget-Paris road, in order to reach Paris and begin the hunt for the lost transatlantic flyer. When he was finally located, sitting on the edge of a bed in the American embassy at three a. m., he had already begun to narrate the 'cream' of his great flight for reporters of many newspapers there assembled

The right of the one New York newspaper in question to 'sew up' Lindbergh reposed primarily upon his contract to tell his story under his own signature. This contract was logical and honorable in every way. What, however, seems to have gone amiss with the strategy was the circumstances at Le Bourget and the flyer's own conception of the modus operandi. He had not been a party to the attempted isolation plan. In fact, he was soon convinced by a group of reporters who sought him out at the embassy that at least a few details of his adventure were general public property.

THE plan to isolate the flyer and 'preserve' his story for one newspaper was defeated, not by the initiative of others, however, but by circumstances which make it difficult for any one newspaper to purchase and monopolize actual living, throbbing news development.

What the single New York newspaper succeeded in buying from Captain Lindbergh was his signature on a general account of the flight. But his first impressions were public property; the combined ingenuity of many correspondents and their pressure upon him for these was so determined that he could not well resist and remain the popular figure which he turned out to be. Withholding from the general public these immediate impressions in

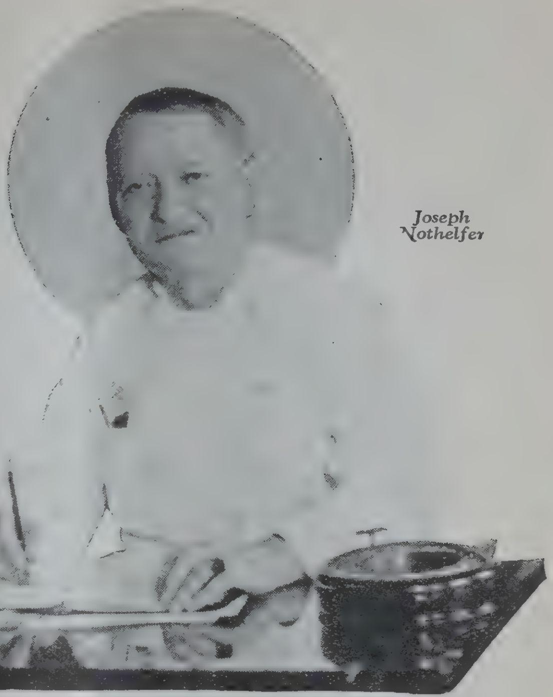
Lamb Chops for VICTOR HUGO

By NORMAN BEASLEY



Joseph Nothelfer

THERE came a great cheering from outside and we apprentices knew . . . we knew that Victor Hugo was coming into the Restaurant Magny.

'I peeked from behind the kitchen door and I saw Victor Hugo pushing his way through the crowd. His teeth were flashing as he laughed, and my master cried:

' "Joseph, hurry the lamb chops. Set out the nicest ones. Monsieur Hugo will be hungry today."

'And, surely, the great man came into the kitchen and, smacking his lips, shouted:

' "Joseph, lamb chops. Lamb chops."

'That was his favorite dish—lamb chops in jardinière of fresh vegetables.'

Joseph Nothelfer, chef of the Hotel Cleveland, in Cleveland, was telling of famous persons he had served—their favorite dishes. As he talked he paused, very frequently, at the mention of a famous name and smiled reminiscently. There were names out of history. Political leaders. Novelists, painters, actors, actresses, empire builders, rulers of nations. Those with names such as:

George Sand, Léon Gambetta, Alexandre Dumas, Admiral Schley, Sarah Bernhardt, William Howard Taft, William McKinley, Mark Hanna, Richard Mansfield, Julia Marlowe, Elbert H. Gary, Sir Henry Irving, Nat Goodwin, Emma Eames, Theodore Thomas, Jay Gould. Others—many others.

Joseph became an apprentice in Paris in 1872. In 1883 he came to the United States as chef in the Hotel Brunswick, in New York City. Three years afterward he went to the Hotel St. Nicholas, in Cincinnati, and it was while here that he received a note from Sarah Bernhardt which he still keeps. It read·

> 'I pity the one who is obliged to live in this smoky city, but the consolation is the famous good hotel St. Nicholas with its fine and excellent cuisine.
>
> —SARAH BERNHARDT.'

He remained in Cincinnati until the opening of the Hotel Cleveland in 1916. Thus, for fifty-five years he has been pleasing—or, certainly, trying to please—the appetites of those who eat in hotels and restaurants. And, in these days, who doesn't, at some time or other, go to a public dining room for satisfaction in food?

'Look at these names (and Joseph passed over a long list, names from which have been taken for use in a box printed elsewhere in this story), and in my mind certain dishes are connected with all of them,' said this delightful old artist of the kitchen. 'I cannot remember them all. Men—many famous men. Women—many wonderful women. In more than fifty years, you know, I have served a great many. Many, many more than I can remember. And I have been trying to remember for days.

'I recall that, when I was an apprentice, my master used to send me around making collections. This was a Monday duty. He equipped me with a big white apron and a satchel with a strap hanging across my shoulder. One of my regular calls was on Alexandre Dumas. This was the younger Dumas and he, too, wrote interesting books. He lived in a garret and he was poor—very poor, was never able to pay for his food when he ordered it; but my master always said:

' "Monsieur Dumas must eat."

'And, with each Monday, before I started out he would call me aside and whisper:

' "Joseph, be sure to see Monsieur Dumas today. He owes us many francs."

'Always I would call and always the servant would tell me:

' "Monsieur Dumas is out."

'I would tell this to my master and he would shake his head sorrowfully and say:

' "Well, another week. It won't make much difference. But, be sure to see him next time."

(*Continued on page 28*)

Favorite Dishes *of the* Great *and the* Near Great

Alexandre Dumas—nol au vent godiveau.

George Sand—filet mignon a la rossini.

Victor Hugo—lamb chops in jardiniere of fresh vegetables.

Leon Gambetta—chicken saute, truffles and fresh mushrooms.

Corot—friture of gougeau in fried parsley.

Admiral Schley—bouillabaisse.

Jay Gould—souffle of Irish potatoes, or sweet potato souffle.

William Howard Taft—filet of beef, larded, roasted au jus.

William McKinley—sirloin steak on the grill, browned potatoes.

Mark Hanna—sweetbreads, braised, with jardiniere of vegetables.

Sir Henry Irving—spring lamb chops a la Nelson.

Elbert H. Gary—filet mignon, fresh asparagus.

Nat Goodwin—St. Nicholas cocktail and assorted hors d'oeuvres.

Sarah Bernhardt—supreme of partridge with truffles.

Emma Eames—chicken saute with fresh mushrooms.

Theodore Thomas—sirloin on the grill.

Maude Adams—sweetbreads a la King.

Common Life and Character

THERE is probably not so much nonsense to be got rid of by the person leaving school nowadays, as there formerly was. Years ago no school was believed to have done its duty which did not send out every pupil filled with the idea that some day he (and now it would be also she) might become President. As the United States has required only 30 Presidents in the 151 years of its national existence, there has been a rather alarming waste of raw material.

The majority of the people are blessed by being destined to the very best kind of life there is, the life of plain persons upon whom all the liberties descend and who constitute the ruling class of the world. They will not be President, nor Congressman, nor town councilman, nor even secretary of their lodge; they will just be folks.

Nevertheless there are no such people as common people, in the sense that makes others uncommon. We are all common, or we are all uncommon, however you choose to look at it. A king is common, once you get to know him. The presidential office is not a common office, but the President is common. That is to say, people on the same plane of character are common possessors of much the same qualities; they are citizens of the same commonwealth.

> *THE common life and character make up the standard of existence. It is the common life which the majority of people now live. All that is good and worthy in it will probably constitute the rule of life in perfect society. When the blind leaders of social discontent announce that the majority are doomed to live common lives they do not see the uncommonness of our common life, nor do they see that the so-called common life is far and away the best life of all. The controlling power is character. The greater and better the character that is developed, the more the outer world is changed to conform to it.*

To say that a king is common and that the President is common is, however, not quite the whole truth; for these statements are made sometimes to soothe those who are in rebellion against being themselves. The major half of the truth is that no man is common; individuality, personality, the moral dignity of a human being as a creation of the infinite mind, these are the most uncommon things we can think about. No man is common. But in the compass of that fact, all men are common. They have a common uncommonness by virtue of their being human beings.

Then again, the book that the majority reads is said to be the best book. The food that the majority eats is held to be the most natural and nourishing food. The mode of life which the majority pursues is held to be the most satisfactory mode. The life that the majority leads may be called the standard, the normal life. Very well; that standard, normal life is the same life that we call common, and that some poor pitiable people regard as a life of failure. Life itself is at once the common and the uncommon thing. The majority are going to live the standard, normal human life. That life is common to all. It is the life that everybody must live in order to live at all; the life of labor and food, of day and night, of home and family, of body and soul—the same life which the President must live in his White House and the pioneer in his prairie home. It is the same life.

Life is divided into two main periods—the period when we take in and the period when we give out. Youth is the receptive period, and although that period does not end, there comes to keep company with it an expressive period when the individual makes his or her contribution to the general life. He does more than that, however; in his work he also makes a contribution to himself. The sum of earthly life is the making of character. It is inevitable.

We make character whether we want to or not. We make it whether we are conscious of it or not. We make it wherever we are and by whatever we do. There is no special location or no special occupation which is more favorable to character making than is another location or occupation. There is no station in life that is favorable to the production of a finer type of character than is any other station.

The more and better the character that is made, the more the outer world is changed to conform to it. The money question, the industrial question, the social question—all these wait for the settlement of the character question.

The reason high office is so powerless to bring about reforms, the reason titles and prerogatives are helpless in making a clean sweep of injustice, is just this—no office or authority gets any further than the character that creates and fills it. Character is the great authority. Given character, we can dispense with office. Presidents and kings and magnates of all degrees are but the servants of great characters. And great characters are independent of riches or power. They are rich and they have power, and are therefore invincible in whatever right things they undertake.

We have rather successful inventions, successful businesses, successful policies, but not enough successful men. The success of a man is to become a man in the character and power that make him a man. And this is all within his own control; no outer circumstance can control that, but he can use that to control outer circumstance.

They Got Him

MAJOR CHARLES P. MILLS, former Army officer, able Federal prohibition commissioner for New York, has resigned. The position had been made intolerable for him. Vicious newspaper attacks were launched against him and his assistants. Wild accusations by convicted criminals were used as the basis for equally wild charges against his administration. Politicians declared their intention to 'get' him. They got him. Mills, transferred to a minor post, resigned. Leaving the service, he told some unpleasant facts about the manner in which the Volstead Act is enforced.

Politics, not personal efficiency, is the keynote in holding a job as prohibition administrator, he declared. When he accepted the post he was assured by Assistant Secretary Andrews that he would have no interference from political sources. He soon learned otherwise. The great problem was not the arresting of law violators, but the dealing with politicians 'who look upon the prohibition bureau solely from the standpoint of political favor and patronage.' Major Mills described a conference in Washington, *attended by high officials of the United States Treasury and a New York politician*, at which Mills was described as 'the most efficient administrator in the country.'

'We won't question his efficiency,' was the reply, 'but let's talk patronage.'

Mills' conversation on this point was apparently not entirely pleasing to the politicians, for, says he: 'I have incurred the displeasure of certain political groups by not acceding to all their requests; which I could not do and still administer the law. Last fall I had occasion to dismiss, for various causes, some twelve or fourteen agents. It so happened that five or six of these men were political district captains, and since that time there has been no let-up in the endeavors of certain politicians to have me transferred.'

Major Mills made one statement that is deeply significant. He said:

'In leaving the prohibition service after sixteen months as administrator, I am convinced that *with decent administration, free from political influence, the sources of liquor supply in the United States can be controlled by the Federal Government.*'

Greatness in Sport

THERE is something wholesome about the rowing game. For more than five years the crimson of Harvard trailed the blue of Yale across the finish line. For almost as many years the blue and gold of California trailed the purple and gold of Washington. Then, of a sudden—in the same season, in fact—Harvard topples Yale from her throne and California unseats Washington. A record of stamina, of perseverance and determination, which lends a pleasing atmosphere to this collegiate sport.

This year we saw at Poughkeepsie the unknown crew of Columbia, after years of trailing the Navy and the University of Washington, sweep to the front and battle her way to victory. It was a triumphant victory made more so by years of patient defeat that had preceded.

One Tree's Destiny

'ONLY God can make a tree,' sang the poet; and of all those made by the Creator, probably few have fulfilled so rich a destiny as the Endicott pear tree of New England. Others have been more famous. The Cambridge elm, the spreading chestnut tree of schoolboy lore, the oaks at Jackson, Michigan, where the Republican Party came into being, each had its hour in history. Under their branches, in the shelter of their shade, the great have stood.

But to the Endicott pear tree was given the precious service of building luscious fruit for America's two greatest men. In the alchemy of its bosom, it blended the sap from Mother Earth with the brilliant sunshine of a New England summer; and it handed down its sweet product—first to George Washington. —

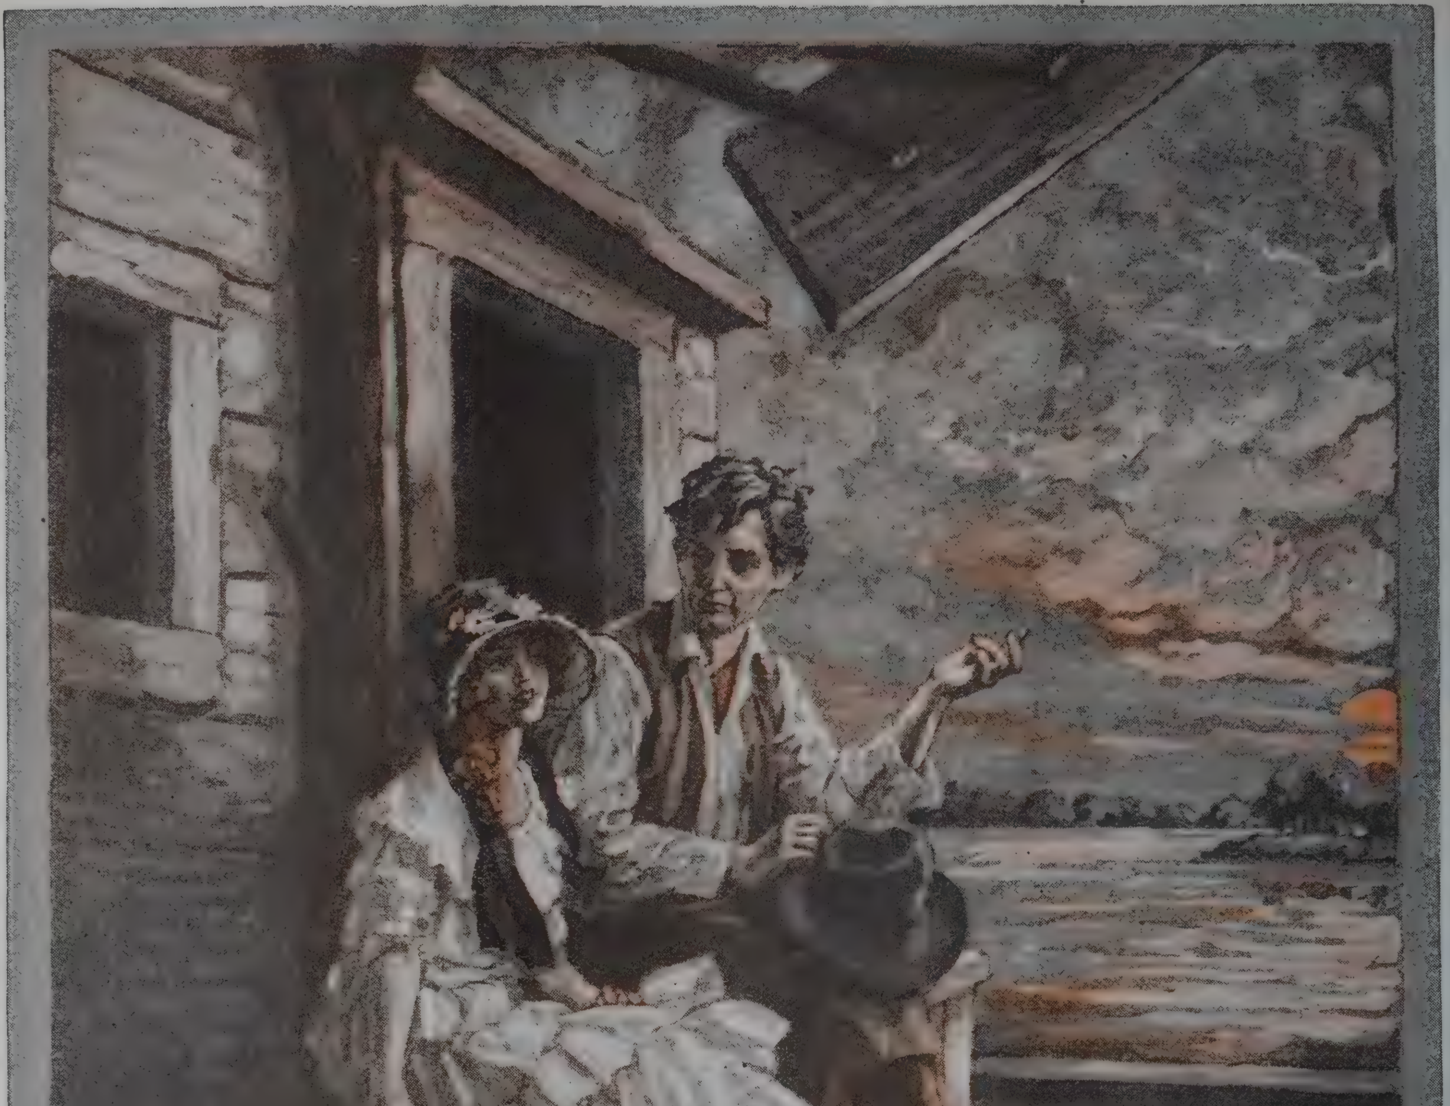
As the years passed, many a noted man partook of its blessing or was grateful for its shade. Daniel Webster admired it and nibbled one of its choicest pears. Then one day came its second great achievement; it dropped from its boughs a juicy gift for—Abraham Lincoln.

The tree is now 296 years old. It has been called the oldest planted fruit tree in America.

And So the Young Men Drowned

IT IS difficult to appreciate the viewpoint of a penitentiary official who permits young men to drown before his very prison walls, rather then release prisoners to rescue them. His explanation —that he feared lest the convicts, once allowed to leap into the water, would escape—does not explain. Judged from past experience, the next parole board will release several men from this same prison. In some modern instances elsewhere, wholesale releases have taken place, with nothing at stake half so valuable as a life.

Rifles should not hold back a good swimmer who is willing to breast a stream like the Hudson in order to save a life—even if the swimmer happens to wear stripes. Convicts should not be compelled to beg *in vain* to save lives—to beg of those whom society and the law have set over them as jailers, but who refuse to lift a hand in such a humane undertaking.

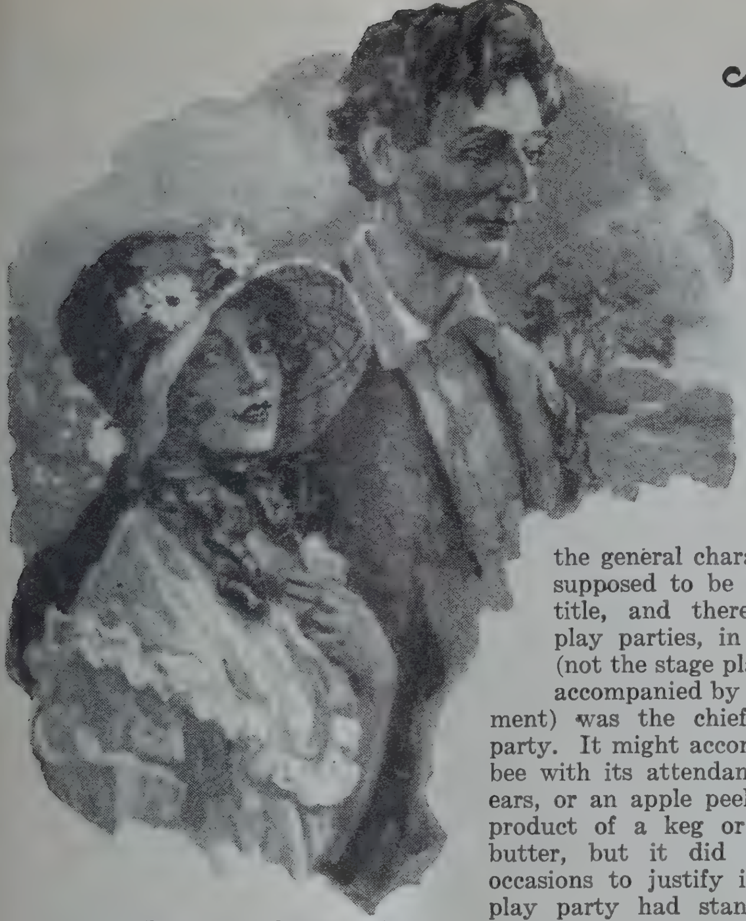


'It don't really go down; it seems so. The earth carries us under, as it were; we do the sinking, as you call it.'

A Schoolmate of LINCOLN

By
WILLIAM E. BARTON

Illustrated by
RAYMOND WARREN



Abraham talked to Katie of science and not of love. It was simply a boy and girl attachment begun in school.

IT IS interesting to recall that of the dim and meager traditions of Abraham Lincoln's boyhood in Indiana there is none that records his presence at a play party. It is not by any means to be inferred that he did not attend play parties; had he not done so we surely should have been informed of it, for that would have been something so completely distinctive as to mark him in the memory of his associates as a strange and unaccountable boy. We should have been told that, either because he was shy, or because he was wrapped up in his books, or because of this or that or the other eccentricity, he could never be induced to attend play parties. We have nothing so outstanding in his conduct with regard to this form of enjoyment.

The play party was a marked feature of social life at the time when the Lincolns were in Indiana. Dances were not held in high esteem by the sober-minded religious people of the frontier, but there was no such interdict upon play parties.

And now lest some reader, ignorant in this regard though intelligent in ordinary subjects that are talked about in books, should inquire what a play party was, and whether it was the same as some other kind of party, the answer is that a play party was a play party, and that is all there is to be said about it. There are card parties and tea parties and other kinds of parties the general character of which is supposed to be described in the title, and there are, or were, play parties, in which the play (not the stage play, but the game accompanied by music and movement) was the chief feature of the party. It might accompany a husking bee with its attendant search for red ears, or an apple peeling with its by-product of a keg or crock of apple butter, but it did not need those occasions to justify its existence. A play party had standing in its own right.

Imagine Abraham Lincoln at a play party. The boys and girls are formed in two parallel lines facing each other, and their first play perhaps is that of the sheep stealer. In real life no man was held more in abhorrence than the sheep thief, though the horse thief was by common consent a worse and more dangerous criminal. To steal a horse was an invitation to be hanged; while a sheep thief received imprisonment and contempt. But in the play party the sheep stealer was not so bad a culprit. Let us suppose that Abraham Lincoln stands at the head of the line, and opposite him, by either accident or design, Katie Roby.

It is a relatively new play, and it is the first time Abraham has participated in it. To commence with someone not familiar with it is part of the game. The boys and girls begin by pointing accusing fingers at Abraham:

There's the man that stole the sheep!
There's the man that stole the sheep!
There's the man that stole the sheep!
    He stole it while we was all asleep.
He holt the salt in his right hand;
He holt the salt in his right hand;
He holt the salt in his right hand;
    And bid the sheep, 'C'Nan! C'Nan!'

Abraham is certainly embarrassed by this accusation, and not less surprised when the company turns upon Katie the similar accusation as an accessory.

Simplifying the threefold repetition, they sing:

There's the lady that fried the meat,
    She fried it while we was all asleep;
She helt the knife in her right hand
    And turned it over in the frying-pan!

Having established her guilt as *particeps criminis*, they turn again on Abraham:

Irish potatoes, tops and all,
Irish potatoes, tops and all,
Irish potatoes, tops and all,
Kiss her now or not at all.

Now under the circumstances, what was Abraham to do? We have no record of his actual conduct, but presumably he did what other young men were accustomed to do.

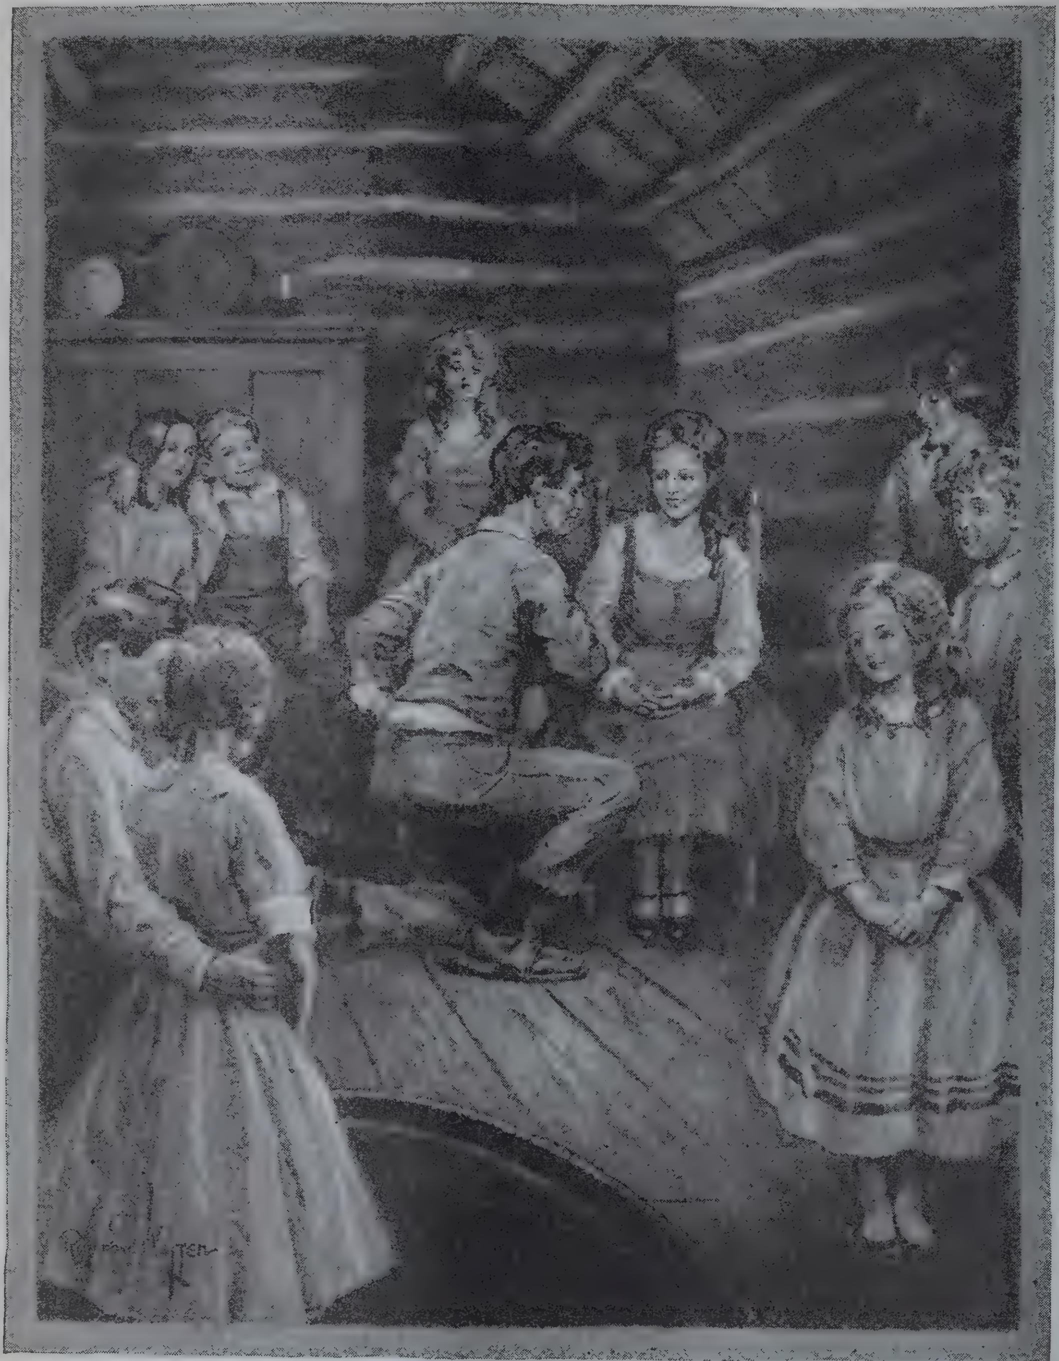
One swallow does not make a summer, nor does one play make a play party. Perhaps the next game is about the young lady who sits down to sleep. Two chairs are placed side by side but facing in opposite directions. In one of them a girl is seated. The company circle round her and sing:

There was a young lady sat down to sleep,
    Sat down to sleep, sat down to sleep,
There was a young lady sat down to sleep,
    So early in the morning.
She wants a young man to keep her awake,
    To keep her awake, to keep her awake,
She wants a young man to keep her awake,
    So early in the morning.
Oh, write his name down and send it by me,
    And send it by me, and send it by me,
Write his name down and send it by me,
    So early in the morning.

As these lines are being sung, the young lady who is supposed to have sat down to sleep, but who is never more awake in her life to all the possibilities of her opportunity, selects her confidante and whispers a name in her ear. That confidante possesses, and is supposed to be the only one who could possibly guess, the name with which the next stanza must begin:

Mr. Abe Lincoln his name shall be,
    His name shall be, his name shall be,
Mr. Abe Lincoln his name shall be,
    So early in the morning.

Mr. Abe Lincoln, thus chosen, sits beside the young lady, but has scant time or need to keep her awake, She has made her choice; there is no kiss or other token of affection. They sit together for a brief musical measure, and then she leaves him. The song goes on. There is now a young man, seated in the expectation of slumber; he needs a young lady to keep him awake; he whispers her name and has her by his side for a moment, then leaves her to select another young man to keep her awake, so early in the morning.



What a trial was before him who had to bow to the wittiest, kneel to the prettiest and kiss the one he loved best.

There is another game, or was, during the boyhood of Lincoln and within the memory of at least one living man, called 'weavilly wheat.' 'Weavilly wheat ain't fit to eat,' according to this play, or at least is not fit for the hero named in this game who was possibly descended from the old Scottish times when Charlie was over the water, and there was not a maid in all the land but vowed 'baith late and early,' she'd to no man give heart and hand who 'would not fight for Charlie'; the times when the Highlanders 'came o'er the heather, came a' togither, for wha'd be king but Charlie,' survived in several frontier songs:

I won't have none of your weavilly wheat,
  And I won't have none of your barley,
Won't have none of your weavilly wheat,
  To bake a cake for Charlie.

There was one that told of the joy of the miller when he lived in the mill, the wheel turned around and it couldn't stand still. There was another about the farmer sowing his seed, standing and taking his ease, stamping his foot, and clapping his hands, and turning around to view the lands—'the lands' being partner for him by the hand of fate in the revolution of the play. And there was 'Skip t'm'loo.' It probably was 'Skip to my love,' but the pronunciation was 'Skip t'm'loo.' This was a play to delight a disciple of Hegel, for it was modeled on a thesis, an antithesis and a synthesis. It started off, every boy having a partner, with one single exception—one boy was 'it.' And it was his care to descend like the Benjaminites at Bethel and steal a bride. The moment at which he had opportunity to do this was the moment when all partners dropped each others' arms, and each man robbed became at once a robber, leaving another 'it.' For he was little less than a booby who, having the whole company to select from and nothing else to occupy his mind, failed and was 'it' for a second time in succession. The distribution being effected, the newly mated partners moved on, avowedly happier for the change. It would seem necessary only to resolve the whole of human life into one game of 'Skip t'm'loo' to have a solution of all the problems of the universe, with everyone happy. With this explanation, and a reference to the philosophy of Hegel for any further comment, the text of the play may be given:

Pretty as a redbird, Skip t'm'loo,
Pretty as a redbird, Skip t'm'loo,
Pretty as a redbird, Skip t'm'loo,
  Skip t'm'loo my darling.
Gone again, Skip t'm'loo,
Gone again, Skip t'm'loo,
Gone again, Skip t'm'loo,
  Skip t'm'loo my darling,
I'll get another one, Skip t'm'loo,
I'll get another one, Skip t'm'loo,
I'll get another one, Skip t'm'loo,
  Skip t'm'loo my darling.

It is fashionable to turn up the modern nose at those old plays, and snuff them out contemptuously as 'kissing games.' Not all, nor even many of them were kissing games, and whether the kissing games were more horrible and disgusting and whatever else you care to call them than the modern dances there is room for an honest difference of opinion. But there were kisses in the games in which forfeits were paid, as, for instance, that game 'Roll the platter,' which called for agility and much besides. When the forfeits were sold, they were held by one girl over the head of another, the latter blindfolded, and possessed of a most elaborate knowledge of penalties:

'Heavy, heavy hangs over your head,' said the girl who held the forfeit, let us say Abraham Lincoln's pocketknife, in full view of all but the blindfolded image of Justice:

'Fine or superfine?'

'Fine,' was the answer. If the forfeit had been Katie Roby's back comb, and if she had been going about with her lovely hair all down ever since she failed to catch the platter, the answer would have been, 'Superfine.' But a man's forfeit is 'Fine.'

'What shall the owner do to redeem it,' was demanded.

Then the oracle utters the bloodcurdling penalty, too terrible for description here, though the legal language may be employed:

'He must make a double-shovel plow with Katie Roby.'

'He must make a sugar bowl with Katie Roby and put three lumps in it.'

'He must bow to the wittiest, kneel to the prettiest, and kiss the one he loves best.'

MAKING a double-shovel plow, or a sugar bowl, or picking cherries, and putting four of them in the bucket, were extreme penalties, but they involved no grace but courage to go straight at the matter and have it done with, but what a trial was before him who had to bow to the wittiest, kneel to the prettiest and kiss the one he loved best! For, even though the one he loved the best was grateful for his choice of her, what was he to say in excuse for having declared others to be prettier or wittier than she?

Did Abraham Lincoln attend these play parties? Certainly he did, and he participated in all these various games and endured, we know not with what grace and submission, penalties such as those that have been named but whose cruelties have not been here described.

Let it be here shamelessly recorded by one who has witnessed not a few of these affairs that they were not attended by terrifying results. They were rude and frank and promiscuous, but they were part and parcel of the social life of a fairly well stratified society, and while modern folk may affect to be shocked by them, they are not so badly shocked as would be the patrons of the play party by the bunny-hug and the cheek-to-cheek dancing.

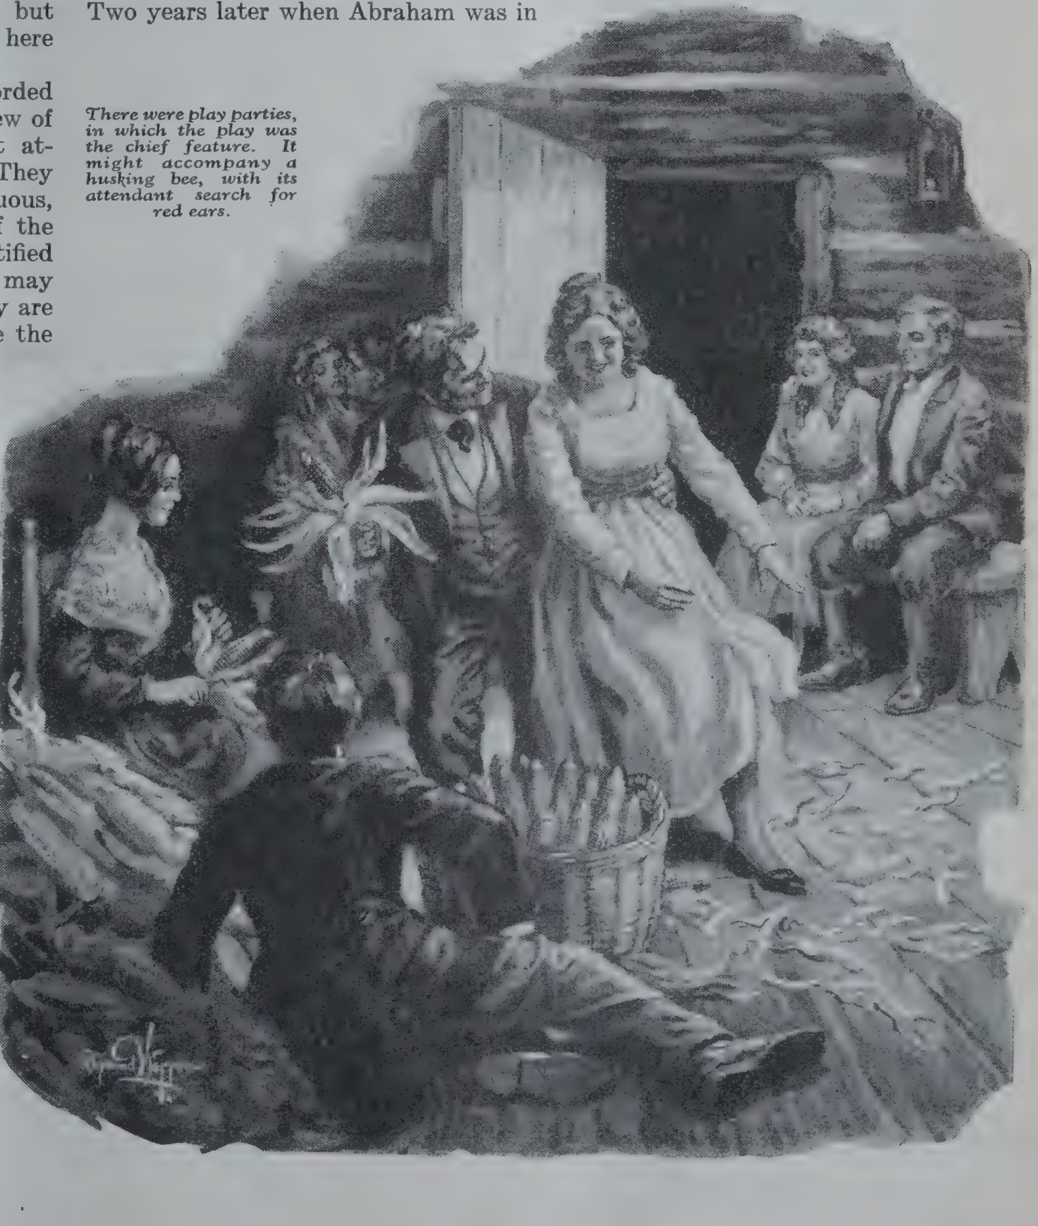
Abraham Lincoln attended two schools in Kentucky, and left that state when he was seven years old. The terms were brief and his attendance was irregular. In Indiana he attended three schools. The first was taught by Hazel Dorsey, whose school convened only a mile and a half from the Lincoln farm. The schoolhouse was built of round logs, and was just high enough under the loft for the teacher to stand erect. The floor was of split puncheons. The windows were made by cutting out parts of two logs, one on each side of the building. It is said that greased paper was placed over these apertures, but the author has known such buildings with no pretense of any paper, much less of glass, to keep out the weather. The chimney was made of poles and clay. The farmers furnished the firewood in rather long logs, which the older boys cut into four-foot lengths for the fireplace. The schoolroom probably had no broom, but was swept semi-occasionally by the older girls, who used a bunch of pawpaw or hazel bush to raise and redistribute the dust.

Abraham was ten years old when he attended this school. He evinced qualities of leadership which his schoolmates remembered. One of his companions wrote in after years that he always appeared quiet during playtime, never was rude, and seemed to have a liking for solitude. He was often chosen to assist in the adjustment of difficulties between his schoolmates, and, when appealed to, his decision ended the dispute. He was known as a lad of courage, but had few if any difficulties with his companions. He won their respect for his character, and later for what they deemed his scholarly attainments. For from the first he was an apt pupil.

It was four years after the close of Hazel Dorsey's school before Abraham Lincoln was privileged to attend school again. The second Indiana school was kept by Andrew Crawford, a neighbor. Two years later when Abraham was in his seventeenth year he attended his third school in Indiana—his fifth in all—kept by a man named Swauey. This last school was four miles away. The distance being so great, his attendance was irregular and brief. Crawford's school would seem to have done more for him than either of his other periods of attendance upon book education.

Lincoln's textbooks were *Webster's Speller*, the *American Speller*, *Pike's Arithmetic*, and *Murray's English Reader*. It was customary to teach a boy to spell through the entire spelling book before he was taught to put words together. The author has known a girl who attended school for two terms, spelling the book through three or four times without getting any definite idea of what the process was for, and who read with great delight a sentence that caused the significance of the educational process to dawn suddenly upon her—'Ann can spin flax.' Spelling was one branch of learning which was not neglected in the backwoods schools.

The Bible was used as a reading



There were play parties, in which the play was the chief feature. It might accompany a husking bee, with its attendant search for red ears.

book in many of the district schools. We know this in many ways; among others, we know it from a story of Lincoln's told by him to Senator Henderson of Missouri, and by Senator Henderson to Vice-President Adlai E. Stevenson, relative to the small boy who stumbled over the names of the three Hebrew children who were cast into the fiery furnace.

CRAWFORD did more than teach the contents of books. He conducted a school of good manners. He would send one student out of the room, and bid him or her reënter as a lady or gentleman should enter a drawing-room or parlor. One pupil was detailed to greet the entering guest, conduct him from seat to seat, and introduce him properly to each member of the school; those to whom he was introduced were taught to respond in the etiquette of the day. We do not know how Lincoln acquitted himself in these formalities. He was very tall and awkward.

He had shot up almost overnight, and had reached his full stature, six feet, three and one-half inches, before he attained his seventeenth year. He weighed about a hundred and sixty pounds, was strong and vigorous, but slow in movement.

We owe to Katie Roby a description of him as he appeared in school:

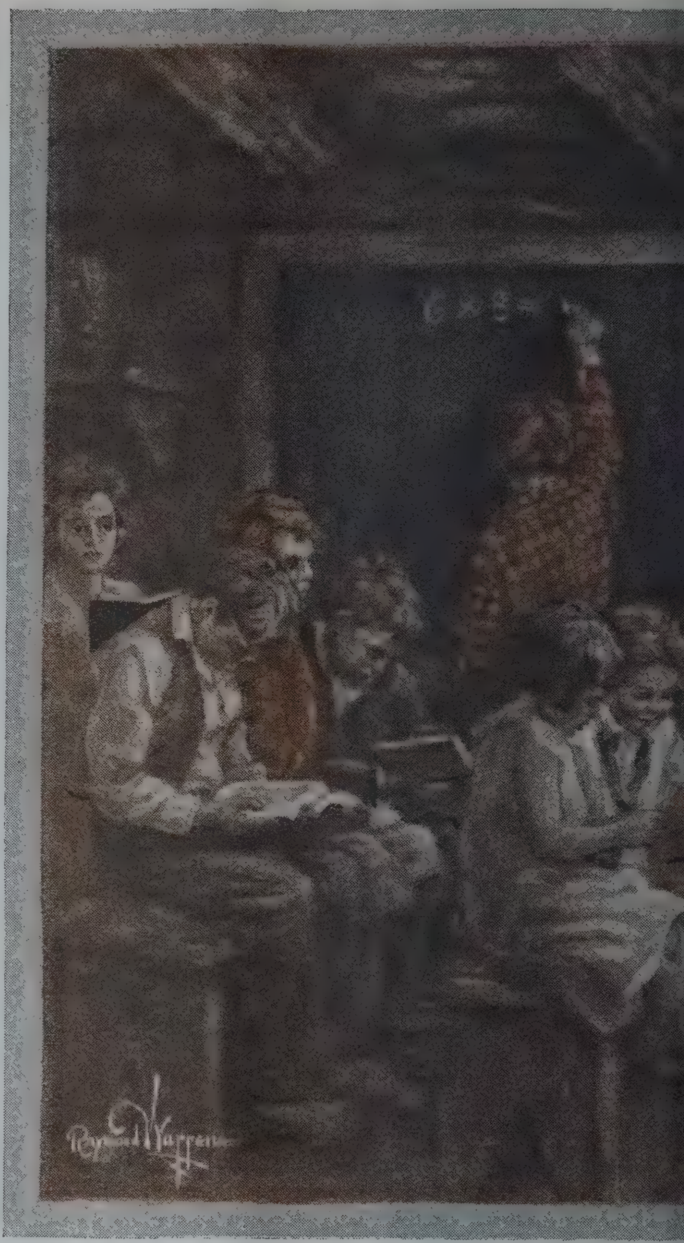
'His skin was shriveled and yellow; his shoes, when he had any, were low. He wore buckskin breeches, linsey-woolsey shirt, and a cap made of the skin of a squirrel or coon. His breeches were baggy, and lacked several inches of meeting the tops of his shoes, thereby exposing his shin bone, sharp, blue and narrow.'

Katie Roby was an observant girl of fifteen.

The description she gave was not flattering as to personal appearance, but she was interested in something more than Lincoln's looks. She knew he was not handsome, but he was worth a careful looking over. She observed him with sufficient care to remember for thirty-five years these convincing details of his personal appearance. Such careful observation was not wholly disinterested. She and Abraham Lincoln liked each other.

She remembered a spelling match in which Abraham, though on the opposing side, helped her out. In those days 'spelling down' was not only a regular weekly exercise in school, but a frequent evening recreation which took in as participants the whole neighborhood. Two captains were selected in advance, and they determined by the tossing of a stick and the piling of hand upon hand above that of the catcher who should have the first choice. Abraham was the almost invariable first choice, for he was recognized as the best speller in the community.

That is saying much, for in the backwoods settlements were people who had an almost uncanny gift of accurate spelling.



The words were pronounced by the teacher, and spelled first on one side and then on the other. The process began with easy words, and sometimes it was several minutes before anyone sat down. Everybody can spell through the first page of 'words of two syllables, accented on the first — baker, shady, lady, tidy,' and so on. The second group containing 'words of two syllables accented on the second' is harder—'abase, translate, embroil,' and so on. The next group of 'words of two syllables accented on the first' is still harder, containing, among others, 'banquet, coupon, curfew, clergy.'

But the opposing lines of spellers begin their serious thinning in the sections beginning with 'amity, abasement, blandish, sirocco, and luminary.' From there on through 'sycophant, superfluity, antipode and juridical,' the mortality is heavy even in a contest between experienced spellers.

The author has held the book and given out these fatal words in a contest that left few survivors beyond the middle of the book. In a spelling bee in Crawford's school, Abraham and Katie stood opposite each other, and the word 'defied' came down the double line.

It ricocheted from side to side, knocking over one contestant after another.

'Abe stood on the opposite side of the room,' said Katie in 1865, 'and he was watching me. I began d-e-f- and then I stopped, hesitating whether to proceed with an "i" or a "y"! Looking up, I beheld Abe, a grin covering his face, and pointing with his index finger to his eye. I took the hint, spelled the word with an "i," and it went through all right.'

Whittier tells of the little girl who was sorry that she spelled the word which gave her a place above him—'because, you see, I love you.' In later life, as he sadly reflected, he had often to give place to men who rose above him, but few of loved him enough to be sorry.

It was safe enough for Lincoln magnanimous to anyone who wa danger of misspelling 'defied,' for he w home with 'antiscorbutic' and 'words of five syllables, accented o fourth,' and with 'words of four o syllables, retaining the accent of primitives' of which the top word 'alcoholize,' and with those very dif words toward the end of the boo which some letters assume the sou other letters. But still there was a r for his willingness to see Katie standing across from him a little lo and not retreating toward her seat the best spellers were on their way t rear.

So he grinned, pointed his i finger to his eye, and Katie gave ov thought of spelling 'defied' with a She knew she could trust him. He helping her, not trapping her, thoug was on the opposing side.

Katie found occasion to admire A

those days Abraham was a regular of a Louisville paper, and kept t of current events with rather remarkable facility, his antecedents and environment considered.

William Wood, whom Lincoln called 'Uncle Wood' was a subscriber to two papers, and Lincoln was an assiduous borrower and reader.

At this time his books consisted of the *Bible*, *Aesop's Fables*, *Pilgrim's Progress*, *Robinson Crusoe*, a *History of the United States*, the author of which has not been identified, and Weems' *Life of Washington*. The last of these books he earned by three days' hard work. He had borrowed the book from Josiah Crawford—not Andrew the teacher, but from him whom the boys called 'Blue Nose.' The book was damaged while in Abraham's possession, and he worked three days to pay for it. He always regarded this as an excessive price, and blamed the owner of the book; but three days' fodder-pulling at twenty-five cents a day would not seem extortionate, when we consider the low price of labor and the scarcity of books.

Lincoln became a good penman. His early handwriting is exhibited in certain of his books. Perhaps the earliest of these is the following often-quoted lines:

Abraham Lincoln
his hand and pen.
He will be good but
God knows when.

Some sentimental writers have professed to find in this doggerel some foreground of the mind and character of Lincoln; but these lines were already decades old before Lincoln ever employed them. His use of these lines means merely that he caught up a current jingle and copied it.

Two other lines he wrote:

Good boys who to their
books apply
Will all be great men bye
and bye.

He wrote some more serious verse. The following ungrammatical stanza has been thought original with him; but though the writer has not identified, or attempted to identify, its author, he does not think these to be the thoughts of a boy:

Time, what an empty vapor
'tis,
And days, how swift they
are:
Swift as an Indian arrow—
Fly on like a shooting
star.
The present moment just is
here,
Then slides away in haste,
That we can never say they're ours,
But only say they're past.

Lincoln later wrote some stanzas of his own, and he exercised his gifts in other forms of composition, including some rude backwoods burlesques, which have been taken more seriously than they deserved. In all these matters he was testing his powers, and showing the beginnings, but only the beginnings, of that strength which later he displayed. But he learned to write a good hand, and to use clear and forcible English.

In manual labor, Abraham Lincoln was not regarded as an industrious boy. 'He was no hand to work like killing snakes,' said a neighbor woman. 'He worked for me,' said John Romaine, 'but he was always reading and thinking.

'I used to get mad at him for it. I say he was awfully lazy. He would laugh and talk, crack jokes and tell stories all the time; didn't love work half so much as his play. He said to me one day that his father taught him to work, but he never taught him to love it.'

He loved to read more than he loved to plow corn. He liked to lie down in the shade of a tree and study, moving around with the sun. He did his sums on 'boards' riven or whipsawed, odds and ends of lumber or split shingle, reserved for kindling. Sometimes he would figure on the wooden shovel which served as one of the fireplace utensils. When the shovel had been covered so many times that erasure was no longer possible, he would shave off the shovel, and begin anew with charcoal to cypher over the fresh wood.

Except at the Swauey school, which was so far away that Lincoln's presence was irregular and very brief, his attendance was prompt, and he was a general favorite on the playground and a good scholar in the schoolroom. He was the best speller, the best penman, and perhaps the best all-round scholar among the boys of the neighborhood. His attainments were meager, but substantial; and they exerted a marked and permanent influence upon his future. Poor as were his facilities for an education, and scant as were the qualifications of his instructors, Abraham Lincoln learned a great many valuable things in the days of his schooling in the woods of Indiana.

In March, 1828, Abraham went to work for James Gentry, the proprietor of Gentryville. Early in April, Mr. Gentry furnished his son Allen a flatboat, on which the latter made a voyage to New Orleans, accompanied by Abraham, who served as 'bow hand' at a stipend of eight dollars a month. This was Abraham's first entrance into the great world, and it meant much to him. While the boat was loading at Gentry's Landing, near Rockport, on the Ohio, Abraham saw a great deal of Katie Roby, whose family would appear to have removed for a time from Gentryville to the village on the Ohio. In the evening, they would stroll together by the great river, and talk of many things. She had grown older since the day when Lincoln helped her to spell 'defied,' and he had learned more than he knew three years before. He was now nineteen years of age, and she sixteen.

'One evening,' she related, 'as Abe and I were sitting on the banks of the Ohio, or rather on the boat spoken of, I remarked to Abe that the sun was going down. He said to me, "That's not so: it doesn't really go down; it seems so. The earth turns from west to east, and the revolution of the earth carries us under, as it were; we do the sinking, as you call it. The sun, to us, is comparatively still; the sun's sinking is only in appearance.'

'I replied, "Abe, what a fool you are!" I know that I was the fool, not Lincoln. I am now thoroughly satisfied that Abe knew the general laws of astronomy and the movements of the heavenly bodies. He was better read then than the world knows, or is likely to know exactly. No man could talk to me as he did that night unless he had known something of geography as well as astronomy. He often and often commented or talked to me of what he had been reading—seemed to read it out of the book as he went along—did so to others. He was the learned boy among us unlearned folks. He took great pains to explain; could do so simply. He was diffident, then, too.'

So far as is known, Abraham talked to Katie only of science and not of love. She married Abraham's partner on the voyage, Allen Gentry. She took pains to say in after years that she and Abe just liked each other, and were never really in love. It was simply a boy and girl attachment begun in school when Lincoln was young and continued in occasional meetings afterward, as Lincoln was merging into manhood and she into womanhood. Lincoln was diffident, even then, she remarked. Perhaps he did not think of love at all; perhaps he thought of it, but saw no prospect before him that could justify his making love to a girl. Perhaps Katie saw a more hopeful outlook in a match with Allen Gentry, son of the foremost man in Gentryville and part owner of a boat, than in the raw deck hand Lincoln, with all his learning.

She was able to tell with pride in after years of the friendship Abraham and she had for each other, and of the time he helped her spell the word, of the evenings when they wandered by the Ohio and dipped their bare feet in the stream and saw the sun go down and the moon rise. But they were not lovers; just good friends. She admired the tall, awkward, diffident lad, in spite of his grotesque attire and his lack of grace. He admired her, and liked to be with her. Such relationships belong to the expanding life of young people. It is well when they are as wholesome and mutually helpful as was the case with Abraham Lincoln and Katie Roby.

Bottling Up News for Private Use

(*Continued from page 8*)

favor of a more limited clientele of one newspaper and its syndicate papers would have dampened the popularity of Captain Lindbergh.

The 'cream' of the great adventure, therefore, was not bottled. Modestly related by the young flyer—clad in pajamas and sitting on an embassy bed—it was, in brief, as follows:

> I had to drive through a thousand miles of fog over the Atlantic.
>
> I could not get over this fog or under it. Sometimes I was within ten feet of the water, just skimming above the surface. Sometimes I was ten thousand feet above it.
>
> I didn't see a single ship during daytime. At night I saw the lights of one.
>
> At one time there was considerable sleet and ice on the bow of the plane and I was a little concerned.
>
> We (the plane and I) could have gone a thousand miles farther, at least.
>
> The thing I cannot get over is how short a time it took to cross the ocean.
>
> I saw flares on the French coast thirty or forty miles away. I saw the Eiffel Tower a short distance out.
>
> I wouldn't have got out of the plane so quickly at Le Bourget if it hadn't been for that crowd. I thought they were going to injure the plane.
>
> No, I am not sleepy at all. Just a little stiff.

These and other statements constituted the 'cream' of the great story of Captain Lindbergh's flight. He did not sell these words. He gave them away. And correspondents who heard them rushed to the cable and hurled them back across the Atlantic at urgent rates. They were not printed exclusively in one newspaper at the expense of lost prestige for others. They were generally published, and all the American public had a right to them.

Undaunted by failure to bottle him on the first and more important occasion, the same newspaper again contracted with Lindbergh to write a special series of ten articles detailing his reactions during the hectic sojourns in Paris, Brussels, London, Washington, New York and St. Louis. Here was another effort to make this American national hero an exclusive feature for that paper during seven days required to cross from Cherbourg to Washington aboard the U. S. Cruiser *Memphis*. Captain Lindbergh was asked to name a representative of that newspaper as his 'literary secretary' during the return voyage. Now the *Memphis* carries powerful radio equipment capable of communicating with American Naval stations at all times. Here would be the representative of a single American newspaper aboard a cruiser with the world hero and at his elbow a radio which would hurl through space every move, every detail, of the hero's voyage.

Certain American diplomats in both London and Paris did their utmost to aid the latest attempt to bottle the transatlantic hero. They succeeded in prevailing upon Secretary of the Navy Wilbur to agree to the 'literary secretary' idea.

However, the Navy Department immediately came under heavy bombardment from the three leading press associations of the United States—and the Secretary was obliged to permit reporters from these associations to board the *Memphis*. The 'literary secretary' was not to use the wireless except for dispatches signed by Captain Lindbergh himself.

These individual newspapers argued that they sought no privilege of interfering with the contracted ten articles which their rival had bought from Captain Lindbergh, but that they believed this youthful American, sailing home to glory, was for the time being as much American public property—in the news sense—as the cruiser *Memphis;* that permission for one single newspaper to be so favored was discrimination in the purest sense. But as the Navy Department and the diplomats took it upon their shoulders to be agents of such discrimination, the representatives of individual newspapers did not sail. Little, however, did they know that at least one of these newspapers had a trained reporter aboard the *Memphis* acting as a motion-picture operator; and, like his rival, barred from using the wireless, he was a free agent to write at will once the ship reached American shores.

Thus, two attempts to tie up the news of the greatest American hero since Admiral Dewey met with failure.

The theory that news—a perishable and exceedingly volatile commodity—cannot be bottled for private use seems to have become substantiated.

The Mayflower Company

LATE in July, three hundred and five years ago, a company of Englishmen left that goodly and pleasant city of Leyden, on a great adventure. This city 'had been their resting place near 12 years; but they knew they weree pilgrimes'; so wrote their governor, William Bradford, thirty years later. The small ship 'came in a short time to Southhamton, wher they found the bigger ship come from London, lying ready with all the rest of their company.' This 'bigger ship' was the *Mayflower* and it carried a company of about one hundred to the New World.

Facsimile of a portion of Bradford's record

The plan had been to go to Virginia, but ships did not sail so accurately in those days; and so arriving at a good harbor the group elected to remain there.

Governor William Bradford wrote, about 1648, a history 'Of Plimoth Plantation,' being an account of the events of the life of that colony from its inception down to 1647. This precious document now reposes in the Massachusetts State Library.

'The names of those which came over first, in ye year 1620, and were by the blessing of God the first beginers and (in a sort) the foundation of all the Plantations and colonies in New England; and their families.

The Mayflower Company	*Thirty Years Later, 1650*
Mr. John Carver; Katherine, his wife,	Mr. Carver and his wife dyed the first year
Desire Minter	returned (to England)
& 2 man-servants, John Howland, Roger Wilder;	his man Roger dyed. John Howland married Elizabeth Tillie, 10 children.
William Latham, a boy; & a	. . . after more than 20 years stay . . . went into England, and . . . to the Bahamy Islands . . . and ther . . . starved for want of food.
maid servant	married and died a year or two after.
& a child that was put to him, called Jasper More	Jasper dyed (in the first year) of ye common infection.
Mr. William Brewster, Mary, his wife; with 2 sons, whose names were Love and Wrasling;	Mr. Brewster and wife died after a long residence. Wrastle dyed a yonge man unmarried. Love . . . dyed (1650),
And a boy was put to him, called Richard More; and another of his brothers The rest of his children were left behind and came over afterwards.	and left 4 children Richard More . . . is married, and hath 4 or 5 children Brother dyed the first winter.
Mr. Edward Winslow; Elizabeth, his wife;	Wife dyed the first winter; and he maried with the widow of Mr. White, and hath 2 children living by her marigable . . .
& 2 men servants, caled Georg Sowle and Elias Story; also a litle girle . . . Ellen More	(Story died) . . Sowle . . . hath 8 children (no record).
William Bradford, and Dorothy, his wife	. . Wife dyed some after their arrivall; and he maried againe . . ; and hath 4 children, 3 whereof are maried.
Mr. Isaack Allerton, and Mary, his wife;	Wife dyed with the first . . Himselfe maried againe with the daughter of Mr. Brewster . . (she died) . . maried againe, and hath left this place (to England).
with 3 children, Bartholomew, Remember, & Mary;	Bartle is maried in England . . Remember is maried at Salem, and hath 3 or 4 children living . . Mary is maried here and hath 4 children.
and a servant boy, John Hooke	Dyed.

The Mayflower Company	*Thirty Years Later, 1650*
Samuel Fuller, and a servant, William Butten,	Mr. Fuller his servant dyed at sea; and after his wife came over, he had tow children by her . . .
John Crakston . . sone, John Crakston	(both dyed)
Captain Myles Standish, and Rose, his wife,	His wife dyed in the first sickness, and he maried againe, and hath 4 sones liveing, and some are dead.
Christopher Martin . . . wife . . . 2 servants, Salamon Prower and John Langemore.	Mr. Martin, he and all his dyed in the first infection.
William Mullines . . wife . . children, Joseph and Priscilla . . . servant, Robart Carter.	Only his daughter Priscilla survied, and maried with John Alden, . . . and have 11 children. And their eldest daughter . . . hath 5 children.
Thomas Rogers, and Joseph, his sone	Dyed in the first sickness; Joseph . . . hath 6 children
Thomas Tinker, and his wife and a sone	All dyed in the first sickness
John Rigdale, and Alice, his wife	Died in the first year
James Chilton, and his wife, and Mary, their dougter	Both dyed; Mary . . . hath 9 children
Edward Fuller, and his wife. and Samuell, their sonne	Dyed son after they came ashore; Samuell . . hath 4 children or more
John Turner, and 2 sones . . .	All dyed in the first sickness
Francis Eaton, and Sarah, his wife, and Samuell, their sone, a yong child	First wife dyed; maried againe, & his 2. wife dyed, & he maried the 3. and had by her 3 children . . Samuell . . . hath a child.
Moyses Fletcher, John Goodman, Thomas Williams, Digerie Preist, Edmond Margeson, Peter Browne, Richard Britterige, Richard Clarke, Richard Gardenar, Gilbart Winslow.	Fletcher, Williams, Preist, Goodman, Margeson, Britteridge, Clarke . . all dyed sone after their arivall; Gardiner and Winslow returned to England; Browne maried twise . . in all 4 children.

'John Alden was hired for a cooper, at South-Hampton, wher the ship victuled and being a hopfull yong man, was much desired, but left to his owne liking to go or stay when he came here; but he stayed, and maryed here.

'John Allerton and Thomas Enlish were both hired, . . . both dyed here, before the shipe returned.

'. . . 2 seamen hired to stay a year . . . William Trevore and one Ely. But when their time was out, they both returned.

'These, being aboute a hundred sowls, came over in this first ship; and began this worke, which God of his goodnes hath hithertoo blesed; let his holy name have the praise.'

Thirty years later William Bradford added the notes concerning the fate of the original adventurers.

'And seeing it hath pleased him to give me to see 30. years completed since these beginings; and that the great works of his providence are to be observed, I have thought it not unworthy my paines to take a view of the decreasings & increasings of these persons, and such changs as hath pased over them & theirs, in this thirty years. It may be of some use to such as come after.'

This list is given in the right-hand column above.

At the end, Bradford wrote:

'Of these 100. persons which came first over in this first ship together, the greater halfe dyed in the generall mortality; and most of them in 2. or three monthes time. And for those few remaining are sprunge up above 160. persons, in this 30. years, and are now living in this presente year, 1650. besids many of their children which are dead, and come not within this account.

'And of the old stock (of one & other) ther are yet living this present year, 1650. nere 30. persons. Let the Lord have ye praise, who is the High Preserver of men.'

The Abdication of the Russian Emperor NICHOLAS II

By GREGORY SHINKARENKO

Lieutenant in H. I. M. Navy.

The fall of the Russian Emperor, Nicholas II, came just at a time when it seemed as though his power were at its height. He had assumed Supreme Command of the Russian troops, replacing Grand Duke Nikolai Nikolaevich, whom he sent to the Caucasian front. The road to Constantinople was open. A grand offensive was about to be undertaken which, it was fondly hoped, would result in the crushing of the enemy. And then came the Revolution!

This article, written by a former officer on the Czar's Imperial Yacht, is frankly partisan. It presents a picture of Nicholas different from that which has grown out of the Red Revolution. It is printed for its unique interest and its historical value.

—Brown Brothers Photo.

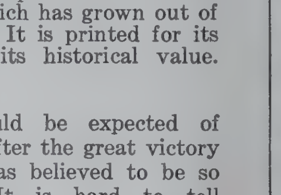
Representative from headquarters of the Russian revolutionary forces reading reports to members of the southern army.

WHAT could be expected of Russia after the great victory which was believed to be so near? It is hard to tell whether the contemplation was pleasant for other nations. But inside Russia the glory of the Emperor would have been at its peak! Now, and only now, before the general offensive of the Russian troops, it was necessary to do something to snatch from his hand the palm of glory.

Revolution was the answer; revolution backed by German money, with many an honest and sincere patriot thoughtlessly taking part, to be cruelly repaid in the end!

The Duma began its destructive work by allowing the pronouncements of Miliukoff on November 14, 1916, and of Pourishkevich in December of the same year. Thus November 14, 1916, should be considered as practically the beginning of the revolution.

There being no need as has been said to create a Raspoutin, since luckily for the enemies of Russia he already existed, this man was chosen as the instrument of destruction. The name of Raspoutin was linked up with accusations of treachery, bad government, scandalous defamation of the Empress and even of the Czar's daughters, rumors being diffused like poisonous gases among the people, the military troops at home and those at the front. And after the revolution had done its work, the revolutionary leaders could calmly relate at last that all such rumors of bad faith on the part of the Emperor and the Empress in their relation to Russia were lies, skillfully concocted and spread!



Raspoutin.

Five Russian patriots undertook on December 30, 1916, the not very clean work of assassinating Raspoutin. March 8, 1917, marked the first signs of riot among the soldiers of the Petrograd garrison already sufficiently demoralized, instead of February 27, as had been arranged by the Duma and its associated circles. Then the terrible fury and abandon of men freed from the shackles of law and order let loose in the murder of police, army officers and any well-dressed person, increasing in cruelty and assuming new forms with every passing day. Cadets and students of military schools and academies were raised up on bayonets in the streets and thrown into the canals; they were shot if attempts to save themselves from drowning were noticed. Naval officers with weights fastened to their feet were thrown overboard or thrust alive into the doors of the burning boiler furnaces on their ships.

From Rodzianko, chairman of the Duma, came the first messages concerning abdication in the form of telegrams to general headquarters. The Emperor left Czarskoe Selo, which was about fifteen miles from Petrograd and was one of his favorite residences, on March 8 for the last time, and arrived at general headquarters on March 9. General headquarters were in Mogiliev City. As usual he was accompanied by Count Fredericks, minister of the Court, a most devoted follower who is still living in Petrograd, not being considered dangerous to the bolsheviki because of his advanced age and shattered mentality. (He even thinks today that nothing has happened to Russia and that everything is as before.) The son-in-law of the count, General Voeikoff, who held the position of palace commandant and who now lives in Finland, was likewise with the Emperor; also Admiral Niloff, the Czar's flag captain; Prince Dolgorouky, chief marshal of the Court, who later was killed by the bolsheviki; General Narishkin, superintendent of the Emperor's chancery; General Count Grabbe, commander of the Emperor's convoy; Court Physician Fiodoroff; General Doubensky and the two duty aids-de-camp, Duke Nicholas of Lichtenberg and Colonel Mordvinoff.

Beginning March 10, General Alexeieff, chief of staff of the Supreme Commander in Chief (the Emperor), and General Voeikoff, the palace commandant, began to receive alarming reports by telegraph concerning the situation in Petrograd, but neither of them took measures to restore order. The Czar himself remained absolutely unperturbed, never having been made aware of the danger by either General Alexeieff or General Voeikoff.

Grand Duke Nicholaevich.

March 12 two telegrams were received from the chairman of the Duma with requests for permission to organize a new ministry to be responsible to the Duma. That same day, when General Alexeieff had reported the telegrams to the Emperor, the latter held a consultation in which General Alexeieff, General Voeikoff and Count Fredericks took part. The Emperor here gave his consent to the organizing of such a ministry with Prince Lvoff at its head. This decision was telegraphed by General Alexeieff to Chairman Rodzianko immediately after the council. But it was never announced to the Russian people.

A sharp change came over the Czar. He became apprehensive, thoughtful and sad.

That very evening he decided to go at once to Czarskoe Selo for the purpose of organizing the new government and of sending the faithful General Ivanoff to Petrograd with the Georgievsky Battalion to replace General Habaloff, commander of the Petrograd garrison, and War Minister Beliaeff, who were unable to quell the disorder.

On March 13 the trains of the Czar and his suite left general headquarters behind and started in the direction of Czarskoe Selo. General Alexeieff, chief of the Emperor's staff, accompanied him for a distance and on the way the Czar said that he would wait in Czarskoe Selo for news from him by telephone from general headquarters in Mogilev. But after the trains left Mogilev it was learned that railroad engineer Boublikoff, who at that time was transportation commissar in the provisional government which had already been organized, had given an order directing the Czar's train not to Czarskoe Selo but to Petrograd.

As the Czar's train arrived at the railroad station of Malaia Vishera on the way between Mogilev and Czarskoe Selo everybody slept, which once more pointed to the criminal negligence of General Voeikoff who had received word from the suite's train, which was about one hour in advance of the Czar's train, that the railroad stations of Luban and Tosna were occupied by revolutionary troops. The Emperor on his part, having given his consent to the formation of a new governmental institution responsible to the Duma, and sure that General Ivanoff and his faithful battalion had been sent to Petrograd for the restoration of order, was comparatively at ease.

But when the train arrived at Malaia Vishera and he heard the report of General Voeikoff, who had been wakened by General Tzabel, commander of the Railroad Regiment, also traveling in the suite's train, the Emperor ordered the train to go to Pskov City, which was headquarters for General Rouzsky, commander in chief of the northern front. The journey to Pskov City presented no evidence of anything revolutionary: large crowds of people as usual rushed to the tracks to do homage to the Little Father!

When the Czar's train arrived at Pskov March 14, however, it was noticed that scarcely anybody was at the station. The honorable guard did not meet the Emperor as prescribed by law, nor did General Rouzsky, who was later chopped down by the bolsheviki near Piatigorsk City. He came later with his chief of staff, General Daniloff, and his adjutant, Count Sheremetieff, and went into Prince Dolgorouky's compartment, where Count Fredericks, minister of the Court, addressed him as follows:

'You know that the Emperor gave his consent to the organizing of a new government responsible to the Duma. The Emperor is now on the way to Czarskoe Selo where his family is. When it became known that he could not pass to Czarskoe Selo, he gave orders to turn to you at Pskov, and it is for you to help him fix matters!'

General Rouzsky replied angrily:

'It is too late! I have said many times that it was necessary to work in agreement with the Duma and to grant the reforms which the country demanded. I was not heeded. The voice of sectarian Raspoutin had bigger meaning. Russia was ruled by him. Then Protopopoff appeared. The good-for-nothing government of Prince Golitzin was formed. Everybody talked of a separate peace . . .'

General Alexeieff.

He was asked what was to be done under the circumstances. He replied:

'It is necessary now to yield to the mercy of the victor!'

Soon after this conversation, in which everybody sought to persuade General Rouzsky of the ruinous consequences of such a course at the present moment, he was summoned by the Emperor, with whom he remained till midnight. In this interview General Rouzsky warned the Emperor in sharp form that to pacify Russia and to bring the war against Germany to a successful end it would be necessary for him to abdicate in favor of his son, under the regentship of his brother, the Grand Duke Mihail Alexandrovich. (He, by the way, was afterward murdered by the bolsheviki near Perm City.) General Rouzsky told the Emperor that a government responsible to the Duma did not satisfy the provisional government, and that all the commanders in chief, General Evert of the western front, General Rouzsky of the northern front, General Broussiloff of the southwestern front, General Saharoff of the Roumanian front and Vice-Admiral Nepenin, commander of the Baltic Fleet, considered that the abdication of the Emperor was the only means in the present situation of saving Russia.

Soviet officials appraising the value of the crown jewels seized after the Emperor's death.

Incidentally, all these commanders first asked of General Alexeieff, chief of the Emperor's staff, by telegram the opinions of generals Rouzsky and Broussiloff on this question, and on being informed that these considered abdication a necessity, they announced their consent also. The last message of all, after General Alexeieff had sent him word of the decision of all the commanders in chief, was from the Grand Duke Nicholas Nicholaevich, in which he begged the Czar 'on his knees' to abdicate. All these communications regarding the necessity of abdication were sent from and received by the Emperor's chief of staff, General Alexeieff.

In his interview with General Rouzsky, the Emperor pointed with astonishment to the dates and asked him when the revolution could have taken place, saying that before leaving he had talked everything over with General Alexeieff, his chief of staff, who had told him not a word of it. General Rouzsky answered that it had all been in a state of preparation long before and was put into action 'after the Emperor left his general headquarters.' In discussing it with General Doubensky the Emperor said:

'If I am a hindrance to the happiness of Russia and if all who are at present the directors of its social interests are asking me to leave the throne and to give over the government to my son and brother, I am ready to do it. I am ready to give up not only my reign but my life for the motherland.'

The Emperor did not go to his bed for a long time that night of March 15 but wept and prayed with the photograph of the heir in his hand. He had waited for the return of General Rouzsky but Rouzsky had not come. The same day he called the Court Physician Fiodoroff and asked him whether the heir's sickness was curable or not; he received the reply that the sickness was incurable, that the heir might live a long time, but that he might also die suddenly. The Emperor then said that he could not give his son to the throne.

At 6 o'clock on the morning of March 16, the Czar was at work at his desk. General Rouzsky came at 10. They had a lengthy conversation during which abdication was decided in principle. But the manifesto of abdication was worked out the night of March 16 in the Czar's general headquarters by Mr. Basily, superintendent of the political office, under the direction and editorship of General Alexeieff. The text of the abdication is as follows:

> In these days of the great struggle against our external enemies who for nearly three years have been attempting to subjugate our motherland, it has been God's will to send us a new and sore trial. Internal strife threatens the further conduct of this urgent war. The fate of Russia, the honor of our heroic army, the welfare of the people, the future of our beloved country, all demand the continuation of the war to a victorious end regardless of all else. The enraged enemy is about to put forth his last great effort and the hour is near when our valiant army with the help of our glorious Allies will be able definitely to crush the foe.
>
> At this important moment in the life of Russia I feel it my conscientious duty to facilitate the close unity of my people and the concentration of all their powers toward the speediest possible victory. Therefore in agreement with the Duma I consider it best to abdicate from the throne of the Russian Empire and to withdraw from the administration of the supreme power.
>
> Not wishing to part with my son, I am giving my inheritance to my brother, the Grand Duke Mihail Alexandrovich, and my blessing on his accession to the throne of the Russian Empire.
>
> I exhort my brother to rule the country in absolute agreement with the representatives of the people in whatever governmental institutions may be established by them on those principles, giving them his inviolable oath.
>
> For the sake of the motherland greatly beloved I call upon all her faithful sons to perform their sacred duty, obeying the Czar in this difficult moment of our common testing, and helping him, together with the representatives of the people, to lead the Russian Empire on a path of victory, prosperity and glory. God help Russia.
>
> Pskov City, March 15, 1917.
> 3:03 p. m.
>
> Nicholas.
>
> Adjutant General Count Fredericks,
> Minister of the Imperial Court.

When the text of the manifesto of abdication became known among the members of the suite, they sent General Voeikoff to the Emperor to ask him to order General Rouzsky to return the signed document before he should report it to general headquarters with the information that it had been signed. General Voeikoff soon returned from the Czar with instructions to the superintendent of his chancery, General Narishkin, to go to General Rouzsky and get the signed manifesto. About half an hour later General Narishkin returned and explained that General Rouzsky refused to comply with the order of the Emperor, but would given an explanation to the Emperor personally.

At 10 o'clock that night a train with the delegates of the provisional government arrived—Goutchkoff, secretary of the army and navy of this government, and Shoulgin, member of the Duma. They asked how to find General Rouzsky and were told to go direct to the Emperor's coach where Count Fredericks, General Rouzsky, General Daniloff, General Voeikoff, General Narishkin, and General Savitch were in presence. The Emperor entered, invited all to be seated, and without a word being spoken handed Goutchkoff the manifesto and signed it. Goutchkoff asked him for a copy of the manifesto, which request was granted. After this the Emperor went to his rooms. Three hours later Goutchkoff and Shoulgin left for Petrograd.

Late in the night of March 17 the Emperor arrived at his general headquarters in Mogilev, where he was met at the station by General Alexeieff and the staff officers, with whom he talked a little. Then he went into his car. Emerging soon, he entered an automobile which took him to the palace, the house of the governor which was about one mile from the station serving that purpose.

The next day the Emperor received a report from General Alexeieff as usual. It was the last. That same day the Dowager Empress Maria Feodorovna, mother of the Emperor, arrived in Mogilev from Kiev. She spent the time in general headquarters until the moment of the Czar's departure for Czarskoe Selo.

On March 20 General Kisliakoff, who soon after deserted to the side of the provisional government and who was also murdered later in Poltava City by the bolsheviki, received a telegram from the commissar of transportation concerning the arrival at general headquarters of four delegates of the provisional government for the purpose of arresting the Czar and escorting him to Czarskoe Selo. These were the following: Boublikoff, Gribounin, Kalinin and Vershinin. They arrived at Mogilev a little later than expected because of making speeches at the railroad stations en route.

Before leaving for Czarskoe Selo on March 21, the Emperor wished to say goodby to the personnel at general headquarters. For this purpose all were gathered in the office of the duty general, which in prewar times had been a chamber of the Mogilev district court. At 11 a. m. the Emperor entered and greeted General Alexeieff and the soldiers, who responded in the established prerevolutionary style: 'We wish your Imperial Majesty health.'

The Emperor was dressed in a gray Kuban *tcherkeska* (Cossack uniform) with the order of St. George pinned on his breast. His face was sallow and drawn. He stopped in the middle of the chamber and addressed himself to all present in his last speech: Today he was seeing them for the last time but after all it was only in accordance with God's will and the result of his own decision. He explained that he had abdicated in favor of his brother, the Grand Duke Mihail Alexandrovich, for the sake of the motherland's best good and that he hoped it would result in the troops marching to victory. He said that the destinies of Russia were now intrusted to the provisional government, which he urged them to serve faithfully and loyally, remembering that only thus could the war be brought to a victorious end. At the close of his speech he thanked all for their faithful service to him and to the motherland.

THERE was dead silence in the chamber, not interrupted by even so much as a cough though several hundred were present. The Emperor started to bid farewell, shaking hands with the senior generals and nodding to the junior officers. The moment was tense. Two of the officers of the Georgievsky Battalion, the majority of whom had received severe wounds during the war, could not endure the nervous strain and fainted; in another quarter a giant Cossack of the convoy fell like a hewn tree. Sobs were heard and the Emperor, unable to control himself longer, hurried out with tears in his eyes.

Besides his personal farewell to the officers of his general headquarters, the Emperor wrote a farewell letter to the troops, which was to be published in the form of an order from the chief of staff of the Supreme Commander in Chief, under No. 371. But it was not destined to be made public. Goutchkoff, being secretary of the army and navy, prohibited General Alexeieff from publishing this last call of the Emperor, and General Alexeieff, who according to the Russian military laws need not take his orders from a war minister, obeyed him. The letter reads as follows:

> For the last time I address the troops so dearly loved by me. Following my abdication for myself and my son from the Russian throne, the rule has been given over to the provisional government, which was formed according to the will of the Duma. May God help them to lead Russia on a path of glory and prosperity.
>
> May God help you, brave troops, to save our motherland from the wicked enemy. For two and a half years you have borne the brunt of arduous service hourly; much blood has been spent, much strength given, and the hour is near when Russia together with her valiant Allies in their common ambition for victory will break the final effort of the enemy. This unprecedented war should be fought to complete victory.
>
> Who thinks now of peace, who wants it —that person is untrue to his country—her traitor! I know that every true soldier believes so. Do your duty, protect bravely our great motherland. Obey the provisional government. Obey the orders of your commanders and remember that every laxity in discipline is gain for the enemy. I firmly believe that unbounded love to our great motherland has not grown cold in your hearts. God bless you and may Saint George the Great Martyr lead you to victory.—Nicholas.

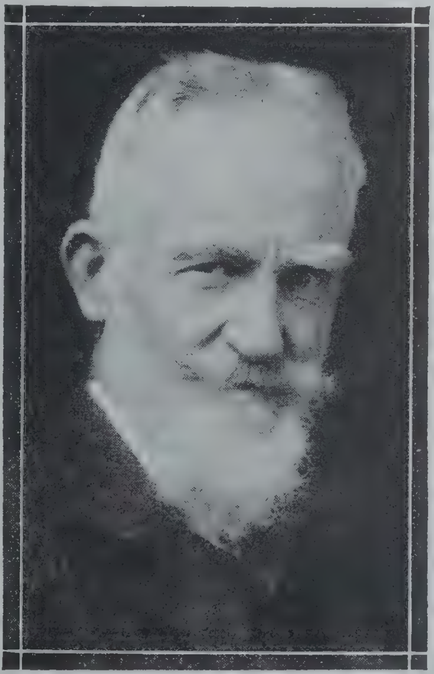
General Alexeieff reported to the Emperor that 'His Majesty would be transported under arrest.' When the Czar heard this he frowned and turned away. Leaving the train of the Empress-Mother, where he had spent most of his time after her arrival at Mogilev, the Emperor entered his own car and stood near the window looking out on all who had come to accompany him. About opposite his window was the window of the coach of his mother, who also stood and wept, blessing her son. It was the last time she was to see him alive. After the Emperor's departure, the Dowager Empress returned to Kiev. She went later to the south of Russia, and returned finally to her native land of Denmark where she is living today.

As the train started Alexeieff saluted the Emperor, but as the car with the delegates passed he took off his cap and bowed low. They were on the way to Czarskoe Selo. There Nicholas II was placed under arrest. A year and four months later, after the reins of power had passed from the provisional government to the bolsheviki, he, his wife, their son, their four daughters, and their little group of faithful servants were murdered in the cellar of the Ipatieff house in Ekaterinburg—July 17, 1918.

Bernard Shaw *and the* Superman

THEY have refused to hang Bernard Shaw in the Royal Academy. His portrait by the Hon. John Collier, an artist of eminence, has been turned down by the hanging committee. But although committees may come and committees may go, George Bernard looks as if he is going on forever, for he seems to possess the secret of perennial youth.

Mr. Shaw has often said that his safety is secured by the fact that the world takes him for a buffoon. If it understood him it would put him to death. May we venture to express the hope that the perspicacity of the public may never grow greater with respect to Mr. Shaw's aims and ideals, for verily his death would (to borrow Johnson's epitaph on Garrick) 'impoverish the public stock of innocent pleasures and eclipse the gayety of nations.'



George Bernard Shaw. —*Keystone View.*

Many of Mr. Shaw's peculiar views find characteristic expression in the following communications evoked by a questionnaire.

On the subject of exploitation Mr. Shaw expressed himself as follows:

'There is no war between exploiters and exploited. The whole people cordially consent to and approve of inequality, privilege, peerage and monopoly, because they all have (or think they have) a chance in the lottery. The exploiting system could no more stand today without an overwhelming consensus of opinion in its favor—especially among the working classes—than Monte Carlo could stand if people were not willing to lose money there.'

In reply to the questions, 'Do present conditions justify the affirmation that "might is right"? Do you conceive that this assertion ever had any justification?' Mr. Shaw writes:

'Your questions are enough to drive any man out of his senses! There is no more identity or necessary connection between might and right than between chalk and cheese. You had better start a discussion on the morality of Alpine thunderstorms and avalanches. Every man strives for might so that his will may prevail; and when he attains it, his will prevails whether it is right or wrong. That will, like gravitation, is a force in itself is true; and that the human race cannot really will its own destruction is a thing that we may at least hope for on the ground that it manages to survive. But under the rule of a standard morality, evolution is limited by the fact that at a certain point of development the individual in whom the advance is manifested (say the superman) is attacked and destroyed in the name of right by the other less developed individuals; so that in effect the race *does* will its own destruction on the plane of the superman. And the attack presents itself to these less developed ones as an attack of right on might; for to the ordinary citizen right means thinking as he does; and the superman who goes deeper into morals than he, is just as much a rascal to him as the criminal who does not go so deep.

'It seems clear, therefore, that the only chance for the superman is to acquire sufficient might to defy the efforts of the average respectable man to destroy him. Hitherto these attempts have not been successful on the physical plane.'

BOOKS *for* COOKS

By LOUIS C. KARPINSKI

THE cookbook would not seem to be a thing of great literary moment and yet, indeed, for many years the cookbooks were second in popularity only to the Bible. Those days are past. However, the road to a man's heart is probably still, in large measure, the same as of yore—via the kitchen. And there is today hardly a home in America that does not boast one well-thumbed cookbook.

The ancient Greeks had their Epicurus and the Romans had their Lucullus, whose names are still known with a doubtful fame as those of great gourmands. The earliest printed cookbooks trace their origin back to Rome. The first printed book on the subject was the work of a librarian of the Vatican, Platina. His *De Honesta Voluptate* was published in Venice in 1475 and appeared in five editions before 1500. Caelii *Apicius; De Re Coquinaria*, or About Cooking, was printed in Venice about 1486 and again in Milan in 1498. Most of the early printed books were on religion, but many a famous book on cooking is dedicated to some bishop or cardinal who had shown appreciation of culinary activities.

The earliest cookbook in English was by a famous scholar, Alexander Neckham, who lived in the 12th Century. But the first practical work was written in the 14th Century by the chief master cooks of Richard the Second, being entitled *The Forme of Cury* (old form of 'cookery'), and giving 196 receipts used in the royal kitchen.

We often read of the fasting in these ancient times and if the menus of royal meals read aright a period of fasting was inevitable following a royal meal.

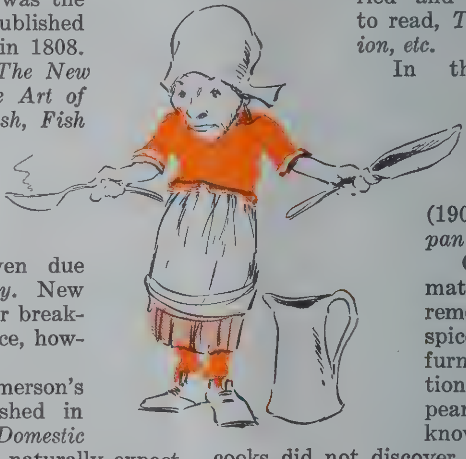
It is surprising to find whale and sturgeon on old bills of fare, with porpoise, seal and crane. Meats were of a variety hardly known today, no feast being complete that did not boast a dozen dishes of meat.

Of famous literary cooks Hannah Glasse of the 18th Century is first. However, Ann Cook, who wrote *Professed Cookery . . . With an Essay upon the Lady's Art of Cookery*, was a rival having an even more appropriate name than Glasse. No doubt the title, *The Art of Cookery made Plain and Easy . . . By a Lady*, had much to do with the popularity of Hannah's work.

In discussing the preparation of the hare, Hannah began: 'Take your Hare when it is cas'd,' meaning 'skinned,' which was misread 'when it is caught.' In this way arose the famous phrase, 'First catch your hare.'

Abraham Veale is said to have been one of the earliest writers on cooking in England, publishing a work in 1575. Patrick Lamb issued his *Royal Cookery* in 1710, and John Cooke's *Cookery* did not appear until 1824. But more famous than any of these was the work by a real Kidder (Edward), who qualified as a pastry master about 1740. Mary Kettilby's *Collection . . . in Cookery* of 1728 belongs in this interesting list, with William Kitchener's *The Art of Invigorating and Prolonging Life, by Food . . . and Peptic Precepts* (London: 1822).

An American treatise was the work of Lucy Emerson, published at Montpelier, Vermont, in 1808. This work was entitled *The New England Cookery; or The Art of Dressing all Kinds of Flesh, Fish and Vegetables, and the Best Modes of Making Pastes, Puffs, Pies . . . and all Kinds of Cakes.* This work was reprinted, without Lucy being given due credit, as *American Cookery*. New England pies (probably for breakfast) made their appearance, however, before this time.



A year before Lucy Emerson's treatise there was published in Boston *A New System of Domestic Cookery*. Here one would naturally expect to find baked beans prescribed for Sunday morning breakfast.

In Colonial America the books on this mundane subject were all reprints of English works. E. Smith's *Compleat Housewife* was published at Williamsburg in Virginia in 1742. But it is safe to say that fried chicken or beaten biscuit was not found in this treatise, nor yet the sweet potato in Virginia style! Susannah Carter's *Frugal Housewife* was published in 1772 in Boston and may have been a native product. The work was popular in England as well as in the Colonies.

The cooks were not literary and the kitchen is found associated with medicine and with cosmetics, with arithmetic and with gardening and the care of horses, and even with morals. Mrs. Haywood had *A Present for the Servant-Maid; or, the Sure Means of Gaining Love and Esteem;* the good woman meant the esteem of the mistress! It would not be so interpreted today. Later Mrs. Haywood revised this to add *Containing Rules for Her Moral Conduct . . . and the Whole Art of Cookery.* Those were indeed other days. This was first printed in Dublin in 1744.

It must indeed have been a man who wrote in 1737, *The Whole Duty of a Woman; or an infallible Guide to the Fair Sex, Containing Rules, Directions, and Observations, for their Conduct and Behavior through all Ages and Circumstances of Life, as Virgins, Wives and Widows . . . With . . . particularly Rules and Receipts in every kind of Cookery.* It was written evidently by a married man, as it was published anonymously. Before issuing a second edition, the author evidently remarried and changed the title to read, *The Lady's Companion, etc.*

In these later times authors make light of this serious business and we find titles, *I Go a Marketing* (1900), *With a Saucepan over the Sea* (1903).

Cooking is a serious matter! It must be remembered that the spices of the Orient furnished the inspiration which led Europeans across the unknown deep. And if cooks did not discover America, yet those who did were the representatives of an art whose proper practice is intimately connected with the welfare of the human race.

New Albion

(*Continued from page 4*)

The ragged rocks here do not impress one as happily as do those near Point Granville or Cape Elizabeth, where the beach is more attractive. One wonders whether some of the smiling natives may not trace their ancestry back to that day when a Chinese junk, blown from its course, stranded on the coast.

This extreme northwestern tip of the United States, as has been mentioned, will be joined some day soon to Grays Harbor and the Columbia River by a highway paralleling the seacoast.

Today the hinterland back of Lake Quinault, the wild freedom of the headwaters of the Hoh, the carefree existence of the outdoors-lover along the Clearwater, are unspoiled by the honk of the automobilist and the ballyhoo of the tourist camp. But already sites have been selected, hotels planned, and crews of men are blasting their way along the western slope of New Albion.

The task begun by Captain Vancouver and his American brother-explorer, Robert Gray, is slowly nearing completion.

WESTERVILLE, *the* Taxless City

By MARCUS T. WOODRUFF

IN A letter from a small city in Ohio, the writer makes this astonishing statement: 'We have planned to place all tax moneys into the sinking fund this year and use earnings and fees for operating expenses.'

That is the most astounding statement THE DEARBORN INDEPENDENT has found in its study of the curse of usury in the administration of American municipalities.

It means, in short, that the tax levy will be confined to the requirements of indebtedness contracted before the days of the present business policy, and that the city occupies the unique position of being the only one of normal conditions in which there is no taxation for running expenses.

Funds for current expenses come from the municipal operation of public utilities.

The taxless city is Westerville, Ohio.

It has a population of 3,200.

The assessed valuation of taxable property is $13,500,000 (about 50 per cent).

Ninety per cent of its streets are paved.

Nearly every street has sewers and water mains.

Every street is well lighted by electricity.

The city is under the city manager system.

It has a commission council of five members. The executive staff consists of the city manager, secretary, clerk-treasurer, auditor and counselor.

The writer of the letter is the city manager, who attributes the showing to that system of administration which was chosen some eight years ago. Credit for the showing probably is due more to the personnel of the city government than to the system, for in many cities having the same system the record has been of extravagance equal to that of the most ill-governed of politically run municipalities.

At the same time there is no reason why any incorporated town may not, by like methods, parallel Westerville's great prosperity.

Another point is that, despite the fact that private use of utilities generally costs less than in towns of its class, it is manifestly unfair that private consumption of water, light and power should bear the whole expense of city and school use of water, lighting of streets, and other purely public service.

The point is of small importance, perhaps, but when the indebtedness shall have been wiped out, the fact that no tax levy is made may lead to future extravagance which might not be thought of if taxes, however small, were levied for a proper share of public expense.

In his letter City Manager Richard Biehl makes the following points, in addition to those stated above:

The public library, one of Westerville's modern facilities.

City affairs are conducted on the plan of a private corporation, employment being limited to necessity and governed by capacity and efficiency. Each of the utilities is expected to pay its own way.

Total expenditures for all departments, including sinking fund for 1923, were $82,235.88. The tax levy was made to produce $16,700. Only 4 per cent of this levy was needed on operating expense, the balance being placed to the credit of the sinking fund for redemption of maturing bonds and interest charges.

The actual expense of the city government was (to quote from the letter):

'The city earned sufficient money from its utilities to pay $13,600 in improvements, all of its major operating expenses, and all managerial salaries. No charge was made the city for water or for current for street lighting, and we furnish the schools water gratis. We purchase electric current from a Columbus corporation and distribute it to our consumers at a rate 30 per cent below that charged its consumers in Columbus.'

Westerville is still under a burden of interest, but its handling of its 'bondage' will recall to our readers some suggestions heretofore made by THE DEARBORN INDEPENDENT as to how best to make the burden as light as possible.

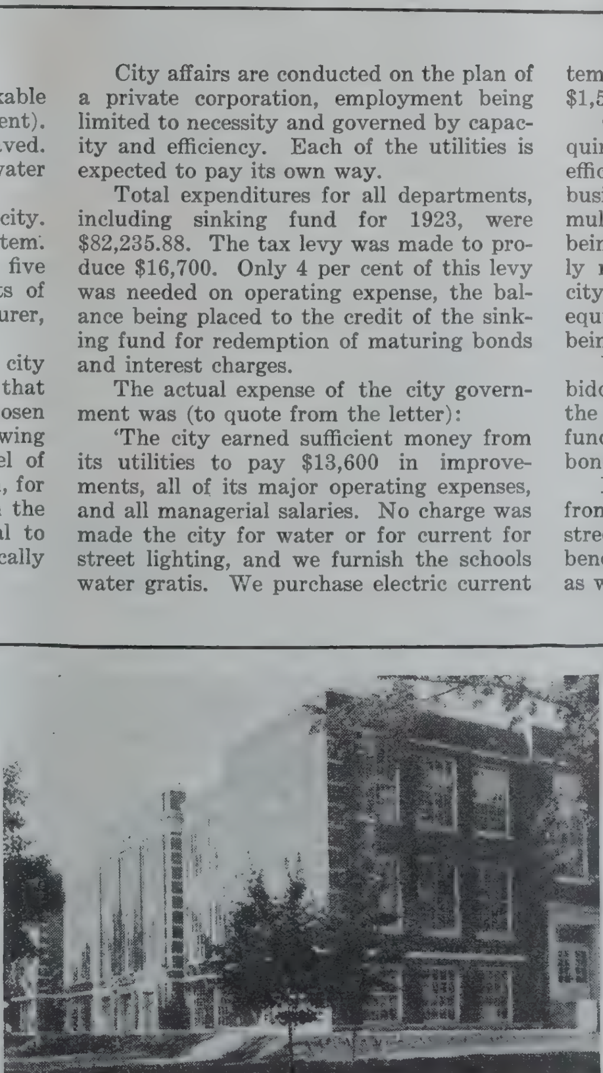
Bonds are issued for short terms and serially. Mr. Biehl says it is surprising the money that is saved each year on interest payments alone. The sinking fund is swelled by this and has a surplus which is constantly growing. It takes 65 per cent of the tax levy to meet the interest on obligations incurred from 15 to 22 years ago. These bonds have been refunded at a saving in aggregate interest of more than $50,000, and under the present system of financing interest charges decrease $1,500 each year.

City employes are well paid, but are required to attain certain standards of efficiency, and the result has been that while business has increased greatly and duties multiply, the additional expense is far from being in proportion. Westerville is thoroughly modern, has every facility of the large city, even to motorized fire and police equipments. It claims the reputation of being 'Ohio's Biggest Little City.'

Westerville's banks carry its accounts, bidding as high as 4⅓ per cent on balances, the city earning nearly as much on sinking fund surplus as it must pay on unexpired bonds.

In answering the criticism that profits from private use provide a means of free street lights and water, which are for the benefit of those who are not private users as well, Mr. Biehl places the matter on the basis of a private corporation operating the same utilities. 'The city owns and operates the utilities, being in effect a corporation in which each citizen is a stockholder, furnishing light, power and water at lower rates than private corporations.'

The argument of 'service at cost' so often pleaded in public operation of utilities is answered logically by Manager Biehl, and will bear study. It is certain that any free service by a franchise company would be paid by the users, and in this case at a higher rate. Besides, a moderate margin of profit is needed for emergency expenses, as in case of accident, 'visitation of Providence,' or other unlooked-for event.



The junior high school.

Alligators fight with tail and teeth, rapidly snapping their jaws.

ALLIGATOR Farming Pays

ALLIGATORS are the Methuselahs of reptiles. Most 'gators live one thousand to twelve hundred years. Neither germ nor contagious disease affects them.

When an alligator grabs a human being in its vise-like jaws, it does not chew off an arm or leg. It turns over and over and literally twists the appendage from its socket. The 'gator is a great coward and will flee from a dog. If cornered, however, the otherwise timid reptile will fight as desperately as a fierce tiger.

Skin hunting used to be a profitable industry in Florida as alligator skins sold for one to two dollars per lineal foot. Overshooting has reduced the numbers, and now wild 'gator haunts are found only in the remote sections of the Everglades and of Big Cypress Swamp. Alligator skin is one of our most durable fancy leathers.

An adult 'gator on a farm eats forty to fifty pounds of fish and meat daily. These reptiles hibernate for five months in the year, remaining five to ten feet below the surface of the water under natural conditions. In early summer, the female deposits fifty to sixty eggs in the warm sand. In two months, the young emerge from the sandy beach incubator and scurry immediately for shallow water. They are practically self-sustaining from birth. The father soon forgets his parental responsibilities, and if he can catch his baby sons and daughters, he will devour them.

Right—
Trussing up a 'gator for transportation.

Luck, and the Bedside Manner

(Continued from page 2)

as for parents, better-halves and children—'*Heraus mit denen.*' They did not count. The doctor was the whole thing and he would brook no contradiction.

One of his peculiarities was that he never looked directly at the person with whom he was talking; he seemed to look beyond, as though into a world peopled by his kind and inhabited by gods. For a quarter of a century he had one of the commanding practices in New York.

His wife was a confirmed nervous invalid.

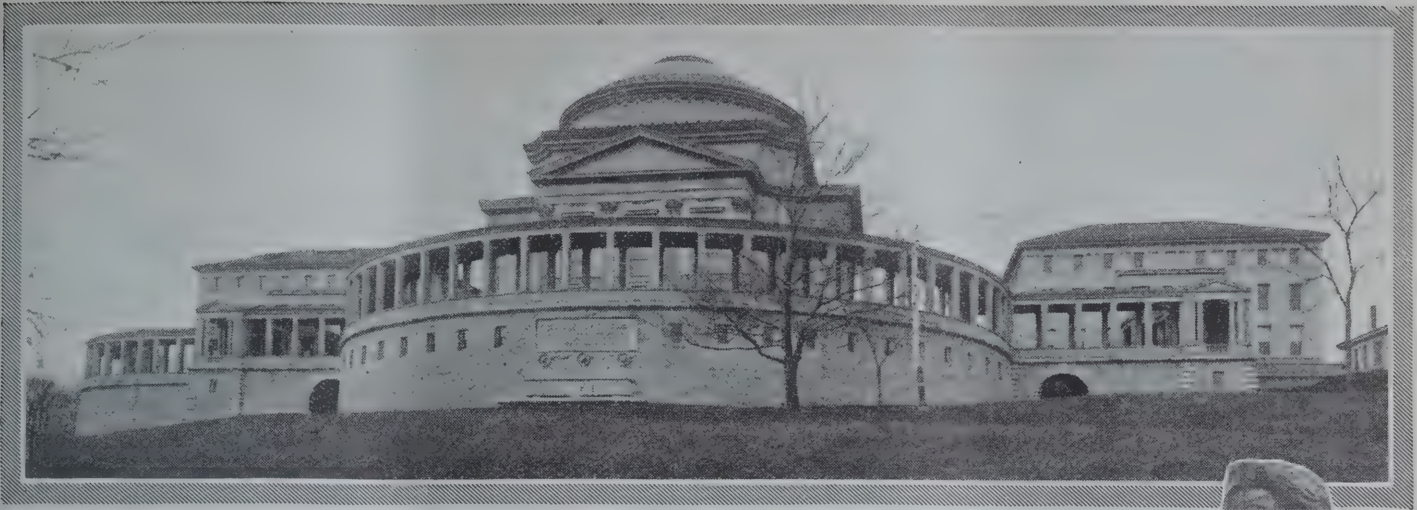
The second group has a large membership. Unlike the first which is particularly adapted to the needs of women, this one finds great favor with men, most of whom, if their wives are to be believed, are cowards when they are ill, or at least fear they are going to die. The possessors of this particular manner, and they are often men of great ability, are to be found throughout the profession, but it is a favorite with those who devote their energies to combating disorders of the digestive tract. The reason for this may be that funk and despair are early and persistent accompaniments of such diseases and the physician has learned intuitively or empirically that the possessor will tolerate neither harsh words nor ingratiating sympathy.

THE most perfect example of this manner that I have known was in a man of marked ability. With time to formulate an opinion of the nature of an ailment, his opinion was always valuable. To observe him enter a sick room, one could not fail to think he had just returned from the Garden of the Hesperides with one of the golden apples. Or that he had been told of the repeal of the Volstead Act. He radiated suavity and reflected solicitude. The coo and caress of his voice as he assured the patient that his examination would cause neither discomfort nor pain would have made any dentist's fortune, had the dentist possessed it a year.

As he proceeded with the examination, his face would light up with a smile, a blend of that to be seen in Da Vinci's masterpiece and upon the faces of Andrea del Verrocchio's madonnas. I have seen this smile spread over his countenance when his erudite fingers had come upon a mass in the patient's abdomen which would soon make his days a torture, his nights a rack, just as I have seen it bloom upon the face of a small boy when a mince pie that he hoped for, but despaired of, was put upon the table. In the conference room, he was deference itself to others, and reconciled disparate views with the ease of a conjuror doing his tricks. He nearly always won out with the doctor, and invariably with the patient.

Each of the varieties of manner previously named has a number of subdivisions, and this one has the most. The commonest is one the purpose of which is to find out what the patient wants, and then let him have it. He patterns himself after the sophist of Socrates. Sick persons, like well persons, indeed like all domestic animals save the cat, are partial to praise.

(To be concluded in an early issue.)



The HALL of FAME

Where Names *of* America's Great *Are* Inscribed

By FRANK DORRANCE HOPLEY

Bust of General Grant in the Hall of Fame.

THE originator of 'The Hall of Fame for Great Americans' was the late Henry Mitchell MacCracken, former chancellor of the New York University. Its fulfillment was made possible by the gift, in 1900, of $100,000 from Mrs. Finley J. Shepard (formerly Miss Helen Gould), which was later increased to $250,000.

One hundred prominent persons in all parts of the country were chosen as electors, and nominations from the public were asked for. They came in a flood. By May, 1900, more than one thousand names had been submitted.

The senate of the university selected the 100 names which had received the largest public support, and sent them to the electors, asking the electors themselves to submit others, which resulted in 234 names being taken under final consideration. Only 29 of these, however, received a majority vote, and were declared elected:

George Washington
Abraham Lincoln
Daniel Webster
Benjamin Franklin
Ulysses Simpson Grant
John Marshall
Thomas Jefferson
Ralph Waldo Emerson
Robert Fulton
Henry Wadsworth Longfellow
Washington Irving
Jonathan Edwards
Samuel Finley Breese Morse
David Glasgow Farragut
Henry Clay
Harriet Beecher Stowe
George Peabody
Nathaniel Hawthorne
Peter Cooper
Eli Whitney
Robert Edward Lee
Horace Mann
Mary Lyon
John James Audubon
James Kent
Henry Ward Beecher
Joseph Story
John Adams
William Ellery Channing

At first, the foreign-born citizen was barred from consideration, but the constitution was amended by striking out every discrimination between citizens of native and foreign birth.

The university set apart a site for a Hall of Fame for Women, but it was finally decided to classify the names of the women with those of the men. At times the battle of ballots has waxed furious, some of the electors being partisan to the extreme, sticking by their favorite to the exclusion of all others. The result has been that the names of many men and women who might justly be included in the roll of Great Americans have, as yet, failed to receive the three-fifths vote of the whole body of electors, necessary to elect. Getting into the Hall of Fame is no easy matter.

When the building was completed, it was announced that 150 panels would be provided for memorial bronze tablets, 50 to be inscribed in 1900, provided 50 could be selected by the judges, and after that, five names every five years, which, provided the full quota was agreed upon at each election, would fill the Hall about the year A. D. 2000.

The site is a very picturesque one, and overlooks the Palisades and Hudson River. The building is of granite, circular in shape, and the colonnade and massive substructure make it a feature of the western group of buildings of the New York University.

In connection with the Hall of Fame it is planned, as funds may be provided for the purpose, to establish a museum for the preservation and exhibition of sculptures, portraits, and other important mementoes of Americans who have been elected.

Organizations and individuals are invited to present bronze busts of persons who have been elected to the Hall of Fame, the busts to surmount the tablets in the colonnade. Many have already been put in place.

Since the world began it has been the delight of man to inscribe in high places the names of his fellows who have won especial distinction where posterity may everlastingly read and honor, and not forget. The Hall of Fame of the New York University holds a unique position in this respect.

Granite colonnade of the Hall of Fame.

Lamb Chops for Victor Hugo

(*Continued from page 9*)

'After several weeks I got to be good friends with the servant, and one Monday I said to him:

' "Monsieur Dumas isn't out. I saw him at the window before I came in."

'I hadn't seen him but I said it in a loud voice. The servant tried to explain that I was mistaken, and while he was telling me Monsieur Dumas appeared in the doorway and cried:

' "What is it, my boy? What is it?"

'I told him who I was and that my master wanted money. He laughed a big laugh, took me by the shoulders and exclaimed:

' "You are a good boy. You shall have the money."

'He paid me. Always it was that way. Monsieur Dumas "wouldn't be home" for weeks and then, suddenly, I would see him. Just like I saw him that first day in the doorway. His laugh would boom out and he would pay me.

'Then, there was Madame Sand. Gossip of today has it that she fretted away—really dying because of her heartbreak after Chopin died. That gossip isn't true. Madame Sand used to come into the Restaurant Magny. Oh, she used to come in very often. So very often. We had the food on counters, in the French style, and she would mince around finally selecting filet mignon—always filet mignon—and would flutter as she ordered:

' "Joseph, you know—filet mignon à la rossini. How I like it, you know. Be a good boy and fix it like you fixed it last time. That was yesterday, wasn't it? No, the day before yesterday."

'We liked to serve Madame Sand. She was short and what you call wide—fat, I mean. Happy. Always laughing. A pretty big woman, and it seemed funny the way she fluttered over the trays, picking just what she wanted and then telling us how she wanted it fixed. Going into detail. And we knew, all the time.

'After I came to New York one of my first American friends was Admiral Schley. He was then commodore on the cutter *Bear* and used to bring his officers to the Brunswick and order a fine bouillabaisse. Liked that better than anything else. He sent for me one day and said he wanted me to be the chef on the cutter for one of her cruises.

' "I'm pleased with you, Joseph," he said.

'I thanked him.

' "I'm fond of your fine bouillabaisse. I want you with me. To make it for me, every day."

' "Maybe you'll get tired of it," I told him.

'He shook his head—like that,' and Joseph gave his head a vigorous shaking.

' "I'd like to go," I told him.

' "Then it's settled. You go."

' "What will you pay me?" I asked.

' "Fifteen dollars a month is all I can pay you," he answered.

'I told him I was getting one hundred dollars a month at the hotel and offered to leave if he would give me ninety. He told me he couldn't do it and I regretfully told him I couldn't go. You see, I had my parents and my brothers and my sisters depending on me. They were in France but I was helping them, every month. When I told this to Commander Schley he just grunted and turned away to one of his officers, muttering:

' "These damned Frenchmen think only of money!"

'That hurt me, I guess. Commander Schley knew it, for he turned around again, smiled and told me he was sorry. Said maybe he was thinking too much of his own stomach.'

'How did you happen to come to America?' I asked Joseph.

He chuckled.

'American girls put the idea into my head.'

'How was that?'

'After the death of M. Magny the restaurant was closed. I was recommended to spend the season at the Pensionnat Yeatman, in Neuilly. This was a fashionable girls' boarding school where the daughters of wealthy American and English families were taught the secrets of French cooking.

'The school was run by two women—mother and daughter. When I reported, the mother was sitting in a hammock, and taking off my hat I told her I was the new chef.

'She looked at me—surprised.

' "Too young," she sniffed, and called her daughter. I gave her daughter a letter from M. Magny which he had given me many months before he died, and in which he said I was one of his best. You see from this that Monsieur Magny liked his pupils. The daughter read the letter and exclaimed:

' "He's from the Restaurant Magny. He must be good. What if he is young?"

'The two ladies had quite a jangle and the mother finally consented to let me go into the kitchen saying I could stay for a few days until she could get an older chef from Paris. I must have satisfied her, because I was there all through the season. The American girls kept telling me of the wonderful opportunities there would be for me in the United States, until I began to believe them.

'And, too, I didn't want, very much, to go back to Paris. Down there in the Latin Quarter, where M. Magny had had his restaurant, everything would have been strange to me. I would have missed all the famous people who used to come into the place. They had scattered. Men such as M. de Lesseps, who made such a name for himself at the Suez Canal and whose favorite dish was saddle of lamb with fresh vegetables, Léon Gambetta, whose oratory did much to bring in the French Republic—many of those famous people whose names I have given you.

'It wasn't too difficult for me to decide to come to New York.'

'What about eating—has the public changed in the years you have been serving it?'

Joseph smiled at the question and answered quickly:

'It changes, much. Americans are becoming more careful of their eating. Even twenty-five years ago the noon meal was heavy. It isn't now. That is, today those who eat in public are what we chefs call "light eaters" at noon—for the most part. They have learned that heavy meals in the middle of the day are not—what you call it . . . con—conducive, that's it, to good work in the afternoon.

'Americans prefer plain foods with no wide range of sauce garnishments; Europeans, on the other hand, go in heavily for sauces. Eating, with an American, is considered in the aspect of a necessity; Europeans, particularly the French, the Latin races, and the Russians, endeavor to make of it an art.'

An English Lady

(*Continued from page 6*)

absolutely certain, penetrated with a marvellous spiritual intimacy and confidence, the foundation of all her life and happiness, and finally mysterious as everything in her was a little mysterious, as though again she belonged to some country that must be unknown to us. But this did not separate her from me; it produced in her no arrogance nor condemnation of others; she took me on my own ground only wanting to understand me and to support me in everything that seemed to her good and courageous.

In these later years everyone, I think, who came into contact with her felt her to be something rare and fine. She was very difficult to know simply because she took so seriously her pledged word and was so sure that she was too usual and ordinary for people to waste time about her. She shrank sometimes from social things that seemed to her useless and waste of time and it was one of her chief troubles that she was not eager enough about the social duties that my father's position necessitated. More and more as the years passed she loved everything that was beautiful, pictures and music and scenery and books. In her young days she had had a very limited education but her artistic judgment was very seldom wrong although it was limited, of course, in its attitude to modern things by the generation to which she belonged.

We had one last expedition to Italy together. I think that that was one of the happiest jaunts in her life and always now when I think of her I see her as a little quiet lady, saying not very much, her eyes shining with pleasure, beautifully gracious to servants and railway porters and peasants, on the road, with a great dignity but with a delightful childishness breaking out again and again, an excitement of appreciation that all the stress and conflict of her life left quite unimpaired.

There came then some last terrible months in Mentone when, in an empty villa lent us by a kind friend set in a garden rioting with huge scentless flowers, life slowly ebbed from her. One last victory remained for her, at first when she was unaware of how serious her illness was she struggled for life which she loved, but there came a day when she suddenly knew the truth and from that moment she presented a most beautiful aspect of courageous acceptance. She hated to leave us but we were all aware in the last weeks that her temporary sojourn in a foreign country was over. One of the last things that she said to me was: 'You don't know what a comfort it is to think that I am never going to be shy again.'

CHATS WITH OFFICE CALLERS

'Prospects of a crop for the first time in nine years are promising in the Big Bend of eastern Washington, this year,' said the ***Dry Farmer.*** 'At the end of each season of drought, the farmers have been saying, "Well, it's three times and out. We'll have a change now." But they didn't. And at the end of seven years they looked for a break—as that number seems to possess certain lucky values. But last year, which was the eighth, was the worst of all.

'For scores of miles in all directions the farms have been abandoned, the fields are full of Russian thistle, the fences are down, and the huge barns and fine houses are going to rack and ruin. The huge combine harvesters that required the strength of thirty and forty horses with which to garner in the golden grain, stand specterlike in the barn lot. Nothing alive is seen for miles and miles, except here and there a stray coyote slinking after the coveys of Hungarian pheasants that feed on the weed seeds.

'It's a melancholy sight to travel through the orchard districts of the valleys where, in scores of places, the yellowing leaves of the fifteen-year-old apple trees are falling to the weed-tangled ground. On their withered branches are scores of apples no bigger than marbles, mute testimony of the trees' last effort to reproduce in kind.

'The pretty homes are deserted and the water courses dry. Fences are useless in their present location, costly woven wire fences that were put up to keep out the jack rabbits when the trees were young and tender; with what hopes the owners planted and nursed them day after day, year after year, watching their vigorous growth. And now, when they have come to full maturity, and when the big red-cheeked apples that they would otherwise have produced are selling at three dollars and more a box, the caretakers have to stand by helplessly and watch them slowly wither and die. On one side are great warehouses and packing sheds. Costly spraying and packing machinery lies rusting in a desert country, like the "Mexican mummies" of Death Valley in California.

'It is a black picture, but not nearly so black as the future of some of the owners who had to move away. Men whose white hair and aged muscles put them out of the race in winning another fortune, and who six or seven years ago could have easily sold their ten-acre orchard for twenty thousand dollars. Now, it is worth nothing at all, considering the cost of grubbing out the dead trees.

'It only goes to prove that *water is life*, life itself. I have seen people fight as savagely over it as though they were protecting the lives of their offspring.

'Yes, water is life. Water is beauty. It is almost everything. It constitutes the attractiveness of so many of our landscape paintings, be it a lake, a river or only a brook. And each one of them finds birth in the fall of rain or snow. So, when water fails and streams fail, it is then that earth's children, civilized or savage, lift their voices in a universal plea by song, prayer or ceremony to the great Creator, that he loosen the sources and let fall the life-giving element, that through its magic the earth may again blossom and the people prosper and be happy.'

* * *

'The power of the Supreme Court to declare legislative and executive acts unconstitutional should not be exercised on a division of five against four,' said the ***Law Professor*** from a midwestern faculty. 'So far as I am concerned, the division should be on a basis of at least seven justices to two; the only question in my mind is how the reform can be brought about.

'I believe the proper way to get it is either by means of a constitutional amendment or by a voluntary limitation which the Court might put on itself. I do not believe Congressional action could help much. It would merely give the Supreme Court another act to be declared unconstitutional.

'The Supreme Court has put other limitations on itself. It has refrained from deciding political questions. It has refused to declare legislation unconstitutional except in "cases and controversies"; that is, it has refused to give advisory opinions. It has refused to declare legislation unconstitutional except when its unconstitutionality was clear.

'No act of the Supreme Court has done more to secure for it the high place it has held in this country than the voluntary limitations it has placed on itself.'

LOADING UP THE OLD BUS!

'This writing business is attracting more and more suckers every day,' said the ***Well-Known Author.*** 'Most editors realize it and don't know just how to remedy it. So long as farm boys, drug-store clerks and immature flappers read advertisements about their fellows who are now making two thousand dollars a week after just a little study from this or that course, so long will we have this deluge of manuscripts.

'It's a wonderful thing for the postal service. In one magazine just recently I read forty-five different advertisements to amateur authors. Some were by critics; others by stenographic services . . . "type manuscripts in the manner that editors require"; and still others were for courses of instruction.

'What's to be done about it? There is nothing we can do; perhaps there isn't anything we should do. For we know that out of all this surplus of aspiration and effort, we may get and we do get new stars for the firmament of literature.'

* * *

'Teaching the small-town merchant how to advertise requires a deal of tact,' said the ***Country Editor,*** 'for it involves education in merchandising. Most of these merchants believe that the sole function of advertising is to list or describe the goods they happen to have to sell.

'First of all, we must show them that its mission is to create new habits of living. It must emphasize the utility and the beauty of their wares, and thus create desire. How to do this in Timothy Centre or Hemlock Corners is, in some ways, an interesting problem.

'In my town, I invested in a well-selected library of advertising books and presented them to the Commercial Club. Then I used advertising as my theme when I was called on to take my turn in addressing the club. I had the inevitable resistance of the mossbacks to overcome. I followed my speech by interviewing individuals. It took me just five months to develop the idea to the point where it began to produce results.

'Yes; it paid me many times over. The first indication was an increase in space used. For the first time in the history of my paper, the advertising department began to show a profit. But there is one thing which had to accompany it. An aggressive and constructive news policy had to be not only maintained, but steadily improved.

'You'd be surprised, perhaps, to hear me say that I have gone more than fifty miles to interview a farmer who had something of importance for my readers. To me, it was just as big and important a story as Lindbergh's return was to the reporters in New York City. To many of my readers—I think I may say with all propriety—it was, also.'

CAN YOU TELL ME?

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

Question. What is the average height and weight of American men and women?

Answer. Dr. Ales Hrdlicka, anthropologist of the Smithsonian Institution, has come to the conclusion, after many years of scientific measurement and study of those whom he designates as 'Old Americans,' and of the immigrants differing from the original stock, that a new American type is appearing. The normal American men and women of the old stock, or stock not affected by the immigration after 1840, are shown to be the tallest of any of the larger groups of the white race. The males are over an inch taller than the average Englishman and two-thirds of an inch taller than the Scot. The average heights are 5 feet 8½ inches for the men, and 5 feet 3 7-10 inches for the women. Weights average 150 pounds for the males (of the mean age of 37 years) and 127 pounds for the females (mean age, 36 years). Their pigmentation (skin, hair) is predominantly of the intermediate variety, both true blonds and pronounced brunets being infrequent. They are not 'Nordic' in type, except individuals. Their eyes, more often than not, are 'mixed,' that is, blue or gray or greenish with plain traces of brown; light without brown admixture; or brown. It must be taken into consideration that the older American stock, or that dating from before 1820, consisted principally of English and Welsh people or their descendants, with strong infusions of Scottish and Scottish-Irish, German, Dutch, Irish, and French, in the order named. However, English and Welsh people and their descendants constituted more than three-fourths, and English, Welsh, Scottish, and Irish not far from nine-tenths, of the early United States population, while during the last one hundred years this country has received, proportionately, more German, Irish, Scandinavian, Italian, Slavic, and Jewish immigrants and a considerably smaller percentage of Scottish, Welsh, English, Dutch and French. This will probably result in a population somewhat more German and Irish, with also a tinge more of Scandinavian and a stronger tinge of Italian, Slavic, and Jewish blood than formerly. The great bulk of the population remains, however, in origin of descent, British, or at least Western European. Dr. Harry L. Hollingworth, a Columbia psychologist, states that the average American man weighs 150 pounds and is 67 inches tall. Dr. Hollingworth's conclusions are based on records and statistics from many thousands of men and women who have submitted to tests like those given in the Army during the World War.

* * *

Q. Who brought the first Negroes to the United States?

A. The first shipment of Negroes to the New World took place in 1503 when the Portuguese landed some in Santo Domingo. The first shipload of Negroes to North America was landed at Jamestown, Virginia, in 1619 when a Dutch ship of war sold some slaves in exchange for provisions. They were not however brought to the continent in large numbers until England secured the Spanish contract in 1713.

* * *

Q. I would like to have the number of banks in the United States—national, state and private.

A. On June 30, 1926, there were 28,146 reporting banks of all classes in continental United States, Alaska and the insular possessions, classified as follows:

	Number	*Resources*
National	7,978	$25,315,624,000
State (commercial)	16,493	16,579,656,000
Loan and trust companies	1,656	12,205,196,000
Stock savings banks	904	2,196,427,000
Mutual savings banks	620	8,422,307,000
Private banks	495	174,152,000
	28,146	$64,893,362,000

* * *

Q. What states, if any, have passed laws prohibiting parochial schools?

A. Parochial schools are not prohibited by law in any state. In November, 1922, the voters of Oregon under the initiative provision of their state constitution passed a law which required all children between 8 and 16 years of age to attend public schools. This act, while not expressly prohibiting parochial schools, was in effect a prohibition of patronage to private schools. This law was to become effective September 1, 1926. On March 31, 1924, the Federal District Court for the District of Oregon issued an injunction restraining the State of Oregon from enforcing the act upon the grounds that it was unconstitutional. The issuance of this injunction was affirmed by the United States Supreme Court on June 1, 1925. Hence the Oregon law was never put into operation.

* * *

Q. How is Greenland governed?

A. Danish authority was formerly limited to the southern portions of Greenland. In 1917, however, the United States ceded, in part payment for the Danish West Indies, its right to any and all parts of Greenland acquired through discovery or by temporary occupation. Under this treaty Denmark now dominates all Greenland. Its royal officers control the administration of government, and the religion and education of the native population. Greenland is divided for administration into the North and South inspectorates, each being governed by a royal inspector appointed by the King of Denmark. Besides exercising magisterial powers, the inspectors supervise the agents of the Royal Greenland Trade Commission and of the Danish and Moravian missions, and they subserve the interests of the Eskimos. Home government exists among the Eskimos in the form of municipal councils, which are organized under the regulations formulated in 1872 by the Danish minister of home affairs. The local priest presides and, in the proportion of one to 120, native Eskimo members are elected from the 'providers' (skilled hunters). They adjust minor offenses and relieve distress among the old and the suffering through the distribution of the Greenland Fund, which is formed by allotment of 20 per cent of all sums paid for domestic produce by the Royal Greenland Trade Commission.

* * *

Q. When and where was the Battle of Hanging Rock fought?

A. This battle was fought on August 6, 1780, at Hanging Rock, South Carolina, between Colonel Hunter's Americans, some 800 in number, and about as many Loyalists commanded by Major Carden.

BRIEFLY TOLD

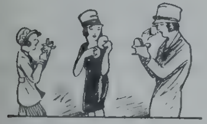
Under Vienna's 'spigot' tax plan each home or apartment is allowed one water faucet free of tax. Since with every additional outlet the duties rise apace, installation of hot and cold water in both kitchen and bathroom is a distinct luxury.

The most northern radio station in the world is that just planted by the Soviet government on Cape Desire, which juts into the Arctic Zone just west of Archangel, Siberia. It will be used to communicate with aerial Arctic explorers.

Platinum, employed by jewelers for about thirty years only, is now so popular in this country that it was found necessary to import more than $10,000,000 worth last year. The most surprising thing about this metal is its weight. A bar of platinum four inches wide, one-half inch thick and a foot long weighs 30 pounds and is worth about $30,000.

'Parasol' ants derive their name from the fact that they cut large pieces out of leaves for making nests and then march along carrying the pieces over their heads like umbrellas.

Owning an auto in China is distinctly a luxury. The license fee in one city costs $37.50 a month and when gasoline is cheap it is $1.50 a gallon. In addition, a jaunt off the main thoroughfare requires the services of at least four attendants.



Five million dollars a day is expended by the women of the United States in the effort to keep themselves beautiful.

Meissen, Germany, the town where Dresden china is made, will be one thousand years old in May, 1929. A feature of the festivities will be a chime of bells of porcelain to be made and hung in a local tower. The largest bell will be three feet high.

Ancient Egypt's sacred lotus was in reality an ordinary water lily.

Fish scales are now valuable, being used in the manufacture of imitation pearls. A Heathsville, Virginia, fisherman recently sold $100 worth of herring scales from one day's fishing.

Post-mortem examination of Ida, famed ostrich at the London Zoölogical Gardens, disclosed the following articles in her gizzard: Three gloves, a handkerchief, cord, an empty film spool, two large and several small nails, a pencil, four halfpennies, two farthings, a French coin, parts of a comb and a gold necklace, a collar button, bicycle tire valves, a clock key, a dozen short bits of wire, metal staples, screws, rivets, a glove fastener and a piece of wood four inches long.

The cleaning up of the 1,800 tons of waste paper and confetti thrown upon the streets during the welcome of Colonel Lindbergh cost New York City $16,000.

Lighting an American match in Peru may be cause for a twenty-dollar fine. A Swedish match company has a monopoly on the sale of matches in that country, which makes all others highly dutiable.

The crown worn by King George on state occasions has two officially appointed guardians. When it is housed in the Tower of London with the other crown jewels, the lieutenant of the Tower is responsible for its safety, but whenever it is removed the King's bargemaster must attend and guard it.

Every Sunday a group of golfers near Fort Stockton, Texas, assemble on the course and listen to the Sunday school lesson broadcast by the pastor of the Presbyterian Church.

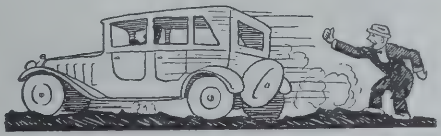
After a two months' trial at Stephens Junior College for Girls, Columbus, Missouri, the midday siesta has been adjudged a success and put into effect permanently. The coeds are not compelled to sleep, but most of them do, while all find relaxation.

Since a family of fourteen Alaskan blue fox cubs requires more attention than one mother can give, the manager of a fox farm at Antigo, Wisconsin, has drafted three house cats to act as foster mothers.

One in each four farms in the United States now uses the radio for business and recreation, announces the Department of Agriculture. The number of sets has increased from 145,350 in 1923 to 1,251,186 at the present time.

Chicago is spending $1,700,000 to build a bridge where there is, as yet, no river. When it is finished a channel will be dug beneath it and the Chicago River will flow where now are only railroad tracks.

An intoxicated violinist in an Argentine lumber camp is credited with the idea of extracting music from an ordinary steel saw, thus originating the 'musical saw' which is now so popular with jazz orchestras.



'Assassin' is the pet name hissed by pedestrians of Paris at chauffeurs who just miss them. They believe the chauffeur misses because his aim is poor.

Seeing New York by air is cheaper than by taxi. The same route covered by an airplane at a cost of $5 will run up a taxicab bill of $6.10, it is reported.

Wool is being made from pine needles by a process recently perfected in Germany. In addition to yielding fine strong fibers, the resin extracted from the needles can be made into briquettes giving a high heat valuable in the manufacture of illuminating gas.

The lifetime of a good watch, experts say, is 50 years. In its daily duties the balance and hairspring vibrate 18,000 times every hour, or more than 157,000,000 times a year, while an equal number of ticks come from the escapement.

In Golden Gate Park, San Francisco, stands a massive stone column erected in honor of the first three Spaniards to enter the city. On top of the column is a huge sundial which rests upon a tortoise, suggesting that time crawls rather than flies.

Because of the great number of laborers who have left the farms of France, farmers are installing modern agricultural machines as labor-savers.

Deprived of eggs, a sitting hen near Cedar Rapids chased a crow from her nest and took possession.

The trunk of a single walnut tree six feet in diameter, grown in Kentucky, recently sold for $625

Snakes have killed more than a million human beings in the last 50 years. An average of 20,000 are killed each year in India alone, and from three to five thousand in the American tropics, besides thousands in Australia and Africa where a large majority of reptiles are poisonous.

A woman placed her savings in a tin container which she concealed in a stove. It was forgotten during cooking operations and all that remained of the currency was charred bits of paper. Experts of the redemption division of the Treasury identified most of the embers and refunded her notes amounting to $1,200.

More than forty-five per cent of the windmills of Holland have been removed or demolished since 1926, according to a report from an official mill association in that country.

In India rickets are more prevalent among high-caste Hindu children who are kept indoors than among low-caste children who play in the sun.

Wyoming is attempting to round up the thousands of wild horses in the state.

Sunday Island, in the Pacific, is said to be the tallest mountain in the world, as it rises 2,000 feet out of five miles of water; this makes its height nearly 30,000 feet.

A terrapin with 'H. E. C., 1873' carved on the shell was found on a farm near Salem, Virginia. H. E. Caldwell of Roanoke says he remembers carving his initials on the back of a full-grown terrapin in April, 1873.

Because of the unusual cold summer, the warmest temperature so far being 35 degrees below zero, the natives of northern Siberia, thinking the gods are angry, have sacrificed scores of precious reindeer.

NOTES · COMMENTS · CRITICISMS

MR. FORD'S Page this week discusses common life and character.

* * *

On page 2 of the cover is a poem—'Roads'—by Lizette Woodworth Reese, the Maryland poet.

* * *

One of the country's greatest authorities on nervous diseases is Dr. Joseph Collins, professor of neurology, New York, and the author of numerous textbooks and articles on this subject. He contributes 'Luck, and the Bedside Manner,' a story which lets one into the methods of some family doctors. (p. 1)

* * *

Doctors who know how to doctor have other ways besides medicine to make a patient well. The 'bedside manner,' is one of the most important of these. Nurses require it as well as doctors. Holding hands with the patient is one of the methods said to be most effective. Telling them that they are looking much better is another; a judicially regulated smile is always an asset. The psychological significance of these things cannot be overestimated. (p. 1)

* * *

There is a region in the West—New Albion—which lies between Puget Sound and the Columbia River. It was Captain Vancouver who called it New Albion. He thought it compared favorably with all that was best in New Albion; but on this extensive strip of mountain, river and sea there is a grandeur that only a mighty country can hold. What a native of New Albion says about it makes one long to explore it, to find a 'valley of the moon' and stay there. (p. 3)

* * *

Hugh Walpole furnishes another of his 'Little Essays from a Northern Cottage.' This time it is about the English Lady in which the writer pays tribute to his own mother. It is a character sketch with a true human touch. (p. 5)

* * *

Newspapers go to great lengths in securing 'scoops.' One of them tried to bottle up the story of Lindbergh's transatlantic flight for its exclusive use, but it might as well have tried to put a lid on Mount Vesuvius. The Paris correspondent of one of the New York papers gives the inside story of how certain news sleuths for a time lost scent of the aviator on his arrival. (p. 7)

* * *

There seems to be no particular diet for men and women of genius. Taken collectively, they eat almost anything. Norman Beasley, magazine writer and essayist, located a retired French chef who had prepared meals for many famous Frenchmen and Americans, including poets, painters, soldiers, sailors, actors and others. What they ate and why they ate it makes a very good story. One might imagine that great singers dined on nightingales' tongues and poets on Parnassian ambrosia. But they didn't; a porterhouse steak with onions had a much wider appeal. (p. 9)

* * *

Katie Roby was a schoolmate of Abraham Lincoln. At play parties she sang the old folk songs with him and she was his close friend throughout. But, says Dr. William E. Barton, Lincoln's biographer and the compiler of Lincolniana, she did not love him enough to marry him. Nevertheless Katie Roby occupied an important place in the future president's life. Incidentally we get a glimpse of the customs and folklore of a very quaint day. (p. 12)

* * *

A list of the *Mayflower's* ship's company as given by Governor William Bradford is one of the most valuable of our historic documents. (p. 19)

* * *

Were the British people as a whole opposed to the Emperor Nicholas II finding sanctuary in their country from Red revolution? This thought arises on reading Gregory Shinkarenko's second article on that ill-starred monarch and his family. The writer, an ex-officer in the Russian Imperial Navy, reveals several intensely interesting episodes in the last part of the Czar's career which ended when, with his wife, their son, their four daughters and their servants, he was murdered in a cellar in Ekaterinburg. (p. 20)

* * *

For many years cook books were second in popularity only to the Bible, and the art of eating was more fully understood than the science of it. The ancient Greeks had their Epicurus and the Romans had their Lucullus. Their names are still remembered as those of great gourmands. The earliest cook books were Roman, and the *Commentaries* of Caesar himself had to take second place to books for cooks. Louis C. Karpinski, of Michigan University, has unearthed some wonderful data on this subject. (p. 24)

* * *

A taxless city is a distinct novelty. There is one in Ohio, and just how it is this way is enlightening. (p. 25)

* * *

'The Hall of Fame' is a short and eminently appropriate article by Frank Dorrance Hopley. (p. 27)

REMARKS BY OUR READERS

Brooklyn, N. Y.

The writer and many millions of American men before the advent of Prohibition prided ourselves in top tenoring to the tune of 'Sweet Adeline'—in close harmony—unto the wee small hours of the morning, spending one-third to one-fourth of our incomes in these misnamed 'poor men's clubs'—those corner hell holes; now, we've all got to be content in going home to radio, lectures, reading, movies, helping kiddies in school work, and so forth—a little bit more domestic, it is admitted, but how much cleaner and better for us all.

New York City is sober and clean and, except the night clubs and a few nefarious speakeasies, it's getting along fine—no drunkenness on the streets—no lapping up of booze during the business day—men and women just attending their knitting in a safe, sane, harmonious, sober way.

Rome wasn't built and Negroes weren't freed in a day—and give this Prohibition law 10 to 15 more years and (we all must admit this) our country will become a virtual Utopia.

Booze and the corner saloon must not return to our midst—it would only bring chaos, business depression and what not. This 'liberty' of booze swigging must be kept from us officially.

There is just one other 'liberty' that should be denied us; that is, that unwholesome, unhealthful, miserable, dirty, mean habit that's fast becoming a stench in the nostrils of all self-respecting American men and women—the smoking of 'butts' by women in public places. This practice is ruining the health of the future mothers of the race. A young girl sitting opposite me while I'm penning this is on her third cigaret—and going strong—and from appearances she's playing 'hookey' from grammar school. The type I see in the restaurants and other public places are usually the anemic, pale and pallid type—and the ones not of that type will be so in time. C. H. KIMBALL.

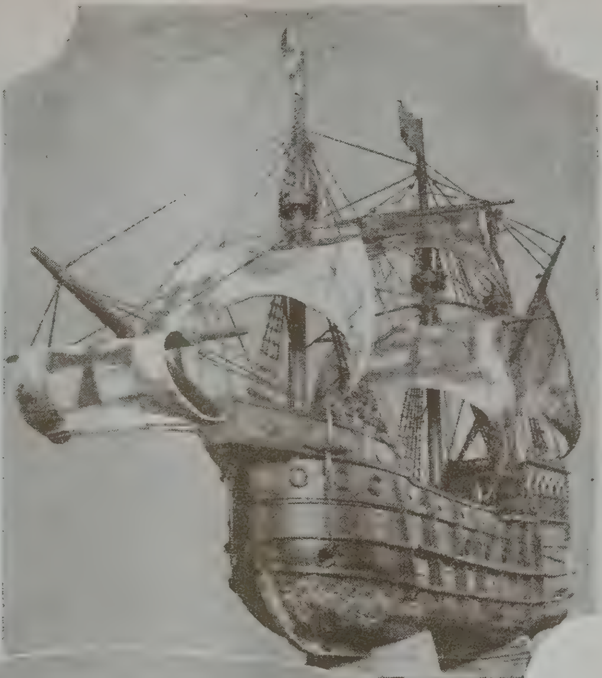
Portland, Oregon.

In renewing my subscription to THE DEARBORN INDEPENDENT I wish especially to express approval of your recent articles on education, bonds and finance, as being both timely and instructive; also of those on the proposed child labor amendment of a little earlier period. I mention the latter in this connection because these questions are all closely interrelated and because it is on a saner handling of these questions that our economic system, perhaps even our Government itself, can be made to endure.

Yes, I like the INDEPENDENT and do not see how I could get along without it. May its influence spread till it fills the land. F. G. HARCOURT.

Adventure *Symbolized* *in* SHIP MODELS

Links Former Centuries *to* Winged Years *of* Today



[—Herbert Photos.]

Making model ships began as more or less of a pastime, but the popularity of the product caused the work to be taken up seriously. In the picture above, one of a group of artists in a workshop in the Bronx demonstrates the first step—shaping the hull from a block of selected wood.

To manufacture these model ships with a margin of profit necessitates that the work be done on a production basis. When the two main parts of the body of the ship have been joined, next to be done is the stepping of the masts, painting of the hull to give a weathered appearance, and arranging of the rigging, ornamented sails, flags and pennants.

The next operation is hollowing out the hull and assembling the superstructure. The crew was housed forward; the officers occupied more pretentious quarters in the stern.

At top, right—
A masterpiece in a miniature replica of a galleon. It appears to be riding the waves before a brisk breeze. This effect is achieved by inclosing bent wires in the bound edges of the sails. Besides being a faithful reproduction for ornamental purposes, this model will ride an even keel in the water.

IDLE money is an evil. It causes idle men: idle men among those who have the idle money and idle men among those who have no money at all. The time is coming—in the moral sense it is already here—when a man will be held to have no rights in money or property that he is not operating for the general benefit.

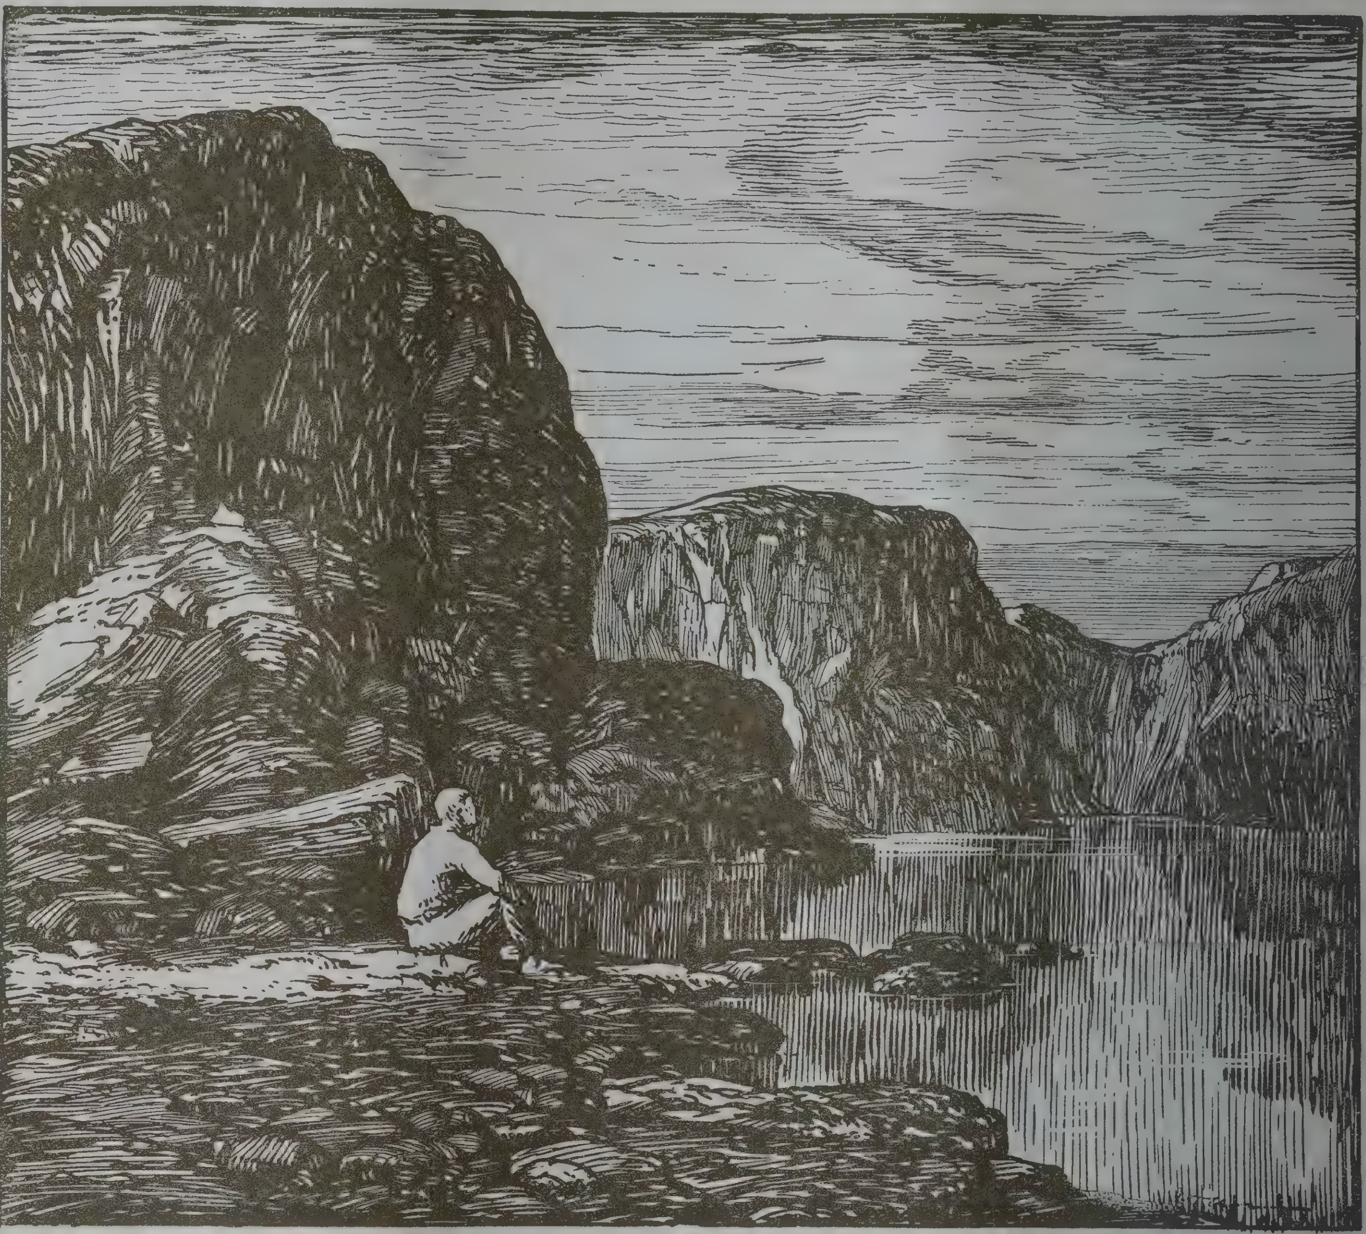
THE RESTORATION OF OLD NEW ENGLAND—Don C. Seitz



To Any Friendly Person

MARGUERITE
WILKINSON

IF EVERY thought, if every breathing
prayer
Takes winged form in passing from
the mind,
And like a bobolink flies, singing
and kind,
Or like a carrion crow divides the air,—
If every dream of those for whom we
care
Lifts pinions into Heaven, if God
could find
No fairer image than the dove's to
unbind
His glory bright above the Beloved's hair,

THEN, happy friend, when you are all
alone,
Listen for wings that flutter and shift
and beat
With moving music of inarticulate
words,
And watch for shining color of flight
unknown
To bodily eyes. In worlds where
prayers meet
You go like Aengus crowned with
living birds.

The Restoration *of* Old New England

By
DON C. SEITZ

THE motor car is restoring New England. This rock-bound region was decimated by the rush to the prairies that followed the building of railroads and the throwing open of Government lands. Soil seekers rushed away from the hills and chills, to the wide open spaces, leaving behind one of the most beautiful regions in the world, to become a land of abandoned farms and reasserting forests. The people concentrated in the factory towns were at first natives from the farms. Lower-priced foreign labor soon drove these out. The great ranges of the West sent cheap cattle to the market killing off such by-product enterprises as there were—notably the tanning of leather, and the profits on raising kine.

Thus agriculture languished, and to own a farm was to assume an obligation. Artemus Ward once expressed it poignantly. A young man had made fun of his baldhead. 'What happened?' he observed, in retaliation. 'In less than a month his aunt died and left him a farm in Oxford County, Maine. The human mind can picture no greater misfortune than this.'

THE statement became almost literally true. 'Getting a living' was a struggle; 'getting ahead' an exploit. For years the farmers saved themselves with their hay crop. The motor ended this, but what it has taken away it is bringing back. It is pushing prosperity into the hills. The 'summer visitor' of yore has been replaced by the motor excursionist, who leaves a layer of money behind. More than this, the motor has brought the farm to life by connecting it up speedily with the town. Farmers are able to find employment for their spare time and spare sons in the villages. Work is done easier and faster. The loneliness has been done away with. New England has been rediscovered and is being restored. The motor has forced the building of good roads.

Once nearly all the highways were horrible. Farmers 'worked out' their taxes in the most wasteful way, plowing up roads where rain and frost had done their best to harden the right of way, and scraping topsoil from the roadside to create quagmires. Through this mess, spring and fall, they goaded their horses, wasted time and wore out equipment. This silly system has been superseded by state supervision, under experienced engineers, with contractors who know their business. Concrete trunk lines have taken the place of muddy sloughs. Easy and fast connection has awakened the people to a sense of their opportunities. Money is coming in, where formerly it went mainly out, or did not come at all.

The pretty villages are no longer dead. In what were once remote roads, service stations establish new centers of activity and spread the money flow. After all, prosperity is not in hoarding, but in keeping the cash current moving. The motor car does it. The visitor has no monopoly of motion.

In my old town of Norway, Maine, save on 'Grange Day,' the street was usually barren of vehicles. Now the village has to employ a traffic cop and the streets are never without life. On a Saturday afternoon, not less than one hundred cars are parked along the curb. Sometimes the number is nearly doubled. Merchants find that 'city folks' look at their window displays and come in to buy. They have learned to 'stock up' for a better trade and make money by it. Incidentally, the townspeople are better served. When a connecting cement road was built to Lewiston and Portland, the merchants thought all their trade would run away. It didn't. Instead, more comes.

The farmer has gained even more than the merchant. One chap who was starving on a sandy plain found himself alongside a trunk line of cement. He woke up, filled his yard with beehives and now he sells something like one thousand dollars' worth of home-raised honey in the comb to passers-by. The bees do the work. In the fall he fills cars up with rosy apples and golden pumpkins. People pine for real pumpkin pie. The pie makers give them canned squash—a crime against the palate. What this man does, others are learning they also can do.

In one remote part of Connecticut, along the upper reaches of the Housatonic, a state highway has created a new land of interest and industry. Old orchards are being trimmed, flower gardens established and hives set up. Moreover, in sunny nooks, where once nothing grew, green fields of tobacco stand sturdily, bringing in a great return since it was found that Connecticut tobacco, despised as a filler, has become the 'wrapper' for the more choice Havana staple. The change wrought is amazing since the engineers blasted their way through to the Berkshires three or four years ago.

Not only have farm and village awakened, but the states themselves have come to life. Maine maintains a busy publicity bureau. New Hampshire booms its delectable mountains, and Vermont's legislature has unbuttoned what was always considered a pretty lean pocketbook, to be surprised to find how much was creeping inside by the motor route. Now it is going to build a trunk line on each side of the Green Mountains from the Massachusetts to the Connecticut line, and a syndicate has been formed to market picturesque spots to summer home seekers, who first heard of the state because of Calvin Coolidge.

MAINE thinks it picks up $100,000,000 a year from motor travelers. New Hampshire comes in a close second. Now Vermont is claiming her share. The change has been almost magical. The conservatives who drove their young people out are amazed to find other people can come in their places and flourish. I attended a Kiwanis luncheon of Norway business men not long since. Of the seventy-five present, only one, the cashier of the National Bank, was a native! They were all prospering.

So New England has been rediscovered, and is being restored.

Passing *of the* Wild Horse

By ROBERT KEMPIS

THE American horse today is a fine specimen, as a result of its careful breeding. And yet, with all the fine points of the pedigreed horse, it generally lacks that fine temperamental trait—'mettle'—which was one of the strong characteristics of the wild horse of the plains years ago, when in its highest degree of perfection.

Before they were deprived of their feeding grounds on that vast stretch of country, then unsettled, between the Rocky Mountain range and the Mississippi River, and from the border of the Dakotas to the southern limit of Texas, they ranged in large and small bands and fed on the luxurious and highly nutritious buffalo grass which then covered these plains and which produced the great energy and endurance they possessed.

When hunters attempted to capture a stallion, they would when possible separate him from his band and run him until he was overcome by loss of wind or by fatigue. A rider would then approach and shoot him in the neck above the bone; this stunned him sufficiently to enable the rider to rope him.

But the rider required much cautious persistence in order to avoid the ferocious attacks of some stallions before their being thrown and tied.

There were times when wild horses were harassed by other things than the white man and the Indian. During the hot summer months when the buffalo grass became seared by the great heat on the plains, they would have to drive at their utmost speed to save their lives from the prairie fires which would sweep their pasturage over vast sections.

There are many opinions regarding the origin of the wild horse of America, but there can be only one as to the origin of the superb specimen which roamed over the plains fifty years ago.

Hunters, settlers and pony-express riders, killed by the Indians, or dying from exposure and disease, left their horses free to seek their own sustenance, and to join the numerous wild bands; they thus assisted in producing an improved offspring. But today, all the finer points of Morgan and Hamiltonian stock have been eliminated by close interbreeding.

The large bands gradually diminished as the country was settled up, so that today only small remnants of former large bands range about the foothills of the Nevada and Idaho mountains, soon to become extinct. It is the passing of a noble specimen.

That Presbyterian Child—
Joseph Hergesheimer

Intimate Chat *With* Writer *Who Took* Eighteen Years to *Make* Good

By
HENRY
ALBERT
PHILLIPS

—Herbert Photo.
Joseph Hergesheimer, photographed at Hollywood, where he went to write scenarios. Left—Dower House, his Pennsylvania home.

A CHICAGO newspaperman recently remarked that Joseph Hergesheimer 'looks like a referee in a prizefight!'—so Mr. Hergesheimer told me himself. Whereas, I should say, after meeting him in person, that Joseph Hergesheimer would more probably be taken for the prize fighter himself. He is one of those bluff King Hal, beefeater types of fellow. He wears his hair convict style; at least it is cut very short in the back and does what it pleases on the top of his massive head.

He has a way of trying to rumple the graying hay-like growth, but it always manages to wriggle back rebelliously in an audacious and ridiculous bang over his squarish brows. I am sure that he would not look natural if it were possible to comb it and part it, and to iron out his rugged features. Everything about Joseph Hergesheimer is thickset—head, neck and body. He looks pugnacious and rebellious.

The first time I saw Joseph Hergesheimer he was sitting quite alone during luncheon hour in Hotel Algonquin, New York. He looked like a forbidding bear sitting there, surrounded by all the literary lions and lionesses purring at one another on every side. I reminded him of it when I visited him in his home.

'Oh, I'm scared to death of New York. That day you saw me in the Algonquin, I was not only scared, but I am nearsighted as well. It's a terrible combination against you that will make you lose your best friends in time.'

In other words, Joseph Hergesheimer turned out to be a rather jovial Scotsman when I met him under his own rooftree, far from the corridors of the Algonquin, in an old Dutch Colonial farmhouse on a country lane in West Chester, which is thirty miles outside Philadelphia.

'I just want to live alone here in this old house with its gardens. I'm just a natural boor, I'm afraid. I even make the neighbors mad with my unsocial habits. I really have few intimate friends—they are always welcome and can't come out too often. Like Henry Mencken, Alfred Knopf, George Lorimer and George Branch Cabell. I don't see many writers. In fact, I don't like writers as writers; they bore me. I don't know what they are talking about most of the time; and less what they are writing about. If I want writers here, I'll invite them.'

He told me this with a mischievous boyish good humor that was infectious. Curiously, Mr. Hergesheimer's right eye is very serious, almost sinister, while his left eye is merry and full of twinkles. He frequently rearranges his shell-rimmed glasses over his thick nose and looks positively impish while half-forming a new sentence with his unruly mouth and thick expressive lips. His voice is always a surprise—it is so soft and pleasant and small.

I asked him to tell me something about himself.

'The trouble with my life is that there is nothing notable about it. And curiously enough, I have very few records of my family. It has never particularly interested me, this shinning up your family tree the way they are always doing down in New England. All I know is that the family were respectable local people. My mother's father was a Scotsman, Thomas Mackellar. He came to Harper's as a typesetter, grew to be very successful and built up a considerable fortune. I inherited some of it, by the way. I had another grandfather who wrote Presbyterian hymns and poems that are a scream. You can see I have no family feeling. I work too hard at my writing to add social labors to it.'

The Hergesheimers, it seems, were Pennsylvania 'Dutch'—as they called the Germans who settled Germantown and other parts of Pennsylvania early in the 18th Century. Joseph was born and bred a Presbyterian child from this stock, in Philadelphia. In his case, the Presbyterian part of it never really 'took.' 'I never could quite get the Presbyterian idea of Heaven,' he said, 'while Hell was not only comprehensible, but actual, from the very beginning.'

I guessed why this was so from what he told me later.

'My father was an officer in the service of the United States Coast

Guard Survey and was absent most all the year. My mother, although she was left home with me, was more often away from it. So, as a child, not only was I reared in an atmosphere of lonely solitude, but I was delicate and sickly as well. I lived a vague sort of existence haunted by strange dreams that pursued me for many years, until I had to write them down to get rid of them. One of the more unpleasant of them, that I can still remember, was an aunt who used to specter our cheerless home dully illumined—like a will-o'-the-wisp—in black jet. More pleasant, was the memory of a small coachman's cottage in red brick festooned with wistaria, a grape arbor and a hedge of mock orange trees—that ingrained an almost pathetic instinct for future scenes of local color.'

IF MR. HERGESHEIMER now and then injected some mellowness into his recital, it should never be construed as sentimentalism. He is at once one of the bluntest and least sentimental people I have ever met.

'I was carefully preserved from evil associates and associations and patiently accepted as a "backward child." I was taught little or nothing except to be a good Presbyterian child and to go to bed early. So I grew up burdened by a painful timidity that still troubles me, although you might never think it. Very late in my boyhood I was sent to a Quaker school in Philadelphia where I remained two years, thus completing my religious confusion and my education at one and the same time.

'At length, with no particular talent or reason, I found myself at sixteen studying painting in the Pennsylvania Academy of Fine Arts. To prove what a rotten artist with the brush I was, not a single daub or canvas I ever painted survives!'

'But writing—how did you ever get into that line of work?' I asked, for I had always to prod him into revealing anything.

'Oh, after muddling about in painting for a year or so, I just petered out of it into writing. But I found that I could not get out of writing so easily. It fairly clung to me, and having no other avocation at hand I kept at it desultorily. For years and years I wrote "short stuff," sent it out into the editorial jungle, got it back, tore it up, and wrote more of it.'

Again he stopped as though he had finished his story, or perhaps at the climacteric moment, like the good story-teller he is? 'And then?' I urged.

'Well, finally, to my great relief and surprise, *The Forum* accepted something. The editor expressed a kindly interest in seeing more of my stuff. I took him seriously and complied and thereafter for some time seemed to satisfy their meager circle of readers. This went on for several years, the readers becoming fewer and fewer. Then Mitchell Kennerly hove on the scene and gave a helping hand to the limping *Forum*, which he gathered into the fold of the publishing house which at that time bore his name. I fully expected to be discovered as the writer who had done much to reduce the circulation and let out. Instead, I was informed that Mr. Kennerly had taken an especial interest in my writings! This was in 1910.

'But it was not until that year of disasters in general—1914, nearly eighteen years after I had muddled out of painting into writing—that I became what you might call an honest-to-goodness author. In that year, Mitchell Kennerly published my first book, *The Lay Anthony*.'

From another source, I learned that the publisher's first reader made this report on the above manuscript: '. . . a book, beautiful, notable, thrilling. It has held my feebleness awake all night and left me tingling so I can scarcely write steadily.'

'*The Lay Anthony* didn't sell, however. Out of the first edition of one thousand copies, I believe only nine hundred were sold. I was not encouraged over my writing, but I tried again. In 1915, *Mountain Blood* appeared—and disappeared—practically a worse failure.'

THEN a new star rose to guide and favor the fortunes of Joseph Hergesheimer—'Alfred,' as he always affectionately calls him.

'Alfred'—Mr. Hergesheimer is referring to Alfred Knopf, of course—'had been manager of the publishing house of Mitchell Kennerly for upward of a year when he turned publisher himself. With all my faults and failures he took me on. The first American novel he published was *The Three Black Pennys*. Well, things have been going pretty well ever since. And I am so pleased at the whole darned thing—the way things have turned out, I mean—that I am having a glorious time over it!'

'But all this talk,' continued Mr. Hergesheimer soberly, 'about my making fabulous sums from my writings is ridiculous. I simply don't do it. It is like those authors who are always telling you about the sacks of mail they get in response to the appeal that their stories make on their readers. Oh, I get letters—a few. Aside from that, I'm too darned pleased, as I said before, and content with it all to wish for more.'

'Then you love to write?' I asked, misinterpreting his obvious joy in something.

'No, I don't love it!' he replied quickly with a show of distaste. 'Only the hideous necessity of writing makes me do it. I am not one of those who write until they bleed at the nose and then say they love it. I think anybody who says he does is either a fool or a liar! I'm afraid I don't ornament any literary "sphere." I'm just a writer and write as near as I can to things as I know them.

'What do I like to write?—You simply do things that you are. I am too lazy to write about things I don't like—although I may not always write about things that I like. A man who has written twenty-one novels should be known through and through by his readers—just through what he has written. Unfortunately, no matter what you may do, or try to do, if you are in the public view, you can't hide yourself. Since 1914, I have written twenty-six books—not all published yet, by the way.'

We fell to talking about authors and writing in general. We were sitting in Mr. Hergesheimer's library at the time, which I found so much smaller than I had expected—a couple of thousand volumes or so.

'How can you strike an attitude, when your books show you up for what you really are?'

'I have a lot of fun in writing articles about art. Art has always amused me. There is so much bunk in it and about it; so much silly affectation. Greenwich Village and its art is the sort of thing I mean. There is only one thing to do about it, only one remedy or cure for it, that is *work!* That is the only honest art I know. I am told that some of my books bring no little despair into this happy world over their art, or the lack of it. The professors and the highbrows shake their heads over them and say, Isn't it too bad! And the lowbrows shake their heads too and wonder what it is all about. But both classes seem to read them, which is the point after all—one vowing they are without art and the other protesting they are artistic.

SOLEMN people bore me to death, and every chance I get I take a whang at them. I love fun in everything.

'What do I like to write? Well, for instance, I want to write about twenty brisk novels. What I would really like to write is—history! And here is something worthy of note: with all my writing about periods, I've never been accused of writing an historical novel.

'There are several impressions abroad that I would like to correct: I've never lived in a seaport town—although I could take a ship up a Chinese river. My father was a seafaring man and I have a sea library that is invaluable. I have never lived in the Orient. Nor am I Jew. I am telling you these things, not out of modesty, but from the lack of it.

'There is a lot of quibble about what is a gentleman here in America. I took great pains

What FOOTBALL May Come To

Knute Rockne (Notre Dame) snapped during rehearsal of one of his new plays.

FOOTBALL will this season see the most drastic innovations in style of play that the game has known since the introduction of the forward pass. Two changes in the rules are responsible for this.

The rules committee made a number of alterations at its annual meeting last March, as the rules committee generally does, but of these changes two stand apart. One concerns a fumbled punt and the other refers to the lateral, or backward, pass. It is the change in the lateral pass rule that affects the game chiefly. The lateral pass has been legal for years but was used only rarely. The reason for its absence from nearly every important game was the penalty attached to failure. The forward pass gave greater promise and offered less risk. If a forward pass is fumbled by the receiver, or unintentionally grounded by the passer, all the attacking team loses is a down; but if a lateral pass, under the previous rule, was grounded or fumbled it became a free ball and the opposing team had a right to recover it and gain possession. This made the lateral pass a risky play, so risky that few teams ever attempted it.

The committee has changed the rule by eliminating the previous penalty. In the future a lateral pass will carry no more risk than a forward pass. The new rule covering the play provides that 'any player may at any time hand or throw the ball in any direction except toward the opponent's goal. If the ball after such a pass on the first, second or third down, strikes the ground within the field of play, or goes out of bounds either before or after having been touched by a player of either side, it shall belong to the side which made the pass at the point where it first struck the ground within the field of play or (if it goes out of bounds before striking the ground) at the point where it crossed the side line. On the fourth down the ball shall go to the opponents at the same point.'

The only way in which the attacking team can lose possession of the ball on a lateral pass (except on fourth down) is to have the defensive team intercept it before it strikes the ground, and this will be one of the most unlikely happenings in football.

It is possible for a player to pass the ball any number of times, from man to man, going down the field or behind the scrimmage line. There are no restrictions as to place.

In changing the rule on the muffed punt, the committee reduced the penalty for such an error on the receiving side. The kicking side may recover a muffed punt but may not run with it; this change eliminates one of the most spectacular of all features from the game. A team with a good kicker always played a punting game against a strong opponent hoping that a punt would be fumbled, giving the kicking side a chance to recover the ball and run for a long gain or touchdown. To eliminate this possibility teams got into the habit of letting the ball roll, whereupon the kicking side drew another big advantage being sure to gain heavily on any exchange of punts. But, under the new rule, the ball will not be allowed to roll so much as formerly. Receivers will take a chance on catching the ball. If they fumble it will mean loss of the ball and loss of the distance of the kick, but unless the fumble is made behind the goal line (which will not happen once in a hundred games), the kicking team will have no chance to recover a fumble for touchdown. The receiving side may still recover a fumbled punt and attempt to advance the ball. The rule is not changed so far as the receiving side is concerned, only the kicking side being dealt with. The rule does not apply to a kick-off, a free kick, or a kick-out after safety; it applies to no kick where all players of the kicking side are onside.

The changes in the rules, of which these two are the most prominent, will make the season of 1927 one of marked importance. It is now up to the coaches to figure out what football shall be like. They will provide the game with a new style; and just what style such eminent professors of play as Knute K. Rockne, Robert C. Zuppke, Fielding Harris Yost, Glenn S. Warner, Bill Roper, Dr. John W. Wilce, Tad Jones and other strategists

LUCK, and the BEDSIDE MANNER

By JOSEPH COLLINS

WITHOUT admitting that any bedside manner is sufficiently desirable to justify studied effort or daily prayer, I have this to say about the subvariety under discussion: it is one of the most hazardous for the reason that it is continuously in conflict with intellectual honesty, and if the possessor is not forever watching his step, he is bound to fall into a morass of hypocrisy.

The meticulous and explanatory variety is much favored by neurologists and pediatrists. This is one of the many things that the former learned from the Germans. I saw it first in full display in a sanatorium in Kissingen. I then realized that what I had seen in New York in the person of a physician who knew a lot about diseases but little about the possessors of them was but the image of the real thing and a blurred one at that.

I had opportunity later to see display of it by one of my friends which made the Bavarian variety seem affectation and pretense. It might be said of him that he had a specialty within a specialty. The inner one was concerned with telling the patient what to eat and how what he ate should be prepared. Trimalchio's chef never had more specific instructions for a banquet than had my friend's patients how to cook a banana. He had no printed slips furnished by ferment manufacturers telling what to eat and what to avoid. His instructions were put down in black and white with his own hand, and he did not confine them to diet. Urges, functions, commissions and omissions were all regulated and synchronized.

It was one of the most telling therapeutic gestures I have ever witnessed. Few could withstand its lure, and I recall that at one time I contemplated including in my matutinal appeal for heavenly aid that the few patients left to me would not learn of his art or of his practice. On deliberation, however, I realized that the impossible should never be asked for. The individual who receives such instruction as this man gave can no more help talking about it, especially at dinner parties, than tobacco can help absorbing moisture.

Lest it be thought that this magician's success as a physician depended entirely upon his bedside manner, I hasten to say that he was *molto simpatico*, as the Italians say, a lovable creature with an uncanny capacity to know what was, and what should be, within the human heart. Within his own, there was a fountain of kindliness, difficult to exhaust.

When I say that I never knew a successful specialist of children's diseases, I do not mean to accuse them of pedantry, but by and large they are sticklers for accuracy and small detail. Should Mussolini be removed, or tire of his job, I can suggest one or two doctors whose experience entitles them to apply for the post.

Pediatrists deal with persons who like to be dominated and with those who cannot resent dominion. Detail is a heartless tyrant. I realize that the activities of pediatrists have reduced the infant mortality rate in this country, but we paid a great price for it. One who observes a hundred-per-cent pediatrist in action can scarcely avoid the reflection: 'How did our ancestors survive childhood. They were brought up so differently from the children of today. Pediatrists are not wholly to blame; parents share the blame with them. But the former made the links of the chain that is fettering us and which prevents us from being what our forefathers were—adventurers, wanderers, explorers.

IT IS better to have ventured and got lost than never to have ventured at all!

The pediatrist's bedside manner is a composite of sternness, sobriety, sincerity and sententiousness. Any admixture of humor, imagination, playfulness, impairs it. Those who have it to perfection are laconic of speech, sparing of gesture, lavish of command, and they exact absolute obedience. Some of them carry around a photograph of the Sphinx which they study between calls in order that their features may take on some qualities of its expression. Hermes, they hold in holy horror.

Had Mr. Coolidge been a physician, doubtless he would have specialized in diseases of children.

The solicitous and exhortatory manner is especially adapted to general practitioners who make friends of their patients. It conveys a keen interest, not only in their bodily but in their spiritual welfare, and it includes their ascendants and descendants. It promotes the belief that personal acquaintance and time, not investigation and insight, make disease an open book. I have known many who had this variety of bedside manner and in moments of depression I have sometimes envied them. I recall one who after many years of general practice became a dermatologist, a beauty specialist they would call him today.

ANYONE who consulted him, no matter how trifling the ailment, concentrated his interest as a burning glass concentrates actinic rays. Invariably this made a favorable impression, and when it was spread over the entire family admiration and publicity resulted. The zeal he displayed to induce patients, their parents and children, to drink milk in a certain way, at a certain time and in certain amount, would have earned salvation for a misfit missionary. Had I not known of his probity, I should have been suspicious that he was subsidized by one of the milk trusts. He was devoid of humor and of imagination, and he had a one-track mind, and of narrow gauge at that, but his bedside manner gave him great favor with the laity. It contributed to his happiness, his prosperity and his vanity.

A subdivision of this variety, the bedside manner marked by extreme sympathy, is very common. It is usually accompanied by a pudgy hand—one pudgy hand holds the hand of the patient and the other pudgy hand pats it soothingly, while the person to whom the manner belongs murmurs smilingly: 'There . . . there, don't be alarmed; we'll take care of you; you are going to get well; you are the most courageous person I know.' Nobody in pain wants sympathy; he can give himself all that he needs and more than is good for him. What he wants is something to relieve him, and he wants it quickly. Whenever I have been in pain my medical attendant's bedside manner has not helped me a bit.

The most annoying bedside manner is the one that I have called the trivial. I recall once taking a patient to a colleague who has it to a superlative degree. I told him I had brought her for a decision whether her appendix should be removed. The first question he asked her was: 'Are you fond of dogs?' She admitted she was, and then for a half-hour he told us more about dogs than either Romulus or Remus knew about wolves. He kept it up until the visit ended, during which time, of course, he examined her. As we were making for the door he said, quite incidentally, he thought the appendix was good enough to keep.

I frequently see him at work, he is always avid to talk about anything save the matter in hand, to flutter about it articulately, as it were, as a butterfly flits in a field of flowers. He is one of the most penetrating diagnosticians of his day and he has a knowledge of his profession that would become a professor.

I have often wanted to ask him if his bedside manner was a defense phenomenon, a kind of gas mask, but I have never had opportunity, as he always talks of some incident of our early days together in the hospital, something that reflects my alertness and his obtuseness, for he has that most insidious of all forms of self-appreciation which consists in exalting others at one's own expense.

The last, the optimist, is not least in this instance. For a very good reason optimism is part of the make-up of every good physician. Many years ago there was a renowned doctor in New York who was a notorious pessimist. He was not a good doctor; he was a good diagnostician. The good doctor is one who keeps you from getting ill, tells you how to get well when you are ill, and who takes you to a detective if he cannot designate the variety of your sin.

THE man whose bedside manner is one of optimism, armed with negation, that is, the man who feels that he is usually right and his colleague usually wrong, is never a good doctor, even though he has a following as large as the late Dr. Munyon of uplifted-finger fame. The doctor who pats his patient's hand or slaps his shoulder and assures him that he will be all right tomorrow or next week is frequently not mistaken, for Nature abhors ill persons and strives to restore them; if she has not chance, she hastens to kill them. This is the kind of doctor who mistakes glanders for grippe and sciatica for sarcoma. He is not so prevalent as he once was, but nearly everyone knows at least one.

This presentation leaves many possessors of distinctive bedside manner undescribed. Something should be said of the pompous and pretentious, the solemn and the subdued, the brusque and the breezy, but it is not possible within the confines of a brief article to describe them all.

The bedside manner is at times an asset, at other times a liability. What the individual really ill, or thinks he is, wants to know is whether the doctor has the experience, knowledge and skill to cure him. The more businesslike the doctor is, the better patients like him and the more he impresses them: 'Have you ever had a case like mine, and did you cure him?' is the question they want answered. It does not interest them to know what the doctor's views on materialism or modernism are; or whether he thinks Maeterlinck is a genius or a mystic; Mussolini a menace or a savior.

They do not want to know the doctor's creed or his politics, whether he has taken up contract bridge, or what he thinks of *Elmer Gantry*. Indeed, if the patient suspects that the doctor devotes much time to these and similar things, or in fact to anything that comes under the head of engrossing interests outside of medicine, the suspicion enters his mind that the doctor has not time to devote to patients, or perhaps is too superior to combat disease.

Culture is a great aid to life, a powerful antidote to *tedium vitae*, but it has small value as therapeutic coadjutor.

The physician makes an impression upon his patient by his manner as well as by his matter. Often, the patient needs more skilful handling than the disease, and frequently the disease cannot be successfully combated until the confidence of the patient is won. Some persons we spontaneously like the moment we meet them. Patients are not beyond similar experience with physicians, and the first impression is influenced by the bedside manner. It often makes a successful doctor out of a poor physician, and the want of it, a scientific physician a poor doctor.

As physicians, we are constantly made aware we are serving two masters—patient and profession. Both are exacting. The former requires infallibility and the capacity to give and to give generously on every demand; the latter, a conformity to ethical principles, most of which are ideal, some of which are absurd.

All medical students should be obliged to go to church. There they will learn how attractive the natural manner and how offensive the artificial.

The clergyman who is speaking more understandingly and appealingly to the people of this country today than anyone in religion is a man whose appearance and manner in the pulpit do not distinguish him from a business man. He presents his thought simply, precisely and convincingly. He appeals to the intellect and emotions of his auditors, but he does not depend upon rising inflections of words and sentences, rolling of the eyes, swaying of the body, or gesticulating with the hands. One does not feel on leaving the church that he has been to a camp meeting, a beer garden or a vaudeville performance as I have frequently felt after listening to one of his brother-preachers who refers to him as a Baptist bootlegger.

Should the embryo doctor in search of enlightenment about professional manners stray into some other church, he would see something that it is prudent for him not to copy. There is so much tragedy in a doctor's life that adding the dramatic to it is superfluous.

THE bedside manner, finally, is a lever of success. The human impulse is a selfish one and the natural reaction to a tale of woe and to others' pain is retaliation. That, however, is not the physician's rôle and if he is patterned for such a rôle by nature it is up to him to change it. The good doctor always makes the patient feel he is an important factor in the physician's life. This feeling is engendered by his manner and solidified by his matter. Both manner and matter should be simple and sincere, for sincerity and simplicity are the weapons that win the struggle for love and idealism.

Scaring DEATH Away

By PAVEL BOULIGIN

I WAS in the midst of a grand nightmare when the sharp note of a horn calling the workmen to the plantation awoke me at seven o'clock in the morning.

'The *ashker* of the *Asatch* Matafari is here,' said Tasso, bringing my breakfast; 'he wants some medicine.'

'Go call him.'

A dirty young Abyssinian *Amara*, a servant of the governor, came in. The *Amaras* are a tribe of victors. They are very proud and when they speak with the *Gouraguies* or *Gallas* (the vanquished), not to say with *Chancala* or Negroes, they cover their noses with a fold of their *kouta*. Idling too is the respectable thing; and swinging naked feet on the sides of his mule, the noble *Amara* displays wrists that droop languidly so that everybody may see how delicate and tender are these hands unaccustomed to work—as much as to say, 'I have servants.' So, a proud *Amara* came into my house. He was spending his usual term in service as an *ashker* of the governor, after which he would be promoted to the position of *chome*, or chief, also. He asked me for some kerosene.

I asked him why he wanted kerosene and learned that his wife had earache and that kerosene must be poured in. His house not being far from mine, I took up my first-aid case and accompanied him. His *bek* was like everybody else's. It was built in the same way, that is, out of *tcheka*, or mud, and eucalyptus poles and branches, which formed the shell of the hut. The straw roof was skilfully made in cone shape, with a soda water bottle in the middle—though I can't say how it came there.

A tired, skinny young woman with large, sad eyes raised herself up from a dirty reed rug.

Her head, smeared as usual with foul-smelling oil, was tied around with a dirty rag. Her forehead was hot, and seemingly she had a fever. A piece of flax protruded from her ear; as I removed it pus came out. Behind the ear was a large painful swelling—what could I do for her? I washed her ear with a boric solution, bandaged her head—and left, realizing my helplessness.

I am no doctor, and have only a bit of a camping kit for first aid. Her husband, bowing low, accompanied me to the gate.

I asked what ailed the wife, and learned that at Easter he had given a great feast at which, becoming drunk from a local whisky called *tala* and from the intoxicating *tedge* made out of honey, he had picked a quarrel with his wife and had struck her on the ear with the palm of his hand. Expecting sympathy from me as I judged from his tone, he told me that his wife was no good—taking sick from such a small usual happening; and he was surprised indeed when I struck him a blow with my palm in the nape of his neck!

About four days later Tasso and several other natives ran into my room and began to beg for my gun. On my asking why it was needed they explained to me vaguely that somebody had been drowned and that they must shoot the demon. I did not understand but was interested in this new sort of hunting. I gave them my gun and also went myself to the river. The people flocked from all directions, the women wailing and lamenting. Through an overgrowth of cactuses and mimosa bushes I followed a wet footpath of slippery stones to the river.

—Herbert Photo.

An African native with an earache having the evil spirits that cause the pain driven out by a witch doctor, who blows through a horn into the sufferer's ear.

There on a large flat gray stone sat a half-drowned woman, just taken from the water. She looked around with wide eyes crazed from pain, cold and fear. It was my former patient. I ordered her to be taken home, put to bed and covered up warm, and I promised to send her tea and aspirin. But the crowd of women wailed, and the village chief respectfully informed me that the demon must first be scared away who had thrown the woman into the water.

That instant her husband stepped out with my gun, and officiating ceremoniously, shot from behind her shoulder into the water. The woman screamed and writhed in the arms of the other women—the shot had been fired near the sore ear.

On the way home I learned from Tasso that she had thrown herself into the river because of the unbearable pain and because of her husband's displeasure. Had he intentionally shot near her ear? Or was that shoulder required by their ritual? Tasso did not know. I gave the word to watch that husband closely.

Two days later I was wakened in the night by the report of rifle shots and by wild cries near my *gebi*, or palace as it is importantly called here. Scarcely roused from my slumbers, I took a *tchjibi* (dagger) from the rug above my bed—and now thoroughly conscious, I also took my gun. It was clear that there were robbers; no doubt they were now attacking some caravan of traders a few hundred steps from the plantation. What should I do?

Without lighting my candle, I opened the door. It being moonlight, to my surprise I saw my servants calmly talking together in the yard. Tasso came to me and said:

'The woman who was nearly drowned has just died, and they are shooting to scare death, lest others die.'

I explained that not long ago there were no guns in Abyssinia. Tasso, apparently not believing me but unable to dispute, sought a compromise.

'The *Chankalas* did not know about guns, but the *Amaras* always knew,' he answered.

Since that time I often hear night shots and sobs. This childless tribe is dying out rapidly. And it is always at night—probably in the daytime death is afraid of guns.

The Function of American Folklore

By MURRAY GODWIN

THE recent interest in American folklore, evidenced by the publication of several versions of the Bunyan cycle, a book of 'tall tales' from the Kentucky highlands, volumes of negro songs, cowboy ballads, sailor chanties, and shantymen's lays, has stimulated certain critics to a determined effort to define the word *folklore*. What, precisely, is folklore, and what is not?

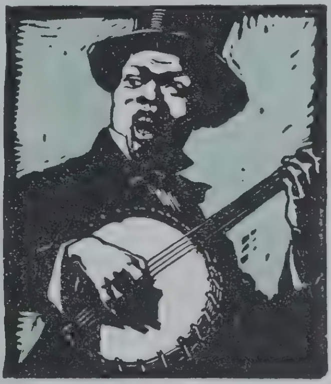
An article in *The Saturday Review of Literature* declares that a collection of shantymen's songs now in circulation is definitely *not* folklore. The songs in this collection, according to the article mentioned, smack too obviously of a labored attempt on the part of their authors to imitate the rueful odes which were published in the newspapers of the seventies and eighties. It would appear that their sentiment is that of the schoolma'am of caricature, their morality that of the *Holiday Chaplet*, their sense of tragedy that of the lamented 'melodrammer' of the last century. When a log-spinning rowdy hangs his socks on the stovepipe and devotes himself to a painful emulation of such models, the result is less like folklore than his lank and muscular frame, shoe-horned into 'store clothes,' is like Lord Chesterfield. For folklore, says the article, must above all things be earthy, simple, and natural.

This is the critic's argument; and it is a convincing one. And yet—

A wider definition of folklore is needed in America. In other countries, where for centuries an unlettered, primitive life has worn deep grooves for itself, apart from the artfully cultured existence of landholding or commercial classes, an independent, or only negatively dependent, illiterate and primitive culture has formed. Then, too, in other countries there has been a time when the whole body of the population has been in a barbaric state, during which it has given birth to great myths like the *Iliad* and the *Edda*. This culture, these myths, being spontaneous, simple, earthy, and natural, come properly within the critic's definition of folklore; indeed, it is from the study of such cultures and myths that the critic's definition has been formed. But, except in a very limited sense—never by any means in a national one—America, as we know it, has never had experience of either of these sets of conditions, and hence has never had any primitive culture or barbaric myth.

Must we decide, then, that America has no national folklore?

It is my contention that America has a folklore, national and extremely abundant; only we have been looking for it where it could not possibly be found. Perhaps we have been hampered by the critic's superstition that folklore, to deserve the name, must be the product of unlettered, earthy, simple, primitive people. For whatever reason, we have not thus far discovered a truly American folklore. Neither shall we discover one until we look to our definition.



Folklore is not *characteristically* earthy, simple, and primitive. The conviction that it must be so has become current simply because the folklores of other countries come under these specifications. What is really characteristic of folklore is its quality of naïvely expressing the wishes, desires, attitudes, and ideals of those who create it. A nation's folklore takes little account of *what is;* it is preponderantly and finally interested in saying, *Thus would we have it.* It is always a people's *yea* to life, in the face of circumstances which may say, *What does it matter*, or even, *It cannot be.* Folklore is most of all a metaphorical expression of a people's will, an expression that is unqualified as well as metaphorical, recognizing obstacles only for the purpose of definitely trampling them underfoot or of circumventing them.

Ulysses outwitted the sirens, Circe, and the Cyclops, not because it was probable that he should do so, but because the Greeks willed that cunning should triumph over sensual allurement and force. The giants in the Irish epic, the *Táin*, hacked and mangled one another in an incredible fashion, but did not die of their wounds, not because it was likely that they should survive but because to the Irish the fight was the thing, and to kill off a combatant would necessitate creating another before the conflict could go on. It was much more pleasing to the Gaelic will that the heroes should recover from their wounds during each night, and wake in the morning ready for another full day of joyful mayhem. The stark and muscular warriors of the *Edda* shed oceans of blood while murmuring such sentiments as might more fitly have adorned the ballads of troubadours, not because they found it easy to combine endearments with the dealing of sudden death, but because their plundering creators willed that battle, which was necessarily their trade, should not be lacking in lure.

Similarly, Paul Bunyan out-Gargantuas Gargantua in both stature and performance, not because it is probable that he should be a giant or accomplish such impossible feats, but because his lumberjack creators, however much they might be forced to compromise with the elements and things and men in the course of the day, willed to override them by myth in their leisure hours. Here, as in the ancient legends, we find the triumph of the will over the dull and stodgy fact.

But shall we stop here? Seeing that our definition permits it, and that the examples we have adduced warrant it, let us press on.

Let us press on to Hector Saint-John de Crèvecoeur, the author of *Letters From an American Farmer*, who flourished here in Colonial, Revolutionary, and early post-Revolutionary times. D. H. Lawrence, in his *Studies in Classic American Literature*, is rather disdainful of Hector Saint-John. This author, says Mr. Lawrence, 'tried to put Nature-Sweet-and-Pure in his pocket. But nature wasn't having any. She poked her head out and baaed.'

And considered as an interpreter of life in the realistic manner, Hector deserves all the disdain that Mr. Lawrence lavishes on him. But it is possible, with our conception of folklore as a gauge, to see in Hector Saint-John a creator of folklore and, as such, one who is not susceptible of being criticized from the realistic point of view. If, as Mr. Lawrence says, 'Hazlitt, Godwin, Shelley, the English romanticists, were of course thrilled by the *Letters From an American Farmer,*' under the impression that they were literal transcriptions of life on the border, that was, as we say, 'their hard luck.' Had they possessed a knowledge of folklore and a true historic sense, they would

OF THE DEARBORN INDEPENDENT

Finance and Industry

IT IS pleasant to see a truth for which one has contended come back in the form of authoritative acceptance from quarters where, before, that truth had not seemed welcome. This magazine has preached that Finance is not the mistress of Industry, but its handmaiden. We have proclaimed that the great function of Finance is to assist Industry and not to rule it. We have held the doctrine that money is at best a belt, a tool, a facility by which men may more easily enter upon creative work and exchange the products of their activities.

There was reason for such preaching because the opposite view has largely obtained in this country. For a long time Industry was looked upon as subservient to Finance, a mere feeder of dividends, and dependent for its life on the mercy of the controllers of money. The history of many industries in this country has shown only too vividly the fallacy of that attitude.

But now the enunciation of the principle of Finance as the handmaid of Industry is no longer dependent on outsiders like ourselves. It is beginning to be sounded by the financiers. At the convention of the American Institute of Banking, attended by two thousand members at Detroit, H. H. McKee, president of the National Capital Bank at Washington, made this clear and unequivocal statement:

> 'Banks do not create anything. They are simply the instruments or tools that are used by the men of industry and commerce to help them to produce and distribute their goods among the people.'

That, we feel, is a tremendous and welcome concession toward a principle which will go further to reconstruct finance than anything else could do. In the recognition of principle are all the elements of progress. This statement of Mr. McKee's is worth the study of every young banker in the land.

Of course, it is not complete. It is too early to expect completeness. The service of finance will not finally be limited, nor is it now, to the men of industry and commerce. The whole authority for the money system in the first place is 'We, the People of the United States.' The people have not been included as fully as might have been expected in the blessings of modern finance, and yet they have not been wholly deprived of benefit. But something more inclusive will come, and a new attitude be found, as is now being found in the relations between Finance and Industry.

The Core of It

CURIOUSLY enough it is from the European press that we get the clearest picture of the United States' position at the Geneva Conference. Such news as we get here in America is somewhat befogged because a full statement would require some confessions which have never yet been made to the American people.

The long and the short of it is that we have representing us at Geneva two men who know the situation and who do not believe that the United States should be used as provender for a European festival. These men are Admiral Jones and Hugh Gibson. They know what goes on behind the scenes and they know the sources of disquieting tendencies in international life. They know also that as a result of the Washington Conference we actually destroyed and sunk the finest navy then existing in the world, and received no compensating disarmament from other nations. That is a fact which has never been emphasized here at home, a fact which the American mind has not grasped. But Admiral Jones and Hugh Gibson both know it, and Europe knows that they know it, and it is well understood—except in the United States—that this forms the basis on which these two American representatives work.

They claim first of all that British naval strength shall not be permitted to become superior to American naval strength. This is of the essence of the Washington Conference Agreement. Our zeal for the idea of disarmament at that time led us, before any other nation had made a move, to give Britain the superiority by immediately destroying our great fleet. So that now our representatives hold that Britain must not accentuate that inequality, but that either she must come down to our standard or we shall go up to theirs. British argument runs that this is unfair since America has not the world-wide commerce to guard that Britain has; but regardless of their argument British representatives have evidently been compelled by Admiral Jones and Hugh Gibson to recognize the superior fairness of the United States' position, resting as it does on a Conference Agreement and confirmed by a greater naval sacrifice than any nation has ever sustained in war or peace.

Our representatives stood firmly also against the scrapping of the Washington Agreement, which was actually proposed to them. They insist that it run for the appointed term, by which time, unless every last sinew of American strength is rotted by insidious pacifism, we may have regained something like the naval prestige which we have sacrificed.

Ireland

WILL ROGERS advises tourists not to miss Ireland. He is evidently afraid that the recent political murder there will give travelers a wrong impression of conditions in the Free State. Will says that if you miss Ireland you miss more real scenery and hospitality than is in any other country in Europe. Will Rogers is remarkably truthful, even when he is funny, but he was never more truthful than in that remark. The hospitality of the Green Isle is a surprise and a rebuke to the sophisticated traveler. Poor the people are, and poorer the land grows through the loss of men by emigration, but the lift of the Irish heart and the lilt of the Irish voice still remain. The author is no Irishman, but after wandering among the *people* of various parts of Europe, he can say like Will Rogers that he lost his heart to the Irish people of the towns, villages and countryside of Ireland.

What People Read

THE circulation of newspapers and periodicals in this country increased 15 per cent during the last two years and now amounts to nearly 200 copies a year for every man, woman and child in the land. But the production of books and pamphlets of all kinds numbers fewer than four for each individual. There were only about 1 3/4 books produced for each of the population, and nearly half of these were textbooks for school use.

Unfortunately, in too many homes in this country it is considered old-fashioned to read books. 'Life is too short' and so the magazine of hectic complexion is the thing.

Americans are really growing stronger in the books that matter, and are largely confining their tastes in lighter literature to the fiction magazines. Anyway, it is not the number of books that a people reads but the quality of the books that are read that really matters.

Sapiro Case Settled

THE DEARBORN INDEPENDENT wishes to announce that the suit commenced by Aaron Sapiro for libel against THE DEARBORN INDEPENDENT and Henry Ford has been terminated satisfactorily to all parties.

The suit was based upon statements appearing in a series of articles published in 1925 and 1926 by THE DEARBORN INDEPENDENT upon the subject matter of coöperative associations organized on the Sapiro plan.

The articles complained of by Mr. Sapiro dealt with the so-called Sapiro plan of coöperative marketing and the relations of Mr. Sapiro with the associations organized on this plan. They were prepared and written by a contributor to THE DEARBORN INDEPENDENT, whose works and writings have in the past appeared in various periodicals in this country. They were accepted at their face value by the Dearborn Publishing Company. It has since been found that inaccuracies of fact were present in the articles and that erroneous conclusions were drawn from these inaccuracies by the writer. As a result of this, Mr. Sapiro may have been injured and reflection cast upon him unjustly. Such statements as may have reflected upon Mr. Sapiro's honor or integrity, impugned his motives or challenged the propriety of his personal or professional actions are withdrawn. Likewise the charge that there was a Jewish ring which sought to exploit the American farmer through coöperative associations is withdrawn.

Mr. Henry Ford did not participate personally in the publication of the articles and has no personal knowledge of what was said in them. He, of course, deprecates greatly that any facts that were published in a periodical so closely associated with his name in the minds of the public should be untrue.

The articles in question dealt with coöperative marketing. THE DEARBORN INDEPENDENT has published repeatedly articles dealing with various phases of this subject and of other subjects of interest to the farmer. If the advancement and development of coöperative marketing has suffered by reason of the publication of these articles, then we sincerely regret it. We recognize coöperative marketing holds promise of substantial relief to the farmer and the grower.

Slums in the Offing

TAKE an airplane and view some of our larger cities from the air. You will be struck by the way builders are crowding the new houses. Why should this be? It is the boast of our land that, unlike the slum cities of Europe, we have lots of room in which to live and breathe.

Then why should our dwellings be so crowded together that between them there is barely room for two persons to pass? Why is it that the windows at the sides of these homes are darkened and rendered almost useless? Why is it that the sunshine, that great healer and life preserver, should be excluded? Is it because grasping speculators cut up the building sites into such minute patches that there are really two houses where only one should be?

The man who can make two blades of grass grow where only one grew before is a benefactor to humankind, but he who deprives his fellow men of air and sunlight in order that he may make the last farthing out of building land is a destructionist and reactionary.

Potential slums should be watched. Our larger cities are full of them. For years there has been a movement in Britain for the sweeping away of slum areas. In this country the opposite is the case. Slum areas are being planned every day. There should be sufficient space between new homes to insure that they at least get their due share of breathing space. There should be no slums in the offing. Take a look at our newly built-over areas from the sky and you will see that this overcrowding of home sites is real.

How HAWTHORNE Laid Literary Cornerstones

By JULIAN HAWTHORNE

THERE used to be a thing known as 'creative criticism,' which approached its subject seeking to reach the soul within, rather than the clay without, and whose aim was to stimulate rather than to let down aspiration. But that device is now lost. What is the use of pretending, when we know that we came from the slime and must return to it.

Nathaniel Hawthorne had begun putting pen to paper as early as his college days; scraps of his boy-writing have indeed been discovered, but of a character too careless and boyish to serve as basis for theories. In fact, he was, like other boys, quite vague in his own mind as to what he would like to become; it was a matter of mood and chance suggestion. He hunted the black bear in the Maine Woods, and very likely foresaw a future for himself as a pioneer and trapper of what we now term the great open spaces, and God's outdoors. But he never overtook the bear, and other amusements obliterated that ambition.

He might have embarked on one of his father's India-going ships; but his father died when the child was four years old, and his mother's horror of the sea prevented further consideration of that project. There was some chance of his becoming a member of a Government scientific expedition; but that fell through. All the while his college chum and lifelong friend, Horace Bridge, was insisting that Hawthorne was a born writer, and must fulfill that destiny. There had never been a writing Hawthorne: captains, majors, judges, farmers, mariners, book readers perhaps, but no bookmakers; and Hawthorne imagines the frowns of their departed spirits, could they look down upon their degenerate offspring. But Bridge stuck to his point, and one wonders how this rather harum-scarum undergraduate should have begotten so shrewd a prophecy.—'While we were two idle lads together at a country college,' says Hawthorne, in a dedicatory letter written thirty years later, to Bridge himself, 'doing a hundred things that the faculty never heard of, or it had been the worse for us—still it was your prognostic of your friend's destiny that he was to be a writer of fiction.'

Bridge not only implanted or at any rate cultivated the idea, but lost no opportunity to foster it and to shield it from frost and drought, after his friend had accepted the assignment. 'It was through your interposition,' observes Hawthorne, in the same letter, 'through your interposition, and that, moreover, unknown to himself, that your early friend was brought before the public, somewhat more prominently than theretofore, in the first volume of *Twice-Told Tales.*' That is to say, Bridge, who had money, guaranteed the publisher of the book against loss for paper, printing and binding, at the same time swearing the publisher to secrecy. It was a cordial and graceful act, and shows Bridge as a likable fellow. Personally, I don't remember him before *The Scarlet Letter* period; I saw him walking beside my father, with an arm round his shoulders, and giving him a little hug now and then. He was in overflowing spirits, seeing at last his youthful forecast fulfilled to the brim. 'I told you so!' is not always uttered in a tone so joyous and generous.

WHAT were Hawthorne's first essays in fiction we cannot precisely know, because his own critical judgment condemned them, and he put them in the fire instead of into an editor's hands. But he may have written some of these condemned sheets before graduating from Bowdoin; and the short novel that he did publish soon after, paying the publisher one hundred dollars for the job, he hastened to recall, buying back all he could lay hands on of the small edition issued (it was entitled *Fanshawe*, and like all his work up to *Twice-Told Tales*, was anonymous) and destroying them. The little book has now the value that sometimes attaches to scarcity; few copies exist; the one that I read was rather feeble, but smoothly written stuff, everywhere echoing Walter Scott, who was ending his great career at that time. In no respect did it foreshadow the Hawthorne whom we came afterward to know. It is interesting only for what it is not.

After obliterating *Fanshawe*, the young author, still in his twenties, set out to discover himself. Everybody writes nowadays, yet writing still remains the most difficult of the arts. The truth is that written and spoken language is a very rude medium for the conveyance of thought, and still more of emotion. The finer the spirit of the message, the less likely is it to be completely or adequately incarnated in words. Thus it comes to pass that great authors, in their great passages, use words indeed, but contrive to inspire into them a significance beyond and above their literal meaning. They create a magical atmosphere, which lends color and fragrance to common things; the secret which works the miracle is incommunicable; the writer himself does not know it.

An instance of this magic, of which few are aware, is illustrated in the story of 'The Great Stone Face,' in the volume entitled *Snow Image*, published in 1851. Twenty years after, in 1891, Robert Carter was editor of a magazine called *Appleton's*. Carter was an admirer of Hawthorne, had corresponded with him, and had urged him to pursue the vein opened in *The Wonder-Book*, and *Tanglewood Tales*. Hawthorne died in 1864, and his books were still read. A manuscript story was submitted to Carter for publication in the magazine; the writer said that he had translated it from a German original. It was not very well written, but it contained a striking idea, and Carter published it. Carter was a friend and counselor of mine, and after I had read the story, the title of which was 'The Profile on the Mountain' (or some such name), I called on Carter, with a copy of the *Snow Image* volume in my hand.

THE result of our deliberations was the discovery that Hawthorne's story, 'The Great Stone Face,' had been discovered in a copy of the old New England periodical in which it first appeared, and had been translated into German by its finder and sold to a German magazine. There it had, in turn, been found by the American translator, and changed back into English—but not into the English that Hawthorne used. Sentence by sentence the two stories were the same, but word by word there was all the difference that there is between India silk and cotton batting.

The German person, no doubt, had acted in good faith as a translator; the American had probably been unacquainted with Hawthorne's work, and thought he was introducing an interesting bit of German literature; and Carter had to blush because he hadn't known, or remembered, enough of Hawthorne to recognize the facts. The thing is a literary curiosity, and affords means for a study of style in literature which would benefit some of our young romancers of today. One might almost say that color and fragrance, tone and atmosphere, the music and magic of a master's use of language, are most of the game: a good idea badly dressed and presented is worth comparatively little. There is a legend that a Frenchman, putting into his own tongue Shakespeare's 'Hail, Horrors, hail!' came out with '*Horreurs, comment vous portez vous!*' ('Horrors, how do you do!')

Hawthorne, then, from his twenty-first year onward, was making a study of the writing art. But it is an art in which the artist always remains the student. It is never mastered; the room for improvement extends onward forever. After more than thirty years of constant application, Hawthorne could write in one of his prefaces, 'In youth, men are apt to write more wisely than they really know or feel; and the remainder of life may be not idly spent in realizing and convincing themselves of the wisdom they uttered long ago. The truth that was only in the fancy then may have since become a substance in the mind and heart.' Benjamin Disraeli, by the way, many years afterward, said the same thing in almost the same words in the introduction to one of his romances.

IN THE light of *The Scarlet Letter* and of the other two romances, the obscurity which had always attended the short stories and essays was deepened, by comparison at least; they must needs be inferior, having been written in an imperfect stage of the author's development; and were brought forth now only to float on the tide of the mature achievements. A handful of persons only had known their value; not many could be induced to improve their acquaintance with them. They had no wide popular appeal, and today they are almost unknown. And yet not a little of the best that Hawthorne has done may be found in the pages of these little pieces. They are more finely wrought and deeply thought out than are all save a few passages of the longer tales.

There are of course a march, sweep and resonance in the longer stories, and an emphasis and insistence upon their central themes, which make them easier to understand and digest. But in conception they are not finer. Hawthorne might have taken several of the ideas on which the *Twice-Told Tales* and the *Mosses* are based, and expanded them into books which would have rivaled their fame. He had no encouragement to do this however; he filed them down to the smallest compass, and made jewels of what might have been palaces. Knowledge might increase in him as he grew older, but the intuitive wisdom of which he speaks in the passage I have quoted came to him betimes, and the seclusion in which he worked freed him from the temptation to hasty creation; there had been no demand for his wares, and, having completed one of them, he would lay it aside, to be remodeled, polished and perfected until his own critical judgment was appeased.

The fact, moreover, that he wrote not anonymously only, but under many different pseudonyms, kept him from recognition; faithfully though he always worked for art, he continually worked against his popular and commercial interests. He perceived this, but seemed unable to prevent it. In a little tale, 'The Ambitious Guest,' he depicts his own predicament. The chief character in the story was possessed of 'a high and abstracted ambition.' He cared not for the wreath of glory that might be his during his lifetime; but would be content that, long after he was gone, the world should realize that the footsteps of genius had passed by. And in the short apologue of David Swan, his young traveler lies down to sleep by the wayside; and during his slumber, fortune, fame and success come near and would awaken him; but accident prevents, and he sleeps on unconscious. And in the preface of one of his books, he remarks, 'I sat down by the wayside of life like a man under enchantment.'

Again, he speaks of himself as of one who 'has been burrowing, to his utmost ability, into the depths of our common nature, for the purpose of psychological romance, and who pursues his researches in that dusky region, as he needs must, as well by the tact of sympathy as by the light of observation.' His aim was the understanding of life—the riddle of the Sphinx. He might liken himself to the hermetic philosophers of old times, searching for the fabled elixir; and indeed, as I have elsewhere said, he began while still a youth to meditate a romance on that subject, and he never throughout his life relinquished that purpose, and death overtook him on the very threshold of attainment. It would have been his own story, under a veil.

WITH such a conception of the highest end of imaginative writing, he could not attempt the portrayal of daily human existence, in its homely haps and mishaps and its trivial detail, which forms the substance of the realistic novel of past and present days. He must, as he says, array the ordinary facts of life in an idealized and artistic guise. This does not mean to employ the rather crude and obvious 'symbolism' of other writers, but to place his whole scene in a region as flexible and plastic as thought itself, yet not so remote as entirely to alienate the characters from common comprehension. It was a difficult, perhaps a hopeless undertaking. His books, he remarks, if opened in broad daylight, are apt to seem like volumes of blank pages; and he 'doubted of public recognition' quite as much as publishers could do. But he wrote for that gentle reader who perhaps exists only in the writer's imagination, created by his need of him, and passing away with his passing.

When the motives underlying all human manifestations are the object of analysis, it is perhaps inevitable that the persons themselves appear pale and wraithlike; or if not always inevitable, it is prone to occur. Yet we must regard this as a falling-short on the writer's part of complete success; the motives in life of man or woman are of the utmost importance, but the man and woman are not less important on their own plane, as carrying the motives into effect. Green earth and blue sea contribute to the landscape, as well as sky and cloud.

ONLY occasionally, however, does Hawthorne obey this demand; he is too prone to neglect the body for the spirit. He is aware of the defect, and labors to overcome it. The volumes of his collected 'Notes,' in this country and abroad, are filled with accurate and minute records of natural things and people; aspects of nature, human acts and appearances. With these in his mind he would take up his parable. But they would become dim as the story went on; the spirit overpowered him. In the longer romances, however, he was able to give more solidity to his material. Hester, Pearl, Chillingworth and Dimmesdale can claim mortal flesh and blood, and the scenes by the way are

Is There a PRESIDENTIAL TYPE?

By McKEE BARCLAY

Illustrated by the AUTHOR

Copyrighted by McKee Barclay

OUR only living ex-President, clothed in a dignified robe of somber black, now presides as Chief Justice over the Supreme Court of the United States.

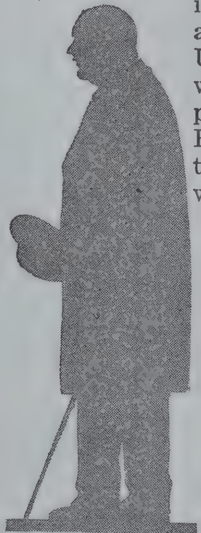
Scattered among the other 115,000,000 people who make up this country's population are fourteen future Presidents. The urchin who sells you your newspaper may be one of the fourteen. The callow 'cowboy' whose Oxford Bags provoked your smile of amusement yesterday may at some future day be the chosen hero of millions of voters. The governor of your state who has never been thought to be of presidential stature, or a plodding senator who doesn't rank high among his fellows, may sit in the White House within the coming decade.

The average age of the men who have been inaugurated as Presidents has been 54 years, so that the number 'fourteen' furnishes the best estimate of the length of the list of living Americans who will reach the goal of national leadership, if we disregard all possible two-termers. If we assume that someone, now a toddling infant, will be chosen for the office about 54 years hence, the probabilities are that another citizen who is at this time somewhere between the ages of 47 and 61 will be our next President and that twelve others will emerge at various periods of the next half-century.

A survey of the personalities of our past Presidents proves that the singling out of Presidents in embryo is a perplexing, if not a wholly futile, undertaking.

Though thirty men have served as President of the United States, no two of them may be said to have been of the same type. In fact, so wide has been the diversity of character that it is difficult to pick any two individuals who resemble each other in more than a very limited number of characteristics.

When our Presidents are assigned to the states which claimed them as citizens at the time of their election, we find that eleven states are on the roll of honor. The record reads: *Ohio*—William Henry Harrison, Hayes, Garfield, McKinley, Taft, Harding. *Virginia*—Washington, Jefferson, Madison, Monroe, Tyler. *New York*—Van Buren, Fillmore, Arthur, Cleveland, Roosevelt. *Massachusetts*—John Adams, John Quincy Adams, Coolidge. *Tennessee*—Jackson, Johnson, Polk. *Illinois*—Lincoln, Grant. *New Hampshire*—Pierce. *Louisiana*—Taylor. *Pennsylvania*—Buchanan. *Indiana*—Benjamin Harrison. *New Jersey*—Wilson.

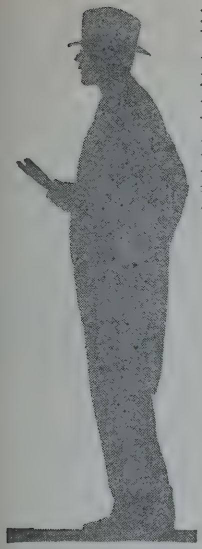


Birthplaces of Presidents are to be found in only ten states. Eight Presidents were born in Virginia. They were Washington, Jefferson, Madison, Monroe, William Henry Harrison, Tyler, Taylor and Wilson. Seven Presidents, Grant, Hayes, Benjamin Harrison, McKinley, Garfield, Taft and Harding, were born in Ohio. Van Buren, Fillmore and Roosevelt first drew breath in New York. Jackson, Polk and Johnson were born in North Carolina—and always remember that the South Carolinians claim that Jackson was born a mile or so south of the line between the two Carolinas. The two Adamses first saw the light in Massachusetts, Buchanan in Pennsylvania, Pierce in New Hampshire, Lincoln in Kentucky, Cleveland in New Jersey, and Arthur and Coolidge in Vermont.

No business man has ever been chosen President of the United States. The nearest approach to this sort of selection was in the case of President Harding, who was editor and publisher of a newspaper. He had, however, been in political life for twenty years before he was made President, having served as lieutenant governor and governor of Ohio, and as United States senator.

Only five callings have furnished Presidents. Twenty-two of our Presidents have been lawyers and, as only thirty men have held the office, we have had only eight Presidents who were not lawyers. The Presidency has gone to five soldiers, George Washington, William Henry Harrison, Zachary Taylor, Andrew Jackson and Ulysses S. Grant. Andrew Johnson was a tailor, Theodore Roosevelt a publicist or politician, and Warren G. Harding a publisher. In addition to the five soldiers named, all of whom, with the exception of Washington, may be classed strictly as professional warriors, a number of our Presidents have fought in our wars, some of them attaining high rank.

Monroe served



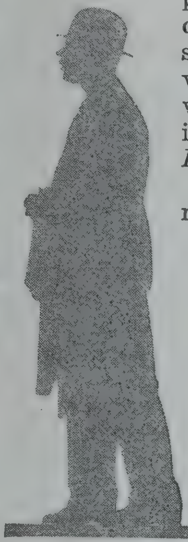
in the Revolutionary War. William Henry Harrison, Tyler, Taylor and Buchanan were veterans of the War of 1812. Lincoln took part in the Black Hawk Indian War. Pierce won a brigadier general's commission and Grant a captaincy in the Mexican War. Hayes, Garfield and B. Harrison were Civil War generals. McKinley saw hard service as a private in the same war and came out a major. Theodore Roosevelt was a Roughrider colonel in the Spanish-American War.

Eight of our Presidents, at one time or another in their lives, were pedagogues. John Adams taught school at Worcester, Massachusetts, and his son, John Quincy Adams, after resigning from the United States Senate, became professor of rhetoric at Harvard. Garfield was for a time president of Hiram College, Arthur was a dominie at Pownal, Vermont, and Wilson was president of Princeton University. After completing their terms as President, both Cleveland and Taft joined the teaching profession, Cleveland going to Princeton and Taft to Yale University.

LINCOLN and Grant clerked in country stores and Jackson spent part of his life as a storekeeper near Nashville, Tennessee. At 40 years of age Grant was looked on as a failure because of the fact that he was only making fifteen dollars a week as a clerk in his father's hardware and leather store at Galena, Illinois.

Roosevelt and Wilson were prolific writers and several other Presidents rank high in the field of literature. Washington's state papers, and even his private letters, are treasured by lovers of style and eloquence. His farewell address and Lincoln's Gettysburg speech are recognized as two immortal utterances. The writings of the artistic and cultured Jefferson far transcend in literary merit his public speeches. Madison's diary, his twenty-nine contributions to *The Federalist* and the many historical papers written by him, occupy an important place as source material for all publicists who are interested in Americana.

Van Buren wrote a book, *An Inquiry Into the Origin and Course of Political Parties in the United States*, which was published by his son in 1867. Without achieving the dignity of expression of Lincoln, Cleveland at times approached the War President in loftiness of style. He wrote forcefully when dealing with matters of statesmanship and displayed a delightful brand of humor when handling lighter subjects.



Taft is the author of a number of legal works, his book on the trust problem having been accepted by the legal profession as one of the most valuable and authoritative works on the subject. Coolidge's literary fame rests on *Have Faith in Massachusetts*.

In the midst of the furor raised in the crusade against religious fundamentalism it is interesting to note that nearly all of our Presidents recognized church affiliations. Jefferson was not a member of any church, nor was Johnson, who is accredited to the Methodists because he accompanied his Methodist wife to a church of that denomination. Lincoln, who was not a church member, is generally classed with the Presbyterians. The division among the sects, as generally written down is:

Presbyterian—Jackson, Polk, Buchanan, Lincoln, Cleveland, Benjamin Harrison, Wilson. *Episcopalian*—Washington, Madison, Monroe, William Henry Harrison, Tyler, Taylor, Pierce, Arthur. *Methodist*—Johnson, Grant, Hayes, McKinley. *Unitarian*—John Adams, John Quincy Adams, Fillmore, Taft. *Reformed Dutch*—Van Buren, Roosevelt. *Disciple*—Garfield. *Baptist*—Harding. *Congregational*—Coolidge.

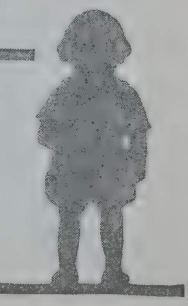
Seventeen of our Presidents were of English ancestry, six of Scottish-Irish, two of Scottish, three of Dutch, and one of Welsh descent. Jefferson was the Welshman, Monroe and Hayes Scotsmen, Van Buren, Roosevelt and Harding Dutchmen. The Scottish-Irish were: Jackson, Polk, Buchanan, Arthur, McKinley and Wilson. Those of English descent were: Washington, John Adams, Madison, John Quincy Adams, William Henry Harrison, Tyler, Taylor, Fillmore, Pierce, Lincoln, Johnson, Grant, Garfield, Cleveland, Benjamin Harrison, Taft and Coolidge.

Sixteen of our Presidents were sons of farmers; three were sired by clergymen, three by lawyers and three by merchants; a constable, a tanner, an iron manufacturer and a doctor were the fathers of the others.

Twenty were college graduates and one, Andrew Johnson, could neither read nor write with ease when he became of voting age.

TWO Presidents were signers of the Declaration of Independence, John Adams and Jefferson. Washington and Madison signed the Constitution.

Though thirty men have been President, one of them never lived in the White House. Because of the parsimony or frugality of Congress the 'President's House,' as it was then called, was not completed until Washington had passed out of office and had retired to Mount Vernon. John Adams occupied the White House for only four months. Those who have read the plaints found in the diaries and private letters of members of White House families will not have to be told that George Washington was more to be congratulated than condoled with for having missed the gloomy grandeur and discomfort of life in the President's House of that early period.



Nine Vice-Presidents have become President. Of this list three men, John Adams, Jefferson and Van Buren, after being elected to the subordinate office, won their way to the higher place at a subsequent election. Six Vice-Presidents served out terms of dead Presidents. They were Tyler,

A Free Fantasia *on* PEASANTS *and Their* ARTS *and* CRAFTS

—Photos, Associated Screen News, Ltd.

In the long summer evenings they spin and weave, singing songs of their homeland.

By
CHARLES J. FINGER

I HAVE said that the folk songsters of Gaspé knew many songs, but the word 'many' hardly fits the case. Their memory is wonderful; that word is not too strong. Indeed, if the people had not such excellent memories, what has happened could never have happened. There was a woman, Madame LeBlonde, between fifty and sixty years of age I should say, who knew close upon two hundred songs, words and music.

There was a lumberjack, Vincent-Ferrier, who could sing three hundred. François Saint-Laurent, a fisherman, recorded three hundred and ten on the phonograph for the National Museum of Canada, and he knows many more.

What that means will be best realized if you will interview your friends and neighbors with a view to discovering how many of them can sing correctly 'The Star-Spangled Banner,' without substituting 'Da-*dum*-do-dee-*day*' for forgotten lines.

Dependence upon the printed and written word has a tendency to weaken the memory. But here, in the case of these folk, is memory in all its excellence, memory individual and memory racial.

It is memory stretching back into the past, far back to the days when Champlain and the Chevalier La Salle fought their way into the wilderness; when Cartier and Sieur de Monts did the work of heroes in trying to establish settlements along the St. Lawrence; when Joliet and Marquette went westward; when Abraham the Scot, who was king's pilot as well as carpenter, pluckily faced life in a new land—and, by the way, had his good name handed down to posterity with those Plains of Abraham where Wolfe died and Montcalm received his death wound. There were other *voyageurs*, many of them, notably Maisonneuve, François de Laval-Montmorency, Antoine de la Mothe Cadillac, and Louis de Suede who had been the child-playmate of Louis XIII.

Also there were missionaries full of zeal, and Theresa of New France who founded a monastery, and who wrought and taught, and learned the Indian tongues. And there was Father Brébeuf who befriended the Hurons and made songs for them as far back as 1640. If anyone should harbor a doubt that songs could be thus passed down from father to son unchanged for three hundred years, let him know that at Quebec I heard the Lorette Indians sing an old French Christmas song which had been turned into the Huron tongue by the good Brébeuf. That's proof enough.

BUT why, you may ask, did not the songs change as manners and customs changed in France, just as the songs of Australia changed as social England changed? If there were historical shiftings in France, why did not the new wipe out the old in Canada, as the new wiped out the old in France? For there were changes, what with the wars and quarrels with Holland and Spain, what with Law's financial bubbles, with the participation in the Revolutionary War under Lafayette, with revolutions and Bastilles and guillotines and all that kind of thing. And the answer is that, in the case of Canada, there was a chopping-off place, very definite indeed. There came a time indeed, when the settlers were quite set apart from their fellows in the mother country. Also, after that cutting-off, the French-English quarrel of 1759 made the separation wider, so that the early Canadians were thrown back on themselves. The manner of that chopping-off was this.

When these adventurers and missionaries first settled in New France along the banks of the St. Lawrence, they were left to shift as best they could, for the colony was almost abandoned by the mother country. France—that is, its rulers—was wasteful, luxurious, careless. By way of understanding things as they were, picture the state of a country where the household of a man of quality, if we are to believe Sieur Audiguier, consisted of seventy-five servitors; where a stable held sixteen saddle horses and fourteen carriage horses for the master, and seven saddle horses and seven carriage horses for the dame! Where a simple councilor kept a secretary, a master of the horse, two menservants, a porter, a house steward, a pantryman, a cook, two pages, six lackeys, two coachmen, two postilions, two footmen, four grooms—and his wife's helpers were two maids, a lady's maid, four women-servants!

LITTLE care would a land with such courtiers have for Canada or for those who tried to settle there. Only Colbert, of all the statesmen, tried to do anything for the new land, and that in rough and ready way. There is his written message which shows the contempt in which New France and her people were held. 'We are getting ready the hundred and fifty girls and the brood mares and the sheep to be sent to Canada,' he wrote. And there were orders too that all soldiers in the colonies had to be married within a week after the arrival of the cargo; otherwise they would be imprisoned. So voyagers and earnest settlers were thrown upon their own resources.

We picture them then, working hard, fighting wilderness and Algonquins. We also see them in the long summer evenings, their work done, making merry as best they can, singing songs of the homeland as they mend their nets, and spin and weave and carve. Those songs were remembered, child learning from parent generation after generation—each learner guarding them, preserving them in their integrity, passing them on until in our own day they are sung as they were once sung in the kingdom of Louis XIII; though in the mother country they are forgotten because of the superimposition of new songs.

I spoke of wood carving. It would be well for everyone who has access to garrets and lumber rooms where old things are stored, to keep an eye open for carvings. There were a few on exhibition at Quebec, but very few indeed considering the number which must have been made. One of the carvers, a man now eighty-three years of age, Louis Jobin by name, has made statuettes by the hundred. Into them he has put loving care, as a good craftsman should, little thinking that a day would come when they would be sought by art collectors from all over the world. There were eight specimens of his work, the carved heads of saints, of angels, the last seeming to me to be likenesses of children. Then there were carvings done by no one knows whom—of a squirrel with a nut, of a cook, of a man seated in a chair.

IT IS pathetic to reflect how much of that kind of thing has been lost or thoughtlessly destroyed. Such work grew out of real observation and feeling. The carvers were inspired men as well as experts. Then there were panels of impressive appeal, and wooden boxes ornamented with a wealth of detail, and church ornaments, such as stands for crucifixes and stands for candles. Those men who profess contempt for people of the hinterland would sing small if they but knew!

A word about legends and folklore. I recently wrote a story for a magazine. It was called 'Ob and the Oat Thief.' I had heard it some years ago from a lumberjack. It was about a curious creature like none in fairy lore, something like a gnome, but only dimly like one. The other day, on the shores of the St. Lawrence, I heard the same tale. The Gaspé folk knew it and knew it well. They also knew the story of the flying canoe, and the tale of the pirate ship that was turned to stone, and the account of how a mist turned into a floating figure and led fugitives in a canoe to safety. But I heard others, quaint tales and well worth taking notice of because they are not variants of Old World folklore. Here are a couple:

There was once, my companion said, a missionary whose name was Nicholas Viel, a good man and true. It was in the early days before the English had taken the land. It came about that Père Viel had to go from one place to another, on his mission; and so he engaged three Hurons to take him in a canoe. Near Montreal, at Sault au Récollet, what should happen but that two of the Hurons went ashore for some reason, leaving with the missionary the third Indian, one given to talk of his own goodness, but possessed of a hatred for religion. As the good père bent over to drink from the river, the Huron leaped at him, struck him, and then held him under the water until he was dead. But mark what followed. The water being cold (for it was early winter) the Huron built a fire to dry and warm himself; but as he crouched over it glorying in his wicked deed, it seemed to him that earth and air were suddenly full of roarings and shriekings and crashings worse than the greatest thunderstorm that ever raged. Nor did the fire have any warmth. What was stranger, there seemed to be no end to the water that dripped from him. Indeed, there was a little lake about him before long. He stood up to go away, but as the noise in the air grew more and more fearful, like the crashing of a thousand forests he found he could not move a step. Then, out of the darkness came a great hand, not suddenly but steadily, advancing like a cloud. The hand closed over the Indian and grasped him, as a man's hand might close over and grasp a leaf. When the two Hurons came back there was no sign of their fellow, nor was he ever seen afterward.

'But note this,' my companion went on; 'from time to time there is a fearful Something seen in that spot where Père Viel was so foully slain. For example, at one time a hundred and more years ago, some fishers were camped at Les Ecorres on a dark night. One of them, chancing to look up, saw a light as of a camp fire. Thinking it to be rivermen, or chance travelers who had lost their way, the fishers put out their canoe and paddled toward the fire gleam.

It was a long pull and a hard pull, and the current seemed to be against them most tremendously. But they were true men, and so had that strength which comes from good will. When they reached the place of the strange light, there they saw a Huron crouched over a fire, a miserable fellow who shivered and shook from head to foot. Nor did he look up in answer to their

In these folk we find memory in all its excellence, memory individual and memory racial.

Madame LeBlonde and her daughters. Madame knows nearly two hundred songs, words and music.

call. Going nearer, the fishers saw that water ran from his head and shoulders, and down his arms, a steady downpour that made a pool at his feet. When they were nearer still, what was their surprise to find that the fire had no heat, though it seemed to burn brightly! One of the men, thinking it to be due to his own coldness of body that the fire seemed to have no heat, threw a piece of bark into the blaze; but it neither scorched nor took fire. So thrusting his hand into what seemed to be flames, he drew forth the birch bark, and thus discovered for a fact that it was a fire without heat. The Indian said six words: 'He who is good does good,' and continued to sit, gazing into the fire without heat, while the water dripped and dripped. So the fishers went away and left him.

In town they told their tale the next day. One man, a lumberjack, laughed at them and called them fools, saying that he would go alone to the place, and would thus prove their tale to be a lie. He went, and soon returned. But he laughed no more; instead, he was grave and said nothing to anyone—would neither tell what he had seen nor answer questions. Thereafter he gave himself to good deeds, lending a helping hand . . . being a true friend . . . and over his door he wrote the words: 'He who is good does good.'

Here is another strange legend. The telling of it came just after we learned that Lindbergh had passed over Halifax on his way to Europe. My companion held that man had much to do in getting matters straight on the earth before he tried to 'fly in the sky.' At that moment seeing the rescue party flying northeast in search of the lost French fliers, he told me that everything reminded him of the story of one, Peter Scoulard—though I did not see the connection. I listened, however, saying nothing.

This Peter Scoulard, he told me, was a ferryman who, many years ago—perhaps two hundred—carried people from Pointe Lévis to Quebec. The voyage was made in canoes in fair weather, or sometimes in a sort of flat boat, when there were several passengers. But when ice was in the river, crossing was a dangerous business, and none but Peter Scoulard would attempt the passage. So we picture Peter as a bold man and willful, one daring to the point of foolhardiness. An arm-flourishing man, loud talking, boasting, blasphemous, he seems to have been. A cock-crowing sort of man, proud of his splendor, forever singing a battle hymn. He wore long hair, and a tam-o'-shanter perched jauntily on his head. His coat was knee-long, made of wool, bright with red and blue stuff, fringed at the bottom and furred at the cuffs. On his feet were moccasins, and round his waist there was wound a multi-colored *ceinture flechee.*

One day as the tide was on the point of turning he had a boatload of passengers. Now Peter and his three boatmen were skilled, and a river of floating ice was no great matter to them, for they could find a way through water lanes when other boatmen had given up in despair. But when the tide turned, there was the trouble; for ice islands became ice fields, and water lanes disappeared in the twinkling of an eye. And there was Peter, red-eyed from heavy drinking, all for going up to the wine shop for a bottle of wine to warm him on the voyage. 'Haste and haste, for the tide is on the turn. Better do without your bottle,' urged Jean. But Peter laughed scornfully. The harder the task the greater his pleasure, he told them. So he went his way and then shambled back, going the slower because of the fear of the others, passengers and paddlers.

Things went fairly well, by great good luck, until they were within a few yards of the Quebec shore; then the flatboat got jammed between two floes, with her bow headed downstream; and soon another ice block knocked a hole in the nose of her. So down went boat and passengers, and Peter alone got to land.

Now nine men out of ten would have been the humbler for such sad adventure, but not so Peter. The devil, he said, was his mainstay and would see him safely through; and, he boasted, when his end was near would be time enough to set about leading another and better life. But in spite of his blasphemies he had no lack of passengers, for of all river men he was most skilled.

Two years to the day much the same kind of thing happened. There was the river full of ice, the tide on the turn; the passengers were worried and impatient, and Peter red-eyed from heavy drinking was all for going up to the wine shop for a bottle of rum to warm him on his voyage.

'What do you suppose could happen?' he asked. 'Am I not a boatman of the first water? Have I ever drowned yet? Do you suppose I am going to have my head chopped off in mid-river? I'd like to see such a thing!' So he went up the bank, bought his bottle of wine, and shambled back, going slowly to enjoy the fear of the others.

Well, they made midstream and there met an ice jam. But this time Peter fell overboard. As he rose to the surface of the water, there came sliding a sharp-edged piece of ice which sliced off his head as a scythe might slice off the top of a turnip.

Luckily the passengers reached the shore in safety, but there was an end of Peter Scoulard. And now sometimes on a winter night, it is said, the ghost of Peter's head is seen. But woe betide him who sees it, for his end is near if he tells of what he has seen.

My companion in ending his story said: 'A man's folly is his worst enemy—that is the saying where we live.'

Lessons *in* Fidelity *From a* Bird Cage

SOME years ago at the University of Michigan a zoölogist made an intensive study, extending over several years, of the evolution of intelligence in turtles. While subjected to this college education, the turtles were taught to find their way to food through various mazes. Innocent rats were similarly enrolled in courses involving the learning of mazes, discrimination by sight (visual education), and even a certain familiarity with electricity by shocks. It is the hope in such studies that the world may learn what is going on in the mind of the turtle and may be able to apply the results of their research to human beings.

Recently a Russian scientist, Dr. Hilda Cinat-Tomson, working at the Institute of Experimental Zoölogy in the University of Riga, made somewhat analagous studies of the tender passions of the parrots, most faithful of all animals to their mates. A pair remain loyal to each other even unto death, and there are no second marriages.

In the first place, in these experiments a male was placed in a cage with several females. The result was simply discord, much scolding on the part of the ladies, and no affair of the heart at all. Two males were placed in a cage with one of the fair sex; it is recorded as a fact of scientific record that the first male to make any amorous advance received invariably an indignant repulse from the lady, who almost immediately thereafter received the less forward male.

A male bird disguised as a female received quite the same attention from his unsuspecting brethren as the real article.

Combs containing honey, pollen, eggs, larvae, and brood are removable for inspection.

The Bee's Buzz *Is Not a* National Stinging Anthem

By G. H. DACY

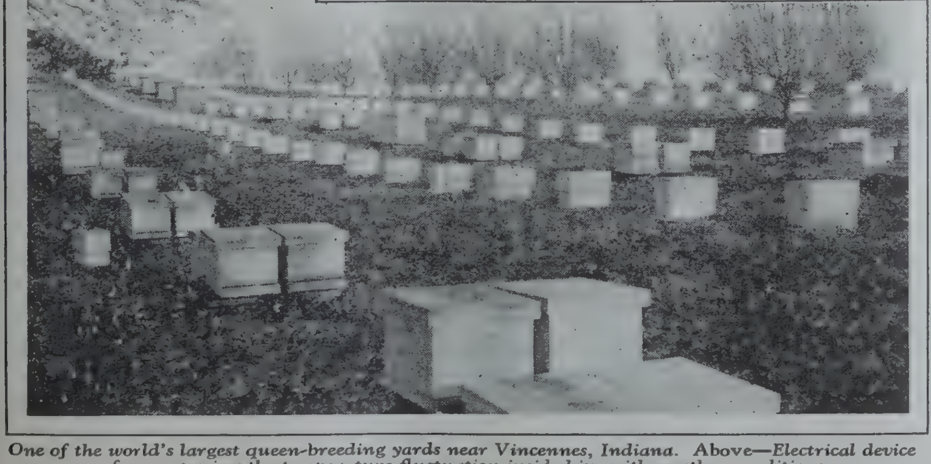
TO CERTAIN of the worker bees is delegated the task of ventilating the hive. As substitute electrical fans, these insects flap their wings in perfect rhythm and force fresh air into all parts of the hive.

Uncle Sam uses special open-faced hives covered with glass where his scientists can study the activities of the bees under a powerful microscope by both night and day. At regular periods all the inmates of the hive join in a sort of vibratory movement like a dance. Science believes that this motion enables the scout bees to tell their mates where the finest caches of nectar are to be found.

Baby bees grow faster than Jack's mythical bean stalk. Five days after the worker bee hatches out, she is fifteen hundred times as heavy as at birth.

During the summer, the average worker bee lives only two months, literally working herself to death.

Tropical countries are the homing haunts of stingless bees. These bees, instead of stinging, either bite or else eject a fluid which burns the human skin. There are 250 species of stingless bees. Science is now conducting experiments in crossing these tropical bees with the commercial honeybee species popular in the United States.



One of the world's largest queen-breeding yards near Vincennes, Indiana. Above—Electrical device for comparing the temperature fluctuation inside hive with weather conditions.

Discovering *the* Colorado River

'DESPITE our abysmal ignorance of the great Colorado River, it has suddenly been discovered, and the storm of energy and oratory that were let loose about it in our recent Congress was a mere prelude to the battles that will be fought over it in the future.' Thus speaks the author, HUSTON THOMPSON, in the first of three articles. This writer in the company of engineers lately made an extensive survey of the Colorado, and discusses the subject with authority.

LITTLE ESSAYS FROM A NORTHERN COTTAGE

HUGH WALPOLE entitles his next essay **'On Loving *a* Little Cottage'**

WHEN this famous novelist was visiting overnight in one of the grandest houses in England, he thought only of his own little cottage with a passion of affection. Why does one house greet you politely but heartlessly, another house indifferently, while a third loves you? Hugh Walpole explains, discussing his own lovely place, with its sea, its mountains, its flowers, its squirrels, its lizards, its paintings and no end of other things that the place possesses.

Holding *the* Crest

By H. G. SALSINGER

TITLES are increasingly difficult to hold. 'It is easy enough to reach the top, but staying there is a real battle,' states this popular sports authority. Mr. Salsinger picks interesting cases among his acquaintances—Dempsey, Tilden, Hoppe, Cobb and others.

Those Strange *But* True Stories *By* McKEE BARCLAY

ASPIRING tellers of tales who succeed only in collecting rejection slips will eagerly permit **McKEE BARCLAY** to point out the trail which leads to real literary treasure trove. 'The plot's the thing with the story,' remarks Mr. Barclay, 'but writers who have talent for plot invention are scarce. They are blind to hints and inspirations for plots encountered every day.' The examples Mr. Barclay quotes, such as that of the rolling coin that solved a $75,000 rubber robbery, are fascinating.

Plus More Than the Usual Number of Extra Features

How Hawthorne Laid Cornerstones

(*Continued from page 13*)

convincingly portrayed. In the *Seven Gables* the realism is even more undeniable, and *Blithedale* seems almost a transcript of actual experience. The spirit still reigns in all of these books, but the flesh plays its due part. Nevertheless the whole structure is apart from the daily walk of mortal events, owing to a subtle treatment of which none but Hawthorne seems to be capable. He is emerging from dreams into reality, yet with the atmosphere of dream still around him. It is a memorable achievement.

But the short tales have a separate value of their own. Speaking of the familiar tone of his prefaces, Hawthorne says, such mention of external habits, casual associates, and the like, hide the man, instead of displaying him. 'You must make quite another kind of inquest, and look through the whole range of his fictitious characters, good and evil, in order to detect any of his essential traits.' And it is in the early tales that this inquest must be conducted.

In one place he calls these tales, 'attempts, and very imperfectly successful ones, to open an intercourse with the world.' In other words, they contain Hawthorne's philosophy of life; speculations and conclusions upon matters vital to all mankind. They constitute, therefore, the cornerstone of his view of the problem of man, God, and the nature which is the medium between them. A student who should group together in their right order all in the stories that pertains to this problem might be surprised to find what an unexpected light it sheds upon the secluded romancer. He would find nothing outwardly sensational or even overtly in opposition to orthodoxy; but the implications, in their aggregate, go to the roots of belief.

Hawthorne was a radical in the profoundest sense of the term; but if he tests the pillars of the universe, he leaves them still apparently upholding the frame of things. In the story called 'Earth's Holocaust,' he turns, almost playfully, the seamy side of civilization to the light, but leaves no defect or absurdity untouched. In 'The New Adam and Eve' he follows the wanderings of a new-created pair through the labyrinth of a great city, all the former inhabitants of the earth having been extirpated by some Divine decree; and their comments on what they find, and their perplexity over the traces of artificial usage, leave hardly anything worthy their approval except their own mutual love and their faith in a loving Creator; and these they did not find, but brought with them.

AGAIN, he pictures a respectable and blameless gentleman, a pillar of society and the state, who imprudently takes a peep into 'Fancy's Show-Box.' And therein he beholds himself guilty of every crime in the calendar; for though he had actually kept the Commandments, yet he had broken all of them in thought and impulse, and been restrained from the act only by dread of consequences or by blind accident. In lighter vein, he weighs the worth of things accounted precious in the world, and in the end finds all the treasures of the 'Virtuoso's Collection' to be no better than rubbish. There is no cynicism here, however; if the worthless are exposed, the true jewels are revealed in their stead; no folly but may be retrieved.

It was not only on such matters that he applied his resources as a writer. In the little series of comments on 'Old News,' he takes up a bundle of issues of newspapers of the 17th and 18th Centuries. I think that these fragments of the latest intelligence of that far-off time must have been in the Hawthorne family for generations; for in some of his boyhood letters to his mother and sisters, there are traces of their effect on his mind; and some of the earliest of his published sketches—as 'The Gray Champion,' which opens the volume of *Twice-Told Tales*—get their substance from such material. But in 'Old News' he brings forward the tattered and yellowed sheets themselves, and by their aid pictures the scenes, figures and customs among which they came into existence. The power of imagination to reconstruct the past and breathe life into it has never been more poignantly displayed.

IN THE first period we see Boston and its inhabitants in the days before there had been any thought of an existence apart from the mother country; all are loyal, and are proud of their ties; they welcome the presence in the city of royal troops, and when the siege of Louisville is in question, they volunteer for the service by hundreds, to return after the event free-mannered veterans, boisterous and victorious. In the second series the name of George Washington has supplanted the cult of George III, and to bring the contrast into relief, the writer imagines the newspapers being read by one of the old Tories, who was still faithful to the king, and who has become a pariah among his townspeople on that account. He reads the reports with anger, sorrow and tears, denouncing the rebellious acts and sentiments of his former friends, and praying for the time when their madness may have passed away, and they may return repentant to their allegiance.

It seems as if a writer who could make warm lifeblood run in the veins of a time long past, need seek no other field for his talent; here, and also in the volume of *Biographical Sketches*, Hawthorne proves himself a vivid and authentic historian, such as the best of English and American writers have never surpassed. But he was only trying his wings for what he held to be more important flights; he will not record merely, but create, though he creates even in recording.

Upon the whole, these little volumes may be regarded as the cornerstone of his achievement as a writer. They abide at the base of the edifice, but the edifice could not have risen to upper air save on such support. There is little in the superstructure whose origins may not be detected in the productions of his youth and young manhood. And before sitting down to write *The Scarlet Letter* he had completed his forty-sixth year.

The volume called the *Snow Image* was collected after the publication of the famous romance, and the eponymous story was written in West Newton, before he began *Blithedale*. In it, realism touches the furthest limit to which he approached in that kind. The homely interior of a household is depicted; the children at their play, the homely environment—and with these the graceful flight into the imaginative, which is made to appear as an inherent part of the whole, its soul and motive, without in any degree diminishing—enhancing, rather—the effect of reality. The great romances attempted no more than this, and not always with such success.

No one knows Hawthorne until he knows these books; and they justify the verdict that he was among the greatest of writers, whose product does not depend for its value on passing fashions, but is as sterling today as yesterday, and may still be valid in far-off times to come.

Who Came Here *First?*

By CHARLES J. FINGER

THE subject is Leif Ericson and his companions, who played a part by discovering America; for not only have the Scandinavians of Chicago honored him, but, according to say-so, signs in the form of picture writing have been found which tend to show that the early explorers crossed the continent. MacMillan, the intrepid, has looked up records in Greenland. Also someone has written a book to show that the name America comes, not from Amerigo the companion of Columbus, but from Americ, the Viking.

What seems certain is this. In 982, Eric the Red, an Icelandic outlaw, discovered Greenland. His son, Leif the Lucky, the first of the Christian religion to set foot on this continent, sailed for the new land from Norway, for it had been colonized by Icelanders. The first white child born on this side of the world was Snorri. The Greenland colony flourished until 1341. So there was a period of settlement lasting 350 years. Eskimo folklore has tales and legends of the white men which are probably tribal or race memories, though it is not safe to build too much on so frail a foundation.

There is this, too. According to the Landnamabok, Icelandic chronicles, one named Ari was storm-driven six days west of Ireland and there found a white man's land. The Eyrbyggja Saga, c. 64, tells of one Bjorn, 'a turbulent fellow of Iceland' and a trader between that country and Ireland, who was driven west of Ireland many days, in the year 1000, and 'came on a land well peopled, where they spoke the Irish tongue.' So there is a grain of hope for those who hold the Irish as having been early discoverers of this continent. And Ireland has a history ancient enough. Its inhabitants were mentioned by Caesar as having been advanced, as those who read Gallic Wars may remember. Ireland was referred to by Aristotle. Plutarch had something to say about the Irish. The Phoenicians knew of Ireland as a forward land holding a forward people. Strabo writes of them and of their shipping. So we may make our choice between discoverers, and when the choice is reluctantly made, there is still interesting speculation possible over the claims of the rejected rivals, and a man is left not quite sure that he has chosen well after all.

GUAM—*an* American Post *on the* Pacific

By
HELOISE LAZARO WHITE

—Photos, Flader and Mahew, Agana.

Aerial view of Agana, capital city of Guam.

COMPARATIVELY little has been written of the Mariana Islands of late years and most particularly does this apply to Guam, the only American possession of the group. The southernmost island and the most densely populated, Guam measures about thirty miles in length, and from four to eight and a half miles in width. The southern part is mountainous, the two highest elevations, Lamlam and Mt. Sasalaguam (Hill Mountain), measuring respectively 1,334 and 1,110 feet, while the northern part of the island forms a large plateau with an elevation ranging from two hundred to five hundred feet. The geographical location of the island is approximately latitude 13 degrees north, longitude 144 degrees east, and the sailing distances to San Francisco, Honolulu, Manila, Hongkong and Nagasaki are respectively as follows: 5,428; 3,337; 1,506; 1,822; 1,440 miles.

The few visitors have been service people, for Guam is a closed port, open only to Army and Navy vessels, and far from the beaten path of the commercial liners plying between America and the Orient. Civilized for over a century, and for the past twenty-six years under American naval government, the natives have grown accustomed to electricity, airplanes, radio and the other developments of modern civilization, but unlike most peoples of the world they have never seen that strange two-legged animal known as the tourist.

Agaña, the capital city of Guam, is the most important settlement. It has a population of 8,500 and is the oldest recorded town in Guam. Practically all the government activities are centered here; marine barracks, post office, executive buildings, commissary, bank and naval hospital, the governor's house, all lend an air of modern progress to an otherwise quaintly foreign village. The streets are very short and narrow with no sidewalks, and the houses with their thatched roofs are indiscriminately huddled together. Mats covered with drying corn or copra can be seen lying about in front of the huts.

Many business and social activities common to the average American small town are found in Agaña. Several churches, garages, drug stores, general merchandise stores, a printing shop, and a movie house show the gradual development of the island. Progress is necessarily slow, for the island is so isolated and small that everything must be done on a meager scale.

Good roads built of local *cascajo* connect these points, and there are about sixty miles of improved road in all. Narrow trails branching from the main road lead inland to different parts of the island where many small farms, locally termed ranches, are found.

In early morning or late afternoon one meets a number of natives on the roads, riding in small two-wheeled carts to which *carabaos* are hitched. Practically all the Chamorros (natives) own town houses to which they return at night after a day's work on their small ranches. As *carabao* travel has none of the elements of speed, this daily trip to and from the ranch takes up much time which could be devoted to work, and the custom is no small hindrance to agricultural development. Some of the financially prosperous natives own automobiles, but the *carabao* really furnish the 'horse power' of the island.

Neither horses nor cattle thrive well in Guam. The natives who own cattle insist on using them as beasts of burden; this destroys their milk-producing qualities and discourages reproduction. As a result, the service people stationed on the island are forced to use canned milk unless they choose like the natives to use *carabao* or goat milk. But there is a forbidding aspect about a muddy *carabao* which impairs the proper appreciation of her milk.

It is a surprising fact that the modern Chamorros, unlike most other islanders, care little for water sports, as the ancient inhabitants were reputed by early historians to be almost amphibious. That the population has changed in many ways is easily appreciated after one has delved a little into the history of the Marianas.

Guam, after its discovery by Fernando Magellan in 1520, was used extensively as a stopping place for whalers. The inhabitants up to this time are supposed to have been Polynesians, who brought with them their beliefs in sun worship. It was not until 1565 that Captain Don Miguel Lopez de Legazpe took possession of the Mariana Islands in the name of Spain, and later when the Spaniards attempted to civilize and christianize the natives, they found them very hostile. It was a question of years before anything like order was established, for the Spaniards had but a few men and no sooner was peace established than the natives would fight among themselves. Gradually, the male inhabitants were killed off, and the women began to marry the conquerors or some of the whalers, sometimes Chinese or Japanese or Filipinos who had drifted to the islands. Naturally, after nearly four hundred

Building a roof from dried thatch plants.

years, the modern native does not show great evidence of a Polynesian strain.

Much of the history of the ancient inhabitants has been gleaned from excavation work done under the auspices of the Bishop Museum in the last few years. On the northern part of the island of Guam and generally distributed over the island of Saipan (also of this group) are rows of monoliths with crude capitals. Some of these stones have been found to weigh thirty tons, to stand fifteen feet high, and to measure five and one-half feet square at the base. They are called *latte* by the natives. Up to recent years it was supposed that they were foundations of old houses and temples. A more plausible theory is now advanced, which holds that these monoliths mark the burial places of the ancient chieftains; for in digging around these *latte*, workers have unearthed human bones, broken and charred, ancient potteries, fishhooks and implements in mother-of-pearl, as well as additional evidences of ceremonial sacrifices and cannibalistic feastings.

The average Chamorro of today (this name was originally applied to the aristocracy only, but is now used generally) is very peace-loving, kind and loyal to his friends. When we were arranging the furniture in our house, I recall that my house boy asked a friend of his to assist him. The lad worked hard for several hours but, when I wished to tip him, flatly refused the offering, telling me that he never accepted money for helping a friend. Now had I asked the favor, he would have had no qualms about taking the tip, but the request coming as it did from his friend precluded any such possibility. I might add that he is a constant visitor to our kitchen and is no doubt responsible for an addition of several dollars each month to the grocery bill.

Though loyal and possessed of numerous good qualities, the masses of Chamorros are extremely lazy and undependable. Prosperity is no incentive to them as they do not know nor crave luxuries and are content to live grouped in little patched shacks, and to eat native vegetables, fruit, rice, fish, and occasional *carabao* and chicken meat.

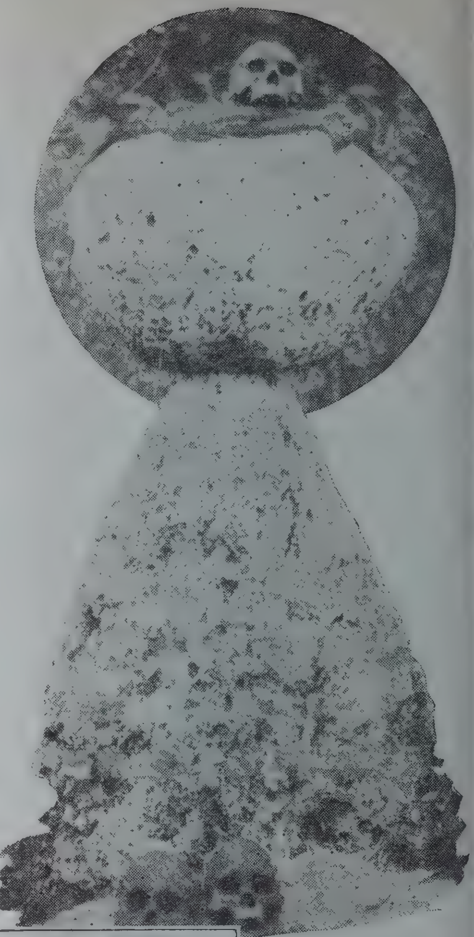
One or two changes of light clothes suffice, for the weather is warm, and personal cleanliness is not at a premium. Those whose ranches are more productive, do not trouble to market their surplus vegetables, and sometimes have to be coaxed to sell. Large-scale production, even in proportion to the size of the island, would admit of many hardships, as the soil is generally shallow and it is impossible to plow many stretches of land as the rock foundation underlying would soon break the plowshares. In these shallow fields the natives use an implement known as a *fosino* or scuffle hoe to clear away weeds and bushes which are later spread over the field and burned in order to fertilize the soil. In sections where plowing is practicable, a *carabao* is hitched to the plow.

The majority of natives own small ranches averaging ten acres, and despite the heroic efforts made by the government experimental station, agriculture is on an extremely low scale. Corn, rice and tobacco are raised in limited quantities, though the production never equals the demand. It is the same with vegetables. The native chiote, cerreguidillas, egg plant (this looks like an elongated bell pepper), plantain, alligator pear, mustard and taro leaves, as well as the wild yam, form delectable dishes, but as most of these plants are obtainable only a few months of the year, the Americans living here are sorely dependent upon canned goods. Fortunately, bananas, oranges, mangoes, and papayas can be obtained practically the year round, and the island government is now beginning to market a small quantity of vegetables produced on one of its farms.

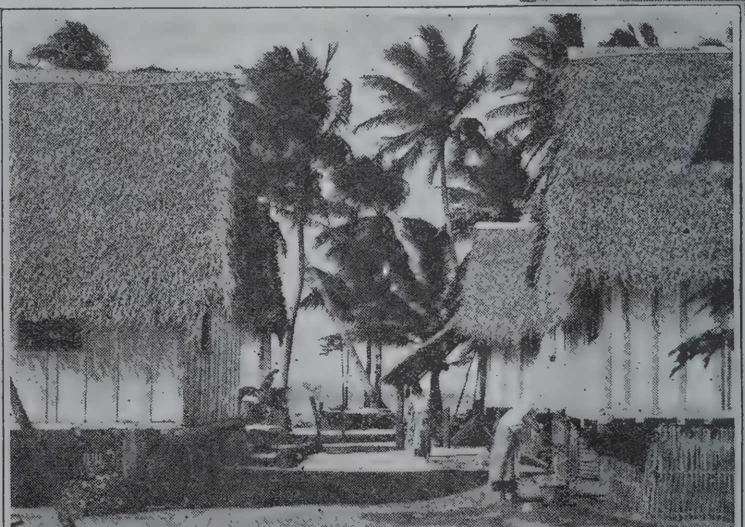
COPRA, which is the dried meat of the coconut, is the only export of the island. The natives barter this copra at the local shops and a few interested firms make a business of exporting it. Last year's shipment approximated 1,816,100 pounds, with an estimated value of $59,970.

Coconut trees do not require cultivation; the coconut is simply dropped on the ground—and grows. One of the picturesque sights of the island is a grove along the beach with row after row of these tall trees, their palmlike leaves bushing from the top and great clusters of the fruit nestling among the leaves. On a moonlight night it is like a bit of fairyland, for the moonbeams dance on the water and stretches of white sand beckon from between the trees while overhead a canopy of blue sky teems with a million stars.

The climate is on the whole fairly pleasant, the mean annual temperature averaging 81 degrees. This is nearly constant during the year, but the humidity is very great and in time, like any tropical climate, this one wears on the nerves of people unaccustomed to it.



Monoliths capped with crude cinerary urns, supposed to mark the burial place of ancient chieftains. Charred bones were found on these sites.



Native huts of Guam. The entire family cooking is done in the rear house, from which a lean-to may be seen projecting.

Typhoons occur occasionally, usually during the rainy season (June to November) but few of these do much damage. Earthquakes are a common occurrence, as the island is at the end of a submarine chain which extends north toward Japan, and is surrounded on the south and southeast by the Challenger Deep, one of the deepest oceanic depressions known. Like the inhabitants, one soon learns to take these for granted, for they rarely do appreciable damage.

Health conditions are favorable for a tropical climate, despite the fact the 99 per cent of the native population suffer from worms. Malarial and yellow fevers are almost unknown, and typhoid is very scarce.

On the whole, living in Guam may be compared to a long summer vacation at the seashore. It finally grows tiresome and we want to get home. Unconsciously we await a change of season; none comes; the vacation seems too long, but could we have a few months of change and bracing air, we would crave it again. Such is the lure of the tropics, for where else can one live with so little exertion, where learn simply to drift along, lazily unthinking? Even as we dream of returning to the States, we admit that once back, there will be times when we shall long for the languorous charm of the tropics and Guam in retrospect will be far more wonderful than the Guam we now know!

Is There a Presidential Type?

(*Continued from page 15*)

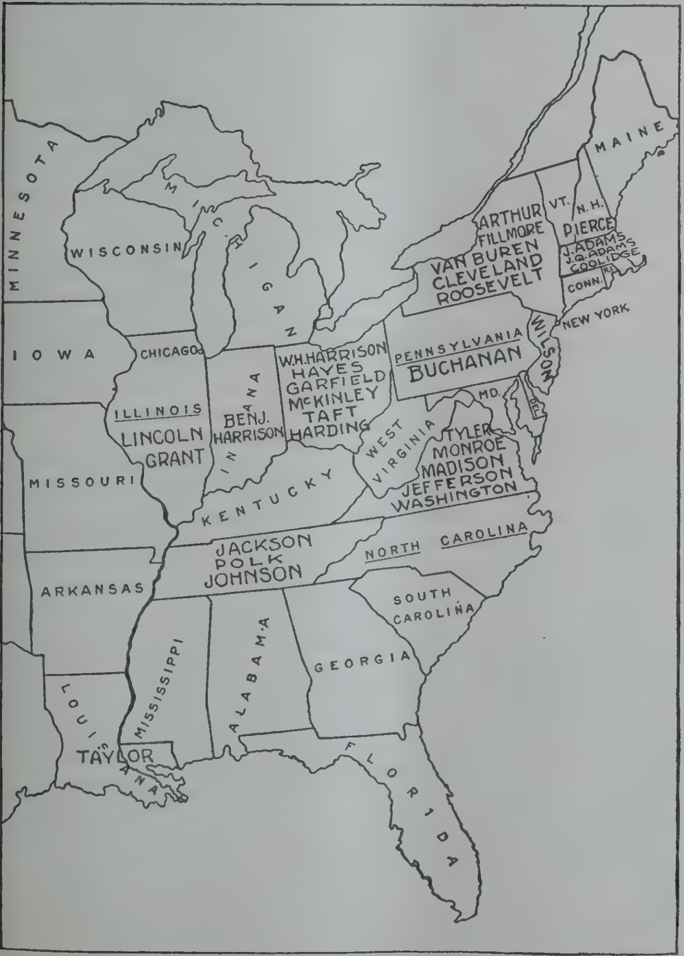
Fillmore, Johnson, Arthur, Roosevelt and Coolidge. Of the six only two, Roosevelt and Coolidge, won for themselves the Presidency in a general election.

Though some of our brainiest and most distinguished public men are to be found on our list of attorney-generals, not one of them has ever reached the coveted goal of all politicians. William Wirt, of Maryland, one of the ablest of them, ran against Andrew Jackson in 1828 as an Antimason candidate but, of the four candidates who were voted for, he was low man with 7 votes in the electoral college. Jackson, of course, was high man. He received 219 electoral votes. No Secretary of the Treasury, no Secretary of the Navy, no Postmaster-General, and in fact no head of any other division of the Cabinet, with the exception of those mentioned, has ever secured a presidential nomination.

Only one Speaker of the House has ever succeeded in reaching the Presidency. Polk, who was speaker for the four years ending in 1839, became President in 1844. Henry Clay and James G. Blaine secured nominations but were defeated in general elections. Clay was a party nominee three times.

Four of our early Presidents had diplomatic careers. John Adams, after acting as commissioner to France with Benjamin Franklin and Arthur Lee in 1778, became minister to Holland and, later, minister to England. Jefferson represented his country at the court of France. Monroe was minister to England. John Quincy Adams was in his twenties when appointed minister to Holland by President Washington. After serving at the Dutch Court young Adams, when only twenty-nine years old, was made minister to Portugal. So well did he acquit himself that when his father, John Adams, became President, Washington suggested that the appointment as minister to Prussia be given him. With the completion of this assignment his diplomatic career was suspended for a time, during which period he served in the Massachusetts state senate and in the United States Senate; but when Madison became President he was made minister to Russia, and later minister to England.

Before attaining the Presidency, Jefferson was governor of Virginia, succeeding that state's first governor, Patrick Henry, in 1779. Monroe was twice governor of the Old Dominion. Van Buren was governor of New York, Tyler served two terms as governor of Virginia, James K. Polk was governor of North Carolina and Andrew Johnson was governor of Tennessee. Hayes was elected governor of Ohio three times. After his second term he ran for Congress, was defeated and then, in 1875, was again made governor. Cleveland, McKinley, Roosevelt, Wilson and Coolidge owed their elevation to the Presidency largely to the records they made as governors.



The geographical domiciles of United States Presidents at the time of their election.

History records some interesting coincidences in connection with the Presidency. John Adams and Jefferson died on the same day, July 4, 1826, the anniversary of the signing of the great document for whose adoption they had labored. John Quincy Adams was the son of John Adams; Benjamin Harrison was the grandson of William Henry Harrison; Frances Taylor of Orange County, Virginia, was the grandmother of Madison and her brother was the grandfather of Zachary Taylor. The Harrisons were descendants of Pocahontas and John Rolfe. Lincoln and Jefferson Davis were born in the same section of Kentucky, only a few miles apart, Davis' birth occurring a year before that of Lincoln. From these facts it will be seen that many of our Presidents were born on farms, that a large proportion of them were lawyers and that governorships seem to be the best stepping-stone to the White House; it will be readily seen that the law of popular choice in force in republics has not come any nearer to developing a standard type of ruler than has the law of primogeniture which creates kings. We have had straightforward, impetuous fighting men like Taylor, Jackson and Roosevelt, but even our soldier-Presidents do not conform to type. A milder-mannered man never scuttled a ship or ordered an assault on a fortress than Ulysses S. Grant, the man who said, 'Let us have peace.'

Jefferson, John Quincy Adams, Wilson and one or two others of our Chief Magistrates were cultured men of scholarly tastes but dissimilar in many characteristics. Hayes, Garfield and McKinley, three Ohioans, were kindly, unassuming men—utterly different in temperament from John Adams, Jackson and Cleveland. And then Jackson was a belligerent partisan who always took the offensive while Cleveland, had he adopted soldiering as a profession, would have probably shone as the indomitable defender of an embattled fort or as a commander who would Grant-wise insist on fighting it out 'along this line if it takes all summer.'

No Death-Rays Yet

A BIT of sanguinary romancing that has marked all wars that have been waged since man's conquest of electricity is the tale of some kind of a ray that can be projected to destroy men.

These much-talked-of but wholly imaginary destructive properties have already begun to be attached to the 'super-X-rays' or penetrating cosmic rays investigated in this country by Millikan and to the powerful cathode rays which Coolidge, the inventor of the improved X-ray tube, has been able to project into the air.

The plain truth is that neither form of force is brand new, and neither can be used for destructive purposes at long ranges. Millikan found that these rays seem to come into our ken from the vast reaches of out space, that they penetrate anything and everything to a depth equivalent to sixty feet of water or five feet of solid lead, and that they belong in the general spectrum of radiant energy with wave lengths much shorter than those of the shortest-length, 'hard' X-rays.

The cathode rays likewise are not new. Dr. Coolidge, however, has projected them into the air for a distance of several feet.

Within their range they are really death-rays, for they have killed bacteria almost instantaneously, and a spot in a rabbit's ear exposed to them for fifty seconds 'died' and subsequently fell out, though apparently without pain to the rabbit. But the reports about the 'disintegration' of a mouse are pure fable. Moreover, they have very low penetration as well as very short range. A thin pane of glass, for instance, stops them completely. It takes from a quarter to a half million volts to produce them, and even though Dr. Coolidge now expects to build a million-volt apparatus, he does not expect considerably to increase their range.

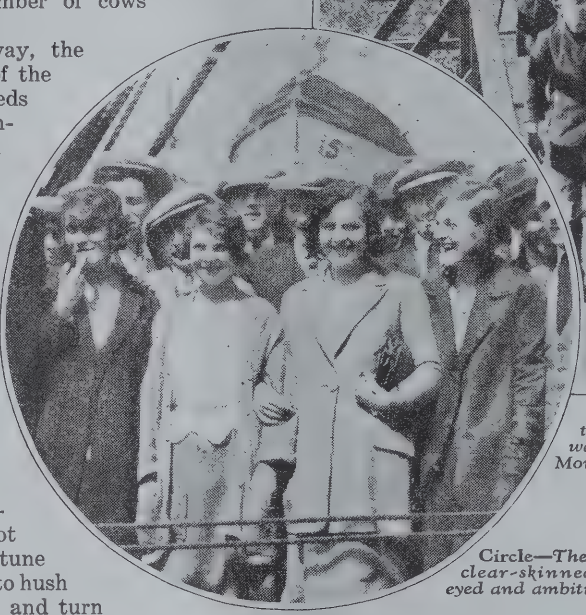
From the Wind-Swept Hebrides

By ESTELLINE BENNETT

THE islands of the Hebrides are bleak stony sentinels against the western coast of Scotland. The people of the Hebrides, blithe in the face of poverty, intelligent against the odds of isolation, are crowded in their little thatched black huts and on their scraps of ground, where with infinite patience and hard labor they raise a few potatoes and herd a small number of cows and sheep.

From Stornoway, the northern harbor of the Hebrides, hundreds of sturdy men, women and children sail away to the West every spring, to a country whose vastness, fruitfulness and sunny splendor not the most imaginative among them could vision. They depart regretfully from the home islands that cannot support them all, tune up their bagpipes to hush the homesickness, and turn their faces toward Canada. Nearly one hundred years ago, Canada had called a little group of the hardiest of their ancestors, and first emigrants from the islands of Lewis, Harris, Skye and Uist had blazed their way to homesteads in the far forests of the province of Quebec.

Hebrideans on their way to the westbound train in Montreal.



Circle—The girls are clear-skinned, bright-eyed and ambitious.

THESE new Canadians are of crofter or small farmer-fishermen stock, sturdy and unafraid, thrifty and hard-working, and in every sense a most desirable type of immigrant. Unlike those first Hebridean immigrants, they come into a country where the trails are blazed and the red roof of the neighbor's barn shows a warm friendly speck across the wheat fields.

The fields and moors of the Hebrides stretch bleak and black, with scarcely enough green to pasture a single sheep. Nothing grows freely but the heather. Peat provides plentiful fuel, but the struggle to wrest any food from the rocky soil would be heartbreaking to a less cheerful, courageous people.

Some of these immigrants came from the little sanctuary island of Eriska, where the shores of Prince's Bay still are purple and white in the early summer with the *convolvulus maritimus* that Bonnie Prince Charlie planted when he found shelter there after the Battle of Culloden nearly two hundred years ago. The bay, facing northwest, is outlined with broken rocks and the remnant of a low wall marks the spot where he landed.

A few rough stone huts lie in a hollow just above the bay—black poor little huts, with an old bit of tin over a hole which serves as a chimney, sometimes thatched, sometimes roofed with corrugated iron, but oftener with bits of old sails and sticks. The one that sheltered Prince Charlie is still standing, occupied now by a cheery, indifferent crofter.

But these voluntary exiles who now leave their little island of Eriska because of its inability to feed them all, face a different future from that of their forefathers who were forcibly evicted from the more prosperous islands and who eked out a meager hard-won living from the windy little slip of granite. They lived principally on root crops and fish. They use, too, a certain kind of seaweed that the women boil and serve with butter. To this primitive fare the islanders have added a small amount of barley, rye, oats and potatoes. Fishing is their main source of livelihood and much of their robust health, especially the happy huskiness of their babies, is attributed, says Dr. William George McCallum of Johns Hopkins University, an authority on vitamines, to the fact that they eat such parts of the fish as cannot be sold, and these are rich in wholesome fats.

The herring is their king of fishes and they have plenty of sea fowl. They pasture just enough sheep and cattle on their barren bit of land to give them proficiency in the care of such stock and a knowledge of the handling of dairy products. More perhaps than any other people, they have learned the art of converting one agricultural talent into ten.

In spite of their poverty, and the hard work necessary for the most meager living, they are refined in their manners and speech and rise blithely superior to the most adverse conditions. Every man is his own master and the pride of race is strong among them.

People who keep their buoyancy in the face of bleak moors, who grow strong and sturdy on the foodstuffs they cannot sell, and learn dairying with no equipment but one cow and a churn, do not come empty-handed into the great opportunity-laden land of Canada.

Most of the immigrants are between the ages of eighteen and thirty, but there is a good sprinkling of the large families for which the Hebrides are famous. Eight children make an average family and ten and twelve are not uncommon. Not one of the men stands less than five feet nine inches, nor weighs less than one hundred and seventy pounds.

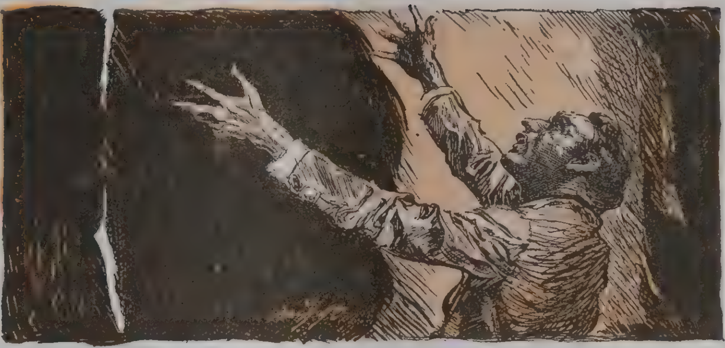
It is a far adventure from Stornoway to Quebec, and Hebrideans do not court strange experiences. Few of them have ever been to the mainland. Most of them have been to the town of Stornoway but once or twice in their lives.

Therefore, confronted with the fear of the unknown, some prefer to stay by their own peat fires and dig with heavy spades in the futile fields.

The Hebridean settlers in Alberta have now all been placed on farms. Those who preferred to do so, will work for established farmers until they learn something of Canadian farming. Most of them, however, already are established on their own small empires of 160 acres. An effort has been made, in so far as possible, to settle them among other people and not at great distances from towns and railroads. Ex-service men among them are in training at the Government farm.

Some Strange Trials at WASHINGTON

By CARSON C. HATHAWAY



He constantly interrupted the proceedings and publicly rebuked his counsel.

Illustrated by
AUSTIN EUGENE BRIGGS

FEW Americans know that an attempt was made to assassinate the President of the United States in 1835.

On January 30, 1835, President Jackson attended the funeral of Warren R. Davis, member of Congress from South Carolina. The services were held in the National Capitol. As he came from the rotunda, he was suddenly confronted by a man armed with two pistols. The stranger snapped one pistol, the percussion cap of which failed to fire the charge. Instantly the assailant was set upon by Jackson's companions but, before he could be overpowered, he snapped the second pistol. It likewise failed to explode. He was then subdued and hurried off to jail.

'There is going to be one in about five minutes!'

In April, 1835, the prisoner was placed on trial. He proved to be one Richard Lawrence, whose relatives claimed that he was a landscape painter. He insisted, however, that he was Richard III of England as well as king of America. He explained that Jackson was usurping his rights and that the Government was more than presumptuous to put 'his majesty' on trial.

The prosecuting attorney was Francis Scott Key, Washington attorney, and author of the 'Star Spangled Banner.' During the proceedings, the prisoner constantly interrupted the court and complained bitterly of the discourtesy which was being accorded him. After a brief trial, the jury brought in the verdict, 'We find him not guilty, he having been under the influence of insanity at the time he committed the act.'

A few years later occurred a famous fraud trial. After the Mexican War, a commission was appointed to settle the claims of American citizens against Mexico. One bill for half a million dollars was presented by George A. Gardiner. He submitted affidavits that in 1844 he was working a valuable mine in the state of San Luis Potosi, Mexico, his investment amounting to more than $300,000. Five hundred persons were said to have been employed on the property. He stated that in 1846 he had been driven away by Mexican soldiers. So conclusive were his proofs that the United States Government paid him $428,750.

Suspicions were aroused later that there were flaws in Gardiner's story. He was indicted for perjury but fled to England. He returned for trial, to have the first jury in the case disagree. Before the second trial was held, investigators were dispatched to Mexico. When they returned, they proved in court that Gardiner, instead of being a wealthy mine operator, was actually a dentist who had formerly peddled on the western coast. It was shown that his elaborate documents were forged and that his whole story was a frame-up. '

'Guilty,' said the jury.

When Gardiner was removed after the verdict he called for a drink of water. He drank it and fell unconscious, dying in a short time, a suicide from strychnine poisoning.

In former days, the Old Willard Hotel, which stood near the Treasury Department, was the rendezvous of statesmen and diplomats. Into its dining room there came one morning in May, 1856, Honorable Philemon T. Herbert, congressman from California. Although it was eleven o'clock the congressman proceeded to order breakfast. The waiter was an Irishman named Thomas Keating. He looked at the clock, told the congressman the breakfast hour had passed and referred the late caller to the manager. At this suggestion, the caller used words that were short and expressive. Plates began to fly, followed by chairs, molasses pitcher. and a silver salver. To the aid of the Irish waiter came reinforcements that proceeded to pounce upon the irate legislator. Herbert finally shot the Irishman dead.

It is easy to imagine the headlines which would have resulted had the incident occurred today.

The Washington papers of 1856, however, carried merely three short paragraphs on an inside page, the bare announcement of the incident being accompanied by the words, 'Public curiosity would no doubt require of us a minute account of this melancholy occurrence but we believe that public justice forbids this gratification at present.'

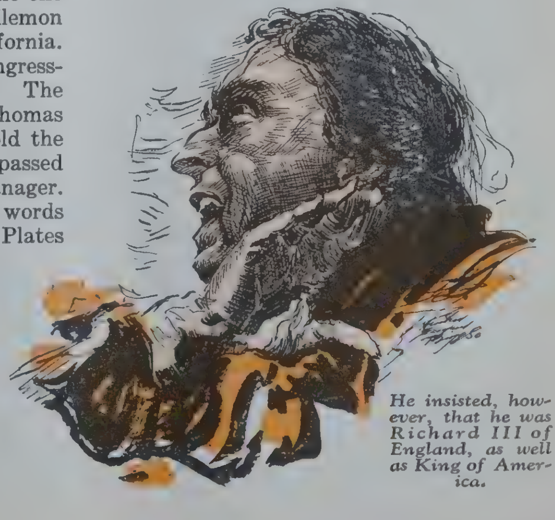
When the case came to trial, the first jury disagreed. The second acquitted the congressman on the ground of self-defense. In this exciting case, the prosecuting attorney was Philip Barton Key.

Three years later, Key was himself involved in a sensational case.

Daniel E. Sickles, congressman from New York, had been warned by mysterious anonymous letters that Key had been showing undue friendliness to Sickles' wife. He investigated and found that the charges were well founded. On February 27, 1859, Sickles and Key met within a stone's throw of the White House. There was a short and bitter discussion. Then shots rang out and Key fell mortally wounded.

The trial was a dramatic one, attracting enormous throngs. The prominence of the principals made the affair one of nationwide interest. One of Sickles' attorneys was Edwin M. Stanton, who was later to be Secretary of War in President Lincoln's Cabinet. Sickles pleaded the unwritten law. He was acquitted. The young defendant had attracted great public sympathy and on the night of the acquittal a crowd of more than two thousand persons, accompanied by a section of the Marine Band, serenaded the victor and his counsel.

In the oil scandals, much attention was directed to the refusal of certain witnesses to testify before Senate committees. A similar stir was created in 1876 when Hallet Kilbourn was called before a



He insisted, however, that he was Richard III of England, as well as King of America.

special committee of the House of Representatives in a case in which the famous firm of Jay Cooke and Company was involved. He refused to answer questions or to produce papers demanded by the committee and, when brought before the bar of the House, he again refused. At this defiance of authority he was arrested by the sergeant at arms and imprisoned in the District of Columbia jail. Here he remained for five weeks; then he applied for a writ of habeas corpus and was released.

He thereupon brought suit against the sergeant at arms and the committee for illegal imprisonment. At the first trial, he was awarded damages of $100,000. The judge set the verdict aside as excessive. Successive verdicts of $60,000 and $37,500 met the same fate. Finally the sum of $20,000 was agreed upon. A sergeant at arms is not usually blessed with twenty-thousand-dollar bank notes and Congress kindly appropriated the amount to salve the injured dignity of the witness.

The next court proceedings of wide interest occurred as a result of the death of President Garfield. On July 2, 1881, as he was about to take the train from Washington, he was shot twice by Charles J. Guiteau, a disappointed officeseeker. He died on September 19, 1881. The ensuing trial was a remarkable one chiefly because of the personal eccentricities of Guiteau. He insisted on being at all times the center of attention. He constantly interrupted the proceedings, publicly rebuked his own counsel for supposed incompetence and made frequent prepared speeches to the jury.

Twice during the period of the trial, attempts were made to shoot the prisoner. On one occasion an army sergeant fired into his cell window, the bullet passing through the prisoner's coat which was hanging on the wall. The second attempt was made by a mysterious horseman who rode behind the prisoner's van and shot at Guiteau, slightly wounding him. Guiteau promptly demanded that President Arthur offer a reward of $5,000 for the capture of his assailant.

'I wish you would put it in your paper that the Lord is opposed to my being shot,' he instructed a reporter.

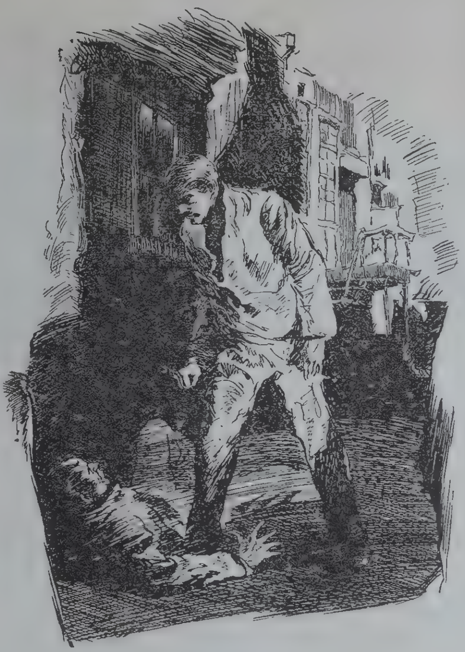
His trial was attended with remarkable publicity.

Autograph albums were frequently mailed in for his signature. Another strange exhibition of public foolishness occurred in a flood of worthless checks mailed to the prisoner. One of them bore the prophetic signature, 'U. R. A. GONER.'

When the verdict of 'Guilty, as indicted' was returned, the prisoner shouted, 'My blood will be upon the heads of the jury and don't you forget it. God will avenge this outrage.'

Shortly before the execution, a Pennsylvania firm offered to pay five thousand dollars for Guiteau's body, planning to preserve it and exhibit it in America and Europe. Half of the proceeds were promised to Guiteau's relatives, who failed to approve the scheme.

One curious incident of the trial occurred when Clark Mills, sculptor of the famous statue of Jackson in Lafayette Square, Washington, was called as a witness for the defense. He brought with him a plaster cast of Guiteau's head to prove that the prisoner was abnormal but he was not allowed to testify.



I was waylaid near my boarding house,

Memories of the famous Sam Houston of Texan Independence days are aroused by an incident that occurred in April, 1832. Houston met William Stanberry, a congressman from Ohio, on Pennsylvania Avenue. Stanberry had publicly stated that Houston was seeking to defraud the Cherokee Indians while pretending to help them. When the dust on Pennsylvania Avenue had settled, it was evident that Stanberry had been subjected to—but let him describe the incident himself, as he did in a letter to the Speaker of the House of Representatives:

> Sir:
>
> I was waylaid in the street, near to my boarding house last night about eight o'clock and attacked, knocked down by a bludgeon and severely bruised and wounded by Samuel Houston, late of Tennessee, for words spoken in my place in the House of Representatives, by reason of which I am confined to my bed, and unable to discharge my duties in the House and attend to the interests of my constituents. I communicate this information to you and request that you will lay it before the House.
>
> WILLIAM STANBERRY.
>
> April 14, 1832.

Houston was thereupon called before the bar of the House, where he had previously been a member, and, after protracted discussion, was mildly reprimanded for his conduct. Later he was arrested for the same assault. The question then arose as to whether the conviction by the House was a bar to further prosecution. The court held otherwise and he was fined $500.

One of the most illustrious of the early lights of the capital was David K. Cartter, Chief Justice of the Supreme Court of the District of Columbia. The story is told that on one occasion an attorney appearing before him had been arguing that he was supported in his contentions by a long line of legal decisions. The particular argument advanced did not impress the judge.

He interrupted the attorney with, 'You insist that there has not been a court decision contrary to your contention for more than a century?'

'That is correct.'

'Well, there is going to be one in about five minutes.'

Joseph Hergesheimer

(*Continued from page 4*)

and strove very hard in the opening of *Balisand* to define the term so there would be no mistake in my meaning. There seem to be two conceptions: that of birth—which was Richard Bale's status—and that other more common interpretation, "one of Nature's Noblemen!" A delicious, meaningless phrase.

'Shop girls all think of a gentleman as a man sitting in a fine car who would stop it to let them cross the street. Whereas, in all probability he would not even see them and dash right along. If people only knew it, they would find the "gentleman class," the aristocracy, much the same as themselves in the matter of selfish codes. For as soon as one group acquires the power, then there remains nothing but to exercise it. That is the beginning of an aristocracy.

'In the same category, I find the love of anyone of the past—especially if he is supposedly harmless in the public eye—grotesque; while the hatred of our strong, wilful men is a baleful public trait. Look at our biographies! Lincoln, Washington, and so on—they don't leave them a decent leg to stand on, simply because they had a decided human side! The public dotes on harmless heroes. Respectable people in America really have a very stupid time of it. Men are uneasy with their families. They are hysterical and galvanic rather than amusing and entertaining. Most Americans really think it wicked to have a good time. It is all very mysterious to me.'

At this point luncheon was announced and we strolled from the library into the century-and-more-old dining-room, which, with the rest of the old house, is furnished in the period in which it was built. There I met the little wife with 'the gentian-blue eyes' that Mr. Hergesheimer has written about somewhere. To be exact, Joseph Hergesheimer has two mistresses besides his charming wife—one is his Creative Work that claims about five hours of his time daily; the other is his precious Old Glass which he goes about the house fondling with his hands or caressing with his eyes most of the rest of the time.

Still they are a very happy family. With only eight rooms, a contented wife, two jealous mistresses, a dog and one thin, efficient colored maid, there is not much room for guests.

The workshop is on the second floor of a typical Main Street building. The whole setting is at least a million miles from *Java Head* or *Cytherea* and their progeny. It consists of two large rooms with dreary outlooks. An efficient secretary occupies the first room. Beyond is the sanctum wherein *Tampico* was lately created. The walls are covered with a French pictorial wall paper several hundred years old, made by hand from wood blocks.

'Telephone!' he exclaimed in response to my query. 'I wouldn't have one here for the world. That's why I come here—to get away from *all* contacts. I allow no one to see me, to bother me. If anyone gets in here—unless I bring them in—Miss McCleary, my secretary, is fired. That is part of her contract.'

Then we motored back again to the little stone house on the knoll, half-hidden in a grove of trees.

Science *Versus* Preconceit

By S. F. AARON

Illustrated by
THE AUTHOR

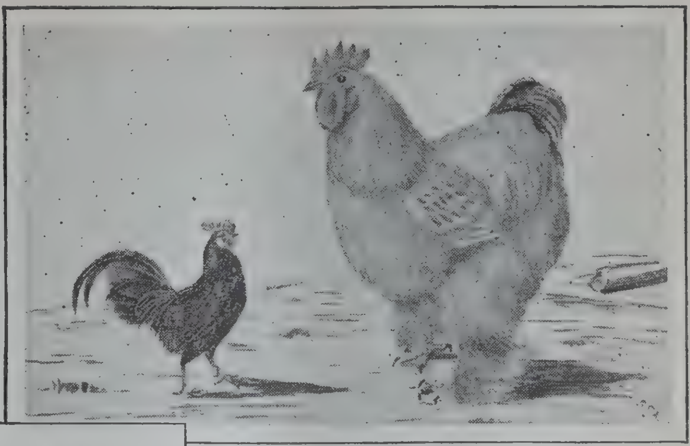
IT SEEMS strange that men trained in the biological laboratory, some who are thorough systematists of widely divergent life, and even nature lovers with wide out-of-door experience, have failed to grasp the essential influences of natural selection. They accept evolution because of its scientific necessity, but blindly, admitting that they know nothing of its origins. Some even go so far as to misinterpret apparent evidences against natural selection.

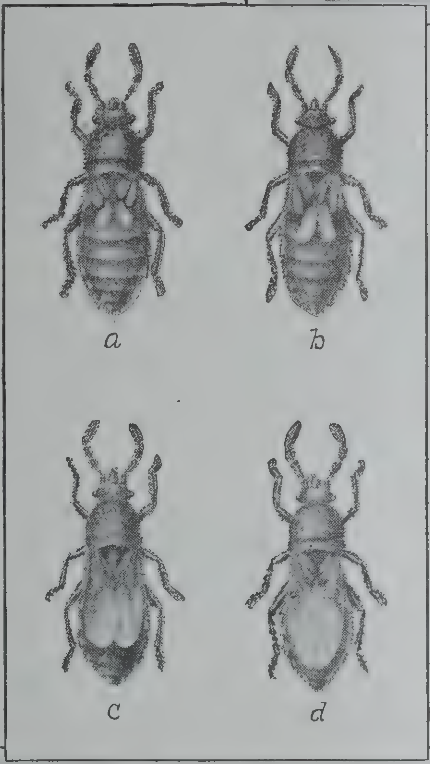
If investigators fail to comprehend a subject compelling the widest knowledge, what of the layman?

It is necessary to cite but a single line of development many times multiplied, to illustrate the inability of observers to make a correct interpretation of simple facts. This concerns the white tails of many quadrupeds and birds commonly preyed upon. Nothing is more apparent to the hunter than the white flag of the Virginia deer lifted high with every retreat of the animal, or the round flare of molly cottontail seeking safety with leaps.

What sort of selective development is this that actually attracts an enemy? Is it not all too apparent that Nature has done something unwise, and that natural selection has somehow slipped a cog?

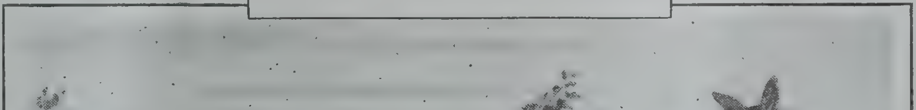
Satisfactory explanation is so obvious that the interpreter feels almost as though he were pointing the finger of derision at those who have missed it.





Examples of extremes in artificial selective breeding. No wild creatures thus widely differing as a result of natural selection would be considered merely as differing specifically but would be classed as very distinct genera or even sub-families.
Left—First, the short-winged and last, the long-winged species of the chinch bug, with two gradational forms that show development from one to the other.

The one brief period in the life of many creatures when survival demands instant and effective protection from numerous enemies is that of *extreme infancy.* The delicate, day-old fawn, squat in the long grass—the new-born rabbit in its snug, fur-lined earthen cavity—the nestling bird—these cannot be hidden from the sharp eyes and noses of many enemies. Militant defense is out of the question. Deer, antelope or mountain sheep cannot oppose puma, wolf or bear; molly cottontail knows nothing but retreat before fox or mink; the bird slips from brooding her young ones and although she may flutter away, pretending injury, this is not enough.



A drama of the open spaces. The white patch of the mother mule deer draws the eager, futile puma away from the helpless, crouching fawn.

Therefore camouflage is the thing. Away goes the mother, never too rapidly, alert to dodge the long spring or rush of any killer that, instantly attracted by the flaunting white tail seen before all else, especially among the dark shadows of night, may follow greedily.

Most of the *Cervidae,* except the powerful moose, easily capable of self-defense; all of the *Ovidae,* some of the *Caproidae,* nearly all hares and squirrels and a large majority of the ground-nesting birds have similar protection. Perhaps different portions of the body are white-streaked or spotted, and plainly visible from the rear. Most notable among them are the meadow lark, junco, vesper sparrow, chewink, some of the ground-nesting warblers, the whippoorwill and nighthawk, the dove and all grouse.

Exceptions among the sparrows and the warblers are those that nest mostly in bushes where the retreat from the nest cannot be quickly followed by an enemy. The marsh hare takes to the water, and so a white tail would be of no use for purposes of distraction. Some arboreal birds, as kingbirds, cuckoos, robins, mocking birds, blue jays, magpies and others, have developed white tails; the purposes are not apparent. Woodpeckers also have them; but it is very evidently in order that they may lure the climbing snakes, weasels, the demolishing opossums and racoons, away from their nest holes. The same may be said of squirrels, the chickarees being the only exception in that class.

The Function of American Folklore

(*Continued from page 9*)

have recognized in Hector's work the *Thus-would-we-have-it* of folk literature—the eternal assertion, in metaphor, of the will of a people. At the same time, the English romanticists were perhaps closer to a true appreciation of the *Letters* than Mr. Lawrence, who is able to see them as merely a pack of gratuitous falsehoods.

A great deal of Walt Whitman's work comes under the head of folklore. Old Walt, striding in his shirt sleeves along the Open Road, extending the right hand of fellowship to worker and vagabond, slave and freeman, saint and sinner; vicariously experiencing the joys and sufferings of all types and conditions of men; hugging the world to his well-mattressed breast, was giving brave expression to new, vital yearnings which, though inarticulate, were nevertheless general among a great body of Americans in his time.

One finds the same urge, expressed in a manner less absolute, in certain political and social movements of that period, and in some of the writings of Mark Twain, Bret Harte, and even of Emerson. Whitman happened to be so constituted that he was able to give full expression to desires which in other writers were tempered by social and intellectual considerations, and so achieved authentic folk literature. With respect to his place and function in a national literature, Whitman is nearest of all our writers to Homer. In this connection it is interesting to note that, in preparation for his task, he spent many days beside the ocean, alone with the great myths of the Greek.

BUT our national folklore does not end with Whitman. His expression of the nation's will prevailed no more than Homer's did. That is not to say that the will to which he had given expression had never existed; it is to say that it was soon qualified and finally defeated, in the national sense, by a new will to material comfort, social and ethical respectability, political, religious, and economic stability, intellectual certainty, emotional orderliness, and success. This will, becoming general in the post-pioneer period, came to prevail entirely over the careless *camaraderie* of the Open Road celebrated by Old Walt.

The voice of Whitman became within his own lifetime the voice of one crying in a wilderness of domesticity. Old Walt, whelmed about by the legions of the new order, terrible and tame, sat in grim silence through his closing years in Camden, as very likely Homer had done somewhere in Greece. The slouch hat, the patriarchal beard, the open shirt, became as a solitary and grotesque oasis in a desert of derbies, sideburns, stand-up collars bound with discreet and reassuring cravats.

The new order, with its passion for domesticity, respectability, and success, developed a folklore of its own, and this folklore persists plentifully in our own day. The biographies written in the eighties and nineties are folklore in which the life of an historic figure serves merely as an appearance under which the national longings may be expressed. The novels of Harold Bell Wright, Gene Stratton Porter, Henry Sydnor Harrison, Kathleen Norris, Oliver Optic, and Horatio Alger are folklore; one does not know how to deal with these works, with any show of justice, save as myth-triumphs of the national will. The homilies of Dr. Frank Crane, Orison Swett Marden, Herbert Kaufman, and to some extent those of Arthur Brisbane, are to be regarded as welcome additions to our American folk literature. It would be easy to add to the list in every field of cultural endeavor. Naïvely, without pretense of challenging the reader's capacity for intellectual adventure, these works assert in their various ways the desires, attitudes, and ideals of the people in our time. 'Thus would we have it,' they declare, and the nation, recognizing without effort its own voice, joins in the chorus. It is because they are folk literature that the criticisms of the intellectual barbarians—of the Nietzschei, the Joyceae, the Expatrii, the Exotici, the Villonae, and other native tribes—fail to have any effect on them.

Folklore serves not the individual but the tribe, and probably it serves as a unifying agent. It serves, too, to refresh continually the morale of a society, by presenting in a succession of forms the fruition of hopes common to most of its members. Considered dynamically, folklore acts as a conservational force.

What Football May Come To

(*Continued from page 5*)

will develop from the possibilities provided by the changes in rules, will not be known until the season ends and the returns are in. However, it is certain that football will vary considerably this year from the football of other years: there is a suspicion that football will come dangerously close to Rugby, the game from which it originated. Year after year football has been pulled further and further away from Rugby, but it is now going back to the root. The lateral pass is the link which will bind the American college game closer to the English game than it has been at any time since its start. There will be many plays this year that have never been used before, plays made possible by the changes in rules; but these plays will resemble Rugby, rather than football as Americans have come to know football.

There was, apparently, an effort on the part of the rule makers to eliminate as much as possible the danger of injuries. Many moves in this direction have been recorded by the committee in recent years. This season the goal posts will be moved ten yards behind the goal line, which will make the distance between goal posts 120 yards but will leave the length of the playing field 100 yards as it has been all these years. One of the reasons for setting back the goal posts was the prevention of accidents. In the past players have frequently collided with the posts and several have been severely hurt. But the main reason for setting them back 10 yards was to get more versatility into the try for point after touchdown. Ever since the rules committee decided that a try for the extra point after touchdown could be made from directly in front of the goal posts, without regard to where the ball was carried across the goal line, there has been criticism over the scoring of the point. As a team with a fair kicker was almost sure to score the point consistently, it became rather a monotonous procedure. With 10 yards farther to kick it becomes a more difficult matter. Under the system in vogue for several years, the ball was put in play on the 3-yard line after touchdown. With the kicker 10 yards back he had to boot the ball only 13 yards, which is not much of a kick. But to kick 23 yards, as will be necessary under the new conditions, requires more than the ordinary drop or place-kicking talent. Those who advocated the change maintain that teams will try to score the extra point by rushing, forward passing or lateral passing, rather than by kicking. At least there will be more of this than before and consequently the attempt will have variety that it lacked previously. Of course, it will remain for the play of 1927 to give a more accurate line on this argument. Setting back the goal posts is certain to do one thing and that is, to remove the so-called 'cheap' kick from football.

Another change in the rules this year compels teams to 'come to an absolute stop, and remain stationary in their new positions without movement of the feet or swaying of the body for a period of approximately one second. This period may be conveniently measured by rapidly counting one-two-three-four.'

This rule is aimed at the shift. It does not abolish the shift, simply makes coaches who use it a bit more careful. There has been a tendency in the past to beat the rule, which before this year provided that teams must come to a complete stop between the shift and the start of the play. The officials were to determine whether teams did come to a complete stop; and if they did not they were to be penalized five yards. Some teams were in the habit of beating the rule, taking a chance on being set back five yards once or twice, because of the advantage they would get when they escaped the penalty. They knew full well that no official would penalize them on every play, and they were quite willing to take a penalty now and then because one good gain, made possible by the shift, would wipe out the disadvantage of several penalties.

In the Western Conference, teams will be compelled to stop two full seconds after coming out of a shift and before starting the play. This will mean the elimination of the shift in the Western Conference, for when a team stops two full seconds after shifting, the stop discounts the advantages that are gained by means of the shift. This shift was overworked during the 1926 season with the result that many criticisms were leveled against it in all sections of the country. While the rules committee did not eliminate it the play has been considerably subdued and the abuse will cease if officials follow the rule and count one-two-three-four rapidly. But, some coaches will ask, 'How fast is *rapidly?*' This question may result in another long wrangle that will, in the end, do away with the shift entirely.

Several minor changes will be found in the rules this year but they will not affect the play. What the spectator will find of interest is the changes that have been discussed here. What the resulting change in style will do to football none can definitely forecast at this point.

CHATS WITH OFFICE CALLERS

'The slums of London are almost gone. It has taken thirty-five years to eradicate them,' said the ***Architect,*** 'but it has been accomplished. As for Berlin, poor as she is, she managed to spend $40,000,000 last year alone toward the eradication of her slums. We have, in New York City, what is known as the "railroad tenement." It is a death house built on a twenty-five-foot frontage. On one side of the building is a hall. Along the hall doors open into rooms. Only the first room on the hall and the last one have any light. There are no windows because the building is built right up against another building. Such a tenement is like a corridor sleeping car except that each compartment in a sleeping car has a window. Hence the name "railroad tenement." These places reek with disease and have killed enough people to fill many cemeteries. They were built before the building code was in operation. No such buildings could be erected in our modern cities today. If we are to remove our slums we should begin with the worst type and do away with the railway tenement. The Whitechapel district of London was once a reeking pit of humanity where, in hot weather, children and weaklings died like flies. Today there are few if any slums in the world's largest city.'

* * *

'The subject of the girl of today has provoked tremendous discussion,' said the ***Police Matron*** from a large eastern center. 'Some insist that nothing is the matter with the girl—that all is well with her, and for her. To me such insistence seems idle and, indeed, harmful. The girl of today is much the same as she of generations past, but her environment has undergone a change. Even the stanchest advocates of the power of heredity concede great influence to environment. Her "problems and pitfalls" antedate herself by about two generations. In fact her troubles began with the industrial expansion of the 19th Century and the attendant development of life outside the home, toward which society has not yet made the correct adjustments.

'With indifference and laxity toward morality generally current, it is not surprising that the girl of today has a share in it. It is of no use to nag her, or to insist blindly that all is well with her. She must be regarded with sympathy and with an enlightened comprehension. Always we should bear in mind that it is difficult to reform; preventive education is much more worth while.

'In former years parents guarded their children more closely. They did not permit their daughters to be alone on streets, especially at night. Proper escorts and suitable chaperones were provided, when the need was really less than it is today.

'To accord with freedom from convention and visible protection, youth must be informed of the dangers that lurk in its paths—whether of pleasure or otherwise. This moral education should begin in the first years of a child's life in the form and proportion that are beneficial and comprehensible to a child. By *moral education* I do not mean merely the education pertaining to sex, but that which should govern the individual in all relations in life.

'Too many mothers have too little comprehension of the youthful needs, desires and temptations of their daughters. Too many mothers scold and nag their daughters, but never take time to give them sympathetic information. Parents of today have fewer children than those had a generation ago, and machinery has made easier and quicker the essential work in the home; yet, less time is given to the rearing of children than ever before.

'Just to tell a girl or boy that such and such a thing is dangerous is not sufficient. She and he must know the causes, the results and the significance of the danger signals. The moral education must be broad and deep. And society owes to youth and to itself an environment as free from evil as it is possible to provide.'

* * *

'Three years ago I was quite pessimistic over the results women had achieved with the ballot,' the ***Suffraget*** began. 'I have now got nicely over it. I realize that during the four years between 1920, when woman first began to exercise her franchise nationally, and 1924, she was passing through the kindergarten of politics and I think we all expected too much.

'Things appear differently now; perhaps it is because our perspective has broadened. I do not claim, of course, that tremendous accomplishments have been made but I do feel that progress has been made in the education of the woman politically.

'You recall that before 1920, dating back at least to the Civil War, the apathetic vote in this country varied between 70 per cent and 75 per cent. After woman had been added to the ranks the apathetic vote (in 1920) became 49 per cent. Only 25 per cent of the enfranchised women voted. It was enough to dismay even the most optimistic of us.

'But now, as we look back we can see where woman has been learning. In two states, she has been placed in the governor's office—how some of our patriot fathers of the early days would roll their eyes if they knew it! In the attorney-general's office a member of our sex has made a record which I think even men will approve. In other governmental and state offices, elective or appointive, woman has taken a larger and larger part. Across the water, Lady Astor has brought luster to our ranks by her intelligent and courageous service in the House of Lords.

'I think, all things considered, woman has made real advances politically; and the hardest thing of all is now going to be the exercise of patience, until the full development is attained. How long will it take? I wish I knew.'

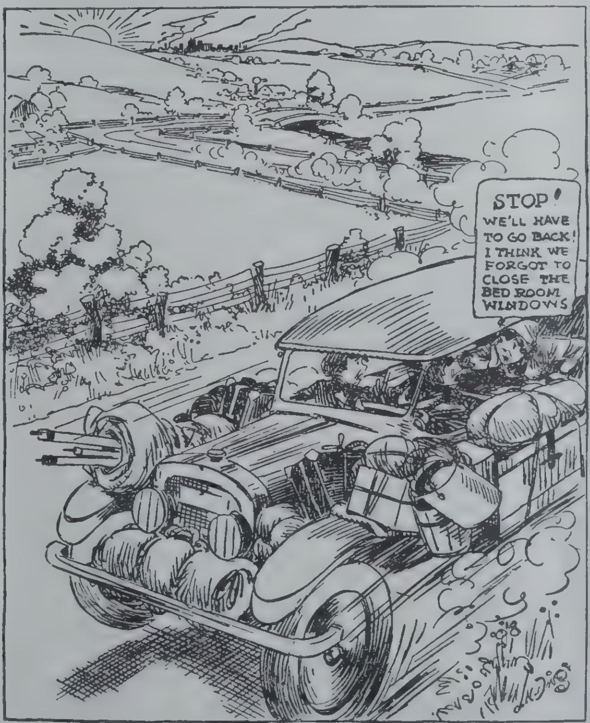
* * *

'Unless all signs fail we shall see the inaugural date for our Presidents changed before many sessions of Congress have passed,' said the ***Congressman.*** 'Three times in the last four years the Senate has sponsored a constitutional amendment to change that date, as well as the date of the opening of Congress. On two of these occasions the vote was almost unanimous. Three times the proposition was reported favorably by a House committee and as many times it died without coming to a vote.

'Under the Norris amendment the President would begin his term late in January; Congress would meet about January 1. As to the possible benefits, at least four are being mentioned:

'First, the short session would vanish; second, 'lame-duck' legislation, enacted by men and parties defeated at the polls, would disappear; third, Congress would meet in two long sessions with no fixed adjournment date instead of in one long and one short session; and, except in rare cases, filibustering would cease; fourth, the President would take office two and one-half months instead of four months after election.

'Changing the date for the assembling of Congress would not require a Constitutional amendment. Congress now has full power to set its own date. Of course this change should not be made without due study; but in my judgment it is certain to come. All that is needed is a little time.'



STOP! WE'LL HAVE TO GO BACK! I THINK WE FORGOT TO CLOSE THE BED ROOM WINDOWS
DING

—Darling, in the *Detroit News.* (c) N. Y. *Tribune.*

THE VACATION SEASON IS ON.

CAN YOU TELL ME?

Question. What has become of the wild pigeons that were so numerous years ago?

Answer. The wild or passenger pigeon that used to be so abundant in past days in the United States is now entirely extinct, the last known specimen having died in the Cincinnati Zoölogical Garden in 1914. The primary cause of its extinction is probably its having been killed for food; but the last colony disappeared rather suddenly, and it is not known exactly what became of these birds.

* * *

Q. I would like to get some information regarding the Government flying schools.

A. The primary flying school is located at Brooks Field, and the advanced school at Kelly Field, both near San Antonio, Texas. The following are eligible for appointment as flying cadets: (1) Enlisted men of the Regular Army; (2) civilians. Candidates must be, at time of application: (a) Unmarried male citizens of the United States; (b) between the ages of 20 and 27 years; (c) high school graduates, or possessors of the equivalent of a high school education; (d) of excellent character; (e) of sound physique and in excellent health. Application blanks may be obtained from any Air Service station or from the Chief of the Air Service. Civilian applicants resident within the continental limits of the United States should forward their applications directly to the Adjutant General of the Army, Washington, D. C.; civilian applicants resident outside the continental limits of the United States should forward their applications to the commanding general of the department or to other independent command within or in the vicinity of which they are resident.

* * *

Q. Will you kindly give me some information about the Salton Sea?

A. Salton Sea is a lake in the wide Colorado Desert or Imperial Valley in Imperial and Riverside counties in southwestern California. Under ordinary conditions it is a salt marsh about 30 miles long, 12 miles wide and 280 feet below sea level, covered in places by shallow lakes. In 1905 and 1906 the basin was flooded by accidental influx of water from irrigation ditches fed by the Colorado River and it became a sea 42 miles long, 10 to 16 miles wide and 93 feet deep covering an area of about 470 square miles. In 1907 the influx of river water was finally stopped by dikes and since then the water area has been diminishing because of the great excess of evaporation over the very scant rainfall. By the end of 1919 the water had decreased to a depth of 21.4 feet with an approximate area of 300 square miles. At present the sea seems to have reached a more or less stabilized balance between accretion and evaporation somewhere around a 20-foot depth. It is far beyond its original size.

> *In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.*

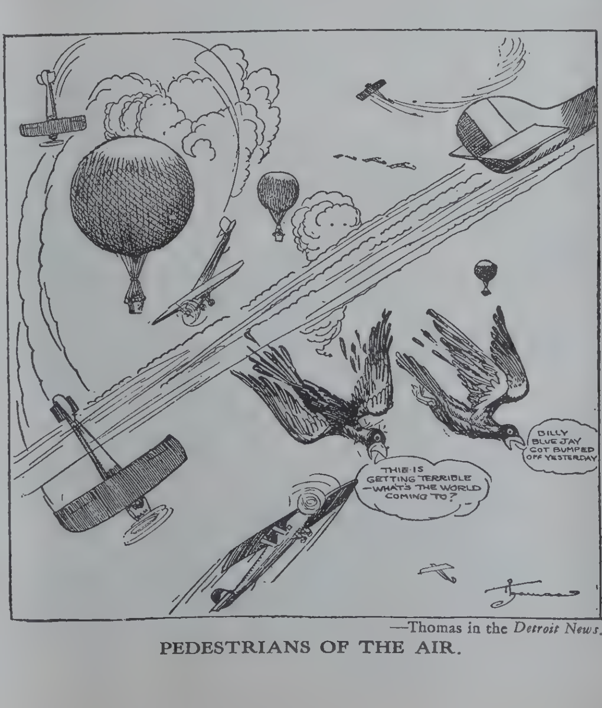
Q. What is the pay of a sergeant in the army?

A. The pay ranges according to the grade and length of service. For first grade—master sergeant—the monthly base pay is $40 with an increase of $2 a month for over four years' service and $2 a month for each four-year period thereafter; for second grade—first sergeant, technical sergeant—the base pay is $33 with a corresponding increase for each four-year period; for third grade—staff sergeant—the base pay is $28; for fourth grade—sergeant—the base pay is $24; with corresponding increases for each four-year period of service.

* * *

Q. I would appreciate some information regarding the Modoc War in California. Did it extend to Oregon, how many white people were killed, how many Indians were executed, and so forth?

A. The Lava Beds, the celebrated stronghold of the Modoc Indians during what is known as the Modoc War, cover about fifty square miles of country in northern California and are located in Modoc and Siskiyou counties, which reach the Oregon line; the Lava Beds do not extend across the line into Oregon. The story of the war is a long one, but briefly stated, it happened as follows: The injudicious acts of Government agents and superintendents of Indian affairs precipitated the *denouement*. The Modocs were forced to leave their country and go to the Klamath Indian reservation on Upper Klamath Lake, Oregon. The Modoc and the Klamath Indians were enemies. The former, becoming restive, left the reservation under the leadership of Captain Jack and returned to their old haunts on Lost River. The Modocs were finally persuaded to return to the reservation; but they left a second time, and the war followed. The whites killed were: Peace commissioners, Major General Canby and Reverend E. Thomas; eight officers, thirty-nine enlisted men, sixteen citizens; also two Warm Spring scouts. There were sixty-seven wounded. Eighteen settlers were killed and about as many wounded before the actual engagement with the troops. The following Modocs were executed: Captain Jack, Black Jim, Boston Charley and Schonchin John.



DILLY BLUE JAY GOT BUMPED OFF YESTERDAY
THIS IS GETTING TERRIBLE—WHAT'S THE WORLD COMING TO?
Thomas

—Thomas in the *Detroit News*.

PEDESTRIANS OF THE AIR.

Q. Is New York City planning on building another large bridge across the Hudson River? If so, what type, what cost of construction, and so forth.

A. The Port of New York Authority is the agency that is constructing the first bridge to be built between Manhattan and New Jersey. When completed this will be the longest suspension bridge in the world, having a distance between towers of 3,500 feet. It will cost $50,000,000 to open it to initial traffic. It will be completed in 1932. The first contract was awarded several weeks ago for the tower foundation upon the New Jersey side. The bridge will cross the Hudson between Fort Lee, New Jersey, and a point in Fort Washington Park, Manhattan, between 178th and 179th Streets.

* * *

Q. What are the provisions regarding the delinquent taxes of Indians?

A. In cases of taxes legally assessed, the Indians are advised to pay assessments and where they have funds under Government control, authority is given by the Office of Indian Affairs for payment; but where there are no such funds, and Indians neglect to pay, or cannot do so, that office cannot afford them relief. This applies to taxable Indian lands generally. Congress has however provided that assessments may be levied against allotments of Omaha and Winnebago Indians in Nebraska, where the restrictive period has been extended, and that the Secretary of the Interior may pay assessments from any funds under his control belonging to the Indian owner of the land; but that if there are no such funds the secretary shall so certify, whereupon the tax shall be canceled by the county and shall not be a lien upon the land. Where assessments are made against what the department considers tax-exempt land the Indians are advised to pay under protest and are assisted in so doing, whenever possible. This is to avoid a tax sale, with the expectation of recovery provided certain suits in the name of the United States now pending in the Federal courts are decided in favor of the Government and the Indians.

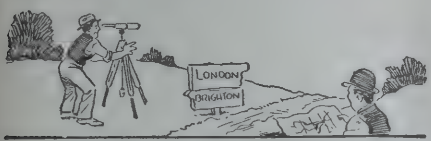
BRIEFLY TOLD

The deepest hole in the earth is known as the Philippine Deep and is located in the Pacific Ocean east of the Philippine Islands. It is 32,089 feet deep, the bottom being more than six miles below the surface of the sea.

Two Denver pathologists claim to have perfected a method for the use of potatoes instead of guinea pigs as mediums for cultivation of tubercle bacilli to aid in the diagnosis of tuberculosis.

Several weeks ago Myron T. Herrick, American Ambassador in Paris, received a letter from a 14-year-old Illinois boy, asking for his autograph and those of 'any other French officials.' The Ambassador sent the boy five autographs, including those of Foch and Poincaré. Accompanying the youth's letter of thanks was a dime, 'so that you may buy yourself a good cigar.'

Cast iron is being tried out as a paving material in France. Should the experiment prove successful, it will provide a use for the great quantities of old iron now being shipped out of the country.



Because of the law forbidding the king from traveling more than fifty miles from London without a minister in attendance, George IV had the milestones from London to Brighton give the distance as less than fifty miles.

The first year's salary of an early Michigan circuit rider consisted of hay, oats, socks, mittens and cash to the total of $118.

Fox hunters of the south do not kill their quarry with firearms but practise the hunt as do the English huntsmen.

Fruits, flowers and vegetables for the tables of the Aztec emperors were grown on isles anchored in the floating gardens of Xochimilco, near the present Mexico City.

The State of Ohio possesses in Greene County a natural history preserve of five hundred acres from which public worship must forever be barred. Such was the stipulation attached to the bequest by the donor, John Bryan. Otherwise, the preserve is open to all persons regardless of creed, race or color.

Ripon, England, has had an official hornblower for more than a thousand years. Taking up his position in the market square just before nine o'clock each night, he must send out a long, mournful blast on his horn before the sound of the last cathedral chime dies away. If an inhabitant can outblow the hornblower in a contest he gets the job.

Though unresponsive, as a rule, to natural beauty, Napoleon showed a marked preference for violets.

Scientists have been unable to discover definitely the sleeping place of the whale. Since these animals can 'hold their breath' for hours at a time under water, it is believed that they do so while asleep, waking occasionally and returning to the surface for a new breath.

An Englishman is walking around the world. He is making the tour to provide material for a book and also as a wager. He is not allowed to beg, borrow or steal, under the terms of the wager, but may collect funds by lectures and the sale of leaflets.

The walls of the fortress of the once great city of Teotihuacan in Mexico are of laid stone more than 200 feet thick.

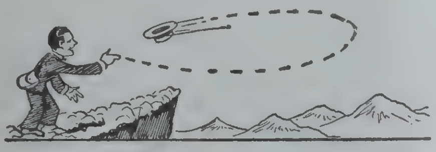
Longhorn cattle, known to cowboys as dogie, are rapidly nearing extinction. Multiplying rapidly on Texas plains during the Civil War, their movement to northern markets over long and difficult trails forms an important part of the Southwest's history.

Before books became so generally used, persons fortunate enough to possess any guarded them closely, often chaining those containing business records to their ledge. Thus they came to be known as 'ledgers.'

That nails have been in use since prehistoric times is a known fact, one over two and one-half pounds in weight having been found in the ruins of Troy and similar enormous specimens discovered in places where prehistoric man made his home. All nails were made by hand before the invention of the nail-making machine in Britain at the end of the 18th Century.

The name of the race which built the pyramid of Cholula in Mexico, before the period of the Aztecs, is unknown today. The purpose of the pyramid is also unknown. Its base covers more than 1,500,000 square feet.

A total of 862 kinds of forest trees in the United States are now known to the Forest Service. The first list of species compiled 28 years ago recognized only 604 varieties.



At Blowing Rock, high in the North Carolina mountains, a hat sailed in a semicircular direction will be caught by the wind and returned to its owner. Below is a chasm hundreds of feet deep.

'Maid Marian,' who appeared in London about forty years ago and measured 8 feet 2 inches in height, was probably the tallest woman that ever lived.

A summer school is conducted each year in the National University of Mexico, the oldest educational institution in the New World.

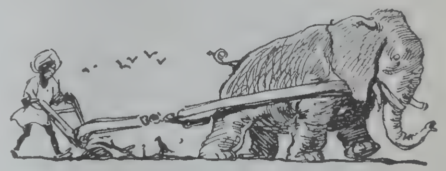
Lizzie Shelton, who died recently near Lexington, Kentucky, was the only Negro woman in the world eligible to membership in the Daughters of the American Revolution.

A dog was sacrificed each year by the Romans to Sirius, the dog star, because they believed this star influenced their herds and crops.

The village of Uyeno on the outskirts of Nagoya has the largest image of Buddha in the world. It is sixty feet high, with the face measuring twenty-four feet from the tip of the chin to the top of the head.

The first political speech of Abraham Lincoln, made in Sangamon County, Illinois, in 1832, when he was a candidate for the state legislature, contained only seventy-five words.

A London housemaid made and presented to Queen Mary a picture from minute pieces of postage stamps. It represented a bouquet of flowers and ferns, topped by a blue butterfly.



Elephants are used for plowing in the Belgian Congo.

The favorite cat of Susuhunan of Surakarta, a wealthy Javanese prince, died recently. It was buried in a costly casket, borne to the grave by twenty-four elaborately accoutered warriors, and followed by an escort of lancers on horseback.

The Prince of Wales and his younger brother, Prince George, hold equal claim to the honor of being the best dancers in the royal family. The Duke of York excels at tennis, while Prince Henry is easily the best cricketer.

All the underside of a starfish is endowed with the sense of smell.

The cornerstone of the building housing the National Conservatory of Music in Mexico City was laid on June 29, 1584, on the site of Montezuma's palace.

In Holstein, a state in northern Germany, there is said to be not a bobbed head among the native women. The women are up to the minute in other fashions but are proud of their long hair.

In an old paper dated March 15, 1823, horses were appraised at from $15 to $40, cows from $2 to $7, sheep at $1 each, and hogs at 50 cents a head.

NOTES - COMMENTS - CRITICISMS

'To Any Friendly Person' is a poem on page 2 of the cover, by Marguerite Wilkinson, who has for years been a frequent contributor to the principal literary and popular magazines. Gerald Van der Heyden furnishes the art setting to these verses in harmony with their beautiful theme of wistful imagery.

* * *

New England, with some four centuries behind it, became old, but like a tree that sheds its leaves in the fall and is clothed with them again in the spring, it is once more becoming new. It is possible, however, that with its newness much of its old-time picturesqueness will disappear. For example, there is the old type of home as depicted on the front cover.

* * *

Don C. Seitz, writer of the Whistler stories and of numerous essays and sketches, gives a very instructive account of the progressiveness that is changing the aspect of New England, bringing it more in line with the best that the country can show. (p. 1)

* * *

There is always a large amount of curiosity as to how and why writers write. Their methods widely differ, for the making of books is a form of production that follows no particular standard. In a chat with Joseph Hergesheimer, who is a Scot on his mother's side, Henry Albert Phillips, special correspondent and traveler, gives many intimate touches in an interesting sketch of Hergesheimer at home in the 'Dower House.' (p. 3)

* * *

H. G. Salsinger, nationally known sports editor, says football will this season see the most drastic innovations in style of play that the game has known since the introduction of the forward pass. Two changes in the rules are responsible for this. What the resulting change in style will do to football none can definitely forecast at this point. (p. 5)

* * *

Some doctors try to make friends with their patients. In doing so they admit they are often baffled. But their object is attained through what Dr. Joseph Collins, the eminent neurologist, calls the bedside manner. In the second part of this subject he discusses the different varieties of the bedside manner. It appears that the solicitous and exhortatory manner is especially adapted to general practitioners. (p. 6)

* * *

Pavel Bouligin, an officer of the Russian Imperial Army, who sought refuge in Abyssinia after the Red revolution, has already given the readers of THE DEARBORN INDEPENDENT quite an insight into the manners and customs of that interesting country. The people, although Christians, have strange superstitions, one of them being that a person can scare death away by making lots of noise. It is a weird story. (p. 8)

* * *

A good many people wonder what folklore means and what it stands for. The function of American folklore is a subject that has been very interestingly treated by Murray Godwin. He says that folklore serves not the individual but the tribe, and that probably it serves as a unifying agent. It serves, too, to refresh continually the morale of society by presenting in a succession of forms the fruition of hopes common to most of its members. (p. 9)

* * *

Nathaniel Hawthorne began to put pen to paper as early as his college days. He burned much of his early work because it did not satisfy. Then he started all over again to build up a career and, almost unconsciously, laid the cornerstones of those literary structures which brought him fame. Just how he did this is told by his son Julian Hawthorne. (p. 12)

* * *

Is there any particular type of man that becomes President of the United States? This is the question discussed by McKee Barclay, cartoonist, editor, and magazine writer, who has for years made a study of Washington and the White House. (p. 14)

* * *

Charles J. Finger, whose writings are full of character, gives us the second part of his essay on the French Canadian habitant or farmer and his arts and crafts carried forward from an almost forgotten age. It shows how the personality of this simple-minded people, who followed Jacques Cartier from old Normandy, is demonstrated in the work of their hands. (p. 16)

* * *

Guam is a far-away American Naval post in the Pacific of which comparatively little is known by the ordinary citizen. It was discovered by Magellan after his famous voyage around the coast of South America. The methods of its inhabitants are still so primitive that cows are used as mediums of transportation, and among the strange insects that plague the stranger are what are known as 'Guam Eagles.' Héloise Lazaro White gives the salient features of this little-known land. (p. 21)

* * *

Washington has witnessed many strange trials. Much of the history of this country is bound up in these tribunals held from time to time in the National Capital. Carson C. Hathaway's research into this subject furnishes a good story. (p. 25)

REMARKS BY OUR READERS

Green Bay, Wisconsin.

In an issue of your paper I noticed an article written by Mr. C. P. Philbrick, Downey, California, upon the Custer Campaign, or Yellowstone Campaign, of 1876.

If it is entirely consistent with your policy to set Mr. Philbrick right upon the subject, I can furnish the following information based on facts with which I am familiar, having personal friends who served under Gen. Geo. Armstrong Custer before and up to the time of his death. I have heard the story from their lips, and they are thoroughly reliable and truthful. They were present at the anniversary June 25, 1926, on the battlefield in Montana, along with thousands of Indians from the reservations, many of them nearly 85 years of age, who fought Custer in his last stand June 25, 1876.

General Custer is buried at West Point; his remains were removed from the battlefield in the summer of 1877, being taken from the fork of the Big and Little Horn Rivers by the Steamer *Fletcher* with those of all other officers who were found and identified except Lieutenant Crittenden's, whose father instructed that he be left where he fell. Coffins were made for these men from cottonwood branches obtained at Fort Custer (side of Hardin, Montana). This fort was built early in 1877. The bodies were placed in the coffins lined with prairie grass.

Captain Keough was sent to Buffalo, and the other officers except those mentioned were taken to Ft. Riley, Kansas, and interred there. The cemetery lies two miles north of the Burlington upon the ridge, instead of south of it.

The bodies of all who were found lie under the monument which is covered on four sides by the names of 218 men besides the names of those killed with Reno on the bluffs four miles south of Custer's stand. Just before the anniversary, the body of one of the 7th Cavalry was unearthed by men fixing a bridge across the Little Horn but was not identified and the funeral was held Saturday, June 26. It may have been Lieutenant Henry Harrington of Coldwater, Michigan, whose body was never found, although Sergeant Chesterton of Mandan informed me they found the body of one of the 7th Cavalry men fifteen miles from the battlefield about a month after the battle; but it was not identified. Thus were three men unaccounted for—Harrington, Porter and Sturgis (the latter General Sturgis' son). For 50 years the Sturgis family have believed this, but at the anniversary, Sturgis' sister who lives at Billings, Montana, accidentally ran against the stone marking where her brother Jack fell. You can imagine the feelings of this woman under the circumstances.

JOSEPH P. GRIMES.

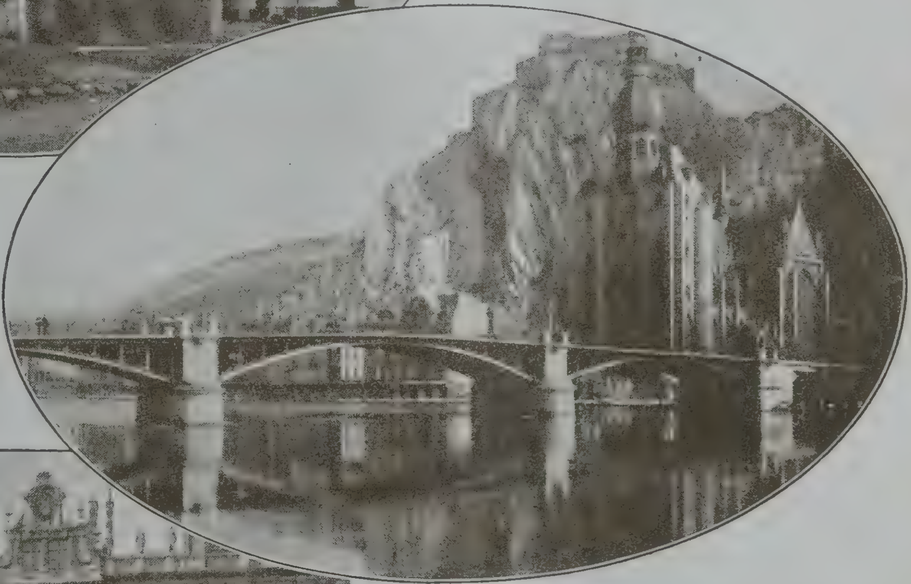
HISTORIC BELGIUM

Lures Lovers *of the* Quaint *and* Picturesque

—Pictures from Publishers' Photo Service.

Antwerp (from 'a an't werp'—'at the wharf'), situated on the broad and deep Scheldt 55 miles from the sea, is one of the greatest seaports of Europe. It serves as an outlet for German commerce as well as Belgian, and its history reaches back to the Seventh Century. Under the powerful protection of Charles V, Antwerp was probably the most prosperous and wealthy city on the continent.

The Chateau of Hougomont was garrisoned to form a defense for the heights above in the Battle of Waterloo. The heroic and successful defense against the furious attack at this point has left its scars. This is the Chapel of Hougomont, where many British soldiers received last rites.



Dinant, apparently with its feet in the waters of the Meuse, snuggles against the frowning, barren limestone cliffs which are crowned by a ruined fortress. With such a forbidding background, the buildings of the little town sink into insignificance, and even the splendid cathedral, at one side of the bridge, blends into the cliff as though a master hand had taken the cliff and by introducing harmony and regularity of line had fashioned a gem of man-wrought beauty. It is the church of Notre Dame, a splendid Gothic edifice of the 13th Century which was restored in 1855. The curious spire gives fantastic and original appearance to the building. At the back of the church are 408 steps leading to the citadel, which was sold privately in 1879.

Flower market at the Grand Plaza in Brussels, Belgium. It will be seen that the market has for a background some of the ancient guild houses, with their elaborately carved figures and quaint architecture.

URBANA ILL

LACK of employment ought to be as rare in the United States as snow is in the Tropics and so it would be if we thought more of the collective welfare and less of individual profit. With the advance of inventive genius and with the perfection of human methods of business management, more and more jobs are going to be created. Here and there we see private employers who are doing their full bit to reduce the problem of unemployment, and they are not doing it as a charity but because a busy world is a good world to do business in. It is a buying and selling world.

A CORNER OF A NEW HAMPSHIRE FARMYARD

Added Benefit in the Out-of-Doors

The family can come and go in safety—everyone's enjoyment un-marred by fatigue or nerve-strain—when the car rides on Firestone Gum-Dipped Tires.

The Firestone Gum-Dipped Balloon, with scientifically designed tread, permits free flexing which gives you easier riding, extra comfort and safety, added confidence. The ordinary balloon, with heavy, flat tread design, is naturally stiffer; it rides harder and steers harder. Besides, the excess rubber at the edges of the tread is not only wasted but puts such a strain on the carcass that it soon breaks through at the "shoulders"—causing inconvenience and short tire-life.

With Firestone Balloons, at no extra cost, you have the benefits of Gum-Dipping—the process which saturates the cords in a rubber solution, making the tire much more flexible and strong and adding many thousands of miles of service.

Firestone Dealers are the experienced tire men in your community. They are given the advantages of Firestone Repair Schools and Educational Meetings where tire design and construction are discussed. They can explain to you the difference between tires "made to serve" and those "made to sell." Get the benefit of their expert advice; see the nearest Firestone Dealer today.

Discovering *the* Colorado River

By HUSTON THOMPSON

IN RECENT times the American people have suddenly become seized ith a curious psy- hological complex. everal years ago it ok the form of a igration to Florida rediscover a land scovered more than ree hundred years go. The Florida raze passed out bout as quickly as it me in. This year e phenomenon has sumed the discov- y of the Colorado iver—perhaps the ost undiscovered rt of the United ates. This does not ean that the Colado River has been known to our Gov- nment engineers d scientists and at it has not been e subject of discus- on in Congress in cent years.

It may be ques- oned, however, hether a dozen men ve traversed the ed River of the ockies from its urce, either at the ot of the western ope of the peaks in e Rocky Moun- ins National Park from the Wind iver Mountains of yoming to the Gulf California.

An impressionistic photograph from e skies would show the melting snows om the Continental Divide losing emselves in beautiful Grand Lake, causing the lake to overflow and start on its way down what was once called the Grand River of Colorado, but now, by legislative enactment, the Colorado.

This stream is augmented by the Green River which rises in the Wind River range in northern Wyoming and flows down through the Sweetwater country across the Utah line, where it finally joins the stream that started from Grand Lake and becomes the mighty Colorado, to be again increased by the run-off from the eastern slope of the Wasatch Mountains of Utah. Thus, it draws its strength and life from the three great mountain ranges.

The melting snow that started with crystalline purity from these ranges dashes its way through canyons of brilliantly colored sandrock and sweeps along with it the silt from the plateaus until this crystalline purity is annually yellowed with 100,000 acre feet of silt that it deposits at the Gulf of California—an amount said to be more than all the earth that was excavated from the Panama Canal. The color of the river undoubtedly was the reason for the Spaniards, coming up from the Gulf of California over 300 years ago, giving the name 'Colorado,' which, in Spanish, means 'colored,' that is, red.

The airman wings his way south across the Arizona border line into the land of Indian reservations, painted deserts, forests, grand canyons, irrigated and arid lands, that need but water to make them bloom, and reservoir sites that, when built upon, will create great artificial lakes and more horsepower than can be produced anywhere else in the world.

Skirting the northwestern part of the Navaho Indian Reservation one soon comes to Lee Ferry, which is four miles south of the dam site in Glen Canyon on the Colorado River. Note the name and location of 'Glen Canyon' and 'Boulder Canyon' some hundreds of miles below, for they will often be heard of before the control of the Colorado River is settled. Sandstone has been drilled to find bedrock at the site, showing a depth of 200 feet below the water. It is at this point that the people of Arizona, through their representatives, say there should be a reservoir 400 feet high constructed that would have

a storage capacity of 8,000,000 acre feet of water. (An acre foot of water is water to the depth of one foot standing on an acre of land.) They assert that such a dam would produce an artificial lake of an estimated length of 185 miles that would be navigable by motor boat and would bring within reach by boat the Rainbow Bridge of Utah, a natural arch of sandstone with a clearance of 309 feet and high enough to span the dome of the Capitol at Washington and surpassing in size and symmetry any other known natural bridge.

From the storage water at Glen Canyon the friends of this project argue that by means of a diversion dam at Bridge Canyon—several hundred miles below—3,000,000 acres of land south of it could be reclaimed from a desert into richly producing farm lands, and over a million electrical horsepower created.

FROM Glen Canyon on, there are a series of canyons in which there are possible dam sites too numerous to detail here. Most of the course of the river from this point on has been photographed by airmen and the public is familiar with its greatest of all scenic views—the Grand Canyon.

The airplane, which has been pointing south, now swings directly west for hundreds of miles. One should pause in the flight at the North Rim of the Grand Canyon and descend to what is one of the finest national forests left in America—Kaibab Forest—occupying about 500 square miles of yellow pine, fir, and aspen, a sanctuary not only for wild game but for human beings. At an elevation of approximately 8,000 feet it is cool, even in the summer time, and a magnificent place, with its grassy floor, for the camper. In this forest man has upset the balance of nature by killing off predatory animals, in order to protect wild game, such as deer. As a result, the herds have increased so rapidly that the problem of saving the deer from starvation has become a real one.

Several years ago, in order to relieve the grass of too much grazing, it was planned to drive part of the herd down in the canyon across the Colorado and into the Grand Canyon National Park, on the south side of the river, but a snowstorm disorganized the project.

Whatever waters are stored here by reservoirs will not destroy the beauty of the Grand Canyon. In fact, if all of the dams that are possible are built some day, one may be able to ride up the river most of the way from the Gulf of California by motor boat. At th place where the river turns from th west to go south are located the Boulde and the Black Canyon dam sites.

THE State of California and, i particular, the people of Imperia Valley, which is in the most southerl part of California and just a shor distance from the Arizona line, ar urging that the first and great dam o the river shall be built at Boulder o Black Canyon in order that it will control the flood waters of this giant o rivers and protect the 65,000 peopl and their investment of $150,000,000 o more in the Imperial Valley from bein swept away when the great freshet come tearing down the river. The point out that not only is the threat o the river constantly before them but als that already great damage to propert and loss of life have been caused by th floods. They assert also that such dam, if built to a height of 550 feet would store more than 26,000,000 acr feet of water, from which could b created 500,000 firm horsepower o electricity, and, should the water b pumped up to a height of 1,730 feet it could be carried by canal to Los Angeles and other cities.

It would also provide for irrigating 385,000 acres in the Imperial Valley and insure against the destruction by drought of crops on 460,000 acres now partially irrigated. They argue that with an all-American canal constructed we would avoid

LITTLE ESSAYS *From a* NORTHERN COTTAGE

On Loving a Little House

By HUGH WALPOLE

IT IS one of the compensations of this ill-balanced life that a little house is, by far, more lovable than a big one. I must not, I suppose, speak for the whole world, but for most of us this is undoubtedly so because we enjoy a supreme intimacy only with things and people of our own size. I was staying a week or two ago for a night in one of the most magnificent houses in England, one of the grand houses that have not as yet been drawn and quartered, that have still their fine parks smiling about them; the room where James I slept, the room with the great bed hung with green silk, is preserved immaculate.

As on that delicious moonlit night I leaned out of my turreted window, looked down upon the keep, saw the black irregular outlines of the outer walls rising from the long, sloping milk-white fields, I realised the magnificent beauty of this but thought of my own little house with a passion of affection. It may be that these affections have little to do with size; you meet a place and it is indifferent to you, another and it gives you a polite greeting without heart, a third and it loves you. This place has had only one owner before me; it was started in tragedy, being built by a gentleman who hoped with his wife to enjoy his old age there; but the lady died while the cottage was being built and as soon as it was finished he sold it. Of course the cottage realised its own tragic start and the two ladies who then lived in it for ten years gave it, I happen to know, an especial tender affection as though they were aware of its sensitiveness; and it must after that have regarded its new owner with exceeding apprehension.

At the first moment that I saw it I bought it and there followed after that, on my part, months of very anxious reconsideration. Through a whole winter I wondered whether I had not done a most foolish thing, considering drains and windows and leaking roofs, whether the room where my books were to be would not breed a perpetual damp, how about the water supply, and so on. And I am sure that through that winter the cottage also anticipated me with a shrinking dismay. For ten years it had been comforted and reassured; it knew its defects only too well, that it was small indeed for anyone who liked parties, that continual hot water had been always, and would be unless someone was very clever, a desperate problem, that some of its walls would not take pictures and that others would take them so securely that they could never be changed again, that the laurels in front of the house were damp and gloomy but that it would be a business to remove them, and that the trees beyond the garden were growing so fast that soon there would be no view of the lake.

Were I to prove impatient, hastily dogmatic, one of those desirers of instant perfection, one sighing for the town whenever he was in the country and complaining because the picture house was seven miles distant, why then the cottage knew that it would suffer months of agitated discontent, pass then through a long naked period of waiting to be sold and then be hustled into the arms of yet another intolerant purchaser. Many of these weaknesses I have, but just as with certain people the better part is uppermost so with this little house. I felt after the first night there that it longed for me to be happy. How do you know these things? By every creak of the door, by every whisper of the stair, by every little curl of smoke that goes twisting up the chimney, by every flower that opens in the garden and by every blind that swings aloft first thing in the morning to show you how the new day is looking.

AND then by something deeper than this. A house can look just what it pleases; you may hang your sitting room with Manets and Cézannes, fill your libraries with first editions and incunabula; you may lay down Persian carpets and stuff your garden with roses, carnations and lilies and yet it will remain apart, hostile and ugly. I have known an attic with a bed, two rickety chairs, some cracked cups and an Arundel print rich in friendliness and warmth of character, and you may say that it is the personality of its owner that makes it so. Not at all; the one I am thinking of was owned by an old crabbed man thinking himself the greatest dramatist since Shakespeare and snarling at the world.

I WON'T deny that I am amiable and that my friends are amiable; I think that the majority of those who have slept in the spare bedroom have wished well to the world and all that is in it. I can't deny a passionate love of this country so that the stones of the house cut from these quarries and the soil where the stones are piled must be pleasantly aware of this. Nevertheless the house itself is responsible for its own happiness.

Although it would have wished, I have no doubt, to have been set a little higher on the hill (which is named Cat Bells) and it would have preferred perhaps to have stretched a little more broadly so that its rooms might be wider and its ceilings loftier, yet its pride in its position is one of its great glories. From the top of Cat Bells you may see the sea, two lakes, twenty mountains (we call them mountains because we feel them to be so) and a hundred running streams. In the acre of ground itself there are three separate gardens, a wood, a tempestuous river, one of the greenest lawns in England, a beehive, four squirrels, all the birds of the neighbourhood, some lizards and as choice a collection of English flowers as you will find outside the poems of Robert Herrick. It would be absurd for me to say that I have arranged that these things should be there; the house, once it saw that I was friendly disposed and enjoyed the intimacy of homely pleasures, did everything that it could to oblige me. I, for instance, never thought of the beehive but the sitting room clock whispered one morning that it would

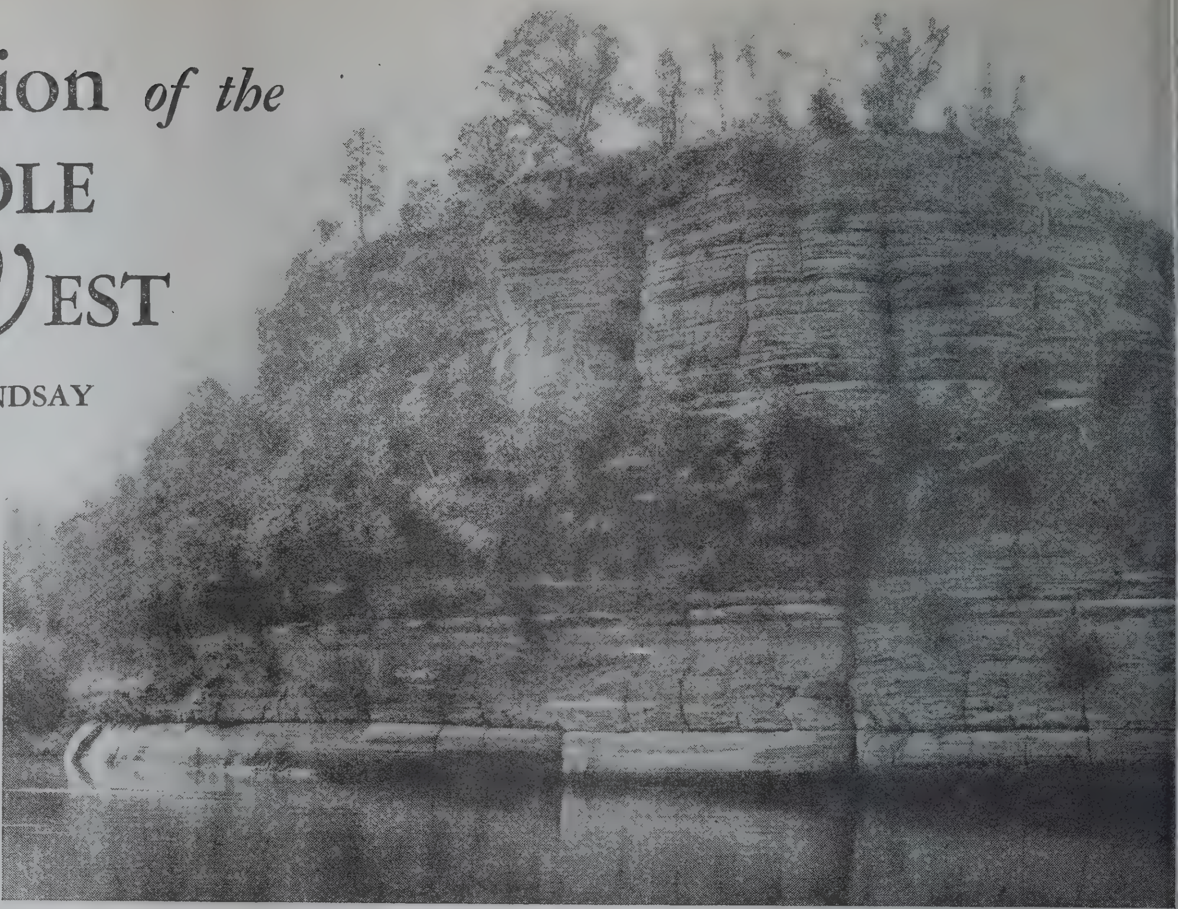
The Definition of the MIDDLE WEST

By VACHEL LINDSAY



'Starved Rock' with its interesting geological formations, near Lasalle, Illinois.

—Ewing Galloway Photo.

SEVERAL doors to the south on Fifth Street in Springfield, near my home, all my life I walked by a rather unpretentious house. It was a two-story frame dwelling, looking about fifty years old, with a little porch, a tree or two, a small lawn, and a very small flower garden. All the dark cynics about the Middle West might easily say that in such houses was brewed its present heaviness, its complete lack of appeal to their imagination.

Springfield had a population of sixty thousand, and in any town of sixty thousand in the Middle West, two-thirds of the houses looked like that about fifty years ago. It was inhabited by the sort of quiet neighbors you never hear from; and no man knows how many quiet families have come and gone throughout its history.

At last someone bought that corner for a three-story brick residence, of some pretensions, and wreckers began to rip away the white clapboards and scrape off the shingles. Then the building became Springfield's wonder for a day.

It was actually a log cabin of the very earliest times, and a two-story log cabin at that. It had been inclosed in sawed boards and fitted with plaster and wall paper, and all modern conveniences; and the logs, almost a foot thick, had been long forgotten; the floors beneath the floors made of hewn logs had been a buried mystery; and the plastered-up fireplace had been a center of incantation long lost. Now all was open. The magnificent walnut logs were there for all to see; and the memory of Sangamon County, when it was the rail splitter's Far West, and not a mere Middle West, was before us. Though the wreckers had torn down this log cabin in a week, and though the new brick residence is on the corner now, that log cabin is eternal, and a symbol of all we desire in America.

I have dreamed of the fire I built on the bluff by the Sangamon River in my youth and of this log cabin. Let us tell a story which is read to us by that Ancient Mariner, on the edge of the prairie sea, that Ancient Mariner whose name is Springfield.

He says, 'I came to that corner one evening and found the log cabin there, complete in its ancient state, lighted by candles, and with the hearth fire burning. There were three women by the fire. These women were spinning. They were from *That Undiscovered Country*. They were from the Land of the Grave, which is eternal. They were three young fates.

'There were others in the room, western boys and men of the old time, about their evening affairs, reading, smoking, talking, their hunting shirts hanging on the wall along with old rifles and skins of animals. But the greatest thing about this log cabin was the hearth fire itself, leaping up the chimney, sending up into the air and over the village crystalline flying books, with wings and leaves of gold, books which are some day to come in visions to all the citizens of Springfield, telling to each man a separate and beautiful story of his future.

'Who are these three women by the fire? Surely two of them have nothing to do with the log cabin fancies of old Springfield. One of them is a woman who died ages ago in a dream of William Shakespeare. She is in the costume of Verona, and her name is Juliet. The other is the woman who dominated the greatest moment of France, in its grimmest chronicle. She is a woman who died for France. She sits here in honor before this fire, one of the three fates of this dream, and her name is Joan of Arc.

It is easy to tell who Juliet is, who Joan of Arc is; the world has been told for generations; and the very sounding of their names is the echo of their story. There is the great official trial and retrial of Joan of Arc, with every inch of her chronicle sworn and certified in open court; and there is the tribute of Thomas De Quincey and the magnificent tribute of Mark Twain. She is a girl whom great men, majestic men, men who have towered above their ages, fall before and reverence. The more mature their judgment and the more distinguished their command over the minds and souls of nations the more apt they are to be set aflame by the saintly fire of Joan of Arc. Juliet, the dream of William Shakespeare, lifted from the dusty chronicle, has become a living word for all time; a young girl of thirteen, but womanhood forever. Joan of Arc died for the love of France;

uliet for the love of Romeo; and these re two of the young spinners of the hread of fate, by this log cabin hearth re, in Springfield, Illinois. They are pinning the thread of the fate of a man ho will die for the love of a land.

Because of this, so long as they are uests in this mere log cabin, in this niddle western town of world pilrimage, they are handmaidens of the hird girl who sits in plain homespun ith them, a comrade forever in the lory of her name. Singers and very reat singers have already spoken her raise; and her dust still cries from the round. She is the golden-haired Anne utledge; and in perfect innocence he tells her handmaidens that she has ust come for a day, from the nearby own of New Salem on the Sangamon, om her father's tavern.

She sings as she spins, an ardent Iethodist hymn, very simple and very ien to these Old World maidens whose earts were given to the High Mass. nd then she tells the other two how he has come to Springfield to attend ourt for a day, and that her young an back in New Salem, keeping store, pproves of such amusements and himelf reads law by her father's fireplace New Salem tonight. Springfield is a ild adventure to this little girl. She as come over the very muddiest roads, orseback with her father, through the rimmest, marshiest, chills-and-fever ndscape, for the land is still undrained. here is no such thing as tile in the elds yet.

—Ewing Galloway Photo.

Interesting log cabin erected on an Indiana farm about 1861.

'Anne Rutledge has had a wonderful ay in Springfield, for she has bought alico at the general store, calico of a nd not sold in the log village of New alem, and she is going back with half a dozen sundries and a new law book for her boy, Abraham Lincoln; and with new shoes that she will wear when she walks with him to meeting and by the Sangamon River under the moon. It will be many a day before Abraham Lincoln comes to live at Springfield, old before his time from a broken heart, because of the death of this girl.

But this is a gala day with Anne; and her adventure in the tiny court room, a very gentle piece of litigation indeed over some farmer's boundary line, is to her a wild revel, just because her young man is studying law by the firelight in New Salem tonight.

The others understand. Juliet knows, for have there not been Montague streets and Capulet streets in Verona, and dreadful disputed boundary lines between them? And did not Joan of Arc try to discover what precisely were the boundaries of France, and trace them with the point of her drawn sword? So they understand little golden-haired Anne Rutledge's prattle of the boundary between two Indian-corn farms, settled in a sleepy Springfield law court. She pictures two gesticulating lawyers in butternut shirts and breeches, wearing yarn-knitted suspenders, and taking off their coats as a gesture in the climax. This question of boundaries will again go far. And when Anne Rutledge is in the dust, her young man, now reading by a New Salem firelight, will be trying to settle forever the exact meaning of that terrible phrase, Mason and Dixon's line.

The three girl fates spin on and on, by the fire, from which come flying books. Anne Rutledge has made a visit to Springfield.

Who Is *to* Own *the* Air?

By DON C. SEITZ

THERE is a tale out of the East to the effect that once a sharp farmer of imposts in the Kingdom of Cashmere went to the ruler of the beauteous vale and offered to buy the wind that blew across it. The price being liberal, and the property seemingly elusive, his majesty, who was hard up, as usual, consented to trade without inquiring how his customer expected to get his money back. He accordingly issued a patent to the farmer of imposts granting him the ownership of all the wind there was in Cashmere. His highness chuckled not a little when counting the cash received and really thought he had trimmed a sucker, to use a popular Americanism.

It turned out quite otherwise. No sooner had the impost farmer come into legal possession of the atmosphere than he forbade its use by all operators of windmills and sailors on the lakes and streams. The farmers were stopped from winnowing their grain, which, as it could no longer be ground, lost its value, though the people cried for bread. What was at first taken as a joke, became a stern reality. Against the outcry the impost farmer exhibited a perfectly legal contract with the government. He owned the wind, and that was all there was to it. Those who wanted to use it could pay the tolls and get a license. Otherwise, nothing doing.

As a result, the Cashmerians had to club together and buy back the wind at a fancy price in order to grind and winnow their grain, or to transport it about by water. They, therefore, were not at all amused by their experience.

Something of the same sort seems to be impending in the United States. A vast capitalization has been issued against the air since its supply of 'waves' has been discovered to be limited, and this capital is endeavoring to secure legislation that will take the chaos out of the radio situation, and transfer the receipts to its own pockets.

We are again face to face with the same problem that resulted in the placing of the telephone in single hands; that it is a natural monopoly by reasons of convenience and therefore should be so recognized and established. The telephone ownership has, by this process, become the greatest corporation in America, which, under the rulings of the United States Court, is entitled to eight per cent upon the 'reproduction' value of its plant. Will the same tale follow the acquisition of the air?

HOLDING the CREST

By H. G. SALSINGER

FRED STONE, the beloved comedian of the stage, once said to me: 'It is easy enough to reach the top, but to stay there—that's the real battle.'

Stone knows more about sports and athletics than most of the men engaged in them. It was he who trained James J. Corbett behind locked doors for one year in preparation for his memorable effort to regain the title from James J. Jeffries. He has played nearly every game known to the United States, so that what he says about reaching the top and staying there will be endorsed by every man who has won a championship.

It is getting to be more and more difficult to hold a title. In each field of athletic endeavor the number of competitors is steadily increasing. These competitors are being constantly better coached, and with rivalry as keen as it is no crown rests securely on any head.

William Harrison Dempsey, who was relieved of the heavyweight championship by Gene Tunney, said a few years ago:

'You can never tell when you'll be through as a ring champion. Any guy is liable to pop you at any time. It only takes a chance blow, maybe a wild swing, to take the title from you. And you always got that in mind when you're a champion. You know that at any time you step into the ring you're likely to join the list of ex-champions.'

If a champion wants to remain champion for any length of time he cannot afford to forget that he holds the title; it has to be in his mind constantly. Not all of them do remember, and they live to regret.

The champion knows there are a dozen men, or more, eager to relieve him of the title. To keep the championship he has to take care of himself. He cannot break training. He cannot afford the luxuries that other men enjoy. He must enter upon a regimen of self-denial.

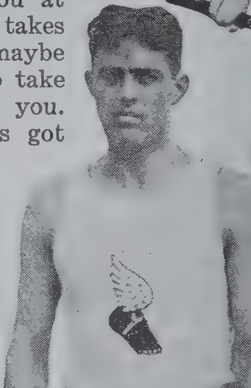
William Tilden, 2nd. —Press Illustrating.

Paavo Nurmi. —Herbert Photo.

Willie Hoppe. —Keystone View.



Ted Meredith. —Keystone View.

Willie Hoppe, who held the world's 18.2 balk-line title for more years than any man ever has and probably than any man ever will, kept in training fifty-two weeks of each year. Every day he went through a series of exercises and he never varied from the diet that his physicians prescribed. No champion ever kept himself in better condition than Hoppe. When he played afternoon and evening matches he would retire to his room immediately after the first, and would rest until time for the evening match, partaking only of a glass of milk. After the evening match he would eat toast, drink tea and retire.

On one occasion, between billiard seasons, a party of friends invited Hoppe to attend the theater. Afterward the party went to supper. But while the others ate clams and lobster à la Newburg, and drank wine, Hoppe munched an apple and drank water.

William T. Tilden, the greatest of tennis players, always kept himself in fine physical condition. In 1922 an infection caused Tilden to lose the upper third of the second finger of his right hand. Experts said it meant his finish. No man could

The World's Women Pioneers

By EDNA M. COLMAN

THE most striking chapters in the world's history today are those which relate the exploits and achievements of women who were actual pioneers in their chosen fields of art, science, business, the professions, inventions and politics, all of which once presented tightly barred doors to feminine applicants.

When institutions, professions and trades did begin to admit women, they did so grudgingly, and only when some more than usually courageous and indomitable woman managed by accident or carefully planned maneuver to gain an entrance. She was not aided, welcomed or even politely tolerated but was treated to the stern disapproval with which the old-fashioned masculine element has always viewed progressiveness in women folk. Women seeking education and professional opportunities were regarded as 'strong minded, advanced females' who had come out of their places in the home and kitchen and who refused to be put back into them.

When Harriet Martineau came to the United States in 1848, she found but seven vocations open to women and these were all to which she might turn to seek a livelihood. They were sewing, domestic service, tailoring, teaching school, music, nursing and millinery. Today, there is not a single vocation open to men that is closed to women. While a great deal of this invasion of women workers into fields once exclusively filled by men came about through necessity, and was a patriotic as well as an economic measure during the World War, women have for the past seventy-five years been steadily forcing their way into new lines of endeavor. The first of these to venture from the shelter of the home into the uncharted seas of men's work, and wrest therefrom success and recognition, deserve commemoration with unstinted praise.

All of the pioneering was not done in the past by our progressive great-grandmothers, our grandmothers or even our mothers, for scarcely a week passes that does not disclose to the now admiring world the successful venture of some modern Portia or Penelope in a brand-new enterprise. Nor is the major part of the pioneering done altogether by the masculine type of woman: far from it; some of the most daring adventures and nerve-shattering achievements have been put through by little, fragile, clinging-vine type women who might be expected to faint at the sight of blood or go into hysterics at the appearance of a mouse.

When Florence Kling of Marion, Ohio, was happily cantering along the country lanes with Warren Harding, who had far more of romance, sentiment and human sympathy than he did of cash or credit, she never dreamed that she would go down in the annals of American history as the first woman citizen-voter to preside over the White House. A romance, with a stern father's veto, and elopement and love in a cottage was the sum of her dream. The love that was strong enough to brave an adored and wealthy father's displeasure to cast her lot with a penniless young editor carried her over every later handicap.

—Bachrach Photo.

Florence Kling Harding, first woman politician and voter to preside in White House. Above—Dr. Mary Edwards Walker, first woman to receive Medal of Honor from Congress.

The first woman to assume the position of First Lady of the Land after the passage of the Suffrage Amendment, Mrs. Harding will always stand out of the galaxy of White House mistresses as typifying the new order of things. Her background and educational equipment made her an able exponent of the woman citizen, a coworker and equal partner with her husband. Unlike any of her predecessors, Mrs. Harding brought to her end of the presidential job a logical, trained business mind, equipped as fully to cope with political and economic questions as her husband. Her intuitions about people were uncannily correct.

Few other presidential ladies have had her grasp upon world events and political affairs. Few of them, as far as history shows, have concerned themselves with these matters. So upon Mrs. Harding's fragile though resolute shoulders rested the epoch-marking opportunity as well as the duty of setting before the world a concrete example of the recently amended American democracy, which has at last opened the previously barred doors to the women of the country.

In Mrs. Harding, the world saw an unpretentious, upstanding American woman, a voter, her husband's adviser and business partner, who rose step by step with him to the highest place and when he closed his eyes in death, hers was the last voice he heard.

While the nation was submerged in grief, this brave woman suppressed the impulse to slip back into the Valley of the Shadow, from which she had so recently emerged for the sake of completing every duty devolving upon her. 'I will not fail,' was the command she gave herself, rallying frazzled nerves, faltering will and aching heart to carry on. Her husband early recognized this strong will of hers, through

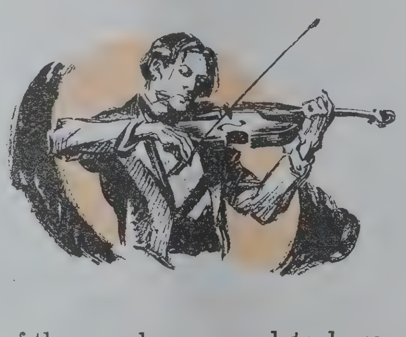
(Continued on page 23)

Finding *the* Ideal Fiddle

By CLYDE WIER

GIVEN, the necessary cash—go out and get the ideal fiddle. That sounds quite easy, for money makes the man, and so should make, or at least get, the right fiddle. And it would not be such an insurmountable task were it not for a few needless obstructions that always present themselves at inopportune times. Among these obstructions we find ignorance, fear of our neighbor's judgment, complacency of knowledge, the changing taste of the enthusiast, changing fashions in fiddles, lack of true discernment, the confounding of tone and the cabinetmaker's art, and the confusion of a work of art and an instrument of music.

Let us suppose that a lover of fiddles owns four cellos, a Strad, a Bergonzi, a Montagnana, and a beautiful nameless specimen. He has become annoyed with too much beauty and wants to eliminate three of the four. If the man is ignorant in respect to what constitutes a perfect cello, if he is merely bound by the spell of the beauty of cellos in general, then he will keep the Strad and let the others go, because it seems the right thing to do. Stradivari was the greatest maker: therefore his Strad is the best of his collection.



Grant that there is a little more elusiveness in the curves of the Bergonzi and a little more fire in the deep varnish that looks in places as if it had been poured on instead of being spread on with a brush, or that there is a certain ruggedness and verve in the fine Montagnana that does not appear in any of the others, or, finally, that there is something in the aspect of the nameless one that gives it an air of nobility unpossessed by the others—what of it? They go; and ever after, their erstwhile possessor feels a yearning in his heart for one or another of them—he can never say why. He was not well acquainted with their fine points, and so he did the easy thing: he kept what seemed best in the eyes of the world. And he made a good choice. Why isn't he satisfied? He will never realize why. Had he been sufficiently well educated he would have made the correct choice even if it had led him to keeping the nameless one, and he would have felt no regret in the loss of the others after once deciding to part with them.

So, broadly speaking, when the lover of violins keeps four or five about him, he does so, not because he needs them, but because he has not developed a keen discrimination. Therefore the difficulty of selecting one and setting it against the world is practically a hopeless one; for it is appalling how few violins the lover of strings ever meets which fully please him when he contemplates them.

MAKING no restrictions as to nationality, age, maker, but demanding simply model, preservation, appearance, the individual finds but few that meet his requirements. And how the individuals disagree among themselves, each clinging to his own and making sport of all that does not belong to him; casting aside all that is unfamiliar with but a glance and a shake of the head, without interest, without curiosity!

In a shop in Chicago, the shop of a great repairer and expert, a popular violinist once left his Stradivari for adjustment. As the different players of the city came in, the expert would hand the violin first to one and then to another. Most of them glanced at it and handed it back. A few after touching it with the bow made wry faces and put it down. Not one recognized it as a great instrument. Finally the expert told them that their ignorance was unbecoming, that they should learn to recognize a good violin without an introduction.

Now these men, all of them, knew a good violin from their own point of view. None of them happened to have an instrument like the one exhibited; it was unfamiliar, therefore uninteresting. They had what suited them and anything else was aside from the point. Moreover, men who play the violin day after day as a profession pay little attention to it beyond considering it as their tool. If it has a suitable tone, if it is easy and agreeable to play, that is enough. And there are thousands of violins that meet the demands of almost anyone who is interested in them merely as musical instruments.

But after one has become a fiddle fancier or fiddle crank or fiddle fool—the terms are almost synonymous—the case is very different. The matter of mere tone is almost too simple. There are literally thousands of fiddles—by fiddles I mean violins, violas, violoncellos, and even basses—that have tone good enough for the most fastidious. But when a man decides that he wants a violin more attractive in appearance than any other violin, more alluring than all the rest that go on and off the stage, with an air so charming that it would keep him away from a Broadway review or a physical culture beauty show, and at the same time possessing a tone in keeping with its appearance, he has to be rather circumspect in making his choice.

Not that such violins do not exist; they are, in fact, met with more frequently than a Venus de Milo or a Diana of the Ephesians among masterpieces in any land whatsoever. The difficulty is in knowing what to choose, and, having once chosen, in abiding faithful. A young man who loves a young woman and makes her his wife may not win the approval of all his friends; but few of those who disapprove will have the temerity to come and reproach him for his poor judgment or his lack of taste.

BUT let him take for his soul mate the fiddle of his choice; then all the 'I told you so's,' those prophets of the past, come one after another and begin to make his life bitter by picking flaws in the pride of his heart: 'the scroll is not original, the *ff's* have been recut, the back has a patch under the post and it is higher arched than the top, the string length is not right, the varnish has been retouched, the label is a fake, the button has been ruined by that ebony rim, the corners have been knocked off and their restoration is poor, all the edge within the right D has been bitten away by the frog of the bow of some careless player, the sweat of a fat chin has ruined the varnish on both sides of the tailpiece, the neck isn't set right, the ribs are too low.' So they go on.

And instead of saying, Go to, or, Get thee behind me, and remembering that the instrument under fire is his own violin which he bought on his own judgment for his own pleasure and not that of his friends, enemies, or rivals, he soon finds himself wondering how many of these critics are correct in their judgment. And unless he is an exceptional man he will soon be most unhappy. Already he has begun to suspect that if he had consulted these excellent people before buying they might have saved him from paying for most of the imperfections that they have called to his attention.

There is a touch of pathos in the fiddle fancier's inane desire to have everyone approve of his choice and admire his selection. He takes a childish pride in showing his treasure and is deeply hurt if its fine points are not at once detected and admired by anyone who may see it, quite unaware that few people recognize at first sight all the merits of a violin, no matter how readily they see its defects; and of those few people not 10 per cent will freely express their admiration even when they feel it. It seems better to look critical and say nothing. Anyway, the fiddle is not theirs; why should they rave over it? Besides, it may be for sale some day.

SO THE poor fellow begins to feel that his ideals are all wrong. And the inevitable follows fast—his fiddle is for sale, and very likely one of those very commenters who found the most fault buys it at his own valuation—not that he cares for it; but he could use it in his work—and gloats in secret over the bargain.

Were this the end, all would be well. But he cannot be content. He goes from maker to dealer and from dealer to maker, getting from each a different idea of what he should seek in a fine violin. One, a varnish crank, makes it clear that except the varnish be thus and so, the instrument can never be worth the price. That his own peculiar varnish is merely a stain covered with ordinary floor varnish he does not say, but he is prompt to condemn another's, particularly if it is an honest attempt at originality.

Another attaches no importance to varnish at all, but ridicules the Cremona varnish as well as other things Cremonese, and boasts that he could make as beautiful varnish as the ancients if the age demanded it; but the times have changed and the varnish also. No doubt Guadagnini felt the same way when he failed to reproduce the varnish of Stradivari.

Still another decries all artistic workmanship that is done purely for art's sake, harping on tone and expatiating on acoustics, a word to make even a freshman laugh; for such a maker's knowledge of that department of physics is about as near the vanishing point as it can well be, and the one who talks the most about it is the one who makes his instruments by rule of thumb or by blue print, hit or miss. He is all too eager to affect a theory which he neither understands nor practises.

To be sure, there are makers who produce good violins and a few who make also good cellos, but not through their knowledge of acoustics. They happen rather to be uncanny judges of wood and very deft workers thereof. Few of them can say just why one piece of wood is better than another. They know the right sort when they see it, which is all they really need to know.

But this pitting of theory against theory is very disconcerting to the idealist, who in time loses all faith in his own judgment, if he ever had any, and vacillates in his attachments, now cleaving to this one and now holding fast to that. As an idealist, however, he refuses to dissociate art and tone. He will not play a cello that looks cheap, no matter what its tone quality may be. If he hears one that pleases him and perceives that it is a poorly made affair with an exceptional tone, he loses interest at once and assumes the pose that to err is human. His fiddle must be beautiful to look at and must possess a tone in harmony with its appearance. This in itself is all very well and good.

BUT unfortunately the years play havoc with one's ideas of both beauty and tone. What one thinks ideal at twenty looks very flat and stale at forty. There lies the great difficulty. Aspiration, enchantment, education, disillusion—this seems to be the *cursus honorum* of the violin fan. I know a man who has owned sixty-seven cellos, many of them good enough for the best concert players and some of them very exceptional instruments, who has renounced all his antiques and is now getting a collection of new cellos made to his order by the various fine makers of today. And he is having more fun teaching these young things to sing than he ever had listening to the trained voices of olden days. In addition he is learning that the cello has an inner nature whose existence he had never even suspected. For example, he has discovered that daily practice will drive away the most tenacious wolf. For when he brought home his new Jean Becker cello, made to his order with the usual assurances, one of the first discoveries that he made was a huge wolf holding for lair the F sharp of the D string.

He felt very grieved at this, for in days gone by he had exhausted all the devices for eliminating these nuisances, only to find that they throve on persecution. But this cello being a very beautiful one, he decided to keep it as a specimen of modern workmanship and to say as little about the tone as possible. At times when particularly irascible he would sit down and play scales on that cello to provoke the beast, and the beast was always ready and willing. The vigor of his snarl became in time almost a joy to hear. Of course the maker justified the wolf by saying that the finer the instrument the more glaring any defect—which is an explanation bringing scant comfort.

However, time went on and the scale practice became a sort of 'daily dozen.' Scales in four octaves are a weariness to the player, as a usual thing; but in this case it was the wolf that died. Now he is gone, and up the hill on the G string at the F sharp station there survives just a small pup that will surely die of solitude before the winter is over.

The instrument is about as perfect as a cello can well be—beautiful to look at, agreeable to play, and noble and convincing to listen to. So there was a lesson learned. Take the instrument from the maker and play it or let it alone. Never touch the post or the bridge, nor experiment with the sizes of strings. The maker has attended to all this before delivering the instrument. Play it until it will do what you expect or until it becomes so hateful that you will use it some cold morning for starting a fire in the grate.

RECENTLY this man brought home another new cello. When he tried it for the first time the tone seemed pure and fluent in all positions on all the strings, but almost too easy to produce. In fact it played like an old, well-trained instrument. But his son, a fine piano player and consequently somewhat impatient of strings, laughingly remarked that the tone had length, some breadth, but no thickness. And that was really the case; the tone was all on the outside.

But its education has begun, and no doubt its voice will grow in power and beauty until it is in accord with its beautiful body, the varnish of which looks as luscious as the inside of a ripe grape skin. Meanwhile, it looks well in the collection that is gathering for the pleasure of future players who may not be so insistent on the old from overseas

A Cure For Poverty

THE very best charity we know anything about is to help a man to the place where he will never need charity. Nothing seems more useless than the trouble we take to ease the effects, when half the trouble would serve to destroy the cause.

We get up all sorts of entertainments and functions to raise money to grant a little temporary benefit, and when we get through we haven't touched the real problem. Surely the futility of it all ought to be apparent.

It is not the charitable mind that one objects to, for human sympathy is a great motive power, and no cool, calculating attitude will take the place of it. One can name very few of the great advances that were not due to human sympathy. It is in order to do something for people that every notable service is undertaken.

The trouble is that we have been using this great motive force for too small ends. If human sympathy prompts us to feed the hungry, why should it not give a much greater prompting toward making hunger impossible?

If we have sympathy enough for people to help them in their trouble, surely we ought to have feeling enough to help them out of their trouble. But in doing this we must look beyond the individual to the causes of his misery, not hesitating to relieve him in the meantime, of course, and not stopping with that.

> *AT PRESENT there is less poverty in the country than ever before. Our material life is on a much higher level than it has ever been, but before the summit is reached much has yet to be done. Far more people, however, can be got to relieve poverty than to devote their energies to removing it. Charity is no substitute for reform. Poverty is not cured by charity—it is only relieved. The cause of the trouble must be located and then removed. Nothing does more to abolish poverty than work. Every man who works is helping to drive poverty away. He not only benefits himself but becomes a benefactor to others.*

It is a curious fact that more people can be got to help relieve poverty than to devote their energies to removing poverty altogether. Men in positions of leadership say, 'What can we do?' Well, this is certain—whatever is done will have to be done by all of us together.

At present there is far less poverty in this country than ever before; our material life is on a much higher level than it has ever been. But comparing the present with what it ought to be, and what it could be, we cannot fail to see that much is yet to be done. How can we do it?

Our first duty we owe to ourselves. We must do our best where we are. We must be fair where we are. We must do honest work where we are. No one who throws down his tools is helping to abolish poverty. Whatever we do in the future we may be sure of this: We shall never be able to make any program go without work.

Work is a good quality to be developed. Every man who works is helping to drive poverty out of the world—first his own and then that of his fellow beings.

The man who does better and more productive work today than he did yesterday is a social reformer of the highest type. He is doing something genuine: he is squaring his own account with the world and helping others to square theirs. Every time a man stops work, he throws that much extra burden on others; he creates that much more poverty in the world.

It is not the men who are doing the talking who are solving our problems, but the men who are at work. When they talk, they know what it is about. And after work, the next duty is to think. Nobody can think straight who does not work. Idleness warps the mind. It is a wonder that we do not hear more about that fact—that the practised hand gives balance to the brain.

Thinking which does not connect with constructive action becomes a disease; the man who has it sees crooked; his views are lopsided. No man can think out our great problems for us. We believe in democracy because we believe that the collective mind is better than the single mind. It is the people thinking together and planning together and acting together that makes the great advances possible.

When really put to the test the people are cool-headed. That is one of the reasons changes seem to come so slowly; the people do not risk the big mistakes which end in the big tragedies.

Every age teems with theories requiring only to stand a while, before their falsity will be revealed. We don't have to test every theory that is offered. Let it stand. If it is right it will endure. If it is wrong the public mind simply outgrows it. No one can imagine how much worse off we should be if we followed every theory and every leader that promised us the golden age. So if our progress seems slow it is only because of the people's carefulness not to make a misstep.

But there is progress being made all the time, now in this direction, now in that, and then all along the line. And such progress is a social creation. It is the people moving up. And that is the only kind of progress there is. If we have not always gone forward rapidly, there is a very great fact to set against that fact: the human race has not had to retrace many steps because of false moves.

One of these false moves would be to make charity a substitute for reform. From the standpoint of efficiency such a move would be a failure.

Only a Child

AFTER all we must remember,' patronizingly remarks the London *Spectator*, 'that the United States is only a child in international affairs.' And strangely enough the British journal is referring not to the Washington Conference, where America scrapped expensive battleships in exchange for paper plans, but to the Geneva Conference, where this nation is attempting at last to place disarmament on a more equable basis.

The jibe is not without warrant. Valiant in war, this nation has been universally unsuccessful in its peace-time negotiations. 'We have never lost a war and have never won a conference,' one man wrote, and history—particularly recent history—bears him out. At Geneva, Ambassador Gibson and Admiral Jones have been doing excellent work. But their predecessors in the experiment of disarmament, and those lusty orators of the United States Senate who tried to vote this nation into the stew of Old World affairs by means of the League of Nations and World Court have furnished abundant proof that this country, in international diplomacy at least, is still 'only a child.' Isolation has been America's greatest single blessing. George Washington recognized that, even in the infant days of the nation. And Baron Rosen, canny Russian ambassador to the United States, years ago, summed the situation pithily when he said our national motto should be:

God bless the Atlantic Ocean.'

Rewriting Scripture

BIBLE tinkerers seldom are successful. The widely heralded 'Bible in slang' which was to revolutionize religion a few years ago has slipped into tranquil oblivion. So too have other modern versions. But past failures serve not to discourage those who believe the Holy Book should be 'brought up to date.' Two savants of the University of Chicago have just completed the latest translation of the Old Testament which, though it may be admirable from a scholarly standpoint, leaves much to be desired as a piece of literature. The story of Creation is alone sufficient for comparison. The new version declares:

> When God began to create the heavens and the earth, the earth being a desolate mass, with darkness covering the abyss and the spirit of God hovering over the waters, then God said: 'Let there be light,' and God saw that the light was good.

Heavy, stodgy and in an involved style that would be outlawed in any school of journalism in the land. Place this excerpt alongside the opening verses in the older version:

> 1. In the beginning God created the heaven and the earth.
>
> 2. And the earth was without form, and void; and darkness was upon the face of the deep. And the spirit of God was upon the face of the waters.
>
> 3. And God said, Let there be light: and there was light.
>
> 4. And God saw the light, that it was good: and God divided the light from the darkness.

There is a beauty, and a swing, and a simplicity to the older version, which makes it without peer among the books of the world.

Along the Mississippi

A STUPENDOUS problem still exists along the lower reaches of the Mississippi. One-fourth of the flooded territory is even now (in late July) under water, or just emerging. Not a single gap in the levee chain from Cairo to Glasscock has been closed. Thousands of people in the crevasse zones live in perpetual fear of new inundations. In the Melville sector the Atchafalaya River still rages almost at flood stage. Destitution, privation, even starvation face the flood victims. Of the nearly 700,000 sufferers, 200,000 are still in pitiful plight. Their crops are gone, their homes ruined, their livestock dead. Few have any resources left. Food comes only from the Red Cross.

To aid in financial rehabilitation, farm loan companies have been organized in those states hardest hit, the theory being that these would advance sufficient credit to tide the victims over the year. But these companies, according to general report, are not accomplishing much. Only those who have security to offer can get credit, critics say; and most of the security disappeared under the flood waters weeks ago!

What's Wrong With Religion?

THE amount of crime and the general disregard for laws, both human and divine, which are afflicting the world like a pestilence, are causing many good people to exclaim, 'What's wrong with religion?' The answer is that there is nothing wrong with any religion that is ethical, is sincerely believed in, and is sincerely practised. Not long ago a prominent divine declared from the pulpit that if he happened to be wandering in a Central African jungle and came suddenly on an aborigine engaged in the worship of a stuffed toad, he would take off his hat to him, as in him would be combined at least the ideals of faith and sincerity.

It is the lack of these virtues that is at the root of most troubles today. How can anything be good if it is neglected and tossed aside? There is nothing wrong with religion: it is the lack of religion in the individual that causes trouble.

PLOT

Those STRANGE *But*

By McKEE BARCLAY

THE play's the thing,' Shakespeare says, but in play writing the plot's the thing. As with the play, so is it with the story. While 'legion' is the name of those whose writing shows good diction and smooth composition, the writers who have talent for plot invention are scarcer. The rarity of the gift is responsible for the glamour which surrounds the names of Balzac, De Maupassant, Poe, Kipling, O. Henry, and the other immortals who make up the scant list of master plot makers.

At the present moment a multitude of rejection-slip collectors are pursuing a quest for workable plots for stories and plays. Having eyes they see not, for scattered through the newspapers that deal with everyday life are hints and inspirations for the tellers of tales.

Truth may not be stranger than fiction, but the true happening is often at least as strange as the invented romance. At times they are as like as two Dromios.

When the would-be Balzac reads his daily paper he is likely to overlook more than one story with a plot around which a prize-winning short story might be built. And some of them are maps to real literary treasure trove. In the day's happenings may be found the spoor of plots innumerable. The tracks are plentiful and the trail is plain.

Think what a Conan Doyle or an O. Henry might have done with the little Associated Press story of the rolling coin that solved the mystery of the $75,000 rubber robbery:

'A coin rolling out of a New York detective's hand today led three sleuths, in its fickle course, directly to a cache in the Williamsburg section of Brooklyn, where $75,000 worth of stolen crude rubber was hidden, with the result that two men were arrested on a charge of grand larceny. The elusive coin rolled underneath the doorway of a garage. The detective opened the door to retrieve it and was ordered brusquely from the premises by the two occupants. Suspicious, the detectives forced their way in, and upon searching the garage found a quantity of rubber, later identified as having been stolen the previous Monday from a Pennsylvania lighter in Brooklyn. A quantity of women's apparel, valued at several thousand dollars, was also found. John ____ and Joseph ____ were held without bail for a hearing.'

In the daily roster of crime, writers of detective stories will find an abundance of suggestions for ingenious plots. Where could one find a better foundation for an Arthur Train story of mystery, or a Sherlock Holmes yarn, than in the numerous stories of crime in these days of yeggmen, hijackers and holdup men?

The finger-print man of any metropolitan police department could supply enough ready-made plots for a lifetime of fiction writing.

The story of the Illinois man who imbedded the body of his slain wife in concrete and then inveigled her unsuspecting son into assisting him in dumping the mass which contained

TRUE STORIES

the corpse into a well has a dozen features of unusual fact which go to make it stranger than ordinary fiction. For weeks the case held its position on the front pages of the newspapers of the country. Then, the harrowing account of the imprisonment of Floyd Collins in a Kentucky cave kept the lovers of morbid news stories charmed for weeks. Even today the phonograph companies are finding in rural communities a big sale for a record containing a ballad which is based on the gruesome tragedy.

SEARCHING at haphazard through the columns of the daily press one comes across many seemingly less theatrical dramas which deserve a place on the list of unusual happenings. By one, in which a tone-deaf man is cast for the part of the villain, we are reminded of that pioneer in the art of advertising, George Robins, an English auctioneer who flourished nearly a century ago. Robins advertised for sale an English country estate, naïvely admitting that it might not suit the man who objected to 'the litter of rose leaves and the noise of the nightingales.' This story, clipped from a Baltimore paper which tells of an individual of the type referred to by the auctioneer, will not, it is to be hoped, find many parallels:

'The firing of a shotgun in the vicinity of the 200 block, Southway, at 8:30 a. m. yesterday startled many persons in the neighborhood. A mockingbird fell from the topmost branches of a tall oak. Its song will be heard no longer. Since early spring this bird and its mate have announced to the Southway residents the coming of dawn. An investigation resulted in the arrest of Charles Haslup, Junior, twenty-two years old, 2900 block, Erdman avenue. Haslup was accused of hunting without a state license and of killing a singing, insectivorous bird. At a hearing before Magistrate James R. Cadden in the Central Police Court, Haslup was fined fifteen dollars and costs on the first charge and five dollars and costs on the second charge. The fines were paid by Louis R. Wilcox, 219 Southway, who, according to the police, said he had asked Haslup to kill the bird, as its warbling annoyed him. Yesterday afternoon in a high tree a single mockingbird perched alone. It was silent. Its mate was gone.'

From the Mexican border comes a story of a man who can foretell the actions of the forces of nature without the aid of either a goose bone or a seismograph. Only a Conan Doyle or a Sir Oliver Lodge would accept the alleged facts in their entirety; others may add salt to suit the taste. This is the tale as told by a New York *World* correspondent: 'Billie Hart has been predicting Texas weather for twenty years. His regular occupation is tending the International Bridge at Eagle Pass. His job keeps him outdoors all day where he can watch the sky and read natural weather signs. In his hours off duty he studies the weather reports of former years, writes his weather column for half a dozen Texas newspapers and answers letters. Daily this man who lives in obscurity receives almost as much mail as the President of the United States. Wires come from bloated bondholders, from financiers who want to play the cotton market, from farmers in the cotton counties and from ranchmen who must have grass for their cattle—from all classes of people in all parts of the country the inquiries come. Sometimes the letters from brokers contain money. Otherwise, the only pay he gets is in the love of his work and the prestige which his predictions give him.'

FOR a dramatic jumbling of tragedy and comedy the story wired in to a Washington paper by its Charleston, West Virginia, correspondent deserves honorable mention. With the near-tragedy part deleted, it ought to make an acceptable scenario.

'Wallace Sayre, twenty-two, student, returned here early this morning from Marshall College, Huntington, and entered his home with a key. Meantime Alfred Sayre, his father, had moved from the house Monday and R. W. Harvey and family had moved in. As young Sayre prepared to retire in one of the rooms, Harvey was awakened and, believing Sayre to be a burglar, shot him four times in the legs and hips. Ernest Anderson, next door, hearing the commotion, climbed out on the roof of his home and called for the police. In the excitement he fell from the roof and landed on his young brother. The elder Anderson broke both arms. The younger suffered a broken leg.'

(*Continued on page 20*)

A BOOKWORM TURNS

By AARON HARDY ULM

THERE was published in Paris not long ago a book which thousands of persons everywhere wanted to read. Publishers were so certain of this that the book, translated into various languages, appeared in many countries almost simultaneously with its publication in France. The writer of this was among those who wished not only to read but also to possess a copy. So he went to a big bookstore in a large city and asked for one. He was offered a copy of the American edition, in English. The price was five dollars. It was a gaudy book, well printed and well illustrated—but he could not afford to pay five dollars for it.

The writer walked up a flight of stairs in the rear of the store and, in a foreign language department maintained in an alcove there, found copies of a French edition. These sold for seventy-five cents each. The price mark on the cover showed that they were selling in France for what was then the equivalent of about fifteen cents in American money! In France the volume was within the reach of anyone; in the English form here the book could be bought only by persons able to pay five dollars a copy for books. What accounts for the huge difference?

Whatever does explain it may account also, at least in much part, for the more general fact that in 1925 there were published in France 14,943 books as compared with the publication of approximately 9,500 in this country. We have nearly three times the population of France.

The figures cover new books and new editions of old books still copyrighted and put forth by standard book publishers—that is, those which supply fresh reading needs. The figures do not cover miscellaneous reprints of books like the Bible or *Robinson Crusoe* that are produced by concerns which are more of a manufacturing than of a truly publishing kind. Figures including these latter are unavailable, except in partial form for this country. Those for the United States are of huge size but when analyzed, as they will be further on, are not nearly so flattering as their hugeness implies.

Here in the United States are probably the most backward, the most hesitant and reluctant, of peoples of all Western countries in the matter of buying, if not in that of reading, books. And this condition is owing probably to the fact that the country is still more backward in the matters of publishing and distributing books for sale. And as an item of proof this writer cites the incident concerning the French book which, in English translation and American imprint, could not be bought for less than five dollars, while imported copies of a French imprint could be bought for seventy-five cents each, which was more than fifty cents above the comparative price charged in Paris. This was not because the book was by a foreign author; the difference is owing to the book-publishing methods followed in the two countries.

THE writer comments on the subject not as an authority on book publishing or book selling, of which he knows nothing. But he does know something about it from the still more important angle of the book consumer. If the French publishing method prevailed in this country, he could and would buy twenty new books for every one he can afford to purchase under the American high-cost system. He is confident there are thousands of similar Americans who resent having thrust constantly under their noses books which they want and cannot buy, all because they are produced and distributed, apparently, by methods which presuppose that few Americans buy books solely for the contents.

There are thousands of other Americans whose desires are forestalled in origination by excessive costs. Books simply are not of their world.

No real book-lover will contend that these costs are excessive when measured with those of other things in terms of delights procured. They are excessive only on the basis of what might be done—and actually is done in some branches of publishing even in this country. When one can buy standard works out of copyright at five to twenty-five cents a volume; when one can get, as often has been possible, in a fifteen-cent magazine the full printing of a book, by, sometimes, a famous writer, before it is put forth at two to two and a half dollars a volume in book form; when one has only to wait for a year or two in order to get fresh printings of originally five-dollar books at a cost, say, of one dollar each—something must be wrong. No such state of affairs exists in any other realm of production and consumption.

Americans are now probably the greatest reading people in all the world—and, because of the situation as to books, the most superficial in their reading habits.

Figures covering money expended in supplying American readers with newspapers and periodicals make one's head swirl. The latest show that this branch of publishing is now a billion-dollar business—that is, more than that much is collected annually for newspaper and magazine subscriptions and advertising.

The circulation of newspapers and periodicals has increased 15 per cent during the last two years reported on and now amounts to nearly two hundred copies a year for every man, woman and child in the land. But the production of books and pamphlets of all kinds amounts to fewer than four per capita. Of books, all kinds, put out in America in 1925 there were 191,769,340 copies—a stupendous number but representing only about one and three-quarter books for unit of population. Nearly half of these were textbooks for school use.

THERE were fifteen million juvenile books, in the main pictorial atrocities purchased as toys for infants. There were thirty million fiction books, made up in large part of the successors of the old yellow-back reprints of such horrors as the novels of 'Bertha M. Clay.'

With half the population of the country living in rural territory, fewer than a half-million copies of volumes dealing with agriculture were put forth. The number treating of sociology and economics was slightly larger, averaging one for about every two hundred of the population. But that there is widespread taste for good reading is shown by the following figures for copies of books treating of subjects regarded usually as of interest among only 'educated' or devout folk:

Books on	*Copies put forth in 1925*
Biography	2,691,583
Fine arts	1,062,729
History	1,253,147
Poetry and drama	8,817,255
Religion and philosophy	12,244,224

The number of these books that were copies of newly written books is not known but the proportion was undoubtedly small. For only 6,832 newly written books were put forth during last year. New editions of copyrighted books, pamphlets and imported productions raised the total listings by standard publishers to 9,925.

Our listings have increased little in recent years, while those of publishers in other countries have jumped immensely since the war. The listings of publishers in France advanced by five thousand in 1925, while in Germany those of standard publishers leaped from 23,082 to 31,595—being more than three times those of American publishers. Despite a falling off there on account of manufacturing difficulties, newly written books put forth in the British Isles in 1926 outnumbered those in this country by nearly four thousand—and, on a basis of population, they more than doubled those of our publishers.

YET all authorities on it say that the American book trade has done better during the last six years than ever before. The big sales enjoyed by numerous works of kinds that never before attained large circulation have astounded both publishers and sellers of books. Works on philosophy, history, even economics, have outdistanced many best-seller novels.

'More than a hundred thousand copies of a recent book of biography have been sold within two years,' wrote Marion Humble for the American Book Publishers Association in 1925. 'Twenty years ago a sale of eight thousand copies of such a book would have been considered large.'

A book on philosophy has recently gone into the hundred thousands, earning fortunes for both the author and the publisher. But tens of thousands can't buy the book now because of its high price. The same holds relatively for numerous other books of recent publication.

The book publishers point out, with conceded credit to themselves, that while the cost of manufacturing and distributing them has gone up 90 per cent prices for new books have been increased only about 50 per cent.

But at least one book lover can't escape the impression that, while average prices may not have gone up more than 50 per cent, those charged for books of anticipated large sale have gone up a great deal more. That is, it seems patent that authors and publishers, instead of taking advantage of large sales to fix low prices for important works and thereby make them available when fresh to the largest possible number of readers, put the charge for a volume at the very highest possible figure in order to skim the last drop of cream from initial popularity and demand.

THE publishers point out the big element of risk in the production of books. The average new book has a circulation of two to three thousand copies. Probably a majority of those put forth yield no profits. Some of the smallest sellers rank highest in quality of contents. It is to the unexpected 'best seller,' or something similar, that the average publisher looks for the recouping of losses on the run of books which fill out his list.

Yet book publishing is the one big industry that is carried on in America in substantially the ways of a century ago—when about half of the population of the country was illiterate and prospective buyers of new books were no more numerous than the buyers of rare books now. The same holds substantially for retail distribution. An authority on the subject says that there are fewer book stores in proportion to population now than there were a century ago.

A BIG portion of the book trade has passed from the booksellers to the department stores, drug stores, cigar stores and news stands. Moreover, a big portion of the book-publishing business has passed from the standard publishers, the ones that control the new book business, to concerns like the Haldeman-Julius establishment at Girard, Kansas.

The first has proved beyond all doubt that there is a mass demand for even the ancient classics, millions of miniature copies of which have been sold by mail. The Kingston establishment has demonstrated that books of common type, bound in boards and well printed, can be put out for sale at ten to twenty-five cents each, and that the demand for them justifies mass production of writings which used to be put forth for the élite of readers only.

Thus there has been developed something similar to the French system in the publishing and distributing of books other than of the new kind. In France the system envisages new as well as old books.

This writer is told by a man who should know, that in France no book of importance is ever put out initially in a single form. The same plates are used for printing all forms. Some are on fine paper and handsomely bound. These are for the fortunate folk who can pay good prices for books of an enduring quality of manufacture. Other volumes are run off on cheap paper with mere paper bindings. These are for mass sales at low prices. This makes it possible for a new book to reach all kinds of readers, those who are poor in money, those who want books for immediate reading only, those who like to read a book before investing a consequential sum of money in it, as well as those who want well-made books for treasured libraries. Even these last often buy the cheap editions, which they may have rebound: in this way they are enabled to fill their libraries with books of uniform binding.

Norrland—Sweden's Wild West

By G. A. SUNBLAD

In the mountainous, heavily forested regions of Norrland. Photo shows a cabin erected by the Swedish Tourists' Bureau in foreground.

Oval—*Great Lake Falls.*

NORRLAND, the northern part of Sweden, is to that nation what the West is to this country. Therefore, it may not be out of place to give some attention to the development that has taken place there along lines astonishingly similar to those in the West, though on a smaller scale. We generally believe that there could be nothing of this sort possible over in 'the old country,' but let us see.

Sweden was at the height of its power in the 17th Century, when it possessed vast lands nearly surrounding the Baltic, where now are situated Finland, Petrograd, Esthonia, Latvia, East Prussia and Pomerania. This power and predominance in Europe was based on Sweden's having for several centuries been the biggest producer of gold, copper and iron. Then, and even so late as in the first half of the 18th Century, it produced one-third of all pig iron in the world.

Discoveries of rich mineral resources in other European countries as well as the rapid growth of the populations all around Sweden became, in the end, factors too overwhelming to allow this proud and dominant nation to be able to uphold its position. The visible turn came in 1709, when the Swedes suffered a complete military defeat at Pultava at the hands of the Russians. A century later there remained in the possession of the country none of the lands east and south of the Baltic. Gone also was the political and economic power.

Thus, distress and pure necessity 'made' Norrland. Nobody knew at that time what its worth would become in valuable resources. A few had the vision, however: a Swedish poet and bishop, Esaias Tegner, pointed out the way by saying that 'in Norrland, Sweden should win Finland back within its own boundaries.' The people, grasping the idea as a consolation and a last hope for a peaceful and tolerable future, set to work. With the aid of the great industrial era that swept the whole of Europe in the last century they colonized and built up Norrland in an up-to-date manner, so that today it ranks with the most highly civilized 'new' countries in the world; for instance, with the American Northwest.

However, Norrland was limited in capacity for absorbing the surplus population of Sweden and could not keep pace with the growing demand for work. Then something happened that turned out to be a safety valve for the overpopulation threatening the middle and south of Sweden, and, later, even Norrland.

As rumors began to come from across the ocean about the fertile lands over there, the big rush to America started. In 1850, exactly three-quarters of a century ago, while paying a visit to the Northwest, Frederika Bremer, the mother of woman's rights in

Sweden, envisaged the value of this country to the Swedes: they ought to come over and settle down.

The old stream of men and women which had flowed *eastward* over the Baltic since the days of the Vikings ceased entirely. Two new ones started, one *northward* to Norrland and the other *westward* to America. In winter, Norrland is worse off than our Northwest, because it enjoys very little sunshine, if any. In the ice-cold nights is to be seen the magical power of the northern lights that shoot with mighty tongues of flame and scintillating rays. Thanks to the warm Gulf Stream flowing nearby in the Atlantic the climate makes modern civilization just possible.

Climbing glaciers is a thrilling sport in Norrland.
Left—*A farmer-lumberjack.*

But in summer it is a real wonderland of life and sunshine day and night. All nature makes it a paradise. During a few months people forget what they have gone through in the long, hard winter. And in the southern parts of Norrland where there is no strange sight of a midnight sun, there are instead those bright, mysterious, shimmering nights that inspire to hope and poetry and song. There are no nights as they are generally known and scarcely any sleep during that time. The Swedes have a word that stands for day and night taken together; they call it *dygn*.

The colonization of Norrland took place in a strikingly similar manner to that of the West.

True, there had been Swedes living up here before, here and there along the coast, but they were few. The colonizers went northward hunting and fishing, burning woods and cultivating land in a primitive way, and they met a strange nomadic people, the Lapps, as their relatives in America met the Indians. Later, trunk railways were built through endless forests and marshlands, on high bridges over numerous streams and broad rivers, across forest-clad mountains and deserted fields, along fertile valleys and the rough seacoast.

This northern country is a land of forests, upon which rests Sweden's large industry of planed and sawed timber, of wood pulp and paper, all of which occupy a prominent or leading position in the different markets of the world. For instance, the greater mass of the wood pulp imported to America for the making of wrapping paper and cardboards comes from Norrland, and many an American newspaper is printed on paper which had its beginnings in these forests. The end of the development is not yet reached. The making of finished products as well as of by-products is under way.

In the West there is a tendency for industry to concentrate itself in big cities, but not so in Norrland. One will find the overwhelming part of the supermodern industries scattered along the rivers close to the seacoast, the reason for which is a matter of transportation. Consequently one will search in vain for big cities. This distribution makes real estate cheap and gives plenty of room for industry and home; it makes it possible for the whole family to enjoy a healthy country life in the midst of beautiful scenery. The people can usually afford to own their homes, or to rent one- or two-family houses.

The stranger will enjoy the neat, modern, well-built, red-white painted houses, always kept in proper condition and surrounded by small gardens full of flowers and vegetables; usually there is agricultural ground too. There is a view from every home of lake or winding river; and a little farther off in the hilly land stands the serious dark-green wood of the North with its

Norrland finds good use for its numerous waterways as transportation facilities.

freshness and grandeur. Add to this picture timber yards and a few factories, the windings of road and railway, a white church and an artistically built railway station, and, furthermore, a flagstaff at each house with the blue-yellow Swedish cross flag flown with the wind in a bright summer night, and you will have a typical picture of this new country.

Up here in the North agriculture alone does not pay as a rule. Agriculture has to be combined with lumbering and forestation, and consequently the farmer is a lumberman too. Both occupations have their 'slack times,' and so one lives his life in rhythm with nature. It provides plenty of work and an income the year round with seasonal changes which the farmer as well as his family enjoys. The case of the industrial worker is the same inasmuch as he is occupied with transportation at certain times of the year, with the floating of timber in the spring and with the loading of manufactured export goods during the rush at the end of the shipping season.

Now, Swedish forestation is probably the most modern and efficient in the world. The woods have not been destroyed. On the contrary, after having been utilized the woods are being replanted, and even marshlands, 'Norrland's prairies,' are being turned into forest land where they are less suitable for agriculture. Worthless land is being made valuable at low cost.

By this foreseeing of large-scale work the people gain four things. First, they continue to prosper from their timber marketing; second, a healthy climate is being maintained; and third, dangerous spring floods arising from rapid melting of snow are being prevented, the woods absorbing most of the water and giving it off slowly. Fourth, this secures a rather equal watershed all the year round, which condition is of the greatest economic value to the water-power stations.

NORRLAND is becoming famous for its potential water power. Great waterfalls and large lake reservoirs make up the power, to be utilized as fast as there is demand for it. Already there have been a few large water-power stations erected, the largest being Porjus; the counties usually have their own small stations for the supply of cheap electrical power and light to the farmers and the small home industry. The demand, of course, is greatest in the middle and south of Sweden; in order to equalize the supply and demand all over the country, an electrical trunk line system is under construction.

Every home and shop and many roads are lighted by electricity, so that work can go on all day long irrespective of the darkness of the winter. Light in the cities is more abundant here than in some of the big cities in Europe; it is being used generously. What a change it has brought to the people during a long, hard, dark winter!

To a greater extent than is believed in America, the homes are making use of modern machinery. They are equipped with electric light, telephones, radios, modern furniture of fine national styles, vacuum cleaners, and so forth.

The iron ores in both Bergslagen and Lapland rank among those of the highest grade in the world. For the manufacture of ordinary steel in quantity production they are being mixed with low-grade ores in Germany, England and France as well as in America, and as an export article of Sweden are second only to wood products.

The iron-ore trunk line which carries a tremendous amount of freight is one of the most interesting railways to be seen. It runs on open fjelds and through many tunnels. It is the northernmost trunk railway on earth as well as the first electrified one representing pure 'mass' transportation. It is a strange sight to watch the endless trains carrying *malm*—that is, ore—rushing down the fjelds under the midnight sun or under the northern lights of a wintry night.

With the exception of the *malm* line the railways are not of such importance as are those in America. Shipping by boat and floating rank first and second as methods of transportation. There is more weight floated than is shipped on the whole Swedish railway system, ore excepted.

THE economic use of floating instead of railways for the transportation of heavy goods has had its great influence upon the upbuilding of the country. Cities built at the mouths of rivers constitute the prominent ports, among which Gefle, Sundsvall, Hernösand and Umea are the greatest. Because of Norrland being the export center it has become a very good home market for Swedish agriculture and industry.

The horse still reigns supreme in agriculture and lumbering. In the cities and on the roads motor transportation has commenced, and on the highways there is good bus service. The roads are hard, though old-fashioned, hilly, winding and narrow, but work on their betterment has started here and there.

It was an extraordinary event in the history of air transportation when the first temporary industrial air line in the world was established to serve the erection of a water-power station in Lapland in 1919.

When the ice was weak no communication was possible. The only way to get quick service for passenger, mail and light freight was to make use of aircraft. As the climate above the Arctic Circle is terrific in winter, icy snowstorms make flying between the fields very dangerous. When after a year and a half the construction work was completed and the air line was serving its purpose, there had not occurred a single severe accident.

The school system is as excellent as it is in the West. In order to obtain specialized education one must go south, to Upsala and Stockholm.

Nowhere in Europe is the educational system so similar to that of America as in Norrland.

The country is really worth seeing and a trip can easily be combined with a tour to the Norwegian fjords close by.

Passengers *on a* Freight Basis

By HARRY PENCE

IT IS an old story but a good one. The little man, crowded by a fat man on a street car, declared with asperity, 'This company ought to charge by weight.' To this the fat man replied contemptuously, 'If it did the cars wouldn't stop for you.'

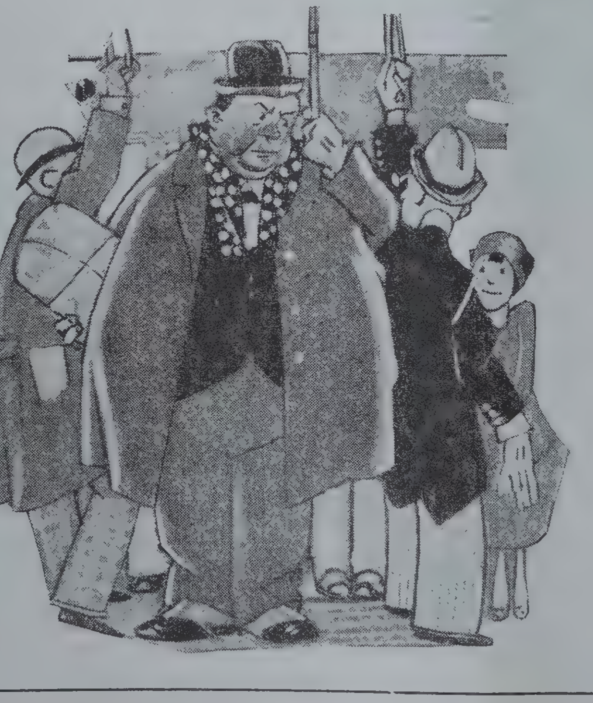
The author of the jest is not likely to have been a traffic rate reformer but he had a precedent and his joke suggests a basis for fixing even passenger rates when aviation becomes more general.

In 1917 the Cleveland Engineering Society issued a pretentious publication entitled *The Conquerors*, chronicling many notable victories of man over nature in the engineering world.

In his chapter on 'Transportation,' A. W. Johnston, of the New York Central Railroad, said:

'In 1820 a new stage route was established between Louisville and St. Louis, via Vincennes, Indiana, there being a break in the journey at Vincennes each way, and the time consumed indicated an average travel speed of 2¼ miles an hour.

'On this particular route the stagecoach company established a basis for carrying charges which caused a considerable fluctuation in the rates of fare paid by passengers. A traveler was arbitrarily considered to weigh 100 pounds, or as the stage rule put it, "One hundred pounds weight will constitute a passenger and be paid for accordingly, a greater or less weight in proportion." So if a passenger weighed 150 pounds he was rated as a passenger and a half and charged accordingly.'



China's George Washington

Sun Yat-Sen—An 'American Citizen'

By
WILLIAM
E.
BARTON

An informal photograph of Dr. Sun and his wife.

WHATEVER the future historian shall declare concerning Dr. Sun Yat-Sen, he was the leader that made China a republic, and of that republic he was the first president. He was the idol of young China, the glorified ideal of the student body in the universities, and the most hated of all to whom conservatism and the *status quo* are acknowledged deities.

Sun Yat-Sen was born in an obscure little village, and his life was largely associated with the city of Canton. Hongkong is not a Chinese city, and certainly Shanghai is not, but Canton is still China. One can see here the conditions of life in which he grew up. His father was a convert to the Christian faith, and a kind of colporteur. Sun himself early professed the Christian religion and was baptized by a Congregational missionary from America. Once at least, and perhaps oftener, Sun professed to be an American citizen.

He used the English language with precision and elegance. He had a keen and versatile mind and an excellent flow of speech. At the age of sixteen he entered the Canton Hospital, founded by American missionaries, and had his medical training under an American doctor.

Sun became a skilful surgeon. The Chinese doctor had to do his work in semipublic, and Sun was never seen to better advantage than when performing a major operation in the presence of the officials of a village. They were particularly interested in seeing him remove stones from the bladder, a rather common ailment in his section of China. They had to fan themselves to keep from fainting as he cut away, but when at length he held up the stone, he was greeted with a chorus of 'Ah's' that were as applause to an actor.

How he evolved from the physician into the politician, the reader of this article can learn from books. He died largely discredited, and he is remembered in Canton as having burned a considerable part of the city, that part still lying in ruins. There are men in plenty who do not love him, but I have not heard him charged with graft or lust for private gain. Sorrowful over the oppression of his people, he was the leading spirit in the revolution that overthrew the Manchu dynasty.

American teachers and missionaries, as I have talked with them, feel that Sun did not maintain the high level of his earlier principles. He came to believe that his honorable ends justified means which they think were wrong. They doubt whether he kept his faith and his religion. They think of him in his later years as vain, egotistical, almost fanatical in his faith that he was the one man who could save China. They tell of his bombast and his conceit. But they say that he kept himself clean from graft, and that he was loyal to China.

They criticize him severely, and I think justly, for his alliance with Russian bolshevism, and believe that his bringing Russia into the picture is a blunder which will yet work sorrow for China. And they think that he became bitterly unjust toward other foreign nations, including those to which he owed most, the United States and Great Britain.

Weakened as he was by disease, and defeated if not betrayed by his opponents and associates, he still was the strongest leader China has had in a century if not in a millennium. He was a man of boundless self-confidence, and he honestly believed, and may not have been far wrong in believing, that he alone was potent enough to have saved China. His face on the Chinese postage stamps was that of a resolute and heroic spirit. His personality was strong and winsome.

In a conversation with an American he once said: 'The British are calling for a strong man in China. America wants unity through strong leadership here. I am the strongest man in China. So long as I live there can be no unification that does not include me. You Americans profess to be our friends. Why do you not communicate with Washington demanding a policy for China? You Americans in China have no policy; you take it from the English, who want to crush China.'

It may be a decade and it may be a century before China is really a republic, but the tomb of Sun Yat-Sen will be a shrine for China's idealists, and his name will be imperishably written, not only on monuments, but in the slowly awakening spirit of his people.

Those Strange But True Stories

(Continued from page 13)

Stories of bottles cast into the sea always intrigue the romantically inclined. Consider how little ingenuity would be required in the development of a readable romance from this true story of the journey of a young girl's message which roamed the seas for over forty years before the waves rolled it ashore:

'New York, May 15.—A dark green bottle, sealed with wax, was picked up at Rockaway Beach a month ago. Inside was a penciled note which indicated that an 18-year-old girl, with romance in her heart, had cast it into the sea at Kingstown, Ireland, on December 4, 1882, hoping "some nice boy finds and returns it to me." Today there came apparent proof that the bottle actually did ride the waves for more than forty-one years.

THE message found in the bottle follows: "This bottle is cast into the sea at Kingstown, in County Dublin, Ireland, on December 4, 1882, by Elizabeth Kinch, Pave Lane, Kingstown, age eighteen years. Hope some nice boy finds and returns it to me." Reading this message in newspaper accounts, Mrs. William Ryan, of this city, who comes from Kingstown, remembered that she once knew an Elizabeth Kinch. She wrote to "Elizabeth Kinch, Pave Lane, Kingstown." Mrs. E. Kinch Befine replied, saying she was the writer of the old note. Her letter resembles the 41-year-old note in general character of handwriting, according to persons who have seen both. It says in part: "I will relate the history of this letter as well as I can remember, first telling you I am no longer romantic, but a poor widow with only a small pension allowed me by the British Government. My husband died a few years ago of consumption contracted during the big war. He was on a ship and got gassed. As a young girl, myself and a companion were very fond of sailors, at that time very frequent in Kingstown harbor; we made up that both of us would write a letter and bottle it up and cast it out to sea." '

Samuel Feland, of Washington, D. C., has a letter which has accomplished a lot of sea voyaging and globe-trotting. According to the Washington *Star* the key to the story is given in this advertisement which appeared in its columns: 'If Samuel Feland, who was a corp. in 1st D. C. Vols., 1898, and who dropped letter corked in bottle overboard off Key West, will address A. A. Ruark, 1226 G st. s. e., he can secure the letter and learn of its remarkable voyage around the globe.'

The letter in question read as follows: 'Key west, July 6, 1898.—To whom it may concern: I am a volunteer in Company D, 1st Regiment, District of Columbia Volunteers, and will be glad if the one who picks this up will write to me at the following address. I am on the way to Cuba with the rest of my regiment; but if you write it will be saved for me. Corporal Samuel Feland, 117 11th st. n. w., Washington, D. C.'

Just before the outbreak of the Spanish-American War a British steamer, the *Restormel*, under Captain Merlin, sailed from Liverpool for Cuba. She was captured by the *St. Paul* as she tried to make Santiago, and was taken to Key West. Later the ship was freed and on the way back to England Captain Merlin picked up the bottle containing Feland's letter. For years he carried the letter with him, sailing in every sea. Finally while sailing from Japan to India in command of a Japanese steamer he happened to mention to a Washington man who was a passenger aboard the ship that he had recovered a letter dropped in the sea by a District of Columbia man. The Washingtonian offered to assume the responsibility of the return of the message. It was many months, however, before the letter was sent on its homeward trip. The traveler loitered in India for a time and then journeyed over the Himalayas into Tibet. Eventually reaching a port which afforded a foreign mail service he forwarded the travel-worn letter to a friend who lived in Washington. The latter turned it over to Ruark, who in turn located Feland and delivered the now yellowed letter.

Sniffing materialists balk at stories of miracles, and incidents which seem to the more credulous to be amazing deeds of supernatural forces are set down by them as results of the mere operation of natural forces in combination with mental science. This account of the almost incredible, near-miraculous cure worked by a bolt of lightning, which is vouched for by the Associated Press, calls for scientific analysis and explanation:

'Bakersfield, California, August 11.—Freakish and wholly local rain, thunder and lightning set a new record for unusual weather here today. More than eighteen inches of rain fell within forty-five minutes and the lightning and thunder were severe. The storm brought a measure of good luck to Noah W. Miers, sixty-seven, who has been suffering with paralysis in the left arm. While he was lying in his tent, lightning struck the tent, hitting a metal cooking utensil, and then struck Miers. A spot about six inches in diameter was burned under his left arm. A physician declared that the patient would recover, and Miers is chiefly pleased to find that he has regained the use of his left arm.'

EVEN floating bottle messages fail to bring the thrill that goes with the discovery of lost treasure. Whether it is the finding of a miser's sock full of coins in the walls of a house which is being dismantled by wreckers, the unearthing of a pirate's brass-bound treasure chest with its pieces of eight, or the salvage of a sunken galleon laden with bullion, a whale of a thrill goes with the tale. Those who know their Arabian Nights will appreciate this story of a Yankee Sindbad's good fortune:

'Greenwich, Connecticut, June 24.—An eel caught by Albert J. Kane, of Greenwich, at Field Point Park, Greenwich Harbor, has netted the fisherman more than five hundred dollars. Inside the elongated fish the fisherman found a platinum dinner ring containing seventeen diamonds and six sapphires. A Greenwich jeweler placed the value of the ring at $550 or more.'

Not so pleasant is the ending of the story of the Virginia tipler who had looked upon the corn liquor when it was white. How he sobered up to find himself the possessor of nearly a quarter of a million dollars is told in a dispatch to a Baltimore paper from a Washington correspondent:

'It is not often a drunken man awakes to find himself worth $225,000, but this was the experience of L. A. C____ of Richmond, Virginia. On Monday the Richmond office of the Chesapeake and Ohio Railroad sent a messenger to a train to mail a certified check to the treasurer of the company in New York. As the train was pulling out the messenger in his hurry handed the envelope to a man who he thought was a mail clerk. Later in the day a man walked into the North Capitol Savings Bank of this city, deposited the check, and was given a book of account. This morning the man awoke to find himself in Washington. Feeling in his pockets he found a bank book and a check book. He was startled to learn that he had $225,000 to his credit in the bank. Reading in the newspapers that a check for this amount had been missed in transit, C____, of the temporary fortune, went to police headquarters and gave himself up. He says he was so drunk he knew nothing of what had happened.'

The story includes some seemingly queer banking methods but, after all, that only makes it the more interesting.

ALL fiction readers are familiar with the plot which deals with the burial of a body which is supposed to be the corpse of a man or a woman who is, in fact, very much alive and kicking. Here is a dispatch that carries a Louisville, Kentucky, date line, sent out by the Associated Press, which may prove to be grist to the mill of some short-story writer who is plot hungry:

'The fictional adventure of the man who stopped a funeral to view what proved to be his own corpse was rivaled in real life when W. Edwin Russell of Louisville went to Indianapolis yesterday to view the body of "Edgar Russell" of St. Louis. The resemblance between the dead man,who had been identified as the Louisville man, was so startling for a moment that the latter was almost persuaded he had died without knowing it. W. Edwin Russell, an antique dealer, notified of his "death" by the police at the instance of the Indianapolis police, who had been advised of the "identity" of the body by an acquaintance of the Louisville man, was so puzzled that he decided to view the body. He believed that he would find only a superficial resemblance, but found the man who had committed suicide November 7 under the name of Edgar Russell almost his exact counterpart, even to a shortened left leg.'

As we glance over the papers, stories of heroism seem to be so plentiful that we are constrained to believe that self-sacrificing bravery is a common human trait. Were all the heroic rescues which are recorded in the daily papers properly rewarded an establishment would be required for the minting of Congressional and Carnegie medals.

The best stories seem to have been set down by the hand of Truth. 'The world's a theatre, the earth a stage, Which God and Nature do with actors fill.'

Prisoners Like to WORK

Have No Use for Coddling

By F. H. SHERMAN

SHOULD inmates of state prisons be assigned to road construction, or be tucked away within the walls of these institutions? This is a question of national importance which Julian H. Alco, member of the California state board of prison directors, believes has been solved by the establishment of prison road camps. At the present time, there are 3,100 inmates of penal institutions going through a daily routine of labor, recreation, study and 'lockup.'

San Quentin prison is today so crowded that cells built to accommodate one prisoner must house two and three. Two ways of remedying the existing congestion are possible. One is to expend approximately six million dollars to construct a new prison. The other is to place more men at the present road camps maintained by the state.

Julian H. Alco of San Francisco is a man who has spent many years in prison work.

Mr. Alco has studied the prison problem carefully from all angles, sparing no expense in his investigations and asking financial aid of no one. He has spent weeks at a time in prison convict camps, living with the convicts, eating with them and working side by side with them on the grade.

He has for years helped paroled or discharged men to rehabilitate themselves, furnishing them clothing and necessary assistance, using the keen judgment in this work which results from years of experience.

As a result of his efforts he succeeded in passing, in the 1923 legislature, a bill known as Assembly Bill No. 1366, which has proved of great benefit in the solution of the prison situation.

Governor Richardson appointed Mr. Alco a member of the board of prison directors on account of his experience and training. This gave Mr. Alco an opportunity to further the road camp plan, carrying out, as it did, the spirit of the work from both the official and the prisoner's point of view.

Under the plan in vogue before this bill was passed, when a man was discharged from prison he received $5; if he was paroled, he had to have a position. But in either case, the $5 was far from adequate to tide him over to the first pay day or to help him secure a position and pay his living expenses. Ex-prisoners also found it difficult to resume the trades or occupations which they had followed before their incarceration, especially in the cases of professional men or bookkeepers; and even laboring men found that they were not physically fit to take a pick-and-shovel job.

The plan of having prisoners work on the roads in California has been in operation for a number of years, but the men for long received no compensation. Under the new law the prisoner may receive a gross wage not to exceed $2.50 a day from the California highway commission. From this amount all his overhead expenses are deducted, which include transportation from prison to road camp, depreciation, food, clothing, tobacco, days off on account of sickness, and so on. By strict economy and coöperation (the talent for which is lacking in the mentality of the average man in prison) he may earn an amount not to exceed 75 cents a day net. In other words, ten days at the road camp will bring him earnings which he could not accumulate in ten years of prison life.

This plan also permits the prisoner to reduce his time in prison, because every two days at the road camp counts for three days in prison. In other words, his time is cut down one-third by the road camp experience.

If a prisoner wishes to be economical, to mend and darn his clothing; likewise to take care of his shoes, he can easily save a good proportion of his wage and in that way demonstrate that he is rehabilitating himself to the satisfaction of his employer and of the prison officials. He is also able to anticipate his release and safeguard his freedom by accumulating sufficient funds to tide him over the rehabilitation period. He is fitting himself for a trade, both physically and mentally, through which he can secure a position when he is released.

Each prison road camp is furnished with

THOUSANDS *of* ALIENS in the United States cannot be naturalized or deported. In next week's issue JAMES J. DAVIS, *Secretary of Labor,* writes of this curious situation—

'*The* Men Without a Country'

a library. Prisoners are charged the lowest possible prices which the large purchasing power of the California highway commission makes possible, and are equipped with the best winter and summer clothing. When a man finishes his work with the highway commission, this clothing belongs to him or, if he is returning to some position where he will not use the clothing and bedding, he may turn them in to the highway commission and receive credit.

In instances where the families of prisoners are enjoying state aid, it is obligatory that the prisoner send two-thirds of his earnings to his family. Where a relative is not eligible for state aid, the prisoner, at his option, may send two-thirds of his earnings to this relative. In this way he establishes in the minds of relatives and friends the proof that he wants to do right.

Prisoners do not serve their entire sentences at the road camp but as a rule only the last year.

These camps are honor camps in every sense of the word. The prisoners do not wear prison uniforms, guards do not carry guns, the greatest insurance against escape and bad conduct being the fact that the men want to make good. The bill provides for a reward of $200 for an escaped convict, and this amount is charged to all the other prisoners in the camp from which the escape was made.

EACH camp has a small band and, where possible, a baseball team or other athletic combination. The relationship between the highway commission and the prisoner is that between employer and employe.

On the basis of 1,500 men, over $1,500 a day should be saved, because, as it costs the state about one dollar a day to maintain a man in prison and as every two days in the road camp counts for three days in prison, the state is saving $1.50 a day by keeping the man on the road.

Mr. Alco states that he has found that prisoners have no respect for reformers and organizations which pet, coddle or offer them charity, and it is his conviction that it would be better for communities to develop more moral courage by squarely facing the prison situation, putting these men to work, letting them become self-supporting and giving them a chance to prove their many resolutions to make good before they are released from prison, rather than to follow the easier channel of misdirected charity.

In coöperation with Mr. Alco, the success of this work is due to Ben Milliken, state superintendent of prison road camps.

While Mr. Milliken is employed by the highway commission, he represents the prisoners who are working at the road camps when their cases come before the board of prison directors.

Mr. Milliken states that the chief difficulty encountered in various states that have used prison labor on highways has been the dual control by highway commission and by prison officials. The first thing accomplished was the elimination of this dual authority.

The State of California favors additional camps. These camps are receiving the support of citizens as well as of prison and state officials because society at large is benefited, the prisoner's dependents are better cared for and, finally, the man himself is better fitted to take his place again among his fellow citizens.

On Loving a Little House

(Continued from page 3)

be nice to have bees, and bees we have (although not as yet, I must confess, much honey).

Then as to colour. I knew that because this is a dark and stormy country we must have bright colours, but the danger was lest, overinfluenced by the spirit of these times which demands the most startling contrasts, I should be forced into a gaudiness that in the passing of a few months would be shabby indeed. Here the house gently accompanied me to London, was with me when I bought my rugs and curtains, insinuated a preference here and without ostentation or conceit helped me to hold my hand.

There has been too the dreadful tyranny of books. Everyone who loves books knows how they will come flooding a place do what you may to prevent them. Books in any numbers were a new problem for my house to face—the passion of the ladies who were the former owners had been for music; but the house marvellously adapted itself to its problem. It is forever pointing out to me new corners where books may go, suggesting to me too books that may be removed as unworthy of their company—and off they fly to the local library in the town. If the house dislikes a book it simply removes it and I must honestly say that never yet has a book vanished without just and sufficient reason.

So also with the pictures. I have a mixed lot ranging from a collection of designs made for the Moscow Art Theatre, exotic and foreign and bizarre, to the water colours of Clausen and Muirhead Bone and Charles Holmes, the most English of country scenes, running streams and fields deep in grass and purple hills capped in mist. The house placed the Russian pictures in the passage below the stairs where they can be seen rather dimly, the brilliant colours fading into a general pattern; and if a picture that deserves light is hung obscurely the house always makes me feel this so that I pass it a hundred times with a sense of something wrong and on the hundred and first realise my mistake and bring it out into the light.

But the greatest gift that this house has given me is a sense of home. A bachelor who is forever travelling needs a home far more urgently than a married man who is forever staying in the same place. He is so pitifully independent that unless he has some centre towards which he may longingly look from the outer edge of his grim restless circle he is lost indeed. There are times when I am away from home when it seems to me that I am unhappy not to be living in such and such a place.

FROM snow-glittering Alpine heights I look down on my little hills and wonder whether they are not too small to be borne, or when I am on a fine rugged seacoast and watch great breakers plunging through the salty air I fancy that my little garden with its tiny flowers and murmuring bees will seem tame indeed. And I will not deny that I have returned from some of my journeys with trepidation. What about the primroses and violet clumps? What about the two silver birches and the collection of poets in the library and the purple rug in the dining room and the Lovat Fraser drawings in the sitting room and my first *Endymion* and my Thackeray manuscript and the two dogs Peter and Gunner, the cat Jeremy and the little wood that hangs over the spare bedroom window?

After the grand sights that I have seen, the wild and torrential rivers, the tremendous mountains and the boundless lakes, shall I be able to prevent that shabby discontent and hide even from myself the scorn for my little acre?

It is here that the house is most glorious. On my return from a journey it comes to meet me with no ostentation, with no eager cheapening of its appeal. It has its pride, its assurance of its own personality. As I walk up the steps to the garden gate and hear again the rough ripple of the stream above the house, the whisper of the trees in the little wood, and see the fire shining beyond the window, glance through the door into the library to find the books waiting rank upon rank, the picture of Walter Scott over the fireplace, the old model of the Dutch barque in its faded golden-red beside the window, and then beyond the wall catch the bleating of the sheep as they move upwards across the hill, I know that I have come home to a house that is friendly and constant and alive as only a few human beings in this world can ever be.

A Bookworm Turns

(Continued from page 15)

vail throughout the Continent, with the result that the average author there reaches—at least during the early life of the book—a much larger public than here. No doubt both author and publisher profit from the process, though earnings by the volume may be less than in this country. It means that people in Europe can and do buy books with the freedom that we buy magazines.

The manufacturing cost of the average novel selling for two to two and a half dollars in this country is about fifty cents—twenty cents each for typesetting and making of plates and thirty cents for printing and binding. The last could be reduced one-half by the use of cheaper paper and cheaper binding.

The author receives a royalty averaging thirty cents a volume. With six times as many sales he would make just as much at five cents a volume. Advertising cost averages ten cents a volume. Yet Haldeman-Julius is a big advertiser and sells his 'Blue Book' for five cents a volume. Overhead and selling costs average thirty-five cents a volume.

In standard book publishing the small operator seems still to be the rule. Of the listed books put out in 1926, nearly seven thousand were published by 173 houses. Only sixty-one put out more than twenty-five titles, only thirty-one put out over fifty titles, and only one—an international house—listed more than five hundred titles during the year.

Thus the standard houses kept on the road nearly five hundred traveling salesmen selling a product that, of all things, should sell itself.

The situation awaits someone who will apply mass production and selling methods to new books.

The World's Women Pioneers

(*Continued from page 7*)

which he could always count upon her staunch support and understanding; therefore he nicknamed her 'The Duchess,' as the captain of their domestic ship.

She earned her place at his side, in business as in the White House, for she put tireless work into his newspaper and into his public service.

Her hardest task while First Lady was to be just a listener, keeping herself from expressing clear-cut opinions of the matters she so thoroughly understood. Big national issues had a way of slipping into her conversation more readily than the regulation small talk so typical of social gatherings.

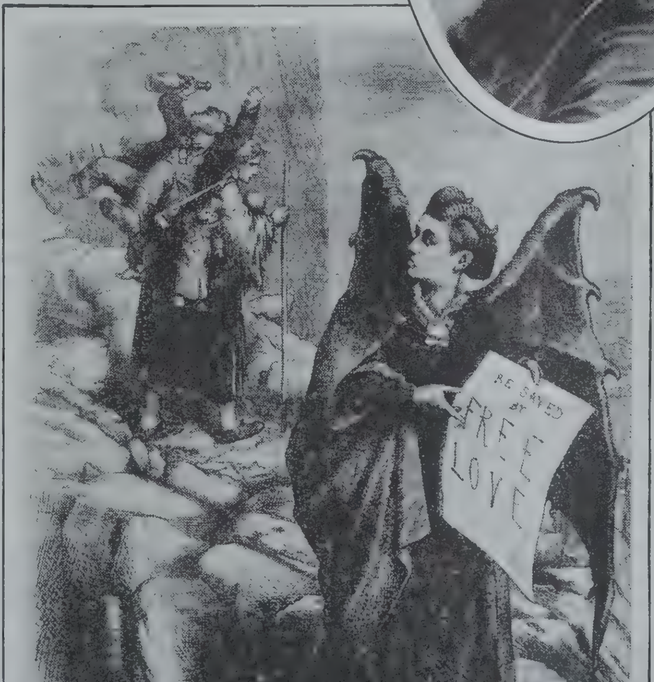
While the White House has been the dream and serious ambition of many women besides Mrs. Abraham Lincoln, their hopes, like hers, were centered in their husbands being elected Chief Executive, but there have been two women to whom alone belongs the honor of having each been nominated for the Presidency of the United States.

Brave and bold were the members of the Equal Rights Party in 1872, when they launched the candidacy of Victoria Claflin Woodhull for the highest office in the land. This, at a time when the suffrage movement, though growing, could not command a sufficient following to be taken as a serious factor in our political life, or to be regarded with more than scant tolerance, for women had not yet even found their way into recognition as officials or competitors in business or public life. Although the only result was the establishment of a precedent and that Mrs. Woodhull has a place in the Hall of Fame as the first woman in the United States to be named for this high honor, the Equal Rights Party were far from discouraged, for again in 1884 and still again in 1888 they nominated the well-known educator and astute lawyer, Belva Ann Bennett Lockwood, of New York State, to carry their standards into the White House.

When Mrs. Woodhull grasped the hopelessness of her ambition she turned her attention to literary and philanthropic and reform channels. She made a brilliant and forceful address before Congress on the suffrage question, and apparently lost her taste for political issues, for she became a noted lecturer, taking up her residence in England where she resided with her daughter and made a notable career for herself as editor of the *Humanitarian Magazine*, in which work she was engaged until her death at the age of eighty-nine.

Mrs. Woodhull Martin, in addition to being a noted lecturer on the scientific betterment of the human race and a lecturer on suffrage, has also written extensively. She is the editor of a large number of books of highly intellectual type.

Victoria Woodhull.
—*Keystone View.*



—*Cartoon by Nast in* Harper's, *1871.*

Wife with heavy burden to Victoria Woodhull: 'I'd rather travel the hardest path of matrimony than follow your footsteps.'

While Mrs. Belva Ann Lockwood was second in the presidential race, she was the first woman lawyer admitted to practice before the Supreme Court. For this privilege, she had to get a bill through Congress permitting women to practise law, and then worked tirelessly for three years to create a favorable sentiment before the barrier was lifted. When she finished her efforts, every court in the land was open to her and never again was a woman lawyer's application refused because of her sex, or, as in Mrs. Lockwood's case, because she was a married woman.

Few women have crowded more worthwhile service to humanity in a lifetime of effort than Belva Lockwood spread over her active eighty-seven years. Born in Royalton, New York, in 1830, with only limited chances for education, her desire for it became her ruling passion, and while other girls of her age were still absorbed in dolls and childish games, she was teaching the district school in summer and going to the academy in the winter.

Romance tripped her at eighteen, when she became the bride of Uriah McNeil, a young farmer of the community. Twenty-three found her a widow, with a baby daughter, and when ambition pushed grief aside, she went to the Genesee College, from which came a degree to crown four years of hard work.

Next came the principalship in Lockport, then the McNeil Seminary reared its head in Oswego, New York, but soon larger fields beckoned and with the lifting of the war clouds, she went to Washington in 1865, to teach and to study law. Another wedding in 1868 interfered with the progress of this career and it was not until the death of her second husband, Dr. Ezekiel Lockwood, U. S. Army chaplain, nine years later, that she again turned to study for distraction.

Degrees from Syracuse and from the National University Law School in the Capitol City gave her the assurance to make the long and spirited fight for admission to practise before the various courts of the land.

Mrs. Lockwood worked tirelessly for equal rights for men and women and drafted and secured the passage of a bill giving to women in governmental service equal pay with men for equal work.

Through her work for world peace, she acquired her greatest fame. For thirty-six years she was a member of the Universal Peace Union, attending the International Peace Bureau at Bern for more than a quarter of a century, and taking a leading part in every large gathering in this cause, beginning with the first Peace Congress in 1885. Mrs. Lockwood compiled the Peace Treaties of the United States and secured the introduction of the first bill in Congress for an international arbitration court.

Following the Peace Congress in London in 1890, though sixty years of age, she remained abroad long enough to take a course of lectures at Oxford. Age and infirmity were always discounted by her, for at the age of eighty-two she started off to Europe to carry a peace message to the women of the world and in 1916, just a year before her death, she gave an address on the reëlection of Woodrow Wilson, giving seven reasons for his choice. This was later used as campaign literature.

One might travel far and seek long for a more interesting character than that of Dr. Mary Edwards Walker, who put herself in the pioneer class on four first counts.

Dr. Walker was the first woman to receive a Medal of Honor from Congress. She was the first woman commissioned as an assistant army surgeon. She was the first woman to adopt men's clothes for her permanent dress and then legalize it by obtaining an act of Congress to authorize her use of it. She was the first woman prisoner of war to be exchanged for a man of her own rank. All of this grew out of her resentment at having been born a girl and her lifelong rebellion over the limitations hedging the feminine sex.

From earliest childhood, Mary Edwards Walker displayed an unusual independence of thought, spurning amusements, frivolities and vocations ordinarily chosen by girls and expressing her undying protest at her sex, by preparing herself to follow a man's work in life.

BORN in Oswego, New York, in 1832, the daughter of Alvah and Vesta Whitcomb Walker, who erected the first free school in that section upon their own estate, Mary had unusual opportunities for a girl of her day. Of Plymouth ancestry, and related to J. Whitcomb Riley and Robert Ingersoll, she thrived in a cultural and intellectual atmosphere that carried her direct from the school where her mother and older sisters taught so long, into the Syracuse Medical College, from which she was graduated in 1855 as a physician, establishing her practice in Ohio.

Always annoyed with the exactions of fashions which she would not follow and as expressed in the fashionable hoop skirts, high heels, false hair and rouge, Dr. Mary at the opening of her professional career devised and wore what she called the American reform costume. But even this in its ugly austerity was not severe enough for her ascetic tastes.

With the outbreak of the Civil War, she put behind her forever all traces of womanish weaknesses and volunteered for service in her professional capacity and was at once commissioned a first lieutenant and assistant army surgeon. In this rôle, male attire facilitated her work on the battlefield and in the hospitals where she served with a rare quality of valor and efficiency. Her self-sacrificing service and unfaltering courage completely submerged the woman in the proficient surgeon and officer, for no risk or danger ever deterred her from going to the aid of the wounded. Her bravery under fire, so often repeated, brought her the Medal of Honor from Congress and the grateful appreciation of the President.

Such experiences naturally precluded her return to her natural sphere of activity and with the close of her war service, she resolved never again to don women's garments. After she obtained the sanction of Congress upon her use of men's clothes, she wore them to the end of her life, despite the rudeness and discourtesy that never failed to be visited upon her in public when she was recognized. She despised tobacco and upon one occasion snatched a cigar from the mouth of a man in the elevator at the Capitol, angrily demanding:

'Have you no more respect than to smoke in the presence of a lady?'

The man looked about the elevator rather deliberately. There were but three men and the doctor in the cage. He then pointedly answered, 'If you want the respect due a lady, you should dress like one and maybe you'll get it then!'

The 'little doctor' got a great deal of fun out of life and people and her sense of humor carried her through many ordeals. Frequently she laid herself open to embarrassing explanations by strolling into places exclusively reserved for women, and her tendency to forget that her clothes placed her apart from women caused the common charge that she assumed all of the privileges of a woman, while demanding the rights of a man.

An ardent student, traveler and tireless worker in the cause of suffrage, her activities were early curtailed by injuries resulting from a fall and from failing eyesight due to war-time injuries. After her retirement to her estate she founded a hospital for consumptives and with it a school of prevention along plans originated by herself.

Dr. Walker wore her Medal of Honor with unabating pride until her death in 1919 and clung determinedly to her conventional frock coat, trousers and high silk hat to the end.

As so many of the notable women now famous in history battled for equal suffrage, more than usual interest must center around the first American suffragist, the first woman to demand the right to vote and to have a voice in legislation, and to make an appeal to the assembly to grant it. This was Mistress Margaret Brent of Maryland, than whom there was no more brilliant, progressive and interesting character in the whole galaxy of women of achievement. Far in advance of her day, Mistress Brent demanded the vote on the most logical grounds, more than two hundred and fifty years before it came to women.

In 1647, Governor Calvert died suddenly, and when stricken assembled Margaret Brent and Thomas Green and a number of others about his bed, and looking at her announced so that all present might hear, 'I make you my sole executrix! Take all, pay all!'

He then appointed his successor, Thomas Green, and ten days after his death letters of administration were granted to Margaret and she set to work at once to carry out the provisions of the shortest will on record.

Mistress Brent did not remain in Maryland to end her days, where there was so much need of her wisdom and courage and where she found herself continually hampered by her political limitations. She took up her residence in Virginia and spent her last years in the Old Dominion.

JUST about the time Calvert set forth for Maryland, the good ship *Griffen* made the Port of Boston in 1634 with her band of Puritan settlers from Europe. In their midst was a Mrs. Anne Hutchinson, forty-three years old, from England, seeking religious freedom in the New World. Although she came to find a new home and liberty, she remained to create disruption and to pay the extreme penalty for her beliefs.

Mrs. Hutchinson was of intellectual parentage, a relative of Dryden, and of Jonathan Swift and reared in a cultural atmosphere where she absorbed more learning than was considered necessary or seemly for the girls of her time. Attractive and youthful-looking far below her age, a loving wife, tender mother and devoted friend, her charm of manner and unselfish ways won her many friends who later became converts to her theories.

No intention of preaching was in her mind when she embarked for America, but on shipboard she became involved in lively discussions upon religious matters with the Reverend Zachariah Symmes, and at times her familiarity with the Scriptures, her clear-cut logic and forceful argument worsted him, with the result that he conceived a bitter animosity toward this gentle, lovable woman, and upon landing almost at once denounced her as a 'prophetess,' a term of grave danger in a time when all Boston was at loggerheads over the religious despotism then prevailing.

Fired with her own earnestness and her faith in her own interpretation of Scripture, Mrs. Hutchinson disregarded the danger signal and gathered about her a large following to whom she expounded her doctrines. She contended that the Gospel of Christ superseded the law of Moses. Her eloquence, with her ready ministry to all in need, soon attracted to her house a large part of the city's meager population, and naturally the clergy were all up in arms.

SOON she and her followers were wrangling with the same ministerial group over the confusing doctrines embraced in the Antinomian Controversy. Business was neglected and all other matters made subservient to the religious fervor which beset the people.

For any person to differ in thought was bad enough, but openly to flout and dispute with the wise and godly men of the church was regarded as actual treason, and when a mere woman took such a stand, measures to suppress or eliminate her were regarded as imperative.

A trial before a court of magistrates in Cambridge, in November, 1637, was called as the result of her teaching doctrines contrary to those laid down for the spiritual guidance of the colony in which she elected to live, and she was ordered to appear.

The record of this trial has been called the most shameful of any record in the annals of Protestantism.

Without the support of a friendly face, Anne Hutchinson was required to stand all day in the cold bleakness of a winter storm, in a windy, chilly room without either food or drink or the privilege of sitting down, even after she had fallen to the floor from weakness. Question after question was hurled at her by the half-dozen wiseacres of the law and church, who were already convinced of her guilt of heresy. Though she answered clearly, quoting passage after passage of the Bible to prove that she had done no wrong, a decree of guilty was passed and she was excommunicated from the Boston church and ordered banished from the State of Massachusetts, to take effect on the last day of March.

When Anne inquired of Elders Winthrop and Endicott, 'Wherefore am I banished?' Winthrop curtly replied: 'SAY NO MORE! The court knows wherefore and is satisfied.'

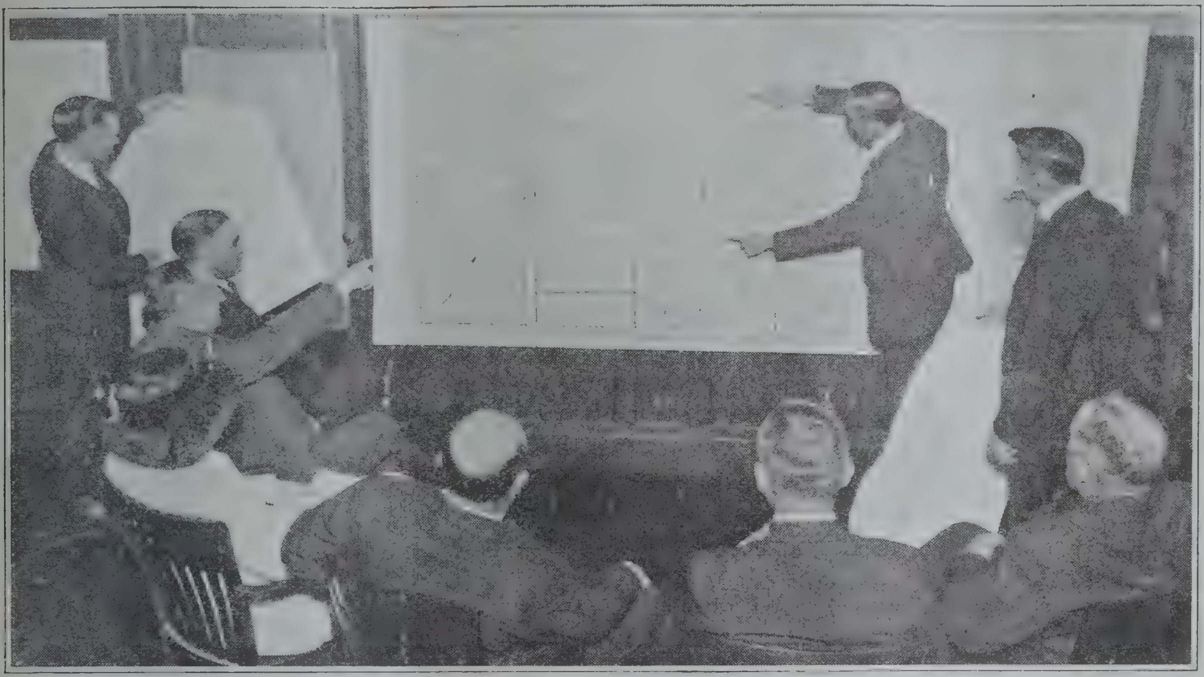
So greatly did the elders of the colony fear this woman's power over her followers that the court issued the following order:

'All whose names are underwritten, shall upon warning give all such guns, swords, pistols, pewter shots and matches over to our custody upon penalty of ten pounds.'

March found Mrs. Hutchinson and a substantial group of her adherents establishing a colony in the Rhode Island forest, but again she was driven forth by these very heads of the church who feared she would found a new sect.

Then she sought refuge among the Dutch of New Netherlands, where religious beliefs were not so closely scrutinized.

Every Man *His Own* Assessor



Owner's committee preparing to appraise local property under plan of self-assessment.

An Effort *to* Establish Equitable Taxation

By

JOHN SLOAN

IN AN effort to establish a uniform, proportionate system of tax assessment which shall be just to the property-owner and at the same time furnish the necessary basis for the collection of funds for the operation of city and county governments, particularly the former, a number of municipalities in the United States have inaugurated the method of allowing the property-owners to assess their own property, both real estate and improvements. This kind of assessment is based on 100-per-cent valuation and is subject to approval by a property-owners' committee and to revision by the tax assessor. It has been in operation for as long as seven years in some cities, notably Los Angeles, California, and none of the dozen or more cities—scattered well across the continent—have abandoned it once they undertook to establish values in this way.

The advantages are many, the method of operation simple and, once set up satisfactorily to owners and assessors, the values so determined become basic, furnishing, with due allowance for movement of centers of population and of trade, a definite and continuous foundation for all future assessments in the community. By the concurrent maintenance of 100-per-cent valuation, favoritism in valuation is done away with and at the same time the tax rate is reduced. Due to these two results, the distribution of taxation is more nearly just, the levy upon each property-owner closer to the amount he should pay, and, as a rule, the actual sum paid is less than in the system whereby one man, the tax assessor, fixes the various valuations. Back of these factors lies the possibly greater result of closer watch on municipal budgets, and appropriations, by all the property-owners of the city or county. Since he fixes the amount he is to pay toward the annual total of the cost of operation of government in his city or county, the property-owner becomes more watchful of the amount that government is to expend. Without exception, this result has followed the adoption of the new valuation and assessment plan in every city that has taken it up. The plan has worked out best in cities which have city managers, and which are operated on a business basis, probably because one man, the city manager, is more amenable to the advice and suggestions of the property-owners, either in groups or as individuals, than is a council, a board of aldermen, a board of supervisors, or similar governing organization.

The majority of the cities and counties undertaking this method first incorporate in their charters, either by drawing up and adopting a new charter or by amending the old, the provision that, in preparation for the first tax assessment after the charter or the amendment becomes effective, a scientific revaluation of real estate and improvement values shall be made under the direction of a man familiar with this sort of work, who is not a resident of the city or the county making the change. This provision that an outsider must be brought in to direct the property-owners in their first self-assessment has been found to be of the utmost importance. It eliminates all influences—political, personal and financial—from the leadership of the movement. City managers in all the California cities which have adopted the method consider that this prohibition of local 'experts' results in unbiased valuations of property, and that it has a large part to do with the just placing of the main burden of taxation where it belongs.

The next step is the appointment of a property-owners' committee, consisting of a considerable number of property-owners from widely scattered sections of the city or the county, as the case may be. An effort is made to get on this committee equable representation from all classes of business, all the professions, retired as well as active men and women, and particularly from the home-owners, who in many cities, under the previous plan of valuation and assessment, bore an unjustly heavy share of the cost of government. Two or three valuation engineers are then employed, together with the necessary field men, clerks, and similar assistants, and the city is thoroughly surveyed as to values. The foundation stone on which the system stands or falls is, of course, the appraisal of value, not only of each piece of real estate and its improvements standing alone, but of that piece of property compared with every other piece of property in the community.

THIS appraisal is based on a system of computation in which mathematics, inflexible and accurate, take the place of the personal estimate and the human factor involved in the work of the average assessor. Since any system of computation must have a standardized unit as a basis for all the mathematical operations carried out under it, the first and most important work of the men who are valuing their own property must be the establishment of such a standard. This standard bears to the general assessment valuation of the community the same relation that such units as the pint, pound, inch and acre bear to the sum total of the commercial and industrial transactions of everyday life in America. This standardized unit of quantity in land values—since improvements can be appraised with ease from their construction costs, qualified by depreciation—must be recognized by the entire community as the expression of the judgment of the community as to land values, so that that judgment may be uniform throughout any taxing district.

These cities have adopted a standard unit foot for the measuring of land values. This is one foot of frontage, 100 feet deep, located in the middle of the block being appraised, where its only value is due to single-street accessibility, and the opportunity of reaching the life and trade of the community at that one point of contact. The 100-foot depth represents 100 per cent of lot value. Lots deeper than 100 feet are increased by a slight percentage above the 100 per cent, while lots shorter than 100 feet are computed by the use of some percentage less than 100 per cent. The parts of a lot nearer the street front are relatively more valuable than similar areas remote from the street frontage. This law of the relative effect of depth on the value of city lots is expressed in a depth-percentage table, as follows:

Depth	*Percentage*	*Depth*	*Percentage*
10	25	25	47.90
15	33.22	30	54.
20	41	35	59.20

With this standard of quantity recognized the problem then becomes one of following a method of analysis of the factors that create and maintain land values in cities, and, when the work is being done there, in counties as well, the centrally located acre being taken as the unit of value in the appraisal of land outside the city limits.

THESE factors involve traffic on foot passing a given point, and the hours at which it passes, the purpose that brings it past, and the quality of the individuals constituting that traffic. Transportation facilities, street cars, width of street for automobile traffic, parking opportunities and regulations, transfer points, physical characteristics of the land itself, accessibility, and the important factors of light and shade on the sides of the street—all enter into this discussion.

The property-owners' committee, taking the above table of depth percentages for its city, converts it into a table of lot values for fifty-foot lots of varying depths, and expresses its ideas of unit foot values accordingly. To obtain the value of any lot, of inside frontage and away from corners, on any of the streets in any city adopting this method, the unit foot value is multiplied by the percentage for the depth of the particular lot, as shown in the table, and this result is multiplied by the frontage of the lot in feet. The product will be the appraised value of the lot. Suppose, for example, that we have a lot 50 by 138 feet, whose unit foot value is appraised at 80 dollars. In the depth percentage table, the 138-foot depth calls for 113 per cent of the unit value, which becomes a front-foot value of $90.40. This, multiplied by the frontage, gives a lot value of $4,520.

Once the appraisal is approved by the people who own the land, and the buildings and other improvements thereon, the appraisal sheets—which, it should be remembered, carry 100-per-cent valuations on everything—go to the city council, city manager, and city assessor. The expense of the municipality for the coming year or two years, as the case may be, are then estimated, and the percentage of taxation necessary to meet this budget fixed.

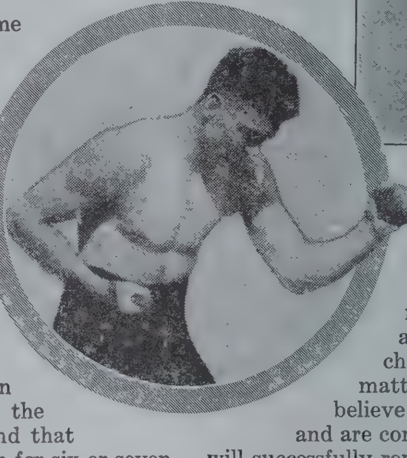
Holding the Crest

(Continued from page 6)

play tennis with a crippled hand since he would be unable to grip the racquet: it would slip. But, in 1923, Tilden was better than ever before.

'After leaving the hospital in midwinter and after recovering from the amputation, I started to practise,' said Tilden. 'My racquet did slip after a few exchanges. So I forced greater power and sharper angles into my shots in order to draw my opponent out of position more quickly and to shorten the rallies.'

'Ty' Cobb when he was manager as well as player.



Jack Dempsey when he still held his title. —U. & U. Photo.

Tilden remained supreme in tennis through three years after losing the full use of his right hand.

Through nearly two decades Ty Cobb was the leading player in baseball. While others loafed through the winter months between the close of one season and the start of another, Cobb kept in shape by long hikes and careful diet. Until he was elevated to a managerial position Cobb never reported in the spring for the training grind that ball players are put through for six or seven weeks before the season opens. Cobb always reported two or three days before the season opened. This angered some of his team mates who would complain to the manager of the team, Hughie Jennings. The manager always answered them: 'If you fellows could be depended on to show up in the condition Cobb is in you also wouldn't have to report. We wouldn't need any spring training if you all did what he does.'

Guarding his title against the field of challengers is not all that a champion has to contend with; a greater danger lies in the admirers who flock to the side of a title holder. This hero worship has helped take the crowns from many kings of sport. Most of the worship is not sincere, either, but selfish. Many people want to bask in the reflected glory of the champions for what personal advantage they can get out of it.

James J. Jeffries understood all this and he shrank from the crowds. He said: 'The day they count me out, not one of them would say "Hello" to me if he met me on the street. They won't know me no more.' Robert Fitzsimmons did not shrink from the crowds. The freckled blacksmith basked in the adoration of the multitude. But on the night that he lost to Jeffries on Coney Island, Fitzsimmons left the ring, walked out of the building and home—all alone. Not a soul paid any attention to him from the moment he lost his title.

Dempsey was unpopular as champion. The main reason was that he was never a 'mixer.' Dempsey carried the same viewpoint as Jeffries. He realized that they wanted to know him only so long as he held the limelight. 'They didn't flock around me before I won the title,' said Dempsey; 'why should they crowd around now?'

All champions do not show this aversion to hero worship. Most of them keenly relish it. As soon as a man wins a title in any sport the gates are opened for him and he is invited to the high and broad roads. They lead to athletic ruin. But few champions ever see the matter in that light. They believe themselves invincible and are convinced that their ability will successfully repulse any challenge. You may say that such a frame of mind is dangerous; but it is also necessary. If a man does not believe he is absolutely superior to his opponent he rarely is. He has to develop that frame of mind in order to conquer. But that same frame of mind often wrecks the career of a champion. He becomes overconfident. He takes too many chances.

The late Harry Greb, the most scientific big man the ring has known for decades, always said that he trained on wine and song, and that he needed nothing further. As long as he made the weight limit he was worried by nothing. Where other boxers trained religiously before a big match, Greb would carouse. He believed himself superhuman, too swift and too clever for any opponent. And then, one night, a Negro parson from down in Georgia, known to the ring as Tiger Flowers—and he had been knocked out eight times—stopped Greb and took the middleweight championship from him.

It was Battling Nelson, the 'Durable Dane,' who told the world, 'I ain't human'; and his successor to the title, Ad Wolgast, said the same thing. But not many years later both were physical wrecks. Wolgast and other opponents battered Nelson while opponents and nature settled Wolgast.

Track and field athletes and champions in every line have fallen suddenly and unexpectedly. There would be no plausible explanation in print for the sudden collapse, but those on the inside would tell how the 'white lights got him.' They could not resist the temptations that come to champions.

'They don't come back,' is an old say-so, but it is based chiefly on the supposition that a man who falls has been burned out by competition and the gay life. He has nothing left in the way of physical and mental resources to bring him back. Holding the crest is truly a much more difficult task than reaching it.

New Glimpses *of* Old Hamath

A Drowsy Syrian City *on the* Orontes River

By MARGARET REID

OLD as the hills' and quaintly beautiful is the drowsy city of Hamath on the Orontes River in northern Syria.

In a number of places Sacred History establishes this antiquated town as the northern boundary of the Israelitish Kingdom: From Mount Hor ye shall point out your borders unto the entrance of Hamath, was the command given to Moses.

No doubt Abraham wandered over this route with his patriarchal flocks and servants, and tarried in the friendly open space that now stretches before Hamath like a grassy front yard.

To the modern traveler viewing this ancient glory from the citadel on the hills, very little imagination is required to people those pastures with some weary tribe of Israel. Almost can one see the thirsty flocks crowding around the wayside wells eagerly awaiting the refreshing drink bubbling within each stone-walled rim.

Truly a restful spot in which to pitch a tent at sunset and to spend a quiet night.

As imagination travels forward down the centuries the thoughtful observer is inspired by a vision of the Apostle Paul passing along this same old roadway on his many holy missions from Jerusalem to Antioch.

In the present day the approach to Hamath from the south leads through desolate Mohammedan burial grounds. The Moslem gives little care to his cemetery; he wastes no sentimental attention on this lonely 'God's acre' and therefore the plot is no more than a jumble of stones that resemble a thousand tipsy candles on an abandoned birthday cake. The marker for the grave of a woman is unadorned, but that for a man is carved at the top in the crude representation of a 'Tarboosh,' or Turkish fez.

It is a relief to leave this dismal scene behind and to hurry forward into hoary old Hamath, the city of lights and shadows, the very antiquity of which thrills and inspires pleasurable delight at every turn.

Black-vaulted streets hundreds of years old run under buildings and end in a blaze of sunlight.

Hamath's special exhibit which calls forth the greatest civic pride is her 'Long Market' which stretches under one roof for at least a mile as if a mammoth department store had been assembled on the level, with one aisle for the customers' convenience. Here may be purchased the silk towels and striped sheets for which Hamath has been famous for thousands of years; or if you prefer you may acquire a pair of almost equally famous scarlet leather slippers.

The houses of Hamath are all in the comfortable, pretty style which originated with the Egyptians some six thousand years ago and which has been adopted by all succeeding peoples down to the present.

White limestone is the prevailing building material, the house being built around an open court which is laid out with stone-paved paths, grassy plots and flower beds.

In the finest homes there is often a fountain and alcoves resembling an American sun parlor where the family gather to drink coffee and gossip gayly with their friends.

This central courtyard is really a charming spot with roses and honeysuckles climbing about in profusion, and pomegranate, fig and almond trees adding color and refreshing shade on hot days.

If the house has a second story, it is reached by an artistic stone stairway leading upward from the courtyard.

The furnishings of the Hamath house are a distressing mixture of Oriental beauty and European tawdriness. Beautiful rugs are thrown lavishly about the stone-paved floor; window curtains of beautiful Damascus silk hang in voluminous folds from ceiling to floor, and chairs and couches shimmer in silken upholstery of scarlet and gold.

But alas! in the midst of this glorious Eastern harmony there towers perhaps a huge shiny *golden oak* sideboard crowded with china slippers, tawdry red vases and other bric-a-brac, and perhaps a huge sea shell sent from America by relatives and labeled 'Souvenir of Atlantic City.'

One of the important industries is rope making. Rope is exported to all the other cities and villages in the Syrian plain from Aleppo to Damascus; the rope factories are just any long or unencumbered stretch of green anywhere in the city, and the principal workers are old men and children whose chief duty it is to keep various wheels and pulleys in motion while two of the head workers twist and weave the fiber into strands.

Possibly the most celebrated feature of Hamath is the queer old waterworks system.

The Orontes River is the source of supply for the city. Ninety-six wheels constitute ninety-six separate pumping stations. These wheels are not municipally owned, but are individual possessions. A wealthy man owns a wheel alone, but those less fortunate financially pool their funds in groups of five or six and buy a wheel together.

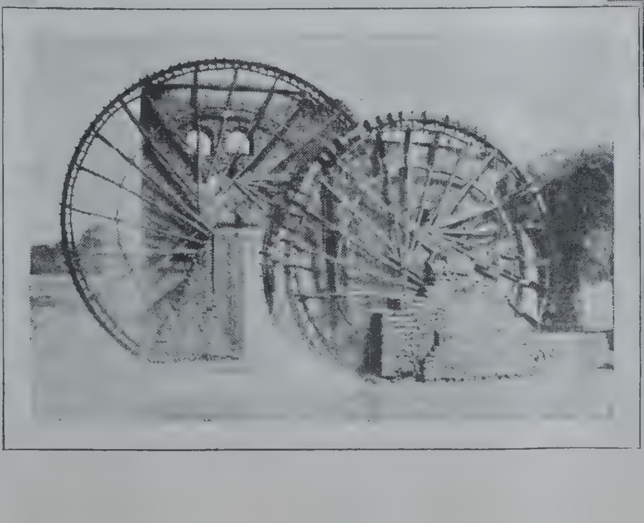
The power turning the wheel is furnished by the current of the rushing Orontes River. Little troughs fastened to the rim of the wheel scoop up the water and carry it to the top where it spills into a duct that spans the distance between the wheel and the shore. Thence through still other conduits the precious water flows for miles through the city to homes and gardens.

The system is not specially sanitary, for channels are open, part of the time on street level, and prove too great a temptation to the small urchin with bare feet and a sailboat.

So lies hoary old Hamath, lulled to the slumber of a thousand years by the continuous sleepy whine and whir of these ancient wheels singing the secrets of many ages.

Dismal aspect of a Mohammedan burial ground on the way to Hamath.

One of the numerous water-pumping wheels on the Orontes River, the sole source of supply for the city.



Natives in the shopping center of Hamath, known as 'Long Market.'

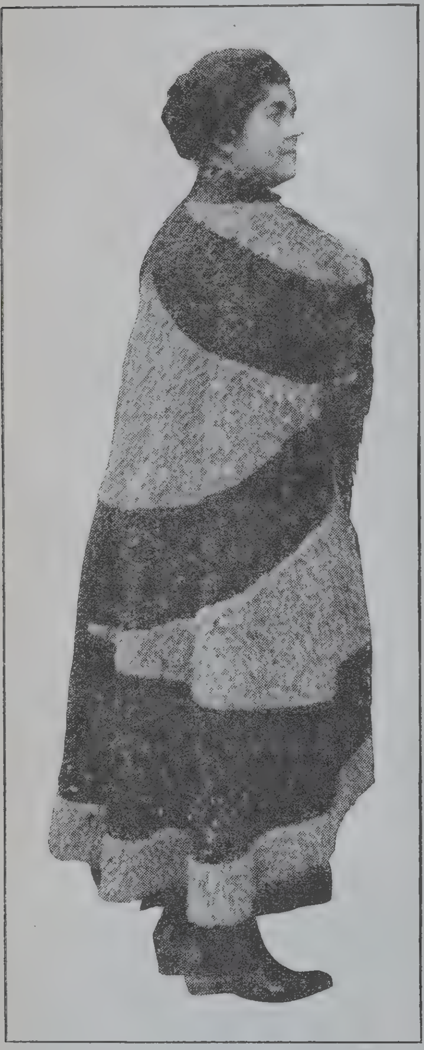
A Million-Dollar Cape

By G. H. DACY

THE most valuable feather cape in all creation—a garment valued at $1,000,000—is shown in the National Museum, Washington.

This remarkable cape, made of almost priceless bird feathers, has never adorned the shoulders of feminine aristocracy. It is the treasured war cloak of one of the most famous chieftains of the Sandwich Islands.

It took dozens of expert workers a century or longer to make the cape which is three and one-half feet long and measures eleven and one-half feet around its lower edge. It is made of tufts of thousands of tiny feathers of tropical birds which are now extinct. King Kamehameha of the Sandwich Islands presented it to Commodore J. H. Aulick of the U. S. Navy. It was worn years ago by King Nehuaskalani, being the most valuable garment in his ceremonial wardrobe.



What war paint was to the American Indians, these feathered capes and helmets were to the natives of Hawaii and the Sandwich Islands. Only the kings, princes and chieftains of the highest rank were eligible to wear these feathered garments—badges of defiance and courage.

The intricate handicraft of making these marvelous capes is a lost art. Previous to 1820, the land of the hula dancers had no written language. The Hawaiians who were the most expert of bird plumage coatmakers left no records of how the work was done.

The feathers of the mamo, Oo and Iwii—extinct birds of brilliant plumage—were used in this unique cloak manufacture. These feathers were used as mediums of barter and exchange. A nobleman's importance was reckoned by the elaborateness of his ceremonial cape.

The hunters smeared the limbs and branches of trees with a mucilaginous material so that the fancy fliers would stick on the limb. The hunters would then come along, pluck the prized feathers and then liberate the captives. The king's orders were that none of the rare birds should be killed. Later on, this restriction was raised with a change of rulers and in a few decades the valuable bird families were destroyed.

It took a half-century of hunting, as a rule, to gather enough of the diminutive feathers for a king's cape. It took scores of years of hand labor to manufacture by hand a crude sort of cloth from a fiber something like ramie grass. The tufts of red, yellow, and black feathers were then fastened to this cloth. The capes were so skilfully made that they looked like garments of scarlet bordered with gold. When the rare birds became extinct, the feather cape manufacture declined and ultimately was forgotten. The million-dollar cape at Washington and several others in the leading museums of Europe are the only records that remain of the marvelous Hawaiian art work.

The Colorado River

(Continued from page 2)

the necessity of bringing the water through a canal, as is now done, that dips into Mexico and which, therefore, is subject to the sovereignty of the Mexican Government. By the construction of such a dam, water and power could also be furnished to Los Angeles and other southern California cities and another artificial lake backed up through the canyon of the river for ninety miles.

The country from here on alternates between canyons, deserts and irrigated spots, and includes the famous Mohave region. The river on leaving the Black Canyon frequently becomes meandering and, owing to its unstaple banks, is ever changing until the hills close in on it at the lower end of the Mohave Valley and the stream is encompassed within the walls of the Mohave Canyon with a channel 240 feet wide and walls of granite rock. Here, too, a dam could be built to raise the water 155 feet high, store up 10,000,000 acre feet and back it up for a hundred miles or more, but such a control of the river would necessitate wiping out the little town of Needles, where the Santa Fe Railroad crosses the river from Arizona and enters California and there would have to be a new location for the stretch of trackage that would be submerged by the reservoir.

The Salton Sea, to the right and over in the northern part of the Imperial Valley, is a constant reminder to the people of the valley of what can happen in that cup-shaped area several hundred feet below sea level when the Colorado River goes on a rampage, breaks through its banks and flows over the rim of the cup. One could also see the Laguna Dam in the bed of the river, which diverts the water that is used in the Yuma irrigation project, a few miles south of it.

The thread of the Imperial Valley canal is visible where it crosses the border line into Mexico and meanders along using the bed of the Alamo River as the method of carrying the water through Mexico and back again north into the Imperial Valley of southern California. One of the sore points of the residents of the Imperial Valley is that they must not only give up half of the water that passes down through the canal to those on the Mexican side of the line, but must also be subject to the Mexican Government, because the canal passes through Mexican territory.

ON THE Mexican side of the border line there are about 200,000 acres irrigated at this time from the canal and possibly a million in all that could be irrigated if there were storage regulation of the flow. The Californians are urging our Federal Government to divert the water for the Imperial Valley at a point shortly below the Laguna Dam and construct a ditch in a westerly direction toward the Imperial Valley that will all be within American territory.

After one has passed Laguna Dam, the town of Yuma and the irrigated section nearby come into view. The town is located near the junction of the Gila and the Colorado rivers. The former stream drains much of the south central part of Arizona and is fed by many rivers, among them the Salt River on which the Roosevelt Dam is located. The run-off from this river frequently comes down in tremendous and sudden floods that carry great quantities of silt and are a threat to the Imperial Valley and the Mexican landowners along the river.

Near the junction of the Colorado and Gila at Yuma, the river turns west for a few miles, flowing along on the top of a ridge. Then the channel sweeps around and veers south toward the Gulf with the river still on the top of the ridge. After a few miles it begins to divide and slip down in numerous streams off the right side and disappear under the cover of the jungle. The view from an airplane reveals a glimpse of the lost streams. They play hide-and-seek for about twenty miles when they reappear.

Many millions of dollars have been spent to hold the river within bounds. On the Mexican side there are seventy-eight miles of levees and in the United States thirty miles, the money for practically all of which came from the United States. There is a constant attack by the river against these levees and despite the fact that there are railroad tracks built up close to the river banks and train loads of stone ready to fill in the breaks, the mad stream breaks through and every time it does so causes destruction of property.

Now that the river has been discovered man proposes to change its career so that it shall become a tranquil slave to him. Its power is to be turned into possibilities for reclaiming deserts and producing energy so controlled that it will make life more comfortable and safer for the conqueror.

CHATS WITH OFFICE CALLERS

Every Westerner should go traipsing to New York at regular intervals and every New Yorker should go traipsing out West and interview the business arena of tomorrow. Westerners should know and appreciate their New York, and New Yorkers should know their West. Personally, I am always grateful to New York for fresh ideas, for new incentive.

So spake the ***Girl From the West Coast*** who was on her way home from Manhattan. 'John Burroughs said that the farther east one went, the more man-made things would he find; and the farther west he went, the more God-made things would he find.

'New York stimulates me; although why, I can't say. I might camp all summer at 42d and Broadway and never see anyone I know. The hectic rush and crush and roar of the crowds is nowhere more tumultuous than at the end of the day at the subway stations; and yet it was in one of these subway stations that I received my first bit of human treatment from a stranger.

'I was alone with piles of baggage around me. I had to get a nickel out somehow, in order to telephone to friends. I didn't have the change; but as I stood wondering what to do, a New Yorker, sensing my dilemma, stepped up, handed me the coin and then hurried off without waiting for my "thank you." That's why we love New York.'

* * *

The ***Man From North Carolina,*** on a visit to his summer cottage on the shores of Lake St. Clair, called at the office to tell us about things down South, particularly about the present status of the southern Negro. Our friend showed that the Negro is not without honor in his own country. 'Take, for example, the case of Thomas Jeffries, a typical "befo the war" darky who has just died at over eighty years of age, and who has been for more than fifty years janitor of Wake Forest College, my alma mater.

'He was known to thousands of former students as "Doctor Tom," and his integrity, unfailing good humor and quaint sayings had made him an institution. "Doctor Tom" was for many years the principal speaker at a smoker held by each senior class shortly before each commencement and he invariably attributed to Shakespeare such advice as he deemed appropriate.

'Said "Doctor Tom" in speaking of himself: "I think my success is come by tendin' to my business an' always usin' exertions to gainin' frien's stid o' gainin' foes. All de people dat graduates an' goes away look as if dey is as glad to see me an' greets me as if I was de president of Wake Fores' College. I have trusted in de Lord an' I haven't put nothin' befo' Him an' I've always had a reward."

'"Doctor Tom" was a great old character and loved by all the students who went to the college during his régime. I wish that I had written down all the things that he ever attributed to Shakespeare. You would frequently hear him paraphrase some statement of a big man as quoted in the daily press by saying: "And, young gemen, as Shakespeare says—" et cetera. I think on the whole the old students who did visit the college were a great deal gladder to see old "Doctor Tom" than they were to see the president of Wake Forest College.

'His funeral services were held in Wingate Memorial Hall where all the larger college events are held and officials of the college acted as honorary pallbearers. Tributes were paid to the memory of "Doctor Tom" by the college faculty and other influential white citizens. I think this clearly demonstrates that a worthy Negro is not without respect and honor even among southern white people, some opinion to the contrary notwithstanding.'

* * *

'If the sums of money now being spent for armament and the military establishment could be devoted to an international travel fund,' suggested the ***Sophomore*** from Columbia University, 'it might do away with all danger of war. Most of us would like to travel and see how the fellow on the other side of the world lives. At present the cost is prohibitive as far as most of us are concerned. But if travel became a Governmental concern, like education, or if it became a part of education, we could readily enjoy its benefits.

'Why couldn't the antiquated war vessels be used to afford a means of travel to our young men in an educational way? Of course, it is possible now to "join the Navy and see the world"—but I have in mind seeing the world through different eyes than those of a sailor. I mean through the eyes of a student.

'Surely if our young men and those of other lands, at a certain period in their college education, received as a part of their course two years in foreign lands, the misunderstandings and the prejudices which now exist would be wiped out. The young Nipponese would understand the Californian; and the young Russian would lose some of his desire to overturn all alien institutions.'

* * *

'The lure of the great out of doors is now in everybody's life,' said the ***Preacher.*** 'The mountains beckon, the trout streams invite, the ocean calls.

'This is the season of vacations and of camp meetings.

'It is interesting to note that the Simpson Park Camp Meeting at Romeo, Michigan, antedates the organization of the National Camp Meetings three years. This camp was started in 1865 by the Reverend John Russell, founder of the Prohibition party.

'There is a note of reality in these camp meetings that attracts thousands. The great tabernacle at Ocean Grove, New Jersey, seats 10,000 persons and is too small for the camp meeting multitudes. The number of children and young people who throng these camp grounds give promise of their perpetuity.'

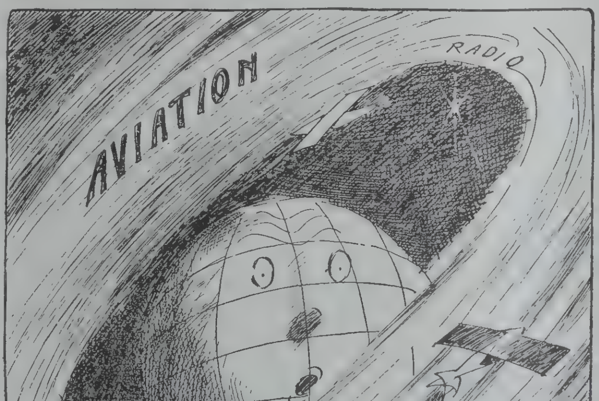
* * *

'Booms are dangerous things under certain conditions and circumstances,' said the ***Man From Texas.*** 'Pent up in limited space they are like a charge of powder between two anvils—there is a loud noise often followed by disaster.

'Now we have booms in Texas, but with the whole front side of the United States in which to expend their force, they simply sweep gently over the landscape like a benison of prosperity, and leave behind them no horrid wrecks, aching voids, sore heads nor cold feet. A boom never "busts" in Texas—it merely evaporates, or ripples off into another county and nobody notices that it is gone.

'Now there's Galveston—second port of the U. S. A., to say nothing of some others which have helped lift Texas above New York as an exporting state. Galveston was first brought into prominence by Jean Lafitte, the picturesque pirate who settled there a century ago.

'Jean is dead, and the black flag no longer floats over the island city, but his tribe persists. Our modern pirates are not nearly so romantic as Lafitte, but they are more efficient, and take no chances of having the governor offer a reward for their heads, as he did. Should Jean's successors, who are engaged in business and finance and other forms of legal hijacking, fall afoul of the authorities, they hire the best lawyer in town, who gets them off with a light sentence, at most.'



—Donahey, in the *Cleveland Plain Dealer.*

MAKES THE OLD BOY DIZZY!

CAN YOU TELL ME?

Question. What is the population of the world? Of China? Russia? India? Japan?

Answer. The population of the world is estimated at 1,748,000,000; of China at 400,000,000; Russia at 133,442,065; India at 318,885,980 and Japan at 142,000,000.

Q. What is the average cost of a destroyer of the type of No. 301?

A. The average cost of the group of destroyers of the type of No. 301 was $1,890,000.

* * *

Q. How many men were killed in the Revolutionary War?

A. The War Department has never made an official compilation of the number of men of the Continental forces killed in the Revolutionary War, due to the fact that the department has not been able to secure all the records of that war in the possession of authorities of states and in some cases private individuals. Upon the basis of such investigation of the subject as has been made it appears that at least 4,440 soldiers of the Continental Army were killed; 6,004 were wounded and 6,642 were captured. These figures do not include 2,000 missing in action and unaccounted for, and represent in each case a minimum.

* * *

Q. Does the Department of Agriculture furnish an analysis of food and water that might contain poison?

A. Samples of foods, including water, are constantly being collected by authorized agents of the department and analyzed by department analysis in the enforcement of the Federal Food and Drugs Act. This law, however, provides for giving out information concerning results of investigations conducted in connection with the enforcement of the act only in the form of Notices of Judgment issued subsequent to court action. The department has no authority to analyze samples of food products and report direct to the individual or corporation desiring the analysis made. The only condition under which it could properly make an examination of foods or water that might contain poison would be in investigations under the Food and Drugs Act.

* * *

Q. Is it possible to get some information about longevity claims of United States Army officers?

A. In the act of January 29, 1927, provision is made for settlement of those claims of officers for longevity pay and allowances certified by the Court of Claims based on service at the United States Military Academy and those claims which were disallowed by the accounting officers between 1890 and 1908. Application can be made only by the officer or his widow or legal representatives of blood relations of deceased. Interest is not paid in these cases. For further information write the General Accounting Office, Washington, D. C.

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

* * *

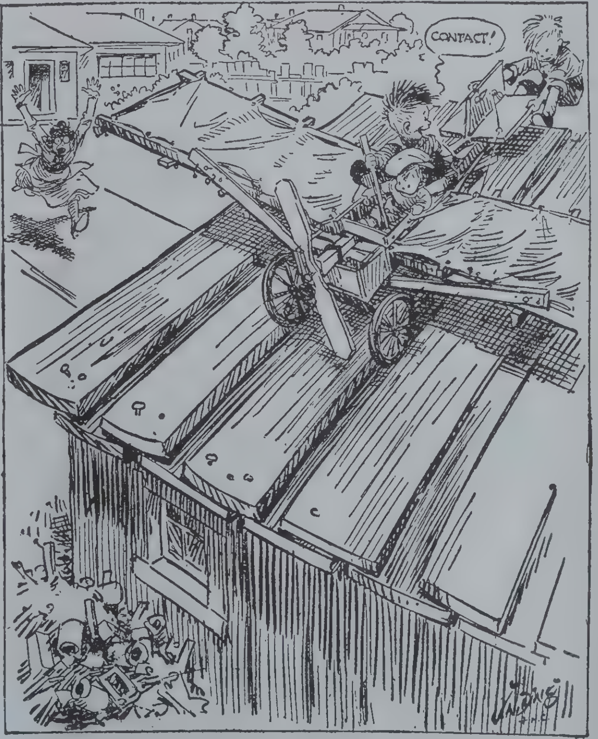
Q. I would like to get a list of the United States senators from Ohio from 1856 to the present time.

A. Benjamin F. Wade, 1851-1869; George E. Pugh, 1855-1861; Salmon P. Chase, 1861; John Sherman, 1861-1877; Allen G. Thurman, 1869-1881; Stanley Matthews, 1877-1879; George H. Pendleton, 1879-1885; John Sherman, 1881-1897; Henry B. Payne, 1885-1891; Calvin S. Brice, 1891-1897; Marcus A. Hanna, 1897-1904; Joseph B. Foraker, 1897-1909; Charles Dick, 1904-1911; Theodore E. Burton, 1909-1915; Atlee Pomerene, 1911-1923; W. G. Harding, 1915-1921; Simeon D. Fess, 1923-1929; Frank B. Willis, 1921-1933.

* * *

Q. I would like to get the names of the generals and lieutenant generals who served in the Confederate Army.

A. General in chief: Robert E. Lee; Generals: Samuel Cooper, Albert Sidney Johnston, G. T. Beauregard, Joseph E. Johnston, Braxton Bragg, E. Kirby Smith, John B. Hood. Lieutenant Generals: James Longstreet, Thos. J. ('Stonewall') Jackson, Leonidas Polk, Theophilus H. Holmes, William J. Hardee, John C. Pemberton, Richard S. Ewell, Ambrose P. Hill, Daniel H. Hill, Richard Taylor, Stephen D. Lee, Jubal A. Early, Richard H. Anderson, Alexander P. Stewart, Nathan Bedford Forrest, Wade Hampton, Simon Bolivar Buckner, Joseph Wheeler, John B. Gordon.



—Darling, in the *Detroit News.* Copyright, *N. Y. Herald-Tribune.*

RECENT EVENTS HAVE GREATLY STIMULATED INTEREST IN AVIATION.

* * *

Q. How many men were drafted in the World War, how many went abroad, and how many were under fire?

A. Under the Selective Service Act passed on May 19, 1917, and subsequently amended, a total of 24,234,021 men were registered and 2,810,296 were inducted into military service. During the war 2,084,000 American men reached France and 1,390,000 saw active service in the front line.

* * *

Q. Did not two Englishmen cross the Atlantic by air from Newfoundland to Ireland about seven years ago?

A. Yes. On June 14 and 15, 1919, Captain John Alcock (knighted later), aviator, and Lieutenant Arthur W. Brown (knighted later), navigator, made a nonstop transoceanic flight from St. Johns, Newfoundland, to Clifden, Ireland, in a Vickers-Vimy biplane, with a Rolls-Royce engine. The distance covered was 1,960 miles in 16 hours 12 minutes. The flight won the London *Daily Mail* prize of $50,000.

* * *

Q. I should like to know something about the President's traveling expenses. How are the funds accounted for, and so forth?

A. The yearly appropriation of $25,000 for traveling expenses covers also 'official entertainment' expenses. From 1915 to 1924 the whole sum of $25,000 has never been spent by any President; the unexpended balance amounting to from $1,099.76 to $22,150.39. The funds thus advanced are accounted for the same as funds advanced to other disbursing agents of the Government, all payments being supported by vouchers, and so forth, approved and certified by the President. The unexpended balances are returned to the Treasury. The expenses of operating the *Mayflower* are paid from appropriations for the Navy, the President's personal expenses of subsistence and entertainment while on the *Mayflower* come under his traveling expenses. In addition to the salary and the traveling expenses, the President is entitled to the use of the White House or an Executive Mansion. Special appropriations take care of the upkeep.

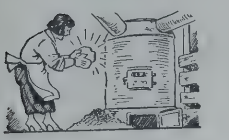
BRIEFLY TOLD

The United States College of Veterinary Surgeons at Washington, D. C., founded thirty-five years ago, has just graduated its last class. The passing of the horse has made necessary the closing of the college.

Before the time of the trousers pocket, man carried his valuables in a little bag of cloth tied about his waist. Often, however, a thief would slip up behind, slit the string with a knife and make off with the treasure. A thoughtful Frenchman, 300 years ago, sewed the bag in the lining of his garments, thereby instituting the first trousers pocket.

Many London factories and business offices have posted an order forbidding girl employes to powder their noses during business hours. Prior to this order the average London business girl powdered her nose four times an hour, taking two minutes to do it each time.

When Caspar Wistar, 182 years ago, gave land for the building of the Trinity Reformed Church at Tulpehocken, Pennsylvania, he stipulated in the deed that one red rose should be the annual rental. Each year the heirs of the donor are presented with a single red rose.



A Cape Charles, Virginia, woman found a clinker jamming her furnace grate. When dislodged it was found to be heavy and yellow in appearance. A jeweler assayed it as twenty-carat gold, worth eighty cents a pennyweight.

Patrick Henry is said to have taught Thomas Jefferson how to play the violin.

The word 'silk' is believed to have originated from the Chinese word for fabric, 'si.'

Daniel Webster objected to taking over the Oregon territory because it was so far away that the terms of office of congressmen might expire before they could reach Washington.

Dante Gabriel Rossetti had published none of his poems when his wife's death occurred in February, 1862. So great was his grief that he buried in her coffin the manuscripts of all his verse. They were rescued by Charles Augustus Howell in 1869.

According to a recent experiment completed in Finland to estimate the energy consumed in dancing, the fast mazurka consumes 10.87 calories; the polka, 7.56; the fox trot, 4.78; the schottische, 4.76 and the waltz, 3.99.

According to a record kept by the editor of the *American Medical Journal*, the average age for a doctor is 62.8 years.

German creosote, a crude form of carbolic acid, used by Lord Lister in May, 1866, was the first antiseptic used in surgery.

The boots made by an Eskimo and worn by Commander Richard Byrd in his Arctic flight have made the trip over the North Pole twice. They were loaned to Lincoln Ellsworth, a passenger in the *Norge*, when it crossed the pole.

There were 27,398,170 pupils enrolled last year in the 263,280 schools of the United States.

When Indian chiefs call the tribesmen together for a powwow nowadays they use newspapers instead of the old signal fires on mountain tops. An advertisement in a daily reaches thousands of tribesmen.

Peter Henlein, a locksmith of Nuremberg, made the first watch in 1500. The awkward instruments, without crystals and with only one hand, were known as 'Nuremberg eggs.'

Robert Raikes is said to have held the first Sunday school in 1812, when one Sunday morning he gathered the street boys of Gloucester, England, into his house and held a free school to keep them off the streets.

When asked the question, 'Who is Calvin Coolidge?' the pupils in a high school in Paris gave the following answers: An aviator; the inventor of the Paris subway; a big diplomat, my father knows him well; and a relative of Lafayette.

The native pearl divers of the South Seas are able to stay under water as long as two and a quarter minutes.

The larvae of the oyster are so small that more than one thousand can be placed on a square inch of shell with very few touching each other.

On the beach at Redondo, near Los Angeles, California, stands the castle 'Flotsam,' built entirely from lumber that the sea cast up on shore. It is the home of Louis Dart who, broke and ill some months ago, decided he must have a home on this beach. His dwelling when finished had cost him but twenty cents, the amount expended for a lock.

Among a group of ancient volumes shown recently in Chicago was one with leaves of thin beaten copper, decorated in lacquer and gold. The covers of this book are of wood.

Because of the curtailment of women's garments, the average weight of trunks carried by the traveling public has been reduced to eighty-five pounds.

The university at Pavia, Italy, founded in A. D. 825 by Lothair, grandson of Charlemagne, is the oldest in the world.

Abraham, Isaac and Jacob Waggoner, seventy-one-year-old triplets, claim the distinction of being the oldest triplets in Tennessee and possibly in the United States. They have lived all their lives within ten miles of one another, have never been ill enough to require a doctor's services and do not smoke, chew or drink.

'Horse' is frequently used in the names of plants and fruits to denote a large, coarse or strong variety. It is supposed that 'horseradish' acquired its name in this way, being regarded as a coarse kind of radish.

Under an act of the British Parliament passed in 1360, punishment for eavesdropping may still be imposed.

A bald-headed bachelor on the faculty of the Ohio State University buys 10,000 hairpins every year. He uses them to attach labels to ears of corn in the laboratory.

A doll's house in a match box, requiring thirty-five years' effort on the part of Charles W. Alfridge, of Battersea, England, has just been finished. The four-room miniature, completely furnished in every detail, is presided over by a tiny doll.

Bill Jenney, a sixty-two-year-old clockmaker who for the last thirty-two years has been winding and tending the 1,050 clocks of the Savoy Hotel, London, claimed many years ago that at any hour of the day or night he could tell the time within half a minute. This uncanny ability baffles the British Medical Society, members of which have tried by numerous tests to dislodge what they call his 'acute psychoastral poise.'

The oldest Christian church in the world, built during the Third Century, stands within the shadow of Mount Ararat at Etchmiadzin in Soviet Armenia. Gregory the Illuminator, whom the Armenians believe converted them to Christianity, is supposed to have been its founder, and it is for that reason known as St. Gregory's Cathedral.

Blue is the favorite color of Queen Mary of England. The Queen carries her color preference even to the royal gardens, where plants with blue blossoms of all shades predominate.

John Henry G. Pierson of New York City, who was graduated this year from Yale University, broke all scholastic records of that institution by going through four years of work with an average grade of 96.

In tropical countries giant fireflies are imprisoned in a perforated gourd, which serves the owner as a lantern.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S Page this week discusses the ethics of charity.

* * *

The cover design is a reproduction of one of Stanley Woodward's pencil sketches. It represents a corner of a New Hampshire farmyard.

* * *

Not so very long ago the industrial world discovered Niagara Falls and 'white coal' was transmitted to both sides of the international border to furnish hundreds of thousands of horsepower to provide light and motivation and other benefits. Now it is the Colorado River. It has been flowing on for many centuries without much thought being given to its possibilities. (p. 1)

* * *

Huston Thompson, formerly chairman of the Federal Trade Commission, and a publicist of note, gives the history of the modern 'discovery' of the Colorado and what it means to the country as a whole. The construction of colossal dams to furnish power and water for irrigation is being discussed. There are rival schemes from Arizona and California. (p. 1)

* * *

A little house that will stand for centuries is better than a big house that only lasts a generation. A little house, a big garden and lots of books is some people's idea of comfort and happiness, and it is apparently Hugh Walpole's. The author of *The Cathedral* and *Harmer John* lives in a little house in the lake district of the north of England. Just like the Lakist poets, of whom Wordsworth was an outstanding example, he finds inspiration that makes his stories intensely human and appealing. (p. 3)

* * *

Vachel Lindsay's second article on the definition of the Middle West might well have been entitled an *interpretation* of the Middle West through the personality of one of its daughters—Anne Rutledge, Abraham Lincoln's early love. Lincoln came to live in Springfield, Illinois, a man 'old before his time, from a broken heart, because of the death of this girl.' (p. 4)

* * *

Vachel Lindsay, with that quick imagination of which he is capable, assumes the rôle of the Ancient Mariner and pictures Anne Rutledge as one of three sitting round the fire in a log cabin. The three women spinning by the fire are the three young fates. The other two are Juliet, beloved of Romeo, and Joan of Arc, martyr and patriot. They are spinning the thread of the fate of a man who will die for the love of a land. (p. 4)

* * *

Athletic champions come and go and as a rule go far more rapidly than they come. It is getting more and more difficult to hold a title in any branch of sport, because as fast as a championship is gained it is attacked and recaptured by some other athlete who has tried out some more effective method. H. G. Salsinger, sports writer and editor, gives many reasons why 'holding the crest' is difficult. (p. 6)

* * *

When a woman writes about women her remarks are always interesting. Edna M. Colman reviews the pioneers in women's social and industrial development. Some regarded these pioneers as so many cranks and busybodies, but one thing they deserve credit for, and that is their perseverance in reaching their objectives. Most of these women pioneers have passed away, but their work remains. (p. 7)

* * *

To find a good fiddle is not so easy as it sounds, and you must have a good fiddle before you can have good music. There are more points about a fiddle when buying it than there are in the buying of a home. When you know these points you may find the ideal fiddle. Clyde Wier of Brown University, who has already contributed a series of talks on stringed instruments to THE DEARBORN INDEPENDENT, gives many practical hints on what to avoid and what to look for when buying a fiddle. (p. 8)

* * *

An article that McKee Barclay, cartoonist and magazine writer, calls 'those strange but true stories' brings attention to items in daily newspapers which show that although 'Life is real, life is earnest,' it is full of romance, mystery and amazing coincidence. Movie scenarios, stage plots, and printed romances which seem improbable to the point of impossibility may be paralleled by the news item which will be served up in tomorrow's paper. The best stories seem to have been set down by the hand of Truth. (p. 12)

* * *

Aaron Hardy Ulm tells just why a bookworm turns. The bookworm in this case is indignant because books are much dearer and scarcer than they ought to be. Even reprints and second editions are sold at a much higher figure than seems justifiable. In Europe, particularly in France, the cost of books is counted in cents while in America it is counted in dollars. (p. 14)

* * *

It only takes little more than a week to reach Sweden from this side of the Atlantic, and it is a perfectly safe country to travel in. It has towering mountains, thundering waterfalls and hardy and picturesque peasantry. Norrland may be called Sweden's Wild West. It is full of surprises for the stranger from afar. (p. 16)

REMARKS BY OUR READERS

Green Bay, Wisconsin.

Reverting to his letter about the Custer massacre which appeared in our last issue, our correspondent continues:

General Custer was not in the least mutilated; he was shot in the right side and temple but looked as natural and as peaceful as a child when found with his body resting between two dead cavalry men. All others were mutilated shockingly. Mr. Philbrick must have confused Tom Custer with his brother, as this same 'Rain in the Face' cut Tom's heart out and has boasted of it. The detachment under General Godfrey found this to be the case when burying the men.

From a check-up of 'Rain in the Face's' talks from time to time there is found to be some padding done, especially in his statement concerning the death of the veterinary and the surgeon of Fort Lincoln. He killed them both, but not at Fort Lincoln as he stated; it happened in August, 1873, on the Yellowstone River. This was due to his eternal hatred for Tom Custer who had arrested him and put him in the guard house at Fort Lincoln. He swore vengeance after his escape. And how well he kept his word!

Custer was soon afterward ordered to the front. 'Comanche' was found by the 7th Cavalry, not by the 10th, was led to the steamer 'Far West' and placed with the wounded on the boat, behind the steering part of the boat where there was just room enough for him to stand; he was taken to Fort Lincoln with fifty wounded from Reno's fight. He was nursed to life at Fort Lincoln—was never mounted again, by order of General Sturgis, the father of Jack, who took charge after Custer's death, and was for years paraded with the troops. He finally died, was mounted at the World's Fair, Chicago, and is now in the Kansas Museum at Lawrence, Kansas. General Sturgis' daughter, Mrs. Dousman, at Billings, Montana, has the original order that her father issued regarding 'Comanche.'

As for Curly, he could not talk English and ran to the steamer 'Far West' anchored twelve miles away; this was the supply steamer for the troops. He was almost crazed but could explain nothing to Captains Marsh and Baker. They finally grasped it that Custer had been wiped out.

The battle ground shows plainly that once they were in there, there was no possible escape. The poor fellows fought with desperation, expecting aid which never came; and when they retreated, they found the enemy blocking every coulee by the score; they all fell bravely and honorably.

Custer's four relatives fell with him.

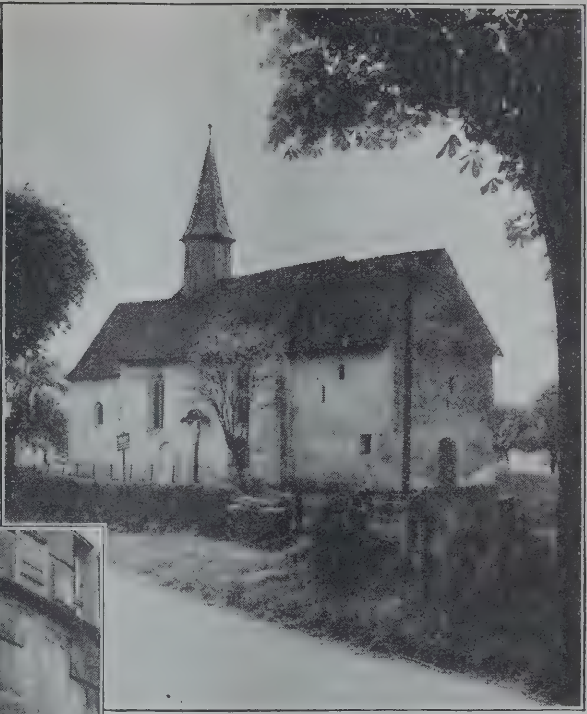
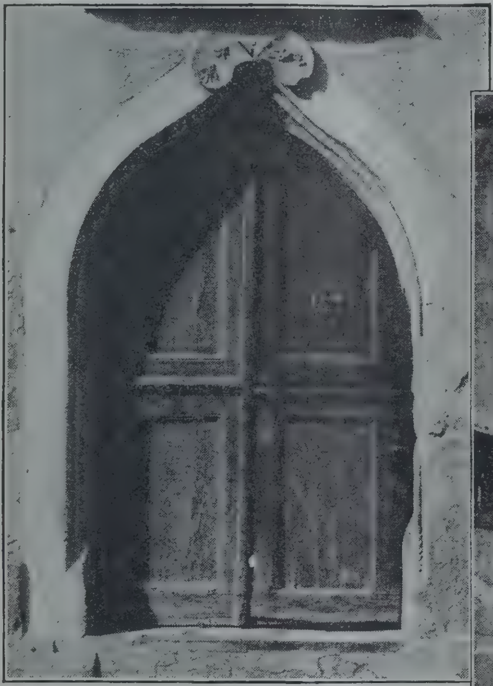
Century-Old Stone Structures

Preserve Beauty *of* Past Master-Builders *in* Germany

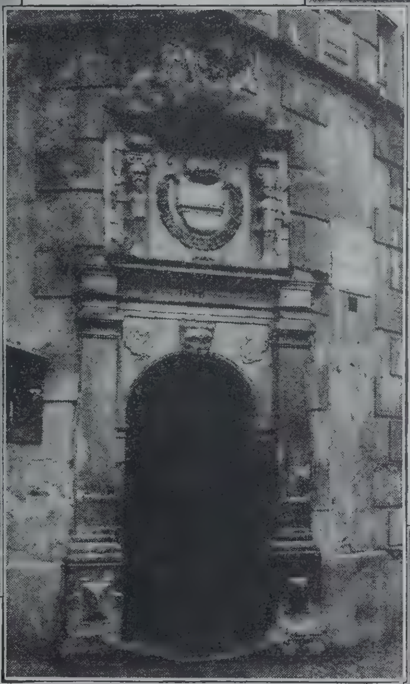
—Photos by K. Obert, Freiburg.



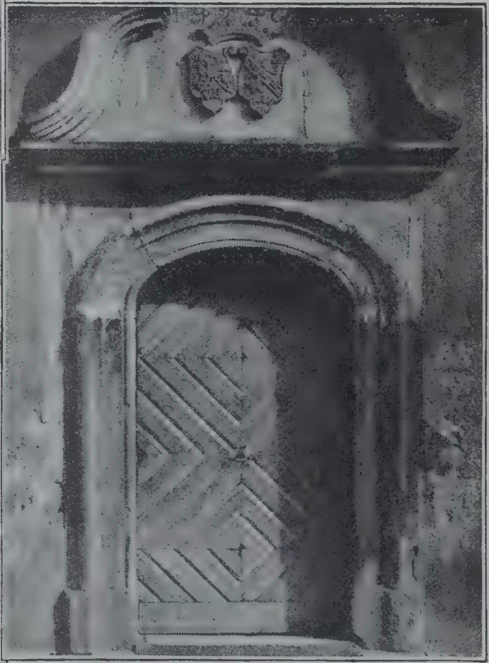
The oldest church in Germany, belonging to the Ninth Century, is found near Goldbach, Lake of Constance. It has the simple lines, very thick walls and arched windows of early days. The mural paintings inside are of particular interest, dating from the 10th Century.



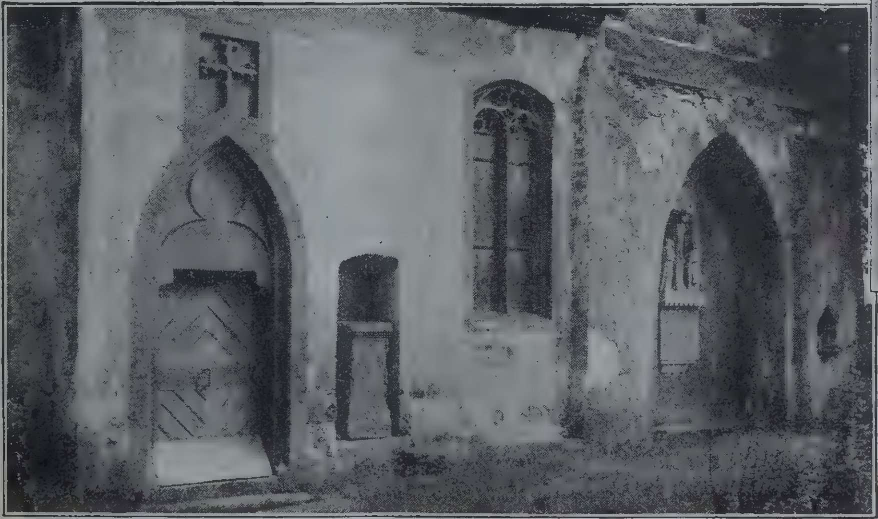
This historic house entrance in Endingen, Germany, shows quaint designing. The arched entrance, with coat of arms overhead, is provided with stout wooden doors, planned to withstand attack.



Another historic arched entrance, dating from 1604, is artistically wrought with pilasters on each side, surmounted by an ornately decorated panel.



In Sasbach am Kaiserstuhl, on the Rhine, is found this historic entrance, with its semi-eliptical arch. The archway is crowned by the coat of arms of the original owner, over which is inscribed the date, 1746. The door, too, is carefully wrought in a concentric diamond design.



Roman sacrificial stone in a niche in the wall of the interesting old chapel of St. Michael near Gundelsheim am Neckar.

GATES

Katherine Marie Barton

I STAND upon the summit of today
And look away . . . away . . .
To where the low blue gates of evening close,
And wonder where time goes.

So much I thought to do is still undone.
Have I too swiftly run?
Oh, where are all the little deeds of gold
A day of mine should hold?

And where, the irised wayside joys that should
Have sprung where my feet stood?
Night comes. No star looks down on my regret.
Time gone—quite gone! And yet

I hear the purple wingbeats of tomorrow—
With brave resolve I borrow
Hope, as dawn's slim latticed gates swing wide,
And step, red-plumed, inside.

The Border Patrol is instrumental in frustrating the attempts of thousands of aliens who would enter this country illegally.

The MEN Without a COUNTRY

Piecemeal Legislation *Has Left* Thousands of Them *in* Our Midst; *The* Secretary *of* Labor Proposes *a* Remedy

By JAMES J. DAVIS

WE HAVE literally hundreds of thousands, and possibly more than a million, aliens residing in the United States—most of them thoroughly assimilated into our business and industrial life—who, should necessity arise, are not in a position to prove the legality of their residence here.

This is a serious situation. These aliens, if they arrived prior to June 3, 1921, when our first quota immigration law became effective, are in the main not deportable. They could be deported, if at all, only on some charge other than illegal residence.

Yet the large proportion of them having the legal right to remain in the United States cannot become citizens. They are under this disability because technically they do not begin their legal residence in the United States until they are lawfully admitted. Their failure to prove, by the records of the Immigration Service, that they have been lawfully admitted, even though that may be a fact, precludes the use of their actual entry date as the beginning of the period of residence required for naturalization.

Because these aliens cannot become naturalized they are debarred from voting and exercising many other rights which citizenship confers. They cannot unite their families, if separated, by bringing in their wives and children outside the quotas. They cannot practise law, or settle on public lands. In a number of states they are debarred from holding land at all, from practising accountancy, and even from inheriting property. They are unable to travel abroad and return home.

Some of these aliens have lived in this country so long that their children born here have grown up and now exercise the right to vote, as native Americans, while they, the parents, are denied it.

Furthermore, although no period of residence in the United States, however extended, of itself confers citizenship, in certain foreign countries lack of residence does forfeit citizenship. Consequently many of our aliens by reason of their long absence have been expatriated in their native lands while denied naturalization here. They are legally, as well as in practical effect, 'men without a country.'

Obviously the ill effects of such a condition are not limited to the alien. They present a danger to our Government and our citizens generally. The situation is an intolerable one in a country of free institutions, and a result of the piecemeal enactment of legislation governing the alien problem. And it is closely related, administratively, to the immense and important task of sending back to their own countries the thousands upon thousands of aliens who are here in violation of our laws and are deportable under those laws.

IN THIS latter class, broadly, are all those who entered without visas after the passage of the Second Quota Law in 1924, many who came between 1921 and 1924, anarchists, immoral classes, and aliens found to have committed a crime before or after entry. The immigration laws lay down many different conditions of deportation for various classes of aliens.

The time has come to set our house in order by giving legal domicile to all those residing here who can qualify under present immigration standards but who are unable to become naturalized because unable to prove their lawful entry and who, at the same time, cannot be deported because of their extended residence, and by providing for the expeditious removal of those who are not desirable.

In view of the accessibility in all parts of the United States of naturalization officers, and the relationship which should exist between naturalization and the permanent residence of aliens in the United States, I have repeatedly recommended the enrollment of aliens with such officers.

This would result in a definite record of the aliens now excluded from citizenship because no record, or an incorrect one, was made when they entered the country. Its primary purpose would be to facilitate the absorption of these aliens, permanently residing here, into the citizenry.

The enrollment should be a form of *nunc pro tunc* proceeding, giving legal domicile to all aliens who upon investigation by the naturalization and immigration officers are found to meet the requirements for admission to the United States under the general immigration laws.

IN PRACTICAL effect these people would be given, by legal dispensation, the same status as lawful residents and candidates for naturalization which would be theirs had they complied fully with the immigration laws at the time they entered the country. There are many reasons, some of them good ones, why they did not so comply.

They came into the country years ago as visitors or tourists, often in all honesty planning to remain only a short time. They drifted over the land borders without proper examination and inspection. They slipped in as stowaways, an easy matter in our early immigration history. They stayed, often married here, became established in our industrial, business, and agricultural life, and now are a potential part of our desirable class of citizens. Their situation today is distressing.

There are even cases where aliens entered legally for permanent residence, went back for a visit, and then through ignorance of the law or misunderstanding returned as 'visitors,' thereby forfeiting their immigration status.

—Harris & Ewing Photo.

Secretary of Labor James J. Davis.

JAMES J. DAVIS was born in Tredegar, South Wales, in 1873. He came to the United States with his parents in 1881 and began work as a puddler's assistant in the iron works at Sharon, Pennsylvania, and Pittsburgh. He was appointed Secretary of Labor by President Harding and continued under President Coolidge. His experience makes him an authority on immigration.

To confer blanket citizenship upon all aliens here illegally is, of course, not the intention. It would be unfair to reward success in evading the law. What is intended is to reach the aliens of such classes as those indicated here, who have been established in the country for a number of years and are qualified fundamentally for citizenship.

Unmistakable evidence that an enormous number of aliens are in this category—sometimes without knowledge on their part of anything irregular in their entry or present status—was found by the Bureau of Immigration during the last two fiscal years. These were the first years in which there was provision for issuance of 'reëntry permits.'

These permits are issued to noncitizen residents of the United States desiring to go abroad temporarily, in order to facilitate their return. They confer upon the lawful holders a nonquota status, although not a general exemption from the immigration laws, such as the health and literacy requirements.

Many applications for these permits had to be rejected because the applicants were unable to show that they ever had been lawfully admitted to the United States, although some of them had been here for many years. They were unable to visit relatives in Europe, or make a business trip out of the country, without giving up their families here, their business interests, and the associations of years, because they would not be permitted to come back to the United States until they could be readmitted under quotas.

THEY were not subject to deportation as long as they remained here. But once they left the country voluntarily, even for a day, they faced a situation like this. The right to enter the United States must always be established under the terms of existing law. Today that law consists basically of the 1924-quota restrictions. The burden of proof of nonquota status by reason of previous lawful admission is placed by the act of 1924 upon the alien seeking to invoke it.

Hence an alien returning to the United States after temporary absence abroad is not entitled to enter by reason of his previous admission and residence unless he furnishes proof of the legality of that admission.

This provision of the law is sound. What is wrong is the existence of an immense number of unnaturalized aliens, unable to prove legal residence, in tragic juxtaposition with a law which in their particular cases spells danger to themselves and to the community.

Under present conditions nothing can be done for these aliens except where special considerations of law as well as of humanity are shown. Always cases of aliens who have resided peacefully in the United States for years and have reared families, and have run counter to the law through ignorance with no intention of any harm to the country or any of its inhabitants, receive the most sympathetic consideration.

SOME months ago we encountered a deportation case in Chicago, which involved a man who had been in the United States since 1923 and was charged with being in excess of the quota. He had an American-born wife and child with him in Chicago. This man had come from Canada but was a citizen of a European country and at the time he entered was subject to the 1921 quota law.

But under the laws in effect when he came in, if an

MEXICO, *the* Pot *of* Gold *at the* Foot *of the* Rainbow

By WILLIAM L. STIDGER

FIVE years ago when I traveled through China a great load of coolies landed at the tip of the Shantung Peninsula at Tsingtao, the former German city. These coolies had been in France for two years, fighting the battles of the Allies back of the lines, digging trenches, and doing the menial tasks that helped to save Democracy.

I watched those men march down the gangplank of the *Asia* to get their pay. They filed past a little box office and each was handed transportation back to his home and five silver dollars.

I asked what kind of money this was and was told that it was 'five dollars Mex.' I looked at these white and shining pieces and sure enough they had been coined in Mexico.

This was a revelation to me. Here we were, on the other side of the earth, and money made of silver dug out of Mexican mines was the surest and safest medium of exchange.

In China at that time—and I think the same condition continues—in every province the coinage system changes, and so when you have Shanghai money it is not good in Canton, and vice versa, Canton money is not good in Peking. It was a burden to be constantly having to change money at some little shop so that every time you moved you would have acceptable currency. It was as bad as if we, here in the United States, were obligated to convert our money into a different coinage every time we crossed a state line; as if money, legal in New York City, were not acceptable in Chicago, and Chicago dollars not good in San Francisco or New Orleans. But the dollar Mex. was good over all China.

This coin contained such a large amount of silver that in recent months the Mexican Government had to reduce the proportion of this metal.

The reason for the reduction was that speculators began to buy up the coins and melt them down, making fortunes on the silver itself. This dollar was shipped out of the country to the United States, to the South Sea Islands, and to the Orient. For untold cen-

Wllm Shakspeare
hundred and twenty poundes

The Boston Public Library signature and writing, enlarged almost twice its original size.

A SHAKESPEARE AUTOGRAPH

That Explains Much

By A. J. PHILPOTT

IN THE Boston Public Library there has been a Shakespeare autograph for forty-six years which has puzzled experts in autographs as well as Shakespearean scholars. Underneath the autograph are four words, evidently in the same handwriting, which, if genuine, gives the Boston Public Library more of Shakespeare's handwriting than has been found elsewhere.

The autograph reads: 'Wllm Shakspeare,' and the four words under the signature are 'hundred and twenty poundes.' What relation these four words bear to the signature—if any—is wholly problematical.

Ever since the library came into possession of the autograph the great question has been, Is it genuine? In the opinion of experts the writing is an autograph of a person who called himself William Shakespeare; that is to say, it is an original signature, not a copy, nor an imitation. Still this is not saying that it is the handwriting of William Shakespeare the great dramatist, although it certainly is in the chirography of the period in which Shakespeare lived. It means that the autograph was written in 1603 by a person whose actual name was 'Wllm Shakspeare.' 'Wllm' was the customary abbreviation for 'William' at that time.

Judge Mellen Chamberlain, who was librarian of the Boston Public Library at the time the autograph came into its possession, says, in a monograph which he wrote telling how the autograph was secured, 'There are many reasons in favor of its genuineness, and too few objections to warrant an adverse judgment.' Judge Chamberlain was a Shakespearean student of considerable ability himself, and he gave some sound reasons in favor of the genuineness of the autograph.

Yet, in spite of all this, the autograph has not been taken very seriously by those most deeply interested in Shakespeare autographs, of which there are very few in existence, and these not any too well, or too clearly, written. This one is clearly written.

The trouble has been, heretofore, that no sound reason could be advanced why such an autograph should appear in the particular place where this one was found. It is written on a scrap of paper that was found where it had been inserted into the 'filling' of the binding at the back of a copy of Sir Thomas North's *Plutarch*, which was printed at London by Richard Field for George Bishop in 1603. It is a folio volume of about 1,500 pages and was considered the finest bit of printing done in England up to that time.

An important thing about that scrap of paper on which the signature of 'Wllm Shakspeare' appears is that it never could have been seen unless the binding came apart at the back of the volume. In the course of time one of the covers broke away from the binding and between the sheets of the 'lip' which held this cover, inside, to the back, was found the scrap of paper containing the autograph. There it was and there it is to this day.

How did it come there?

If that can be explained then it may be possible to explain the signature itself; and when all the known facts concerning the printing of this volume and concerning Richard Field and William Shakespeare are coördinated and analyzed it may be possible to show that this particular autograph is not only genuine but is by all means the best Shakespeare autograph so far discovered—written when he was in his prime.

The other known autographs of Shakespeare were clearly written at a time when the great dramatist was suffering either from palsy or from some infirmity which made it extremely difficult for him to write at the time. Of such is the signature on the will.

Another thing. The facts brought together in connection with this autograph in the Boston Public Library may serve to clear up some of the mystery which has always attached to the wide field of knowledge and the extensive vocabulary which Shakespeare had at his command.

An artist can no more paint a great picture without a precise knowledge of pigments and pigmentary values than an author can write a great composition without a precise knowledge of the words which he uses. No writer in the English language has ever used such an extensive vocabulary as Shakespeare, nor has any writer used words with a keener sense of word values and word meanings.

HE DIDN'T go to college, and if he had gone, it is indeed doubtful if he could have acquired in any college or university so extensive a vocabulary. And, of course, it is sheer nonsense to suppose he could have acquired such a vocabulary in the grammar school at Stratford. It is just as nonsensical to suppose that he could have unconsciously picked up such a vocabulary in the course of conversation with his fellow men—even if they were all scholars.

Where then did he get this general knowledge and such an extensive vocabulary?

William Blades, a London printer and student of the history of printing, offered a reasonable solution of this problem in 1872 in a little pamphlet which he published. In this same pamphlet he offered a solution of the mystery attaching to the first four years of Shakespeare's residence in

London—what he did during those years before he went on the stage.

Bear in mind that William Blades knew nothing of this autograph in the Boston Public Library.

Nobody but a printer like William Blades could have seen the facts he uses in the light in which he uses them. But, of course, his assumptions, based on these facts, were either ignored or treated in a humorous way by the critics. This was natural enough because there are so few students of literature, or critics, who know anything about the technique of printing.

In his pamphlet William Blades assumed that Shakespeare had worked in a printing office during his first four years in London and that the printer for whom he worked was Thomas Vautrollier. He based this assumption on the fact that Shakespeare's boyhood friend in Stratford, Richard Field, was working in a London printing office when Shakespeare went to London and that Field got him a job in Vautrollier's office.

STRANGELY enough it is this same Richard Field who printed the volume of North's *Plutarch* in the Boston Public Library in which the autograph was found. But, as has been said, William Blades knew nothing of that.

Halliwell and others knew that Shakespeare and Field were acquainted but attached no particular importance to the fact. It took William Blades to see the importance of the matter.

Briefly the facts of Richard Field's life and of the life of Thomas Vautrollier are as follows:

Richard Field was born in Stratford about the same time as Shakespeare—1564. Both undoubtedly attended the grammar school at Stratford, the only school there at the time. Field was the son of a tanner and Shakespeare the son of a butcher who was also a glover. So the two families must have known each other very well. In fact Halliwell says that Field's father was 'a friend of Shakespeare's family.' And both families were of the same social rank. In 1592 Shakespeare's father was engaged in appraising the goods of Richard Field's father at Stratford.

Early in 1579 young Field was taken to London and apprenticed to George Bishop, printer and publisher. This was the same George Bishop for whom, twenty-four years later, Richard Field, in business for himself, printed the North *Plutarch* which is in the Boston Public Library and which contains the Shakespeare autograph.

In London at the same time was another eminent printer, Thomas Vautrollier, a Frenchman who came to England at the beginning of Queen Elizabeth's reign and was admitted a brother of the Stationer's Company in 1564, giving him all the rights and privileges of that guild. Naturally he knew George Bishop.

One of the interesting things about Thomas Vautrollier is that he printed the first edition of North's *Plutarch* in 1579. It was a popular book, for it ran through many editions.

Vautrollier, like many of the early master printers, especially on the Continent, was a learned man and a translator. The books which he printed in London were of a high grade and many of them were educational in character—books on religion, law, medicine, insanity, grammars and classical romances. He was both intellectual and energetic and at one time got into some trouble with the government because of his supposed interest in the cause of Mary Queen of Scots. He fled to Edinburgh but returned and died in London in 1588. That same year his daughter married Richard Field and a year later Field took over Vautrollier's business.

These are some of the reasons why William Blades came to the conclusion that Shakespeare worked in Vautrollier's printing office during those first four years after he went from Stratford to London, and before he went on the stage.

What more natural, says Blades, than when Shakespeare got to London, penniless, and not knowing which way to turn, he should call on his boyhood friend Richard Field and that Field should help him, and get him work in his prospective father-in-law's printing shop? And what more natural than that Vautrollier should take a quick liking to the robust, quick-witted William Shakespeare? It would be like bringing together 'two of a kind.'

Vautrollier's shop was in Blackfriars, near the theaters and the taverns and all the active life of London of that day. Vautrollier was the type of man who would be interested in the stage and in stage people; and certainly the whole thing would have fascinated such a nature as Shakespeare's.

Another reason which Blades gave for his assumption that Shakespeare worked with Vautrollier either as compositor or copy reader, or both, was that this would explain how Shakespeare came to have such an extensive and redundant vocabulary and also how he came to have such an apparently intimate knowledge of history, science and the classics, a knowledge which coincides exactly with the kind and character of knowledge contained in the books printed by Vautrollier. In point of fact Shakespeare quotes verbatim, in some of his plays, whole sentences from North's *Plutarch*.

AND, of course, if Shakespeare were either compositor or copy reader in Vautrollier's printing shop he would not only come into contact with this varied knowledge but would be enabled to acquire, without much effort, the extensive vocabulary he possessed. For the old-time compositor not only literally handled words but knew the structure of words as well as their meanings, as only a (*Continued on page 25*)

ART *May Be* 'Long,' *But Not* 'Long-Faced'!

By REGINALD POLAND

WE CAN see beauty practically everywhere, if we so much as try to open our eyes, and it is still true that, 'If eyes were made for seeing, then Beauty is its own excuse for being.' Too much time has been spent in arguing as to why art should exist; it needs no apology.

Now, then, do we like nature because we have seen its interpretation in pictures or pictures becauses we have lived next to nature? (Probably one enhances a love for the other.) Corot said, 'You should not give me, personally, too much credit. I simply paint what I see.' Perhaps—but his vision was surely more than human. Fritz Kreisler is reported to have said, 'I want an artist to paint for me the woods, the valleys, hills and streams in a much more beautiful way than I can see them myself.' That is the way; the painter can see more clearly without being confused by the variety of extraneous matter that often camouflages the truth.

One hears that perhaps everything, elements and all, may be reduced to one force, to force vibrations. Certainly there are simple, common, underlying principles in the universe more or less in harmony with each other. Truth, Goodness and Beauty are bases of life and when combined have been called the *summum bonum,* the greatest good.

Harmony enters into art as into other truths of life. A picture uses nature as its 'alphabet,' its means of 'telling the story.' To get along in life we must observe natural laws. We cannot 'fall up,' if we step from a height into space. That which registers as a deformed thing in art cannot be right because it is unnatural; the likeness of the normal, however, is in harmony with us and often also life-enhancing. Like attracts like. A note when sounded will cause the violin string of the same tone to vibrate sympathetically, though discords will cause 'cold shivers' and make even the dogs howl mournfully! Harmony means not only lack of friction but also, more positively, tranquillity and happiness. The word 'art' comes from a Greek root meaning 'the fitting,' that is, the harmonious.

WHEN an organization such as a factory is operating smoothly, evidently a working system and good plan are responsible. Such order is a mark of the artistic whether in an accurate watch, an automobile factory, or the picture of 'The Last Supper' by Leonardo da Vinci. From chaos the world, the greatest work of art, evolved when order entered into it.

A picture with its order, composition or whatever you choose to call it, tends to enrich life. Beauty comes with such pattern and results in happiness. 'Laugh and the world laughs with you . . . ' The enigmatic but enchanting smile of Mona Lisa is due to the joy which the sitter experienced as she posed to the strains played for her and Da Vinci. And the two things which most delighted this artist were the smiles of beautiful women and the charm of winding streams. Both are evident in this famous portrait. It deserves its fame, giving beholders the joy contributed to it by the painter and his subject.

Esthetic joy is contagious. The more art is shared, the greater is its return. This is easily proved. In traveling alone one should derive much satisfaction, but certainly definite happiness if accompanied by friends of similar tastes. Art is a social matter. Unless this were so, its creators would not need to visualize their masterpieces concretely, but merely in the 'mind's eye,' for themselves alone.

Time and again I have caught myself humming or whistling when modeling. Why? Probably because I am trying to create a natural form in an orderly design that is somewhat akin to my own life. If successful, my clay figure will then embody my song of joy which was itself a part of the universal rhythm.

Every art object needs a reason for its existence. It must mean something. This creation of an idea like the other components, design and at least sufficient technique to be convincing, should bring a wealth of satisfaction to artist and beholder. The real artist is ever creating from his superabundant ideas. Whistler had to leave West Point because he persisted in covering his sheets of surveying problems with his artistic interpretations.

Such expression or creation of ideas is most important for great art. A story runs that William M. Chase, in imagination, painted his most perfect pictures on a blank canvas. He said that, perhaps, some day he might be able to translate these masterpieces into visible paintings—but probably not. This American leader found his truest happiness in the pictures of his imagination. What a pity, however, that they could not be realized, so that others might also share his treasures.

WE HAVE used the word 'creation'; 're-creation,' possibly is better. The artist takes nature, selects, eliminates, rearranges, emphasizes and interprets as he believes he can do so to the benefit of man. With his superior sight and viewpoint he intensifies life and gives us a refreshing picture. Thus in its enjoyment we get a 'second wind,' a new 'lease on life.'

Who does not thrill with the sight of Michaelangelo's 'Creation of Man' on the ceiling of the Sistine Chapel? In it, God the Father swoops down scarcely to touch the common clay which is already in the likeness of man and appears alive with the spark from the extended finger of the Creator. For whom is not life more dramatic and intriguing upon seeing 'The Night Watch' of Rembrandt with its armed and uniformed shooting company in its quarters? It is as effective and ordered as a tableau in the theater. Its 'spot-lighting,' mystic shadows, pleasant lemon yellow, mellow gold and positive maroons combine with the tactile appeal of forms and space to enhance our own being. Of course, one might multiply examples, for similar to this picture is Velasquez 'Maids of Honor' ('*Las Meninas*'), called 'The Theology of Painting.'

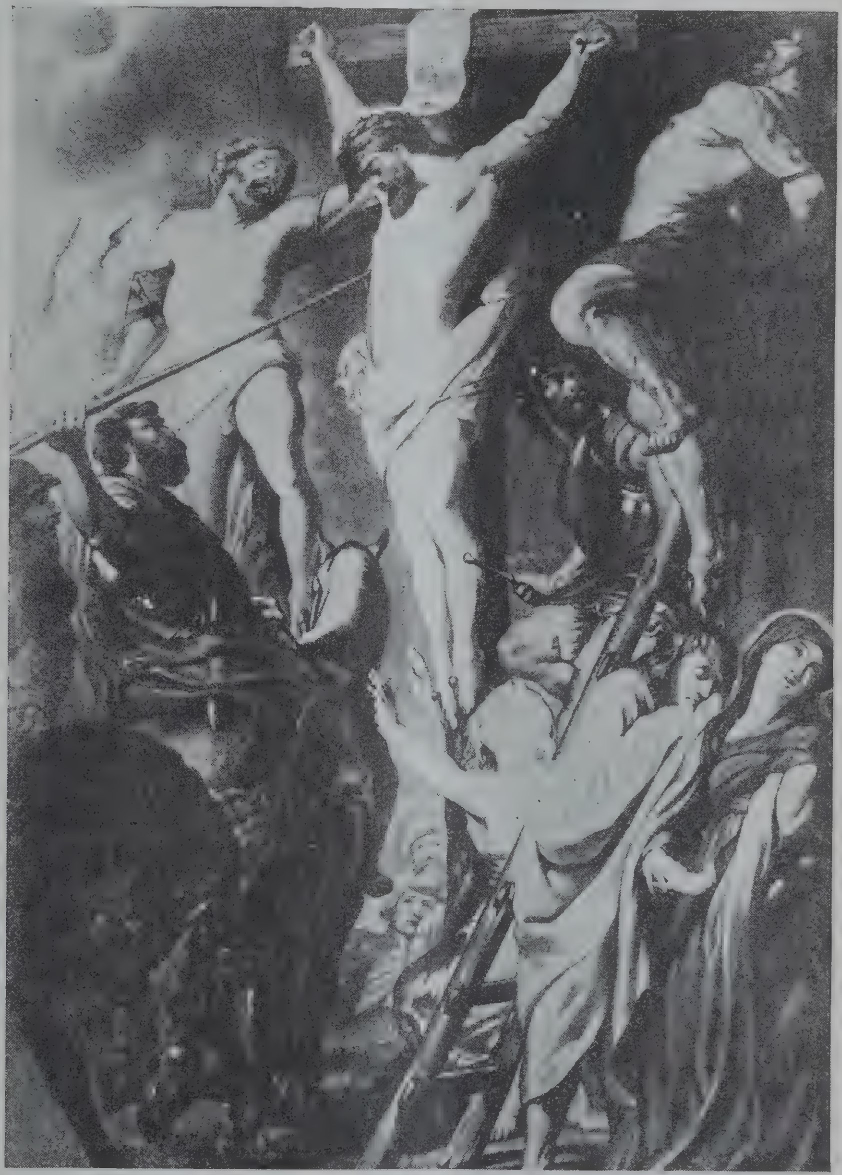
A physical stimulus is added to our study of Rubens' masterly conceptions. This is most obvious in his 'Rape of the Sabines,' wherein the canvas almost resounds with the vibrating of fleshy forms as is the case in the equally muscular 'Elevation of the Cross.' Even more lasting and quite as stirring is the 'Coup de Lance' of Christ on the Cross. Here Rubens interpreted a drama in which the human body and the spirit are both concerned. How greatly such art can influence mankind!

Art can please one and all if they have an open mind and are neither pessimistic nor poisoned by false happiness. We remember a wealthy business man who purchased a landscape by Corot of cattle slaking their thirst in a cool stream beneath the willows. The picture was a great consolation and definite joy to him in the irreparable loss of one dearest to him. Incidentally, he was incensed that friends came to see his 'fabulously expensive Corot,' for he wished no money consideration to be confused with art. Later, though he suffered financial embarrassment, he never parted with that or any other picture to tide him over his misfortune. Rather they made life seem more worth while than when he was prosperous.

Another similarly successful man purchased his first fine lithograph, incidentally paying very little for it, for often superlative prints cost much less than other forms of art. Later he telephoned for other examples, saying that he preferred to use his money for something valuable in terms of beauty rather than in 'road-house parties' which left nothing but a disagreeable memory.

Equally significant, though opposite, is the case of a poor Westerner, who sold eggs, saving the little that she could until she had enough to buy an etching or two. She appreciated the artists' ideas of the Rocky Mountains, the ragged pines, the graceful quaking aspens and sheltering cottonwood trees. She did not let the prosaic farm life, nor even the natural beauties, suffer. She even had to make sacrifices to possess the prints, but having done so, of course, prized them all the more.

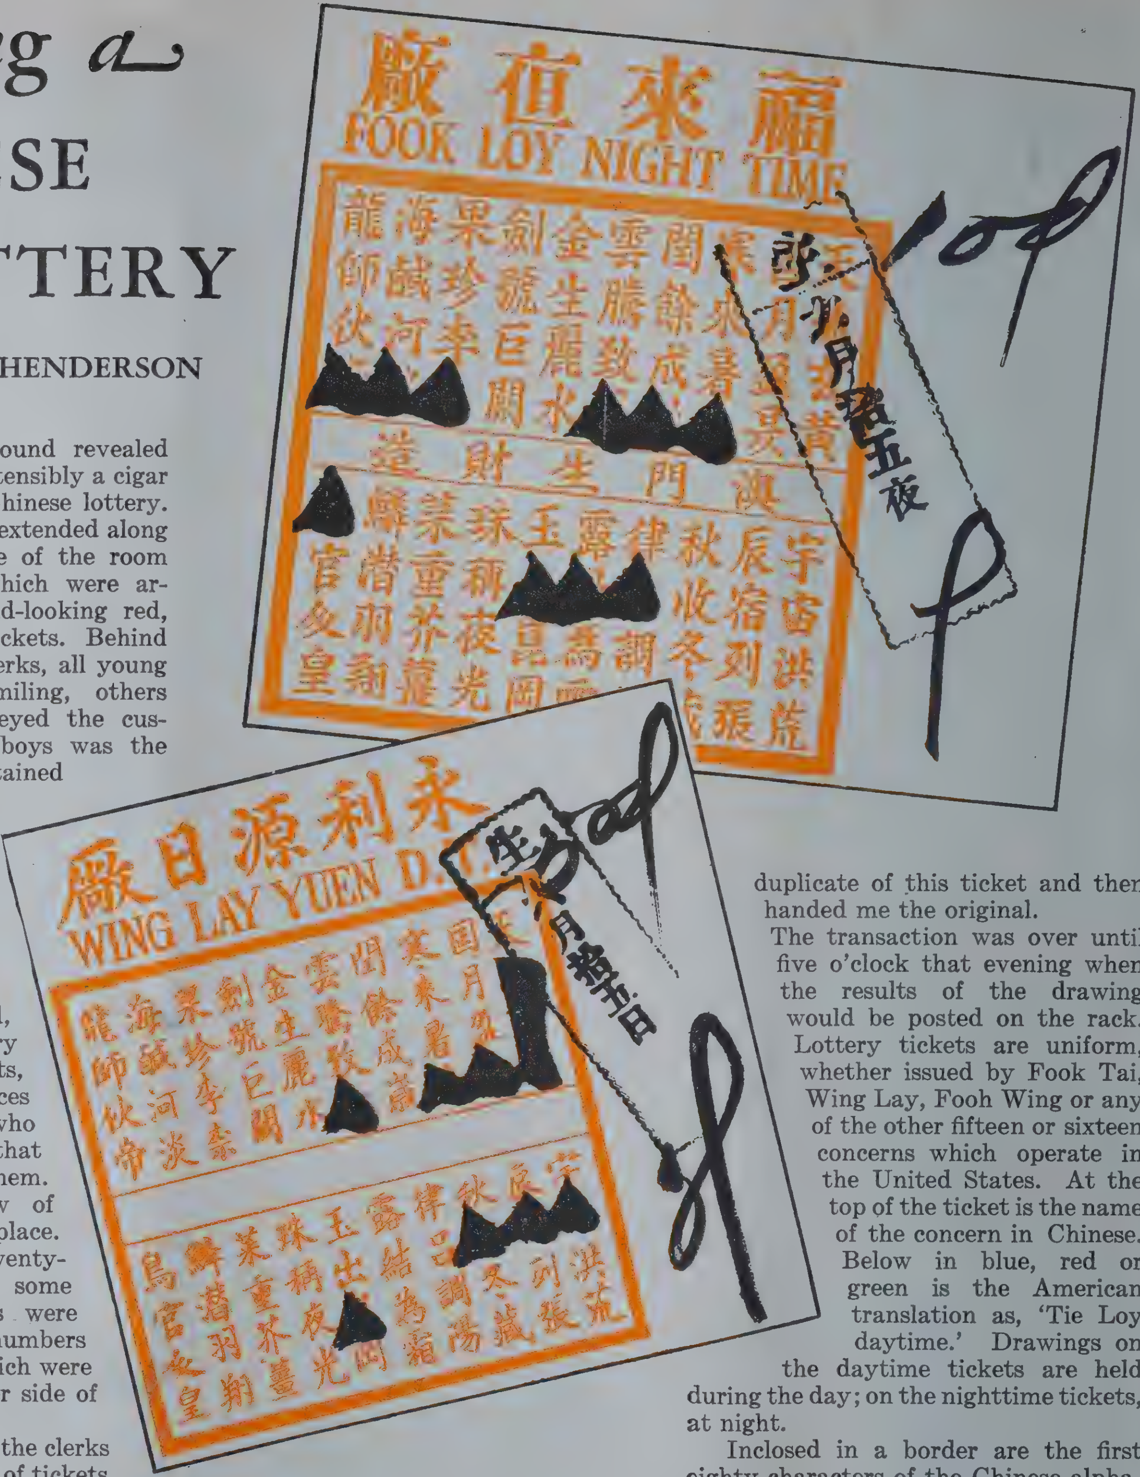
A young couple have no money for the acquisition of original art works. For some time they have borrowed true and attractive reproductions of paintings that are framed and loaned, like library books, by the Detroit Institute of Arts. They have not been ashamed to show them to connoisseurs, to poor or to rich, for they know that much of the quality of the (Continued on page 24)



'Christ on the Cross,' frequently regarded as Rubens' masterpiece.

Visiting a CHINESE LOTTERY

By GEORGE C. HENDERSON



福來宜廠
FOOK LOY NIGHT TIME
永利源日廠
WING LAY YUEN D.T.

ONE glance around revealed the place—ostensibly a cigar store—as a Chinese lottery. In front, and extended along an entire side of the room was a counter upon which were arranged in trays the odd-looking red, green and blue lottery tickets. Behind this counter were the clerks, all young Chinese boys, some smiling, others scowling, as they surveyed the customers. Before these boys was the cabinet or tray that contained the neatly arranged tickets of the various companies. At hand was a pot of ink, a brush for marking the ticket and a stamp for making Chinese characters.

As the arrivals entered, the clerks became very busy, handing out tickets, marking the square pieces of paper for those who thought it was luckier that way, and stamping them.

A disreputable crew of men lounged about the place. Some were playing the twenty-five-cent slot machines, some sat on benches, others were looking at the winning numbers of the last drawing, which were posted on racks on either side of the room.

I walked up to one of the clerks and surveyed the display of tickets. Some twelve or thirteen different lottery companies were represented there: Fook Loy nighttime, Wing Loy Yuen daytime, Fook Wing Quai daytime, American nighttime, Fook Tai daytime, Tie Loy daytime, Fooh Quy Chong, Union daytime, Fook Chung daytime, Tan Toi nighttime, New York daytime, Tang Toi nighttime and Fook Look Sue daytime. I selected a Wing Loy Yuen and a Fook Wing Quai ticket and handed them to the boy with a dollar. 'You mark it,' I suggested.

He waited several minutes before complying. I saw him glance out of the corner of his eye toward the end of the room and, following the look, I saw an American regarding me keenly. Just as I saw him, he made a motion, which apparently meant that I had not been recognized as a menace, because the boy smiled and took the money. Evidently this American was familiar with all the detectives, sheriffs and deputies and he was stationed there to prevent an incriminating sale to an officer.

Dipping his camel's hair brush in the pot of ink, the Chinese boy deftly marked ten of the spots in black, wrote '5 o'cl' and stamped the paper in red ink with a Cantonese design. He finished it off with a mysterious flourish which meant nothing to me. With meticulous care he made a duplicate of this ticket and then handed me the original.

The transaction was over until five o'clock that evening when the results of the drawing would be posted on the rack. Lottery tickets are uniform, whether issued by Fook Tai, Wing Lay, Fooh Wing or any of the other fifteen or sixteen concerns which operate in the United States. At the top of the ticket is the name of the concern in Chinese. Below in blue, red or green is the American translation as, 'Tie Loy daytime.' Drawings on the daytime tickets are held during the day; on the nighttime tickets, at night.

Inclosed in a border are the first eighty characters of the Chinese alphabet, divided into two sections of forty characters each.

After the Fook Tai drawings have closed, the secret clique of the Fook Tai company makes a 'master ticket.' On this master ticket the ten winning characters are marked. Just how the Chinese devise this ticket no one but themselves knows. At any rate it is posted on the rack in the room and copies of it are sent around to pool halls and cigar stores in surrounding cities, so that the gamblers may compare their own tickets with it.

In many cities hundreds of men and women play the lotteries without ever entering one of the 'joints.' Chinese laundrymen, vegetable peddlers, gardeners and professional

World's Greatest DISTANCE MEN *Found at* 5,000 Feet *Above Sea Level*

By H. G. SALSINGER

UP IN the Sierra Madre of Mexico lives an Indian tribe known as the Tarahumaras. Few white men have ever visited their native haunts and the few who have came back with tales of endurance far beyond anything known to the civilized nations of the world. They told of Tarahumara Indian men who ran 52 hours at a stretch, and of girls and older women of the tribe who ran from 25 to 40 miles.

Thomas Rodriguez, a Y. M. C. A. secretary in Mexico, visited the land of the Tarahumaras and he discovered the tales that had been told of their prowess as runners were true. He made friends with them and in time he was able to bring a few of them into the cities to prove that reports had not been exaggerated. Last spring he succeeded in bringing three girls and three men into Texas and here, for the first time, an English-speaking people was able to view the super-runners of the Sierra Madre.

AMPEON DE CH

—International Newsreel.

Three members of the Tarahumara Indian tribe who broke Marathon records. Left to right—Jose Lorres, Augustin Salido and Thomas Safiro.

Girl runners of the famous Indian tribe. Left to right—Lola de Curarara, Juenta Pacencia, Juanita de Curarara and Martina Baquetero.

In their American début three Indian bucks attempted to run from San Antonio to Austin, a distance of 86 miles. They started from the city hall in San Antonio and finished in the Texas University Stadium at Austin where the annual Texas Relays were being held. One of the Indians was forced to drop out after running more than sixty miles; the other two went the remaining distance and ran nearly four additional miles. When they ended their run they were not panting. They had, to all appearances, expended no more energy than if they had walked rapidly for three or four blocks through a downtown street.

Three girls started, on the same day, to run the Marathon distance (26 miles 385 yards) and one of them finished. She ran more than the Marathon distance, covering 28½ miles. She, like the men, was not out of breath when she finished, nor was she even breathing rapidly.

In this day and age of athletics, when records tumble almost weekly and we talk of the great advancement in the science of competition, there arrive these Indians who, until this year, had never sat in an automobile and had never been ininside a railroad coach, and who give an exhibition such as no civilized athlete would even attempt.

They are still near the savage stage, these Tarahumaras, but they can show their heels to the athletes of the civilized nations over the longer distances. In their American début, where they were handicapped to such an extent that running was almost impossible, they demonstrated that the world's greatest runners are not listed in the record books.

The one American performance that approaches the work of these Indians is credited in the official records to J. Saunders of New York. Back in 1882 he took a notion to establish some distance marks and he set out to run as long as he could. *(Continued on page 26)*

The Only Cure for Waste

TO USE what you have is much better than to 'save' what you have. The only cure for waste is proper use. We cannot destroy matter. We can miss our opportunity with it, and misuse it, that's all. Our own interests are all locked up in the principle of use.

It is rather a strange arrangement of nature that only the most precious values can be wasted. You can waste time, you can waste labor, you can waste material—and that is about all. You cannot waste money. You can misuse money, but you cannot waste it; it is still somewhere. You can waste your own opportunity to use it for benefit, but that is all.

> *ECONOMY is no cure for waste; use is the word. The only cure for waste is proper use. Economy is the rule of half-alive minds. It is, of course, better than waste, but it can never be substituted for use. Use is alive, positive and active. It adds to the common good. Our interests are all locked up in the principle of use. There are two kinds of waste: that of the prodigal who misuses his substance, and that of the sluggard who allows his substance to rot through nonuse. Both are creators of waste. The strict economizer is in danger of being classed with the sluggard. The remedy in both instances is use.*

Time, energy and material are worth more than money, because they cannot be purchased by money. Not one hour of yesterday, not one hour of today can be bought back. Material wasted is wasted beyond recovery. These things are in the front rank of values. They are the precious elements out of which all wealth is made.

It is worth noting that these precious values are not of human creation. We have done a great deal with our human intelligence and energy, we have accomplished much by the manipulation of natural material and forces, but the severely modifying fact remains that ourselves and all we have worked with, and the very intelligence we have worked by, were not our own creation. So, while mankind may be pleased and even thankful, it ill becomes it to be boastful.

All our values were given us. Mind-values, power-values, material-values were all here. And we, the human race, have simply been cutting our eyeteeth on some of the elementary problems. The tree makes apples, mankind makes engines and philosophies—the tree cannot boast itself to be very original and powerful; it does what it was given power to do.

But mankind always has promise of being permitted to do still greater things. Its present progress has every sign of being only preparation, but there must be energy and use. There must be no standing still.

One circumstance, however, acts as a safeguard against the improvidence of individuals. The waste which we practise upon the original store of wealth is always repairing itself. That is to say, the time we waste is wasted for us as individuals, but the unused hours and days return to their original source, that of endless duration.

Hours and days are doled out to us as small coin to see how we will use them.

The earth never ceases making what we need and is prepared to fill the future needs of which we have not now the slightest foreknowledge. If men waste energy, it is lost to them as individuals—the great reservoir of energy on which all life draws is not exhausted. But everything depends on use.

Some would substitute the word economy for use. This is wrong. The word economy represents a half-idea born of fear. Its history is something like this: the great and tragic fact of waste is brought home to the mind by some circumstance, usually of a most materialistic kind; or there comes a violent reaction against extravagance—for even nature rebels against our unwise courses (which is the reason why so many people break down from 'overwork,' which is not overwork at all); and, as a sudden revulsion against it all, the mind catches hold of the idea of 'economy.' It flies from a greater evil to a lesser one; it does not make the full journey from error to truth.

Economy is the rule of half-alive minds. There can be no doubt that it is better than waste, neither can there be any doubt that it is not so good as use.

There are two kinds of waste: that of the prodigal who throws his substance away in riotous living, and that of the sluggard who allows his substance to rot through nonuse. In the precious things of life the strict economizer is in danger of being classed with the sluggard.

Everything is given to us to use. There is no evil from which we suffer that did not come to us through misuse. There is no function which human beings can fulfill that is not good. But we have all about us the spectacle of whole nations having to make laws against things, not bad fundamentally, but bad in their misuse.

The worst possible sin we can commit against the things of our common life is to misuse them. 'Misuse' is the wider term. We like to say 'waste,' but waste is only one phase of misuse. All waste is misuse; all misuse is waste.

The principle of use is the main guidepost.

EDITORIALS

OF THE DEARBORN INDEPENDENT

Fair Play

AN OBSCURE item in a New York newspaper the other day told that Major Augustus Heise had been restored to duty as a federal prohibition agent. It added that he would not be returned to his former post in New York because of 'unfavorable publicity' which had centered about him there. Instead, official Washington would bow to that publicity by sending him elsewhere.

On June 24, Major Heise was suspended *without pay*, following wild accusations against him by a Negro on trial for bribery. The accusations ranged the gamut from 'third degree' methods to Chinese torture. Manhattan newspapers, alert for anything to cast discredit upon prohibition, rushed to the aid of the Negro. Witches were burned again. Biased accounts appeared in their news columns, scathing denunciations on their editorial pages. *Heise*, not the Negro, was treated as a criminal. His name was made anathema throughout the country. The 'Heise scandal' threatened to become national in scope. Even the drys deplored his supposed actions. Largely as a result of the publicity:

> The Negro was acquitted.
>
> Charges against Heise were lodged with the federal grand jury, and he was haled before that body by the United States District Attorney.
>
> Heise was suspended without pay.
>
> He was denounced by official Washington *before he had been heard*, and intimations were strong that he would be promptly fired.
>
> His superior, Chester P. Mills, was censured and transferred to a minor post. He resigned.

Now, weeks later, the truth filters out. The absurd charges against Heise were untrue. *So found the federal grand jury. So found official Washington, when it took the time to investigate.* But the facts are either ignored by those newspapers which so zealously prosecuted the case before, or are buried in back-page positions where they will not be seen by one-tenth of the people who read the accusations. Major Heise stands vindicated. His reward is transfer to some other city because of 'unfavorable publicity.'

Learn It

OFFICERS and directors of banks are compelled to know the texts of the banking acts. Business men are always seeking information about credit and contract laws; workmen's compensation and income tax acts. Golf players pride themselves on knowing the rules of that ancient and royal game.

But these same people, and many others, are usually ignorant of the text of the Constitution of the United States. While many of them are opposed to suggested changes in the Constitution, they are unable intelligently to discuss the thing they seek to defend. Americans need more facts, especially in dealing with citizenship problems. No person who has prospered and who professes a desire to see the nation well governed has any excuse for failing to familiarize himself with the Constitution.

The Governors Confer

THE Governors have gathered and talked and dispersed, and the impression seems general that their meeting was more in the nature of a picnic than an important conference. Only eighteen of the forty-eight were present at Mackinac Island, and even these made a rather sorry showing.

The disappointment at the lack of accomplishments is probably due to the high expectations which were held at the inception of the annual conferences nineteen years ago. At that time it was freely predicted that a mass of uniform legislation would result. Reforms which could not be brought about in any other way would be accomplished. The 'Board of Governors' would form a new safeguard for states' rights. But for one reason and another the conferences have dwindled in attendance and influence, rather than increased. They have dealt with current events rather than fundamentals. They have been useful at times in discussing problems of the moment, but they have fallen far short of the hoped-for destiny. And in the reaction of disillusionment, the public which once expected everything has come to expect nothing.

The Decline of Oratory

GREAT, round words from behind which not even the most efficient vacuum cleaner could extract an ounce of reality have upon some of us an amazing effect. We grow enthusiastic over becoming noises from a decorated platform. Aroused by high-sounding piffle, we seize meshless nets and chase imaginary butterflies across vacant lots under the impression that we are really accomplishing something in the way of a great reform. It is easy for men to thump a table, to gesticulate grandly, to cultivate a deep and resonant voice. Those things constitute *oratory*. And oratory impresses some people merely because of its own weight. A great deal of bombastic nonsense is uttered—and accepted—under the magic spell of the word.

But the orator's sphere is lessening and his day is passing. Why? Because people are beginning to realize that no matter how much orating is done, all achievements and changes that are permanent, decisive and irresistible proceed in our time from the silent laboratories of chemical and mechanical engineers. Even in the golden age of verbosity, the United States seldom elected orators to the Presidency. The nation knew instinctively that talkers are seldom doers.

BLACK and WHITE in AFRICA

By W. H. WORRELL

Contemporary portrait of the architect of the Great Pyramid. His features are plainly those of a White man. Left—Portrait-statue of a scribe of the old Egyptian empire. There is nothing African about this face.

TO EUROPEANS all Africans look pretty much alike: black. Yet examine them more closely, and you will find that they differ from one another in outward appearance quite as much as Chinamen from Japanese; that their habits of life are as varied as those of the peoples of Europe; and that their languages bear no more resemblance to one another than Hebrew to Hottentot.

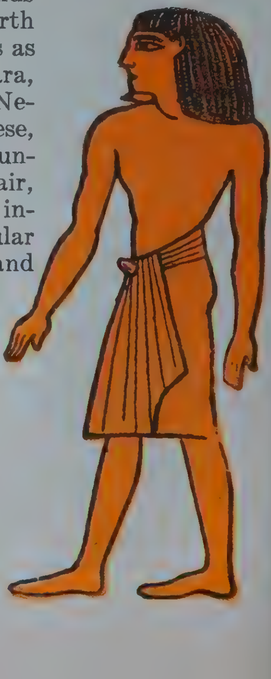
Underneath these outward differences lie even greater differences in natural ability. There are the miserable Pygmies, who nourish themselves, as best they can, with roots and berries. They have been driven into the very heart of the equatorial forests; and hold their own there merely because stronger Negro tribes will not, or cannot, live under such adverse conditions.

Then there are the wretched Strandlopers, whom the Dutch found picking up dead fish upon the seashore. But, on the other hand, there are the redoubtable and gifted Gallas and Somalis of East Africa, and the well-organized Housas and Ful tribesmen of the western Sudan. The Housas are a peaceful and reliable merchant folk who trade over vast areas; and the Ful are a determined people who are known afar for their military prowess. Not much inferior to these are the great Bantu people of Equatorial Africa, a branch of which, the Zulus, have been made famous by Rider Haggard. All of these are superior to the true Negro, and all of them have some measure of white blood.

By 'White' men in Africa we do not mean, of course, the Dutch, or British, or any other sort of European colonist who within recent times has gained a foothold in the Dark Continent; nor do we mean the Arabs, who came in under the banner of Mohammed in the Seventh Century, anno Domini; nor even those remarkable invaders from the land of the Queen of Sheba, who settled in Abyssinia at the beginning of the Christian Era, and who today occupy a seat in the League of Nations. To understand what is meant we shall have to go back to prehistoric Africa.

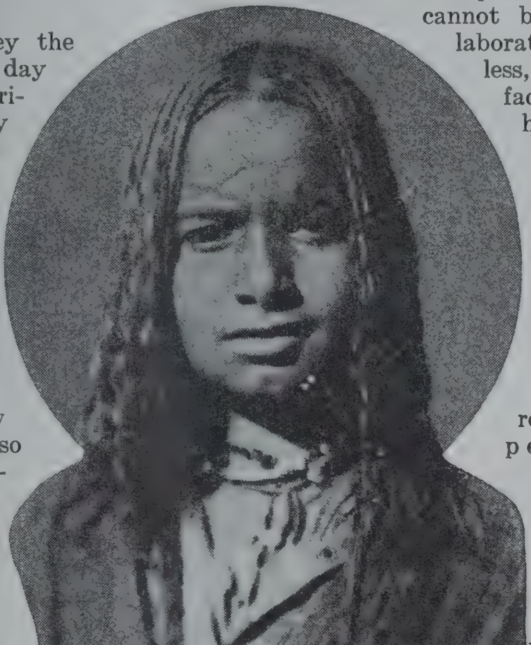
At one time the southern part of the Dark Continent was occupied by the race which we now call 'Bushmen': wizened, yellowish people, with sparse, woolly hair that grew in tiny tufts all over the head, whose speech abounded in sucking sounds or 'clicks.' North of them, perhaps as far as the Sahara, were the true Negroes, or Sudanese, with more abundant, woolly hair, whose languages involve the regular use of tones and word melodies, while lacking—from our point of view—the most necessary grammatical distinctions.

To the north of these, again, was the



Sahara, a garden spot in those days, the home of a genuinely White people who had been cut off from Europe by the subsidence of the great land bridges across the Mediterranean. Europe had been covered with a sheet of ice, and its inhabitants had retreated to northern Africa. As the ice-sheet melted, the Sahara began to dry out; and the people again went northward into Europe, or sought an escape to the south, in the lands of the true Negro and the Bushman. There was a crevice in the great limestone plateau of the Sahara, in which flowed the bounteous river Nile. Its sources were fed from unfailing rains of the Abyssinian highlands and the region of Victoria Nyanza; while its rolling waters yearly renewed the soil with rich black silt.

In that valley the sun shone every day of the year. Security was assured by trackless deserts on either hand. Here the White men found the almost ideal conditions which led to the first great civilization. The Saharan Whites, whom we shall now call 'Hamites,' also invaded the eastern 'horn' of Africa, and continued southward, struggling with, and eventually blending with, the Negroes and Bushmen, until they at last reached the Cape of Good Hope.



A woman of the Hamitic nomads who live east of the Nile. Both white and black blood are evident.

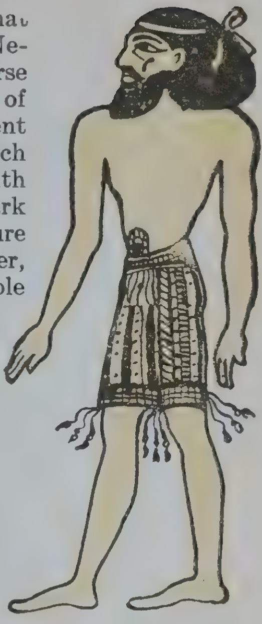
Naturally, those Hamites who turned northward, settling all about the Mediterranean basin, and upward into the British Isles, did not come into contact with the Negroes and Bushmen, and consequently are as truly White as the Nordics or Alpines of Europe. In their old home land, the Atlas Mountains, in Morocco, they still exist as 'Berbers'; and their complexion is so light that they have been mistaken for Europeans. Both France and Spain have learned to respect these people. The Rif tribesmen under Abd-el-Krim were only subdued with the greatest difficulty, by France and her organized industries of war.

The Hamitic race of Africa, then, is the same as the Mediterranean race of Europe: a race in no way inferior to the Nordic, though distinct and different from it. The great early civilizations of Egypt and Palestine are Mediterranean; and Greece and Rome resulted from the interplay of Mediterranean and Nordic.

The fine quality of British stock is due no less to the Mediterranean strain of the old dark-haired race of Britain than to the blood of the Vikings. It comes to the surface strongly in the common people of England, and particularly in the Scots and Irish. At the other end of the scale we find, at the Cape of Good Hope, the inferior Hottentot people, whose sole claim to the possession of Mediterranean blood is the presence of certain peculiarities in their language.

Psychologists assure us that there is no evidence as yet of any differences in the intelligence of different races. Racial superiority or inferiority cannot be proved in the laboratory. Nevertheless, it is a striking fact that Negroes have never produced a civilization, nor even successfully borrowed one, although they have repeatedly been in contact with civilized nations. Their capacity for progress seems to depend upon the amount of White blood which they possess.

In this connection it should be remembered that the American Negroes are of diverse origin, and many of them have ancient white blood which they brought with them from the Dark Continent. The pure Negro has, however, certain undeniable qualities, such as a capacity for music and a natural social charm. 'Deep River' is, I think, the greatest accomplishment in American music; and it is purely Negro in origin. We should not forget in justice to note that the art of smelting iron was discovered by Negroes at a time when highly civilized White men were using copper and bronze.



How do we know that there is White blood in Africa? The first evidence is general appearance. Place a true Negro beside a Galla or Somali, or even a Zulu, and the contrast is striking. Some of the African groups are as light as mulattoes. Others are very dark, but have the features of White men. Some of the Hima chieftains indeed resemble the noble race of the Pharaohs.

Their languages betray more or less of the White man's psychology. For instance, like ourselves, they distinguish 'gender' or sex in language, not only in living things but in inanimate objects. We make the sun 'masculine' and the moon 'feminine'; while the rest of the human race hardly bothers to distinguish 'he' from 'she' even when speaking of persons. Then, again, they have a curious trick of dividing things into two classes: Big Things and Little Things. This division has something to do with sex, but is not exactly the same; for a live cow is 'masculine,' because it is 'the best kind,' while a dead cow is 'feminine,' because it is good only for meat.

So also, when a woman rules a tribe she is called 'he,' and the woman's husband is called 'she' and 'the wife,' because he plays second fiddle to the chieftainess.

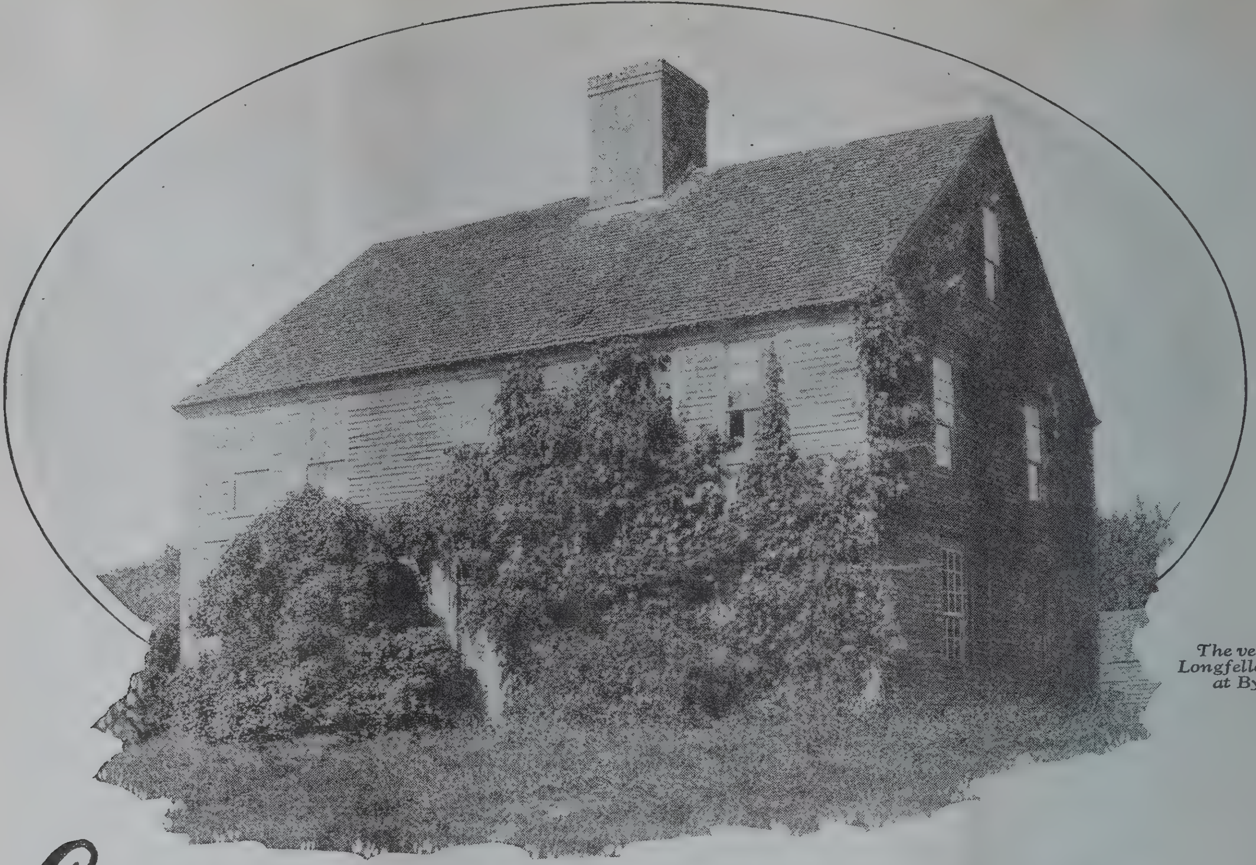
Christian peasant boy from Upper Egypt. His features resemble the portrait-statues of the Pharaohs.



The venerable Longfellow house at Byfield.

LONGFELLOW'S Ancestral Home

The Old House Still Stands in the Parish of Byfield, Massachusetts

By MARY HARROD NORTHEND

THE old-time Parish of Byfield, known in early days as Newbury, Massachusetts, lies midway between Georgetown and Haverhill. It comprises an irregular tract of rolling country, given over to farm lands and notable historic houses. Here came William Longfellow, the first of the name in America; he who married, on November 10, 1676, Anne Sewell, sister of Judge Samuel Sewell and daughter of Henry and Jane Dummer. William Longfellow lived on the Sewell grant just above the old Mills in Byfield proper. This is proved by a clause in Henry Sewell's will dated August 17, 1678.

'I give and bequeath to my Son-in-law William Longfellow and my daughter Anne, his wife, during their natural life, a tract of Land with the house upon it, commonly knowne by the name of highfield with a parcell of meadow adjoyning thereunto, containing about seven or eight acres, being on the east side of the falls-river, bounded on the southwest side with a little brooke & the great river & the northeast side with a small creeke & Stony brooke running into it, also an equal part or moyty of my great meadow, formerly possessed by Launcelot Granger, and after their decease to the heires of the said Anne of her body lawfully begotten, or to be begotten, & for want of said issue to my sonne Samuel Sewell to enjoy to him and his heires for ever.'

This will was not proved until May 24, 1700, ten years after the death of William Longfellow. Meanwhile the deed of the house and land was conveyed from Henry Sewell to his daughter Anne Longfellow, the house and land being handed down from generation to generation until with the passing of Uncle Joseph Longfellow and his son it was sold out of the direct family line.

The old parish is unique, for in reality it is composed of three separate communities: upper Byfield which lies nearest to Georgetown; south Byfield where the historic houses are located, and the Dummer Academy district.

On the estate of William Longfellow who married Anne Sewell is the site of their original homestead, while nearby is the farmhouse where their descendants have lived. The weather-beaten old farmhouse is still standing, covered with vines, and was a favorite visiting place of Henry W. Longfellow. Not many years before his death he paid his last visit to the ancestral home, going there in company with Charles Sumner, Major Benjamin Perley Poore of Indian Hill, and my father, a kinsman of Longfellow, the late Honorable W. D. Northend.

Adjoining this estate is the Abraham Adams house where one of the first settlers of Newbury built—Captain Abraham Adams who had followed the sea for his livelihood and on one of his trips brought back seeds of apples which he planted on the division of the Sewell grant where he lived. The handful of seeds later developed into a splendid orchard.

The old house still stands, many of the original shingles and clapboards being in a good state of preservation. There are numerous legends related concerning this house. Under the attic eaves is shown a bunk known as Booth's Bin from the fact that an Indian slave of that name slept there.

It was nearby that a little band of twenty-five Indians settled, becoming very friendly with Mother Anne, who enjoyed sauntering down across the fields to sit with the old squaws.

One day, being urged to partake of the Indian hospitality, she accepted, when a slight rustle in the branches caused her to turn her head just in time to perceive Quanto, the brave, come quietly out from the shadow with a great black snake twined around his

Right—Byfield church, inside of which two persons, in the same pew, may sit one in Rowley and the other in Georgetown.

Below—Adams House, where Anne Longfellow, from across the fields, came to live as the wife of Abraham Adams.

arms and shoulders. Removing the kettle cover, he threw the writhing snake into the soup. Needless to say, Mother Anne's household duties immediately called her home.

The old church, since replaced by a modern one, had many notable preachers, prominent among whom was Moses Pearsons who died in 1783. He received a salary of but eighty pounds yearly. It was during his settlement that the new church was erected and that congregational singing was omitted, for the New Englanders were rarely able to sing more than three or four tunes and these were tortured and twisted as every unskilful throat saw fit.

Choirs were a never-ending subject of discussion and on March 9, 1775, twenty-one men were chosen to 'pitch ye tune.' Parsons, like everyone else in Byfield, owned slaves, three in number. Upon being charged with this, he called his slaves together and offered them freedom. The two men accepted, but Violet refused. 'No, no, massa,' she said. 'You have had the best of me and you and yours must have the worst. I will belong to your children when you are gone and by them I mean to be cared for.'

She was nearly ninety years old when she died, a privileged personage who liberated her mind upon any topic to any person at her own pleasure, having all the money she chose to ask for and spending it as she liked.

Few members of the family were clothed more gorgeously. In her old age, she was troubled with rheumatism, calling upon the family physician to help her. He was a testy old man and out of patience with her constant complaints.

'Violet,' he told her, 'you should not call on me so often. Your pains are constitutional and you must learn to bear them.'

'Oh, dear,' was the answer. 'I s'pose I must. Massa had the rheumatiz bad, and Susy had it, and Theop and Billy and Eben have it, though not so bad as I do, and I s'pose it runs in the family.'

The old church with its high square pews and imposing pulpit stands on the line of division between Georgetown and Rowley so that a man and his wife may sit in the same pew and one be in Georgetown and the other in Rowley. Little wonder that one of the parsons felt perplexed even after a year's sojourn as to where his congregation did reside. If he located them in Georgetown they were sure to be in Rowley and vice versa.

Dummer Academy, the summer residence of

Glittering cascades on Clifty Creek.

A Scenic Wonderland in Southern INDIANA

By
ALBERT A. HANSEN

MADISON, Indiana, is an old-fashioned hospitable town of seven thousand souls situated on the banks of the Ohio River opposite the wooded hills of Kentucky. Located in a small valley, the city is encircled by a series of hills that rise like a protecting wall to a height of more than four hundred feet above the river and it is in this region that some of the most remarkable natural scenery in America may be found.

Perpendicular cliffs defy climbers.

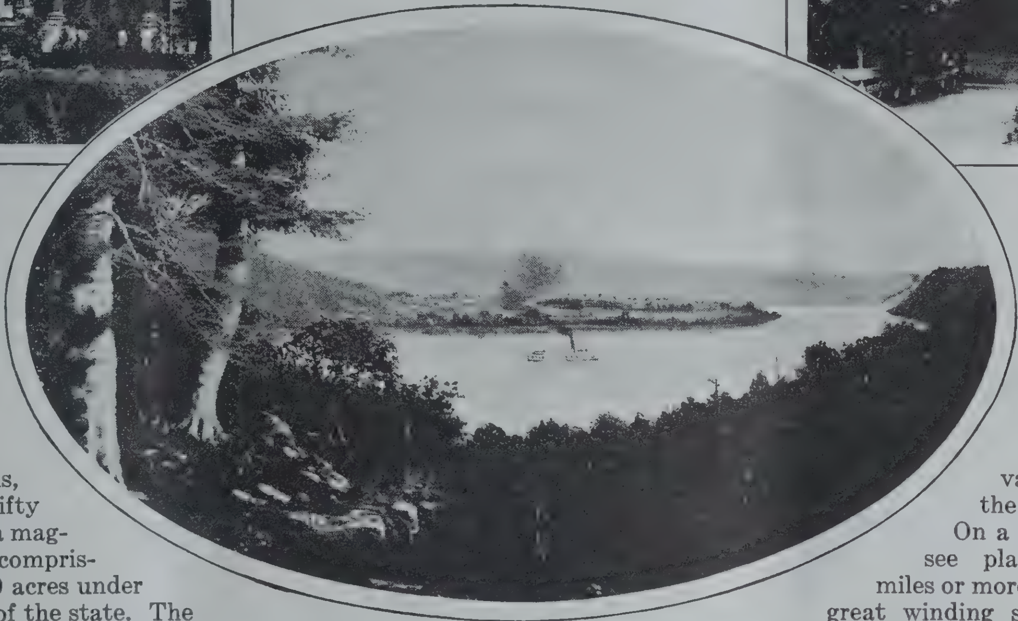
Crow's Falls, typical of thirty others.

Although lacking the immensity and magnitude of Rocky Mountain and Appalachian scenery, it is doubtful if there is anything more genuinely beautiful on the American continent than the marvelous gorges, rugged bluffs, deep rocky ravines, delicate waterfalls, inspiring vistas, huge caves and other natural wonders that are scattered in marvelous abundance among the emerald hills that form a rich setting for historic Madison. Why the praises of this great Hoosier beauty spot have remained so long unsung is a mystery, since few folks outside of Indiana have ever heard of the matchless Madison wonderland.

Perhaps the best known of the numerous and beautiful waterfalls that surround Madi-

Water veil of Clifty Falls.

Students of architecture find inspiration in the homes that are reminders of Madison's early glory. This is the Lanier Mansion on the banks of the Ohio River.



Hanging Rock, crowned with a cascade. Oval—One of the vistas of the Madison wonderland as painted by an artist. An old-fashioned side-wheeler is shown on the Ohio River.

son is Clifty Falls, located in the Clifty Falls State Park, a magnificent wild area comprising more than 400 acres under the guardianship of the state. The park is in reality a great ravine that cuts into the plateau for a distance of two miles, and through the length of this natural trough runs a stream that forms a series of thirty cascades and waterfalls of remarkable beauty.

The largest of these is Clifty Falls, almost fairylike in a beauty that is peculiarly its own. The crowning beauty of the falls is a succession of charming cascades from which the water finally plunges over the cliff, spreading gracefully into a thin veil that breaks into a glittering mist on the rocks a hundred feet below. The falls are at the head of a deep canyon of indescribable beauty. From the dizzy heights on the edge of this ravine, the full grandeur of the scene can best be appreciated.

But Clifty Falls, with all its rare beauty, is but one of over a score of similar waterfalls and their accompanying ravines found in this gifted section. Among the most picturesque are Crow's, Chain Mill, Heart's, Dead Man's, Butler's and Rose Hill falls.

Heart's Falls derived its name from two hearts carved on the rock, which, according to a romantic legend, represents the work of an Indian lover. There are two Chain Mill Falls, the names alluding to the manner in which the water power was formerly utilized in driving the buckets on the mill chain, although all trace of the mills has long since disappeared with the exception of the well-worn millstones that are still splashed by the running water.

Not far from Clifty Falls is Rose Hill from which a magnificent view may be obtained of the Ohio River as it flows lazily and majestically down the valley until lost in the mist of distance. On a clear day one can see plainly for twenty miles or more up and down the great winding stream, its bosom dotted with old-fashioned side-wheelers, its shores lined with inspiring scenery.

More than four hundred feet below, nestled in a peaceful valley, lies Madison, a beautiful city in a beautiful setting. To the right may be seen the Devil's Back Bone, a long ridge that was once an island in the Ohio River when the stream flowed to the north of the ridge instead of to the south as it now does. The vista from this rocky pinnacle cannot be surpassed anywhere in America and many who have traveled the world around declare that they have seen nothing finer. The impressive view from Rose Hill has inspired the name 'Switzerland of America,' sometimes applied to this region.

During the middle of the last century the possession of the only railroad that tapped the Ohio River made Madison the metropolis of Indiana and the 'Gateway of the North.' During the prosperous fifties Madison was

The road to Canaan—offered by the Hoosier state as a match for the world's beauty spots.

the center of Hoosier finance, learning and culture, the largest and most important city in the state. The old paddle-wheelers left Madison loaded with pork and other products, since Madison was at one time the largest pork-packing city in the world. Pork products were sent to the East and were exported to Europe to the extent that the Crimean War was said to have been won on Hoosier-packed pork from thriving Madison.

It was during these bustling days that J. D. F. Lanier, the noted financier, accumulated a fortune that later was patriotically placed at the disposal of the state during the stirring days of the Rebellion. In commemoration of this deed, the handsome Lanier home on the banks of the Ohio River in Madison has recently been transformed at public expense into a memorial museum. Madison today, with less than half the population of the halcyon days of the fifties, is but a shadow of its former greatness, but the handsome old homes, fine churches and huge packing establishments bear eloquent witness of past glory.

Training *the* African Boys *and* Girls

THROUGHOUT dim, undoubted centuries before the distinguished Chief Scout and Founder—Sir Robert Baden-Powell—had earned in his beloved Africa the name of 'Wolf-That-Never-Sleeps,' Equatorial Africa had its equivalent to the Boy Scout institution. It also had its Girl Guides.

Down in the forests of Kamerun, French Congo and the Nigerian frontiers, among the equatorial tribes, the treatment of the adolescent was basically similar. The writer became closely identified with one of the tribes during four years of forest life.

Within the instruction center the squads of initiates from the various villages are entirely in the hands of the wise old elders. There are no sympathetic parents within call. Knowledge befitting the coming men of the tribe is to be their portion. Their acceptance in the order is marked by a special dress. It consists, often, in a close-hung screen of palm fronds, enveloping the 'Scout' from his waist downward. They have their signs and signals, and frequently a special variation of the local dialect.

In certain districts no common male person may address the novitiates should they be met with.

They are given the tribal laws, and made acquainted with the punishments attendant upon any infraction of these: Forest lore and instruction; the tribal animosities and the grounds for these; the tradition of their people.

The principal purpose of the collecting of the boys, however, is for physical instruction. Then is made known every possible aspect of those intimate physical matters which in less primitive regions are taken as understood and must not be talked about.

From the seclusion of the forest the initiate returns to his people an educated man. He is quite a personage, an eligible bachelor.

The education of the girls is no less complete than that of the boys in those matters regarded as of paramount importance by the African bush native.

Confessions *in* Literature

By MURRAY GODWIN

THE confession of one's faults to another is a practice enjoined on purely religious grounds by certain creeds. At one time the idea of confession as a religious duty was, as we know, accepted by the entire western world. Then there came a time when its validity was questioned, along with that of other ideas, and at length its universal acceptance became a thing of the past. It became a matter of conscience only within a few large denominations. It became a matter of choice; one believed and practised, or one did not, according to one's point of view.

While the conflict between those who believed, in this particular regard, and those who did not, was still in progress, feeling ran high, and confession was upheld or denied on theological grounds. Simple examination of the idea by a merely interested spectator was impossible. But today, when toleration has succeeded its opposite, one may take occasion to inspect this idea from a more earthly angle in order to discover in it—if it be there—some evidence of that 'instinctive wisdom' which the philosophers have believed all religious teachers to possess, and which should certainly be present in their works.

Is there a really *human* need for confession, the act itself, apart from any benefit which may accrue from its performance as a religious duty on a supernatural plane? We all feel, it is true, the urge to confide in some friend when we are troubled by a problem or an affliction that seems too heavy to be borne alone. We know that there can be no real shifting of one's mental or emotional burdens, either in whole or in part, to the 'shoulders' of another; but we know, too, that the very communicating of one's trouble to one's friend seems to lighten the terrible strain. But this is not precisely confession. There are some things which we feel we cannot confide to friends, not because they are matters so serious (in the moral sense) that we fear our friends might be estranged in the process—though this in a few instances may be the case—but because in them our very self is so deeply involved.

Lately I read a book bearing the strange title, *Nightshade*. Its author's name remains unknown; not so his troubled soul—*that* transpires (as they say) in terms of experience through the pages of the book. He has lived during his youth and a fair portion of his manhood in a small town somewhere in New York State. He practises law there, as his father did before him; he coaches the high school girls' basket ball team; he is looked on with kindliness and confidence by his fellow townsmen, old and young. Yet, behind this front which he presents to the town lurks a down-hearted, somewhat sensual fellow who regards himself as a failure, as a sort of 'slacker' in the battle of life.

It is no romantic qualm that has been cultivated for the sake of atmosphere, but an authentic consciousness of the discrepancy between the potentiality and the achievement. To this half of his personality the town has been poison. Yet he cannot leave; the town has got 'into his blood' through some congenital rift in his character, and has rendered him incapable of stepping aside and away from the stream that bears him onward toward his last horizon. But this other self of his, though its full expression has been interdicted, has grown in a twisted way into a sad commentator on what it regards as his wasted life.

On occasion his sense of the discrepancy between what is and what might have been becomes so keen as to plunge him into dissipation—a happening which is regarded more charitably by the townspeople than the 'realists' would believe; and this serves to loosen the strings of the inner necessity sufficiently for the lawyer and citizen to act his part—until next time; and one feels in reading the book that it will continue to do so. Thus the evil balance is maintained, outwardly; but within the man himself the desire for expression and synthesis—for light and health—grows overwhelmingly insistent . . . I should say 'grew': for it has already achieved its object and, in achieving it, has given us a very interesting book.

Now, if this were an isolated phenomenon—if this book were the only book—but it is a specimen from a very large class. One could without difficulty recall the names of at least a score of recent novels—'novels'—which are simply confessions from beginning to end. Names are disguised, sometimes very plainly, and incidents are related, perhaps in an order different from that in which they actually occurred, but that is all.

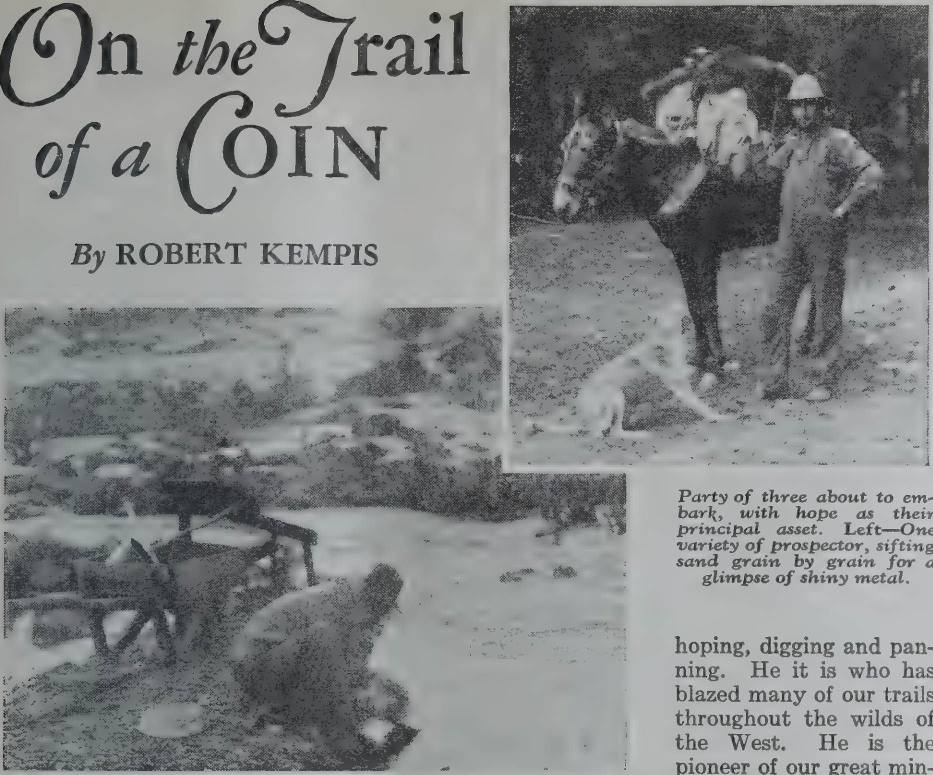
This is at bottom why so many of our younger writers manage to write a first novel which astonishes us by its intensity and truth, and a second which astounds us by its painfully fabricated texture, its wooden characterization, its poorly integrated ideas. They confess and feel relieved, but presently their confession has gone through six large printings. There is nothing for it but try it again; so they try it again and naturally fail badly, for how can one contrive an interesting confession when one has nothing to confess?

'Straight autobiographical literature has in late years grown from a mere trickle to a raging flood. It has also become increasingly unconventional; it no longer partakes of the staid formality of the epitaph; in certain instances it is labeled outright, *Confessions* . . . However, to separate in this class of literature the material which is purely autobiographical from that which might with justice be called confession, would be a tedious undertaking at best. One may note only that the need for confession, as we know it, may achieve its object in traditional literary channels as well as in more typically modern ones.

It is another matter with the more ephemeral literary forms taken by expression in our day. Beyond a doubt the 'True Tales' and 'Real Life' type of magazine, which seems lately to have become so prevalent, is made up almost wholly of confession, not particularly pure but decidedly simple; the romantic trimming being added as an afterthought by the eternally rationalizing human mind.

On the Trail of a COIN

By ROBERT KEMPIS



Party of three about to embark, with hope as their principal asset. Left—One variety of prospector, sifting sand grain by grain for a glimpse of shiny metal.

AFTER complacently dropping into our purses the shining coins which we have received from the paying teller at the bank, most of us go our way without a thought of the routine through which they have passed before arriving at the bank.

Of course, it is well known that they are brought to the bank from the United States Mints. But many, even those who have visited a mint and have seen the coins being produced by the ingenious machines, are not acquainted with the method by which the mints procure the bullion from which the coins are made.

The mint at Philadelphia obtains bullion generally from the large smelters in the West; also from the mints at San Francisco, Denver, and New Orleans, and in small amounts from the old mint at Carson City, Nevada, all of which produce coins, except the last one, which now only assays ore for the miners.

The mints in the West buy bullion from the numerous large mines and smelters, and from individual miners throughout the West. Then as bullion is needed by the mints at Philadelphia and New Orleans, it is shipped east under strong guard.

Much of the bullion is bought by the smelters from individual miners, who toil and sweat in their underground workings or in an open cut on the mountainside or on the burning desert; also from those who, clad in rubber hip boots, slush around in the placer diggings along the streams of the West and Alaska.

They obtain it from yet another, the man who with gold pan extracts the glittering metal from the small streams as he tries to trace up a rich vein, toiling faithfully and hopefully; for he may make himself rich if he is fortunate enough to strike a good pay streak.

Persistent and patient, he tramps with burro generally, but sometimes alone, over deserts and high mountain ranges, through great forests and over brushy ridges, always hoping, digging and panning. He it is who has blazed many of our trails throughout the wilds of the West. He is the pioneer of our great mining and smelter industries, and has made our large coinage possible.

On a hot summer's day he leaves the shady trail and the cool rippling stream, patiently to tramp over dusty arid plain, or briny scorching desert. He also combats the cold rain and the fierce snow—often terrific blizzards—in his mountain home, all alone. Miles away is the settlement from which he must carry on his back his sometimes scanty supply of food; and for drinking and cooking purposes he must haul water a quarter of a mile up the steep mountain trail. At other times, in the heat of burning sun, he must tramp miles with pick, shovel, gold-pan, mortar, grub sack, frying pan, coffeepot, and then a bulky blanket atop his heavy load.

Seldom complaining, always hopeful, he works from daylight until dark during the long summer days, testing rocks and soils, in the anticipation of striking the rich streak which will yield enough to take him back to his home and friends. Sometimes, but rarely, he has the companionship of a dog to break the loneliness of his isolated life. Generally contented, always freely hospitable, he will share his last flour and bacon, or his blanket, with a needy, deserving fellow whom he may chance to meet on the trail, or whom chance may lead to his camp and to his mess of frying-pan bread and bacon.

When he strikes a rich mine, he works it faithfully until he sells or dies. If the latter is the climax, there is a lone grave near a shady stream, at the foot of a mountain, or beside a pile of rocks on the desert, marked with a wooden slab or a few stones—but perchance he lies in the solitudes uncovered and unmarked.

As the beautiful coins for our need and comfort pass under smile or frown, some do not know, others forget, the great debt of gratitude we owe to the lonely pioneer miner who so faithfully toils at collecting the tempting metal, pure and untarnished, from the great storehouse of nature.

INVENTORS who derive largest profits know and heed certain simple but vital facts *before* applying for Patents. Our book *Patent-Sense* gives those facts; sent *free*. Write **LACEY & LACEY, 696 F St., Washington, D. C. Established 1869.**

Why *the* Liquor Interests Went Unpaid

A real contribution to a discussion sadly in need of fact.

By WILLIS J. ABBOT

THIS writer has interviewed various persons whose opinions relative to the prohibition law are of importance, and the resulting article is a real service at this time when so many people are expressing sympathy for the distillers as being put out of business without either compensation or time to prepare.

NANCY HANKS, *the* Mother *of* LINCOLN

TRUE story of the courtship of Tom Lincoln and Nancy Hanks, who became the parents of Abraham Lincoln. More stimulating than any piece of fiction ever written.

> 'That evening five grown people sat around the fire. The most important words that were spoken were certain unrecorded words that passed between Tom Lincoln, 26, and Nancy Hanks, 22. They made no undue haste about their approach to each other, but they looked at each other and neither was blind . . .'

The Dyspeptic Critic

By HUGH WALPOLE

EVERARD TALLBOYS, critic and author, became so tiresome that his acquaintances decided he must either be saved or murdered. They must separate his pen from his indigestion. In endeavoring to help Tallboys, three of his friends are led into the most romantic adventure of their lives. A short story complete in one issue.

An Unusually Generous Offering of Short Subjects

Ohio Honors *Her* Presidents

Imposing Memorial Stands *as* Tribute *to the* Buckeye State's Sons

By HARRY PENCE

PERHAPS the most imposing final resting place of a former President of the United States is Grant's Tomb in New York City, but as an historic shrine, hallowed by time and indifferent to material embellishment, Mount Vernon readily outranks all. Grant's Tomb is more a tribute to a military genius than to a Chief Executive. Virginia has been content to permit her celebrated men to repose in modest sepulchers.

Ohio, it must be remembered, has given the nation as many Presidents as has Virginia, although their tenure of office has been much briefer. Death has taken heavy toll. Of the six who died in office, four were from Ohio.

The first President from Ohio to be felled by a murderous bullet was James Abram Garfield, born near Cleveland, to which city his body was brought after his death, September 19, 1881. A few years later a handsome memorial was erected with funds raised by popular subscription and cost considerably more than $100,000.

President McKinley was reëlected in 1900 and began his second term the following March, but his public career was abruptly terminated by the bullet of an anarchist at the Pan-American Exposition, in Buffalo, New York, on September 6, 1901. He lingered till September 14.

Few will ever forget the series of memorial services held in almost every city and village in the country.

IT WAS inevitable that a nation enjoying unwonted prosperity, feeling itself for the first time in its history to be a leader among the nations of the world, and attributing these desirable conditions to the policies typified and sponsored by the late President, should seek to manifest its devotion in some enduring form. Even before an association, officered by the illustrious and the great, could begin activities many small funds had been raised in many communities for a lasting memorial to McKinley. More than one million persons contributed, the pennies of school children making a sizeable portion of the ultimate sum.

In 1907 a mausoleum of shining white marble was dedicated on a hill near the city of Canton and the surrounding grounds beautified in keeping with the memorial itself. At the head of the stairway leading to the entrance is a life-size bronze statue. The memorial and grounds are maintained from the proceeds of the fund administered by a commission composed of personal friends of McKinley. Though the grounds are open to the public, they are not a public park.

The sudden death of President Harding plunged the nation into mourning. It was determined that the most fitting memorial would be one in which his remains might rest till the end of time. Again the people were given an opportunity to contribute and again they made a generous response. The design of Eric F. Wood and Henry Hornbostel was selected for the structure. The Harding Memorial Association has procured an appropriate site on the outskirts of the city of Marion and plans are being rapidly matured for the construction of the memorial, which will cost more than $500,000. Until its completion the remains of the late President reposes in a vault in the cemetery at Marion watched day and night by an honor guard of soldiers.

The former residence of the Hardings has been given to the association to be maintained as a shrine, housing mementoes and relics which are being gathered from many places.

The fame of the late President is further perpetuated by the rechristening of the old Marion road, eastward to Lima and southward to Columbus. This is now the Harding Highway.

Garfield and McKinley were assassinated and Harding died while President. The memory of a fourth and older Ohio President casualty is being worthily revived. William Henry Harrison contributed his full share to the winning of the West. His victory at Tippecanoe broke the power of that redoubtable Indian Tecumseh, and as an administrator of the old Indian Territory he proved both zealous and able. His part in the War of 1812 would insure him a place among American immortals had he never been elected to the Presidency. Defeated once in 1836, he was elected in 1840, but occupied the office only one month.

His remains were returned to his old home at North Bend, Ohio, near Cincinnati, where he was buried in a plain, stone tomb on the brow of a hill overlooking the beautiful Ohio River. Not even Grant's Tomb occupies so picturesque a spot. His son deeded the tomb and the plot of ground surrounding it to the State of Ohio, but for many years the resting place was shamefully neglected.

In recent years, however, patriotic Ohioans have atoned for this neglect. An association has taken over the grounds and converted it into a park. The original tomb has not been disturbed, but upon it has been erected a shaft of unpretentious dignity, while the approach has been appropriately beautified. Nature has done the rest, and from an object of reproach the tomb of William Henry Harrison has been made a veritable shrine.

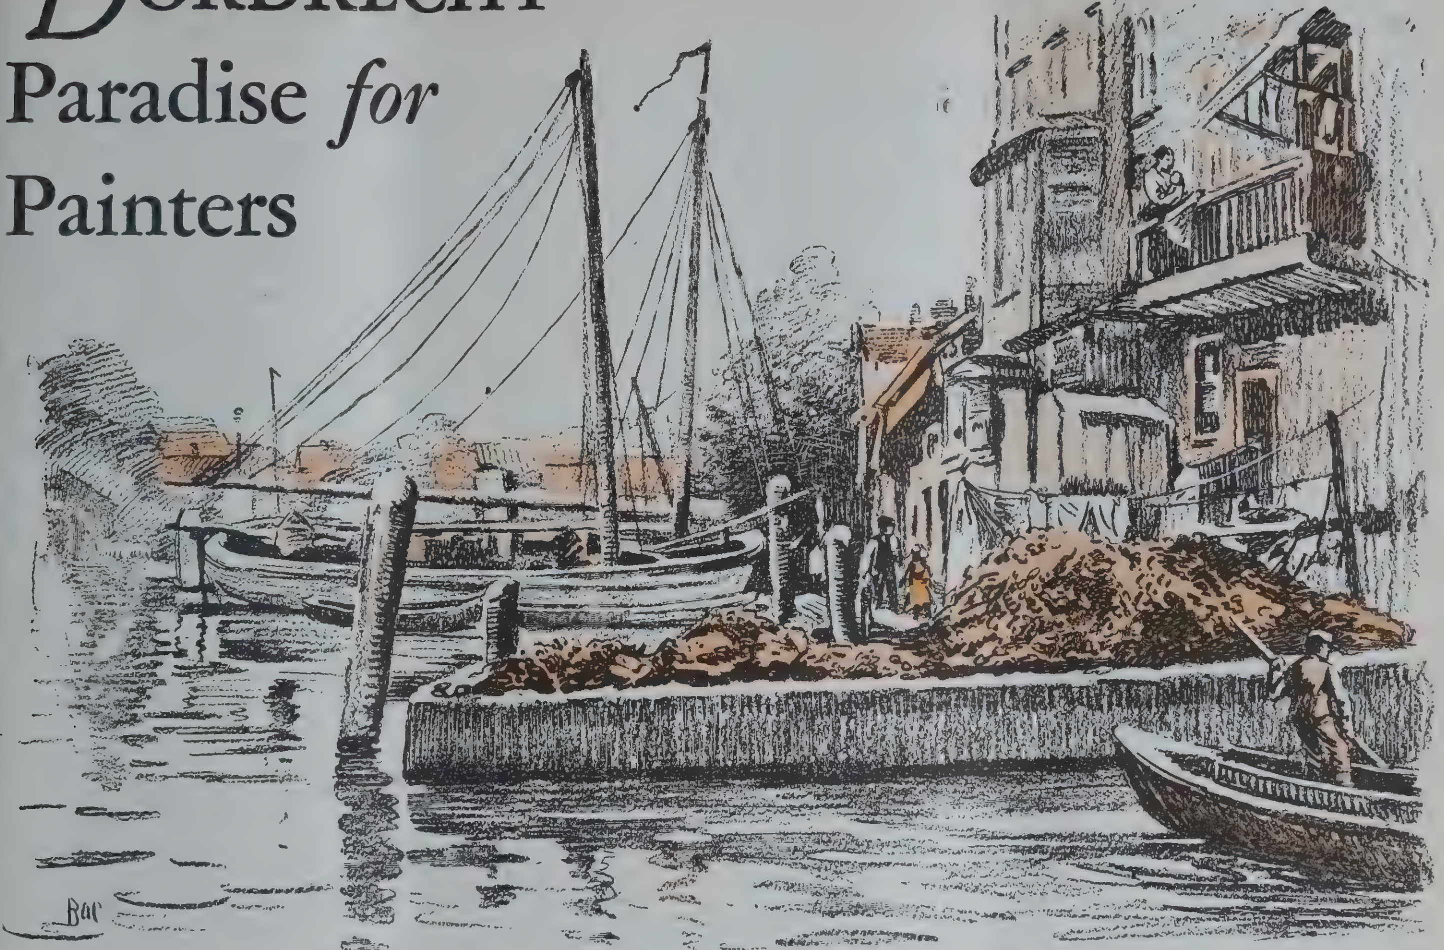
ON APRIL 27, 1922, the citizens of Clermont County, in which is located Point Pleasant, birthplace of General Grant, celebrated the centennial of his birth. President and Mrs. Harding and a distinguished party made the trip there by steamboat from Cincinnati and the citizens spent three days in commemorating the event at Point Pleasant and at Georgetown, where Grant spent his boyhood. The house in which he was born was not there. It had been removed and rebuilt in Columbus, where some years ago a state society believed that it would be more accessible to visitors. Point Pleasant's tribute to his memory is a highway which connects the isolated village to the outside world. This is being improved and one of its features is the Grant Memorial Bridge.

Rutherford Birchard Hayes ran for the Presidency at an unfortunate time. Postwar hatreds still rankled and his title to election was sadly clouded. He was an able jurist, a statesman and publicist, thrice elected governor of Ohio and winning distinction in the office. Content with a single term he withdrew, at its close, to his beautiful estate at Spiegel Grove, near Fremont, and spent the remainder of his days in tranquil retirement. His wife, Lucy Webb Hayes, is celebrated as the first mistress to banish liquor from the White House. She and her distinguished husband lie side by side in Oakwood Cemetery, Fremont, but the Hayes home at Spiegel Grove has become a memorial in their honor.

Benjamin Harrison was born almost within sight of his grandfather's tomb and spent his boyhood and youth in his native village and in Cincinnati, but his subsequent career belongs to Indiana, of which state he was a resident at the time of his election to the Presidency. He died and was buried in Indianapolis.

William Howard Taft was born in Cincinnati. He is our only living ex-President and is Chief Justice of the United States Supreme Court.

DORDRECHT—Paradise *for* Painters



By JANE L. HICKS

Illustrated by IRVING R. BACON

RECENTLY the returned artist came upon me with some of his irresistible marines and landscapes of Dordrecht, scenes that would start the bells ringing in the heart of any admirer of the quaint and picturesque.

His glimpses into this delightful place were supplemented by a chance happening on that charming account of Holland that E. V. Lucas gives us in his *An Adventurer in Holland.* So charming is this second-hand impression of Dordrecht that I venture to make large use of it, with all due apologies to Mr. Lucas for any plagiarism it may contain.

Dort—as Dordrecht is affectionately called by those familiar with her and who have succumbed to her charms—should be approached by water to be seen as she has been pictured by her great son, Albert Cuyp, and countless artists since his day.

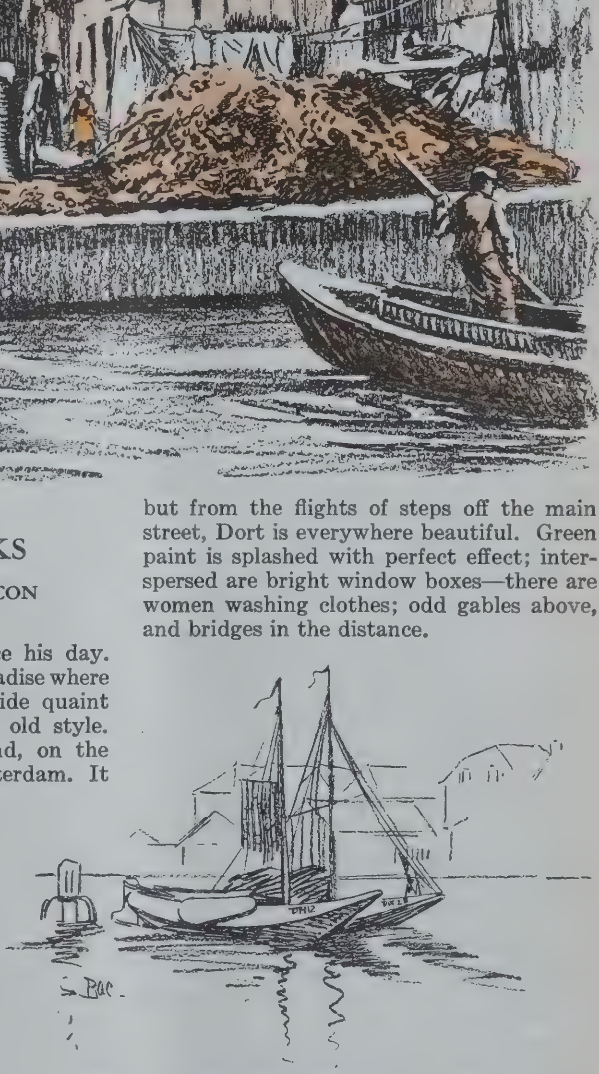
Indeed it is still an artist's paradise where men smoke Dutch tobacco outside quaint taverns and gossip in the good old style. Dort is a city of South Holland, on the Meuse delta, ten miles from Rotterdam. It was founded in 1012.

The town is the subject of interesting tales, as all old towns are.

The best known of these tales is that about the milkmaid who saved the town from the Spaniards by giving warning to the burgomaster.

The states council in memory of the merry milkmaid's good service caused the coin of the city to have the milkmaid under her cow to be engraven, which is to be seen upon the Dort dollar, stivers, and doights to this day.

Dort is the most painted of all Dutch towns, and no other town sits with more calm dignity among the waters, nor has another town such a quaintly medieval canal as extends from end to end, far below the level of streets. A series of little bridges cross this canal throughout the town, and her admirers assure us that seen not only from the bridges but from the flights of steps off the main street, Dort is everywhere beautiful. Green paint is splashed with perfect effect; interspersed are bright window boxes—there are women washing clothes; odd gables above, and bridges in the distance.



Over the streets, converging façades incline toward each other like deaf people. It is the result not of age and sinking foundations, but of design. The law many years ago decreed that roofs should so far project beyond the perpendicular as to shed their water into the gutter, so that passers-by may go by unharmed.

Dort's greatest artist, Albert Cuyp, was born in 1605 and died in the town of his birth in 1691. His body lies in the Church of the Augustines. He has been called the Dutch Claude, but he is more simple, more human than Claude. He painted principally pastorals, also good portraits and many charming scenes of his own Dort. Reproductions fail to give his gift of diffusing golden light, his most precious and distinguishing possession.

Another of Dort's sons, Nicholas Maes, is by some considered above Cuyp in interest and power. He was born in 1632, a great year for Dutch art, for it was also the birth year for Vermeer of Delft and Peter de Hooch. Maes is probably the greatest of Rembrandt's pupils.

Another pupil of Rembrandt, Ferdinand Bol, also belongs to Dort. At one time his pictures were considered finer than those of his master, but we are wiser today. He had, however, a fine free way, united to a delicate charm to which Rembrandt paid little attention.

By perverse judgment, Dort has honored Ary Scheffer more than any of her really great sons. It is his statue which rises in the center of town, and his sentimental and saccharine inventions fill three rooms in the museum. We are reminded that Dort had no right to be intoxicated with the excitement of having given birth to Scheffer, since his father was a German, a mere sojourner in the town.

Dort also owns a master sculptor, Jan Terween Aertz, born in 1511, whose carvings in the choir of Groote Kerk are among its chief glories. It is amazing that such spirit and movement can be expressed in wood.

By the irony of fate, Dort, possessor of Terween's carving of the Triumph of Charles V (pendant to Triumph of the Church and the Eucharist), in 1572, only a few years after the carving was made, held the congress that decided the fate of Spain in the Netherlands.

So it is that Dort, that paradise of painters, was created by the combined efforts of Nature and man to be one of the quaint and distinctive towns of the earth. Having been created, she brought forth her own artists to record her charm and beauty. And so she stands today, a mecca for lovers of the picturesque, a magnet for artists.

Chinese Lottery

(*Continued from page 8*)

Oriental gamblers go from house to house and from office to office enlisting an ever-increasing army of lottery fans.

I know men who have been investing fifty cents or one dollar a week in Chinese lotteries for years in the vain hope that they will win one of the capital prizes. This is one of the outstanding examples of the implicit trust that the gullible will place in games of chance and especially in those devices that are surrounded by a cloud of oriental mystery.

Nor does he consider the odds against him. There is nothing to prevent the lottery proprietors from so manipulating the drawing that the capital prize will always remain with the promoters. Some of these prizes amount to as high as $31,266 where $25.50 is paid for a ticket. On an ordinary fifty-cent ticket such as I purchased, if five spots on my ticket corresponded with five on the 'key,' I would receive one dollar but if the entire ten spots were identical with those on the 'key' ticket, I would receive $1,600. I may say that in all my experience among Chinese, I have never known an American to win a capital prize.

I do not fear contradiction when I say that the odds are a thousand to one against the bettor in a Chinese lottery.

A Journal *of* Other Earths

By JULIAN HAWTHORNE

THE spirits of Mars are the best of all among the spirits who are from the earths of our solar system; being for the most part celestial men, not unlike the men who were of the Most Ancient Church on this earth . . . The spirits of each earth represent some particular province in the Grand Man, and hence each is in a state different from that of the spirits of other earths.'

This extraordinary paragraph was written in Latin one hundred and seventy years ago, and was published in London in the year 1758, together with much other material of similar tenor. The little book—of 118 pages—which contains it gives an account also of five other earths in our system, and of our own moon; and then the traveler ventures beyond our solar region, into the vast of space, and brings us tidings of five planets, forever unseen of us, in what he calls 'The Starry Heavens'; and returns to his own home here, after that inconceivable journey, to tell what he found.

It is about sixty years, I think, since I first picked it up and plunged eagerly into it. I read it through from cover to cover, and laid it down little wiser, but more perplexed than before. But I was able to understand why it had never been 'popular.' It postulated everything and proved nothing. Even its postulates were mysterious.

What was meant, for instance, by the 'Grand Man' in the previously quoted paragraph? The entire narrative was studded with references to a thousand matters whereof I knew nothing. And at the end of it all, you might discover that you could not agree with all or any of it!

And yet permit your mind to entertain the claims of this Marco Polo of Space, and how almost intolerable is the interest of his tale! For he has seen these people, their dress, dwellings and countries; has conversed familiarly with them; knows their minds and natures, notes their likeness or unlikeness to ourselves.

But did he visit these other worlds in his personal flesh and bones? He claims no such miracle; his material body stayed at home; it was his spiritual body that made the journey—the real, imperishable body, the immediate form of the mind. And in the world of spirits, spaces are not fixed, as here, but we are in whatever place we intelligently wish to be. Why Emanuel Swedenborg, humblest of men, was selected for this office and why his election occurred at the time it did, instead of at any other date in human history, is explained, together with a great deal more, which those who will may know.

The face of a Martian was like our own, but the lower part—where beards grow here—was black; the rest, not white, but tawny, perhaps of the hue of South Sea Island natives. Fibers of tree bark, held together with a sort of gum, made his dress. His food was fruit, chiefly 'a round fruit that grows up out of the ground.' These people have the art of making fluid fires, for light in darkness. That is nearly all that we are told of the physical aspects of Martian existence. Nothing of 'canals,' of seasons, of air to breathe, of polar snows, of the biological details which we are eager to know. Swedenborg seemed to be very moderately curious on such matters.

The information concerning the inhabitants of Jupiter is much more detailed, and nearer to our own understanding. The population, we are told, is as great as it could support; its earth is fertile and abounds in all things, but the inhabitants desire nothing save what is useful and necessary; their intercourse is confined to relatives; none covets another's possessions. As to their appearance, their faces are like ours, but more fair and beautiful, sincerity and modesty beaming forth from them. They consider the face to be the mind in form, and for that reason they cleanse their faces much, and have a covering made of the inner rind of a tree, of a bluish color, which they wrap around the head and so cover the face.

The people of Saturn are upright and modest and worship the One Only Lord, except some of them who call their nocturnal light, which is great, the Lord: this is the light that comes from the great ring and from moons. But these are heretics. The ring does not appear to the inhabitants as a ring, but only as a snowy light in the sky, varying in direction. They live grouped in families, and the children, when they marry, are separated from the home of their parents, and care no longer for it. They have small use for food and clothing, living on fruit and vegetables, and are clad lightly.

And what of Venus, our poets' Planet of Love? Two kinds of men live on it: those who are mild and humane, and those who are fierce and almost like wild beasts. The former occupy the side of the planet which is turned away from our earth, leaving the savages to face our lovers in the evening and morning sky. With these, our traveler did not speak, but 'was told by angels what their quality is.' 'Their chief delight is in plundering and feasting on their plunder. They are for the most part giants, twice our height; they are stupid, not asking what heaven is, but caring only for their land and cattle.'

People on the moon appeared of the stature of children of seven years, but stouter, like dwarfs, and 'what was strange, one carried another on his back.' Their voices were loud and terrifying, being sent forth from the abdomen, like eructations. Their faces were long, but not unattractive. They do not speak, like others, from the lungs, but from air collected in the abdomen, 'because the moon is not surrounded by the same kind of atmosphere as the other earths.'

The account of the Mercury people is long and begins the volume; but they are perhaps less comprehensible to us than the others, and I shall leave them to other students.

* * *

We are now come to the brink of the abyss which divides us from the Milky Way and its galaxies; across which Swedenborg passed devoutly, but whither I shall not follow him. The way lies open, and I will only remark that nothing monstrous or sensational will be met with, but that kindred traces of our own human nature are everywhere, always in the human form.

The Scots *and* Their Stone *of* Destiny

By WILLIAM STIDGER

THERE is strange and unusual romance in stones. The world over, stones have been used to mark great epochs in history, and, as Shakespeare said, there are 'sermons in stones and books in running brooks.'

All through beautiful Brittany huge monoliths indicate where certain primal religious rites took place. On top of Mount Taishan, in China, a huge monolith marks the spot where man first worshiped.

Not long ago, I stood in front of that marvelous bit of black basalt called the Rosetta Stone. It is in the British Museum. It was discovered by French army officers, buried in the sands at the mouth of the Nile. Scientists took a quarter of a century to decipher the inscription on it, and when they had read its story they found it was the key that unlocked the history of the past ages. Why? Because there were three sets of writing in hieroglyphics carved on its flat surface.

The first was in the priestly language, the second in the language of the common people, or the vernacular, and the third in the Greek. When scientists had deciphered the Greek they were able to read the other two.

But, perhaps the strangest legend concerning a stone is that which surrounds the Scottish Stone of Destiny. This stone rests under the Coronation Chair in Westminster Abbey.

The story is told that Jacob slept on it at Bethel, slept on it that immortal night when he wrestled with God while fleeing before his brother Esau whose birthright he had stolen, and had his great vision.

From Bethel, the stone was carried to Egypt, possibly by Jacob's family, although little is known of this part of its history.

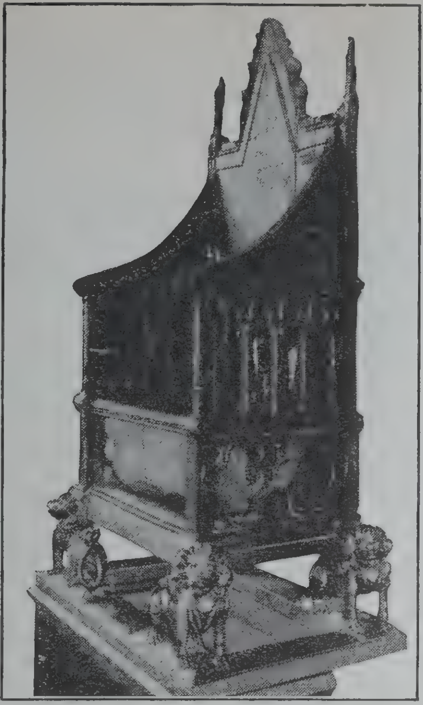
ITS next journey, which was about 700 B. C., was to Ireland. How it got to Ireland historians do not tell, but there is no doubt about its being there. From Ireland it was later taken to Scone in Scotland where it rested for five hundred years. Edward the First of England took it from the Scots and brought it to England where it was placed beneath the seat of the Coronation Chair in Westminster Abbey.

Sir Walter Scott has a verse about this sacred stone:

> 'Unless the fates are faithless grown,
>   And Prophet's voice be vain,
> Where'er is found this sacred stone,
>   The Scottish race shall reign.'

The stone is mentioned in the histories of the English, Irish and Scottish peoples. It was even discussed on the floor of the House of Commons while I was writing this article in London.

The discussion arose because a Scottish member, Mr. Kirkwood, in giving notice of a bill to remove the stone to Holyrood, insisted that the Scottish people wanted it returned.



Edward I of England removed the stone and the regalia of Scotland after the Battle of Dunbar, fought March 30, 1296, in which he defeated John Baliol.

This stone is very closely connected with the well-defined legend that the Anglo-Saxon-Celts are the lost tribes of Israel. It is of red sandstone, and Lord Apsley, who spoke on the matter in the British House of Commons, said that he had slept at Bethel himself several times, and that the Stone of Destiny was exactly like the red sandstone found there.

Black and White in Africa

(Continued from page 13)

Another widespread and unfailing sign of the White man's influence is the trick of contracting the throat and raising the larynx, which is called the 'pressure tone.'

This exists today and can be established with certainty for the earliest Egyptian period, on evidence from the hieroglyphs. All these peculiarities are foreign to the pure Sudanese Negro and the Bushman.

The only great civilization native to African soil is the Egyptian. Its course is just the reverse of what we should expect. It begins suddenly, reaches its culmination within two hundred years or so, and then steadily declines. We suspect that the original impetus was given by an infusion of White blood from the Delta, when king Menes joined the 'Lower' kingdom to the 'Upper' at about 3300 B. C.

We can imagine, also, that the steady decline resulted from the steady 'boiling out' of the White ingredient; for the Nile Valley in the end proves deadly to all but those who are perfectly adapted to its climate; and the possession of too much White blood would be a disadvantage.

The present-day Egyptian peasant looks exactly like the portraits of his ancestors, and sometimes even like the Pharoahs; but he has lost his stamina and his skill. The race which reared the pyramids without machinery cannot now hang a door or paint a window sash. The modern Egyptian is yellowish or coppery, with slightly frizzled hair. He has the softness of the Negro in his voice, his movements, and all his ways. He is extremely likable, but lacks ability. The affairs of Egypt are forever in the hands of Asiatics and Europeans. For more than two millenniums Egypt has been ruled by aliens.

In the legend of Osiris we glimpse the early struggle between White and Black men in Egypt. The story is that the great and good god Osiris was slain by his wicked brother, the god Set. His consort and sister, the goddess Isis, collected the fragments of his dismembered body from many places and erected a shrine in each. Finally, with the help of her divine son Horus, she drove Set forever from the land. Now, the people of Set seem to have been blacksmiths, perhaps Negroes, while the people of Isis and Horus lived in the Delta, and were probably white.

The religion of Osiris is the most exalted faith that Egypt produced; and while it dominated Egyptian thought for ages, it never displaced the strange and, to us, repulsive, worship of animals which is the central fact of Egyptian religious thinking as a whole. The Osiris religion taught that after death the souls of men entered into the presence of the god and were judged. The heart of a man was weighed in a balance against an ostrich feather. If it was burdened with any of the forty-two sins, he could not enter into the reward of the blessed.

ON THE other hand, the common people of Egypt continued to worship various animals: the baboon for his wisdom, the ram and the bull for their strength, the jackal for his cunning in the wilderness. Some of these, like Apis, the bull of Memphis, and Amon, the ram of Thebes, acquired almost national importance. Some attempt was made to transform them into human beings by giving them the bodies of men while they kept the heads of beasts and birds. But, nevertheless, they remained animals to the very end of paganism. Sacred cats, alligators, and bulls were carefully mummified.

Even the accidental killing of an animal of the sacred species was punished by death. Now all this seems very strange to White men. The Negro, however, is a lover of animals. To him they are brethren, as in the Uncle Remus stories of our Southern States. The animal gods of Egypt were Negro.

In present-day England we see very few of the tall, light-haired people who brought the English language from northern Europe, and very few of the brawny red-haired people who originally spoke Welsh, Irish, and Gaelic. Instead, we see everywhere—particularly among women—dark-haired, rather short people, with fine features and blue or hazel eyes. They represent the old British race, which is reasserting itself.

It is a part of the romance of human history that everything is related in some measure to everything else. Most of my readers are sprung from the people of the British Isles. In their veins runs some of the blood of the pyramid builders, along with the boasted blood of the Nordic blonds.

Art May Be Long

(Continued from page 7)

original is there. And naturally excellent reproductions, like these, are better than even second-rate originals. You may also borrow these color prints and hang them on your walls. No doubt they will make you desirous of owning similar art for permanent happiness.

Everyone can get something from art—the butcher, the baker, the candlestick-maker. We have often guaranteed that every visitor must depart from such a collection as the Detroit Institute of Arts with a pleasant remembrance of at least one treasure. It may be an Egyptian mummy in a gilded and painted case, a rhythmically undulating classic Greek marble figure, or a richly glazed vase of peach pink, apple green or moonlight blue from China. Perhaps it will be a picture so perfectly, even stereoscopically, painted as to appear reality itself, or a 'modernist' pattern of almost abstract form in scintillating colors, a veritable kaleidoscopic jewel of many glowing gems, dynamic and dominating in its emotional appeal.

You can remember the treasures of the galleries and thus make your own collection mentally for future reference whether you buy or not. No one can destroy nor take these treasures from you. Time will but make such precious possessions more definite and lasting.

After learning how others have so beautifully interpreted nature, we can 'go and do likewise,' at least in our mind's eye, if not with actual paint. Perhaps nature has intentionally withheld something that only those who are willing to make some effort may reap the reward.

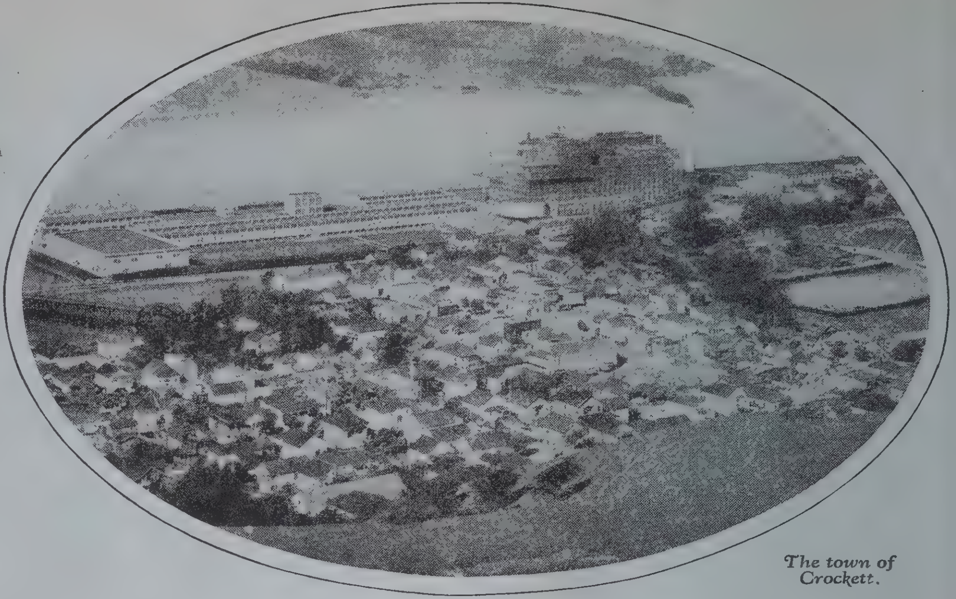
Longfellow's Home

(Continued from page 15)

Lieutenant Governor Dummer, still stands being now used for educational purposes. It was said that at the housewarming he mounted a white steed and rode down the front stairs much to the consternation of the guests. This event which took place in the month of August in the full of the moon, tradition relates, is repeated at the present day and whenever there are two moons in the month, the nocturnal escapade takes place on the occasion of the first one.

The old house is replete with visions, for in the kitchen a little child was wont to appear, a golden-haired, blue-eyed girl of five years. She would balance herself upon the doorsill peeping in and out as any child would do, but was never seen in any other part of the house. Her pleasant, smiling face became so familiar to the occupants that they called her Elizabeth. It was during the oiling of the kitchen floor one day that a child's ring was discovered embedded in a crevice. In trying to remove it, a trapdoor with a sceret spring was disclosed with an old ladder leading below. Upon exploration, in a secret recess, was found a large round cheesebox containing the bones of a child. After they had been properly buried, 'Elizabeth' appeared no more.

Tales there are no end, so we take leave of the old-time parish that it may enjoy its past unmolested by modern-day intrusion.



The town of Crockett.

Give Workers a Home

Beautiful Surroundings as Inducement to Good Service

By JOHN SLOAN

PROVIDE the workingman with beautiful surroundings, and you will have neither strikes, walkouts nor heavy labor turnover.

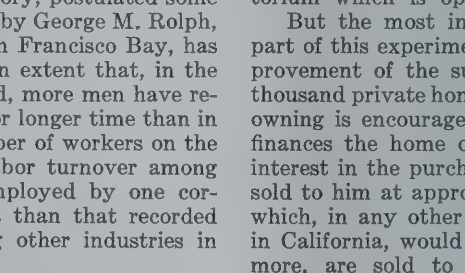
This interesting theory, postulated some twenty-three years ago by George M. Rolph, out on the shore of San Francisco Bay, has been proved to such an extent that, in the town where it was tried, more men have remained on their jobs for longer time than in any other similar number of workers on the Pacific Coast. The labor turnover among two thousand men employed by one corporation has been less than that recorded proportionately among other industries in the same section.

The experiment was tried out at Crockett, a town which operates under county government, with a county justice of the peace and two constables as its officials. This town is about thirty miles from San Francisco. The California and Hawaiian Sugar Refining Corporation, a semi-coöperative organization, owned and directed by sugar planters in the Hawaiian Islands, supports the town.

No attempt is made to control the town or to direct public opinion, except toward beautification of homes, gardens and the mile-square area of Crockett. Parks, playgrounds, an auditorium, and a public tennis court have been established, without expense to the people of the town, while the streets pass between walls of shrubbery and flowers, and the homes seem to be placed in parks, rather than on the usual paved thoroughfares and sidewalks. There are two large parks, several smaller breathing spaces, covered with flowers and walled in with trees; the best tennis court on the Pacific Coast, presented at a cost of $11,000 to the town by Wallace Alexander, when he was president of the corporation, and an auditorium which is open day and night.

But the most interesting and valuable part of this experiment in beauty is the improvement of the surroundings of the one thousand private homes in Crockett. Home-owning is encouraged, and the corporation finances the home owner at a low rate of interest in the purchase of a house and lot, sold to him at approximately cost. Homes which, in any other town of the same size in California, would be selling at $5,000 or more, are sold to the workers here for $3,500 to $4,000, and the reduction in higher-quality houses, situated on larger lots in better locations, is in proportion.

In order thus to convert the town into one huge garden, the sugar refining company established a nursery, and put an expert gardener in charge. This nursery started with five acres, and the gardener had four assistants; in 1924 it covered ten acres, with fifteen assistants. In 1923, this nursery distributed among the householders of Crockett 150,000 trees, flowering plants and shrubs. Up to September 1, 1924, more than 100,000 plants had been given away. More than two hundred varieties of these three forms of plant growth are kept constantly in stock at this nursery, ready at demand for distribution to the homes of the town. This distribution is not limited to the families of workers in the refinery, but anyone living in Crockett may have an abundance of plants for his yard free of all charge, no matter how large that yard may be.



A Spanish-type bungalow in Crockett, surrounded by shrubbery and flowers.

Shakespeare Autograph

(*Continued from page 5*)

lexicographer could. That is how Benjamin Franklin, who never went to school after he was thirteen years of age, came by his wonderful vocabulary and his complete knowledge of the meanings of words.

But what of the autograph in the Boston Public Library? How did the library come by the autograph?

Judge Mellen Chamberlain, librarian at the time, tells the story:

'The history of the volume is this: It was brought to the library, together with the first folio of Ben Jonson, in the autumn of 1880, by a Mr. Samuel Gasking, an Englishman from London, who claimed to be a proof reader seeking employment, and said that he had several old volumes picked up in a London secondhand bookshop, which he was willing to dispose of at reasonable prices.

'As the library lacked these volumes they were purchased at something less than the prices usually quoted in English sale catalogs. Mr. Gasking drew the librarian's attention to the signature and other writing which he thought might be that of Shakespeare; but he did not seek to enhance the price on that account.'

As I happen to know how the old-time bookbinders worked I think I can explain just how that piece of paper containing the Shakespeare autograph came in the book.

When the binder in Richard Field's shop—in any of the old shops—had the leaves of his book stitched together he took the volume and put it into a screw clamp at the end of the bench on which he worked, where it was firmly held together with the back up. He rounded this back with a mallet and then he took any useless pieces of paper that happened to be within his reach at the moment. He laid these strips on the bench, put a bookbinder's straight edge over them and with a sharp knife cut them into strips the desired length and width. Some of these strips he pasted on the rounded back to cover the stitched channels and the back ends of the folded sheets.

In the case of folio volumes like North's *Plutarch* it was customary to strengthen the hinge of back and covers by means of strips of parchment and paper that were glued to the back and adhered to the lower inside of the cover boards. This was in addition to the loose ends of the binding strings that were adhered to the covers, inside. It is on a piece of paper that was inserted between the strips of parchment that were used to strengthen the back binding of this volume that the Shakespeare autograph was found.

THAT piece of paper happened to be lying on the bench within reach of the bookbinder at the time and he used it. The fact that there happened to be some writing on it made no difference. In point of fact there is writing—handwriting of the period—on the strips of parchment. Some of this writing is in Latin. It would not have been possible to do any of this writing, on either parchment or paper, after the book was bound.

Another curious thing is that there is a wormhole—which runs through the parchment and paper passing through a space before the word 'and' in the line 'hundred and twenty pounds.' That wormhole goes through 310 pages of the text and was there when the library purchased the volume.

That binding was placed on that volume in 1603 in Richard Field's office, an office to which Shakespeare was a frequent visitor; the office in which his own first literary ventures were printed; the office which Vautrollier owned and in which William Shakespeare himself very probably worked for a few years when he first came from Stratford to London—the office where he acquired his knowledge of words, his knowledge of ancient history and the erudition which has so mystified students.

The only difference between this Shakespeare autograph and the existing autographs of Shakespeare is that this one is much better than any of the others because it was written by a hand that was neither palsied nor weak from illness—as the others plainly were. This was written when Shakespeare was in his prime, about thirteen years before he died.

There is one more debt which I am confident Shakespeare owes to another London printer, Isaac Jaggard—nothing less than the saving of his masterpieces to the world.

Men Without Country

(*Continued from page 2*)

alien had resided in territory contiguous to the United States for five years immediately preceding his application, he could be admitted in excess of the quota. Apparently this man could not quite meet even this requirement, for although he had come to Canada before the war, he had served abroad in the army during the war and his last unbroken physical residence in Canada had continued only three years.

We ruled, however, that service in the Canadian army after enlistment in Canada did not constitute a change of his residence when he served abroad. The deportation warrant was canceled.

This case, of course, involved the Immigration Act of 1921; the result would have been different had this man arrived since July 1, 1924, because on that date the present law took effect, under which the only geographical basis for nonquota status is birth in a nonquota country; residence alone, no matter how extended, would not remove the quota barrier.

In attempting to confer a regular status upon the qualified undeportable aliens it should be emphasized that no police registration or regulation is contemplated. Objection has been raised to enrollment on the assumption that it is an espionage proposal. The object is far removed from that. The enrollment could be put into effect on a voluntary basis.

Even a voluntary enrollment of aliens with naturalization officers would serve to benefit those who took advantage of it, and it would enable us to know those aliens who have intentions of becoming citizens.

These officers desire to assist aliens who may wish to become citizens and to keep in touch with them until they become naturalized. The enrollment suggested should take the place of the declaration of intention, or so-called first papers.

The record made voluntarily by the alien would relieve him of much of the usual expense of proving residence by the furnishing of witnesses.

A Strange Friendship

By BEN HUR LAMPMAN

THE steward was recalling old days, while the mollyhawks kept pace with the ship, and now and again a flying fish burst from the changing emerald alongside and went planing away. A big man he was, heavy-veined, ponderous, with a way of balancing on the balls of his feet, as though he had known the prize ring. The engine was throbbing as perfectly as a sound pulse. Blue vastness of sea.

'Them birds is mollyhawks,' said the steward. 'Sailors catch them sometimes with baited hooks. Put them on deck and they can't fly; can't seem to take off. Reminds me of a story I meant to tell you. A leopard and a chicken was pals. You wouldn't believe that, would you? There's a lot of things you wouldn't believe.

'I bought this leopard from some niggers at Boma, a trading post far up the Congo. He was the meanest cat I ever saw. We fed him chickens. See this scar on my thumb? And this one across the back of my hand? That's where he clawed me one time. At any rate, we used to feed him chickens. You'd throw one in the cage and he'd have it in a pounce. A scrunch or two and the bird was gone, feathers and all. Scrunch and a snarl. He was death on chickens!

'So one time a runt chicken that run around the deck goes teetering up to the cage, and darn my hide if that chicken doesn't walk right through the bars. The cat blinked at it, and crouched, and sat up and blinked again. The chicken goes picking around here and there as unconcerned as you please. It goes up to the leopard and takes a swipe at a fly, and says something in chicken talk. I'm a liar if that cat didn't just punch it easy—like with one paw—and lie down again, and go to sleep. After that they was great friends. The bird roosted in the cage every night, and visited there every day. Throw in another chicken and it was a goner, but not the runt.

WE KEPT the cat four months before I got a chance to sell him, and for the last month the chicken stayed in the cage all the time, because it was too big to get out again, and anyway it was lonesome outside.

'That's the truth. I left the ship a little while before she went to glory at Stanley Falls. She was carrying a cargo of black gunpowder, and the lighters came alongside to take it off. Niggers was careless with their pipes. Knocked the dottle out anywhere.

One of those bloody heathens tapped his pipe on the head of a leaky powder keg. The whole forward end of the ship was blown away, and they found a winch drum half a mile ashore. There weren't any white men killed.'

World's Greatest Distance Men

(*Continued from page 9*)

He managed to run for 22 hours 45 minutes and at the end of that time he collapsed. He had covered 120 miles 275 yards and his run established all distance records from 55 miles to 120 miles.

Going against the record performance for distance, the two Tarahumaras who ran in Texas covered 89.45 miles in 14 hours 44 minutes, while J. Saunders, in his record-making run, required 15 hours 14 minutes to cover 89 miles. The Indians not only beat the best of American records but consider the handicaps under which they ran. They were far removed from their native haunts for the first time in their lives. The temperature at home is low and the air thin and dry. Their previous running had been done at an elevation of something like five thousand feet above sea level and always on virgin soil, with plenty of spring. From San Antonio to Austin they were forced to run over paved and hard gravel roads and under the glare of a hot sun. Their feet were cut and blistered and at times they very nearly choked from the gas fumes of automobiles that crowded the roads over which they ran and which became so congested at times that they were forced to halt. Had they been permitted to run on a cinder track, with spectators kept out of the path, they would probably have run one hundred miles in less time and easily have gone miles farther, smashing all known records.

The greatest runners of the Tarahumaras have never been watched in action by white men. Attempts have been made to reach them but as soon as they catch sight of strangers they flee. Among them are some who will run three days and nights at a stretch, according to the few half-civilized members of their tribe.

The name Tarahumara means 'runner with the ball.' In their own land it is their custom to run behind an oak ball, not quite so large as a baseball. They kick the ball, pursue it, and, when they catch up to it, kick it again. This is repeated, for miles and miles. They carry a bamboo stave when they run. This is used for steep grades. Nearly all of their country is hilly, making the use of staves necessary. They occasionally partake of native food while running. It is called pinole and is made of maize, ground with brown sugar. They also drink liquid refreshments made of native herbs.

The Tarahumaras do not try for distance, time, pace or rhythm. They have no conception of them. The aim is for endurance, each runner trying to outdo the others. They do not run like the civilized athletes of the world. The civilized runners use the balls of their feet but the Tarahumaras reverse this; they run on their heels. Most of the time they move with a shuffle and a glide, the feet barely leaving the ground.

When Mr. Rodriguez finally induced the Indians to compete in a track meet he found it impossible to get them to wear track suits. They wanted to appear in native dress. This, of course, was not possible. The white man then had an idea. These stoical Indians have the savage passion for color, and the color that would appeal mostly to them was red. So the white man traveled back to the city and had track pants made for the men and bloomers for the women of the brightest red he could buy. He then bought white track shirts for the men and middies for the women and had wide red ribbons sewn across the fronts of these. When he returned and showed them to the Indians they all wanted to take part in the meet. Now, unless they can wear their glaring red, they refuse to compete.

The Tarahumaras ran in Mexico City, setting a few records, and receiving wild ovations from the civilized crowd that watched them finish, but they do not want to run in Mexico City again, at least the best of them do not. When they finished their race they received but few presents and they objected, the most modern trait they have shown since they were discovered. In Texas, the men received guitars, violins, mouth harps and bright toys. The women, too, received bright-colored toys and red silk shawls. They want to run many, many miles in the United States and receive many gifts, for they believe these white men under the Stars and Stripes appreciate athletic feats, while the Mexicans do not.

Mexico expects to enter the Tarahumaras in the Olympic Games next year but the Tarahumaras must be taught many things about running before they will be able to win points for their white rulers.

The Pot of Gold

(*Continued from page 3*)

turies Mexico has enriched the world with its gold and its silver. From the days of Montezuma, a name which in itself suggests sumptuousness, through the days of Cortez and the Spanish Conquest, through the Revolutionary days down to the present, Mexico has been known as the Eldorado of America.

Every state in Mexico, with one or two exceptions, has gold and silver mines, a total of about twenty-five thousand mines in all.

The Indians first discovered the deposits of gold and silver in Mexico and used the gold for ornaments. Then came the Spanish who took over the crude mines the Indians had opened.

In 1521 the first silver was taken from Mexico and sent to Europe. And the mines from which it came are still producing heavily.

For three centuries, from 1521 to 1821, the Spanish controlled and exploited Mexico, and three billions of pesos in gold and silver were taken from this treasure house and sent to Spain.

It is said by authorities that the greatest gold mining camp in Mexico if not in the world, and, most certainly, the largest on the American Continent, is at Real del Oro.

We have our gold romances in America. We had one in Georgia, but it was soon forgotten in the rush to California in 1849. In California placer mining, hydraulic mining, and shaft mining has each had its glorious day. Then came the discovery of gold in the Klondike. All three of these great fields are more or less denuded of their treasure, but from the discovery of America down to the present time, Mexico has been the great gold and silver mine of the world—constantly exploited and constantly producing. Three-fourths of Mexico's rich fields are still unopened, however.

In fact, a mining expert told me in Mexico City that very few new mines had been opened since the Spanish Conquest of Mexico; that most of the mines now in operation were mines that were begun by the Spanish. The Americans and English are merely continuing the working of these old mines on a more efficient system. What may happen when American capital begins to open new fields of richness no man can prophesy.

Vox Populi in Polls

NEWSPAPER polls and straw vote contests mean nothing so far as they seem to represent the actual feeling of the majority of the people. It is an odd quirk in human nature that comes out in polls. It is easy to get an adverse opinion on any subject, for the world is full of people keen to kick on something. *Patches* magazine contains a meaty little comment which we quote in part:

'There is something to be said about newspaper polls in general and the prohibition poll in particular. The prohibition poll completed recently was no exception to the rule. Cigar stores, club rooms, barber shops, cafés, etc., not only talked about the poll but participated in it, and got their habitués to do so. The Rotary and Kiwanis and Commercial clubs, the church organizations and the multitude of women's organizations took no active part. Moreover, it was a city poll. The country folk were not in it at all. To be still more specific, the cities were largely those noted for their wet tendencies. And finally, practically every newspaper engaged in making the poll has been and is openly against the present prohibition laws; so naturally their readers were the ones voting in this poll.

'This is not theory. Let some practical tests be applied. The poll showed New Jersey to be wet in the ratio of about thirty to one. Last year there was a state election in New Jersey, in which one candidate was supported by the drys and the other by the wets. Out of a total vote of about 700,000 the wet won by 40,000. Nothing of a thirty to one ratio about that. The poll showed New York to be wet by something like fifty to one. Within a week after the poll closed, the wets defeated a prohibition move in the New York State senate by a narrow margin that fell very, very far short of fifty to one.

'In 1922, Ohio, with a dozen big industrial wet cities, held a prohibition referendum to liberalize the strict liquor laws. The newspaper polls indicated the wets would carry the election overwhelmingly. On the other hand, the drys carried the state by 125,000.

'Some wet enthusiasts in control of certain Wisconsin municipal governments sent out questionnaires and pledges to over seven hundred municipal governments, asking them to go on record in favor of modification of the present prohibition laws.' In two months' time only twenty-eight responded favorably, according to the statement in *Patches*.

The Canadian Rockies

By T. M. VESSEY

THE Banff-Windermere road was the first motor road ever built to cross the central Rockies. Through it one may visit Lake Louise, the Valley of the Ten Peaks, Moraine Lake and Paradise Valley; and there are direct connections with Spokane, Seattle, Vancouver, Victoria, Portland, San Francisco and Los Angeles. The traveler may swing eastward on his return journey, and visit the Grand Canyon, Salt Lake City, and Glacier and Yellowstone National parks.

When construction crews were making a deep cut in the road in Kootenay Park.

To one who has not known them it is impossible to describe the delights of the new motor highway. From the eastern wall of the Rockies to the upper reaches of the Columbia River is a little more than a hundred and twenty-five miles, and every mile is a surprise and an enchantment. It does not matter whether the motorist enters by eastern or western gateway, he is swept at once into an enchanted world. The magnificence of the mountain ranges, the immensity of the scale on which they have been laid out refuse to be put into words.

Something is left out in every picture or photograph. Only the eye can gather the sense of height and vastness, the infinite serenity and majesty which thrill the beholder on his first glimpse of the Canadian Rockies. The endless succession of ranges billowing off to the distance as far as the eye can see, the countless variety of forms, peak after peak rearing its glorious bulk more than a mile up into the radiant blue, the shifting play of light and shade, the indescribable variation of color, the very opulence of the sunshine itself, are a joy and a revelation.

That is high praise; but eloquent as it is, it falls short, as mere word painting must, of what is actually conveyed by a sight of that grandest of all natural canvases, the Rocky Mountains.

The road runs clear through the central Rockies, and is one of the world's modern feats of engineering. The length of this stretch is one hundred and fifty-five miles, and every furlong of it is through some of the most remarkable mountain scenery this continent has to show.

In its 125-mile course through almost virgin territory, this highway crosses two mountain ranges. Sinclair Canyon is shown here.

How Our Commercial Club *Made* Good

By FRANK S. SULLIVAN

OUR town has a 'commercial club,' and so, I presume, has every other small town; but ours has 'made good.' I helped organize the first commercial club in our town about twenty years ago. The efforts were abortive; at least the birth was premature and the offspring immature. The young progeny got busy, however, and put forth its puerile efforts to draw trade to our town. But as every other town on the map paid higher prices for farm produce, and sold goods for less, no net results were obtained, and the Commercial Club finally wearied and sank into a comatose condition, from which now and then it would arouse to exert some spasmodic effort, all futile.

Finally, as the automobile came into extended use, tourists commenced to pass through our country bound for Colorado and other western resorts. Our town derived little benefit from this. Tourists, on entering the county, would pass through a rival town fifteen miles northeast, and thence, following directions, would take a road that led directly to a town in the west of the county, passing our town several miles to the north.

It finally dawned on our Commercial Club that if the town could offer attractions in the way of good roads leading in and out of it these would be a drawing card; and so the club got busy in earnest, with the result that a road was opened through the very worst part of the county, passing through our town from east to west, and shortening the route by several miles. And such a road! It traverses waste land, crosses canyons, winds around inaccessible peaks, swerves to avoid a precipice, and is picturesque withal. It is the first road of its kind to receive Federal aid, and is said to be the best dirt road in America. As tourists were quick to learn of it travel was soon diverted to pass through our town.

And then, when someone conceived the idea that a good camping ground would be a very desirable addition, the Commercial Club got busy again and purchased a two-acre tract of ground adjoining the town site, on which fortunately were growing a number of large shade trees.

The crowning glory of it all is a swimming pool with concrete bottom and sides.

In this work the Commercial Club has been assisted by the social and fraternal bodies. One organization financed the lighting; another put in seats; a third contributed tables. All contributed to the pool. Most of the labor was donated.

One enterprising citizen thought of the plan of having the tourists register, and so he provided a great leather-bound book, properly ruled, to record the name and address of the traveler, the place to which he was bound, and his 'remarks' as well. It is interesting to read these remarks. All comment favorably upon the camp or some particular feature of it. In the first six months after this book was installed more than twenty-five hundred tourists registered. And they go hence on their journey, east or west, north or south, and sing the praises of our camp and of our town.

Helping MOTHER NATURE

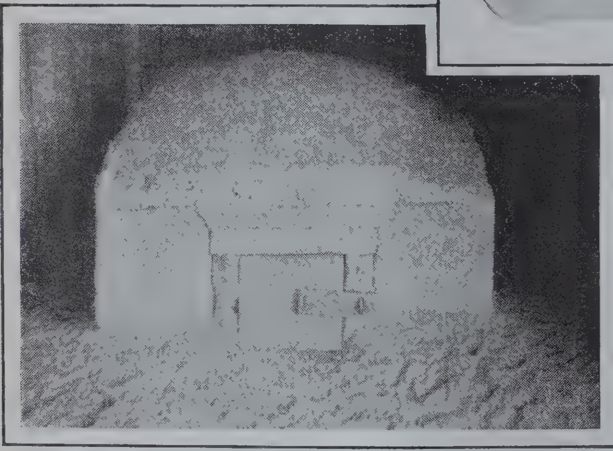
By
JOHN L.
VON BLON

Displaying a full-size chinchilla fur.

ON A SMALL herd of less than fifty specimens depend the world's hopes of perpetuating the dainty, timid chinchilla. This bearer of the most precious fur is nearly extinct in its lofty Andean habitat. From vast numbers the gentle little creature has been reduced to a pitiful remnant to gratify feminine desire for costly raiment. Here is almost a repetition of past lamentable animal tragedies. Fortunately it seems to have been circumvented at the crucial moment.

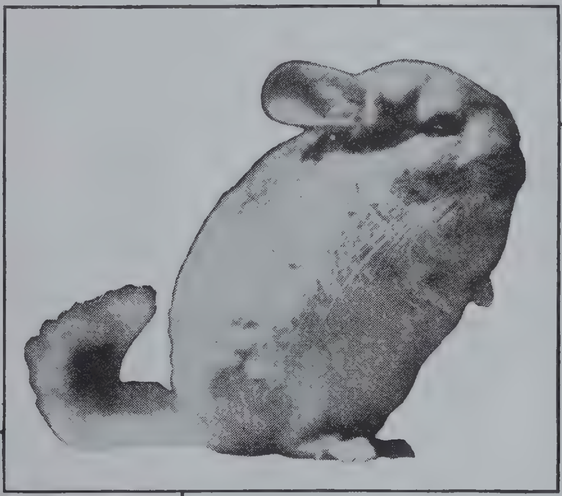
M. F. Chapman of Los Angeles has effected a transplantation of a herd from Chile to the United States. There is splendid promise of the perpetuation of the animal in North America. What it will mean is beyond conjecture.

From thirty-one, comprising four generations, which were in his pens in southern California, in 1925, they have been increasing steadily. Nowhere is another outside their homeland though the zoos of the globe long have sought them. Mr. Chapman estimates that he will have 3,000 by 1931. One pair of babies kept six years will normally produce 126 pairs. He expects to develop a huge fur-farming industry, and would not sell any of his animals at any price. Exportation from South America is strictly prohibited and the herd could never be replaced. It is the one hope of preservation and permanency.



Concrete container for chinchillas, designed to afford coolness, quiet and safety from fire. Inside, these retreats measure about twelve by eighteen inches.

The chinchilla is slightly less than a foot long with a tail of seven to eight inches that curls upward somewhat like a squirrel's. Its head resembles that of the cottontail rabbit, and its body is plump. A burrowing mammal, it lives underground in colonies at 12,000 to 19,000 feet elevation on the eastern slopes of the Andes in Chile, Peru, Bolivia, and the Argentine Republic. The fur is dense, soft and fragile, from an inch and a quarter to an inch and a half deep, a decided slate-blue about half its length and merging into a delicate French pearl-gray, handsomely mottled with black at the end of each hair. On the sides and belly it is creamy white. Nature produces nothing more exquisite. In the slightest breeze it ripples and changes color like water in a fountain. It cannot possibly be imitated with any degree of success except from the questionable furrier's mercenary viewpoint. The hairs are in tufts like the bristles of a toothbrush, perhaps five hundred to each, very delicately tinted and shaded.



A dainty chinchilla bearer brought from the Andes Mountains and acclimated to the climate of California.

The pelts were first exported, then only to Europe, early in the 19th Century, and did not for a long time attain wide popularity. In 1898 Chile, the principal source, sent out 32,000 dozen. During 1925 the production dropped almost to zero. Corresponding conditions obtain in neighboring countries. Less than thirty-two years ago the market price of skins was twenty-five cents each. Today the trapper receives one hundred dollars or more for every one he can obtain. In *The Fur Trade and Wild Animals*, by William T. Hornaday, is illustrated a full-length evening coat or wrap and the caption states that one similar was sold in 1920 for $55,000.

All attempts to take chinchillas out of South America or to rear them in captivity had miserably failed because of the high altitudes necessary to their existence, when Mr. Chapman solved the problem. He overcame the difficulty ingeniously by bringing them down very gradually from the mountains. Capturing them in a bleak, rigorous region, he kept them two years at 11,000 feet, giving them the utmost care and providing every requisite. The next stage was 9,000 feet, where a year's stop was made. Then other long halts, successively lower until, after a period of nearly six years, he was ready to sail with the original even dozen for a land of far different clime and a reverse season.

This was the supreme test. While passing through the tropics the chinchillas had literally to be packed in ice. Often they would become overheated, drop, and stretch as though dying, but invariably they demonstrated their amazing hardiness by responding to cold applications and speedily reviving, with no ill effects. Within four days of their new country they had to be wrapped in blankets to withstand the change to lower temperature.

They are now kept in large screened buildings, well ventilated, with double roofs, one of concrete, and divided into pens six by twelve feet. In each of these is a concrete oven-shaped box eighteen by twelve inches, inside measurement, and placed partly underground. Coolness, quiet and protection against fire are the objects. For security there are heavy padlocks.

CHATS WITH OFFICE CALLERS

'The banana plant grows rapidly, and it is a fascinating pastime to watch it grow from the bulb root to the fully developed tree-like plant,' said the ***Man from Honduras.***

'The real trunk or main stem of the plant is underground, and is a thick, fleshy rootstock, known as the rhizome, on which large buds or "eyes" are developed, somewhat as the eyes develop on the potato. The bananas are, in fact, planted very much as potatoes are planted, by selecting a piece of rhizome containing a bud, or eye, and placing it in a hole about twelve inches deep, with the eye toward the bottom, and then covering it with earth.

'The infant plant is carefully tended. In about four weeks the green leaf-sheath shoots above the ground. After that growth is very rapid. The first leaves are tightly rolled and sharply pointed. New leaves keep pushing up through the center and the stalk increases in height until it is several yards above the ground.

'As the plant approaches maturity, it produces a flower bud which later becomes a bunch of bananas. The stem which bears the fruit pushes up from the rhizome through the center of the leaf sheath, until at the end of the ninth month after planting, the flower bud emerges at the top of the trunk, looking like a huge ear of corn enveloped in its husks or bracts. As the flower bud increases in size its weight causes it to bend downward; the covering or bracts then drop off, disclosing the young bananas, quite small and pointing outward, but bending upward as they become larger.

'After I had harvested my first crop of bananas from this tree, or plant, I was surprised to learn that it would not bear again as other fruit trees do. Each plant developed to maturity from the rootstock bears but a single bunch of bananas, and if one wishes to continue banana raising one must either plant another rhizome or, as I did, cut the plant off short near the ground and allow it to sprout again.'

* * *

'There is money in raising fur-bearing animals for the man who starts modestly, learns the business, and then expands his holdings,' said the ***Biologist.*** 'But there are losses in store for the tyro who starts with a big ranch, no knowledge of the business, and only a desire for quick profits. Most fox farmers raise animals for breeding purposes, and comparatively few have adjusted the business to a pelt basis.

'In Canada, where the industry originated, and especially on Prince Edward Island, where there are approximately fifteen thousand foxes, fox farming is conducted on a much more extensive scale than in the United States. Its promise of good financial returns to those willing to master its problems give indication that within a comparatively short time in this country it will rival in proportions the industry in Canada.

'The best location for a fox farm is where the winters are cold and the fox may have opportunity to develop fur in keeping with the needs of the climate. The industry is thus confined by climatic conditions to the Northern States. There the raising of foxes for breeding and for the fur markets flourishes. Most of the foxes raised in captivity are on farms, or "ranches," with pens for from twenty-five to fifty pairs, although in occasional instances the ranches are much larger, containing pens for as many as one hundred and fifty pairs.

'It is not advisable to kill a fox for the pelt before it is eighteen months old, for at that time its fur is most valuable. Comparatively few foxes raised on American ranches are sold at the present time, however, for their pelts. Most of the ranchmen obtain higher values than the worth of the pelt by selling the live animals for breeding purposes.

'The breeding of fur-bearing animals in captivity should be encouraged. The production of skunks, beavers and muskrats, as well as foxes, has been proved successful when intelligently managed. Inferior animals, temperament, feeding and breeding problems, sanitation, diseases and parasites, all raise questions to be faced by the average stockman and farmer. Every person engaged in the rearing of fur-bearing animals will meet these same problems sooner or later, and success in the business depends largely on just how completely they are solved.'

* * *

The conversation, as might have been expected with a ***Dietitian*** present, turned to modern food and its accompanying ills.

'Nervous troubles are not the result of town life but of town food,' opined the ***Feature Writer.*** 'Our cooks spoil what they set before us. Good food is cooked until it is fit for little or nothing.'

The Dietitian, who was attached to one of the nearby hospitals, did not agree and politely said so.

'Fire does not necessarily kill vitamins,' he went on. 'Much food nowadays is cooked so that plenty of them are left.'

'But even so, a raw apple is better than apple sauce,' rejoined the Writer. 'Everyone admits that fresh fruits and vegetables are high in the health list.'

The Dietitian quoted the old saw about 'an apple a day.' 'You may have in mind the belief that germs are introduced into the system through meat,' he remarked. 'Don't forget that vegetables and fruits ferment also; and the same germs can be introduced into the system through them.'

'Doesn't the fact that the apple is raw tend to make it more healthful?' the ***Editor*** injected. 'How about brown sugar? I have believed that it was better than white; and similarly with whole wheat flour. How about it?'

The Dietitian agreed as to the whole wheat, although he preferred rye even to it. But he balked at the brown sugar. 'If we are to consider that better, why not use commercial glucose or corn syrup?'

The Feature Writer rose to go. 'You mentioned rye bread. I'd like to have your opinion of mineral oil. Can it increase our longevity, as some of the advertisments claim?'

'It has its place,' answered the Dietitian. 'But it certainly hasn't killed the pill business.'

* * *

'Does the Community Chest idea, well-intentioned though it be, signify just one more step in the process of communizing us all?' inquired the ***Social Worker*** from Chicago. 'Although it is designed to facilitate charity and directed almsgiving, does it not destroy much of individual responsibility as well as initiative?

'Please don't understand that I have any fault to find with the Community Fund system. It has been evolved to meet certain needs in our large cities; and with all its faults, it may be the best solution yet offered. The point I make is the significance of the movement, and of others like it.

'We have so many community efforts nowadays that it keeps the average man on the jump keeping up with them; and his bank account at a low level to support them. There is so much supervision and super-supervision and directed neighborhood activities that little room is left to exercise individual responsibility.

'Certainly the ideals are well-meant—but where is the limit? Dinner clubs, improvement associations, relief societies and drives of all kinds—all interfering in some way with the home. Soon the community will be the center of life and the hearthstone will be relegated to the museum.

THE NEXT BIG HOPOFF.

CAN YOU TELL ME?

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

Question. How many men were killed in the Civil War?

Answer. In the Union Army 67,058 were killed on the field and 43,012 died of wounds (total 110,070); 224,586 died from disease and 24,872 from accidents and other causes, making the total number of deaths 359,528. In the Confederate Army 94,000 were killed or mortally wounded and probably 164,000 died from disease, accidents and other causes.

* * *

Q. What was the Children's Crusade?

A. The Children's Crusade was a religious movement in 1212, preached in France by Stephen, a peasant boy, and in Germany the same year by Nicholas, also a peasant boy. Some 90,000 children left their mothers and their schoolmasters in the spring 'to rescue the Holy Land from the infidels.' Ships were placed at their disposal. The French contingent embarked at Marseilles in August; part perished the same month by shipwreck on the island of San Pietro, and the rest were sold into slavery to Mohammedans. The German contingent reached Genoa in August and was utterly dispersed by various disasters before the next spring.

* * *

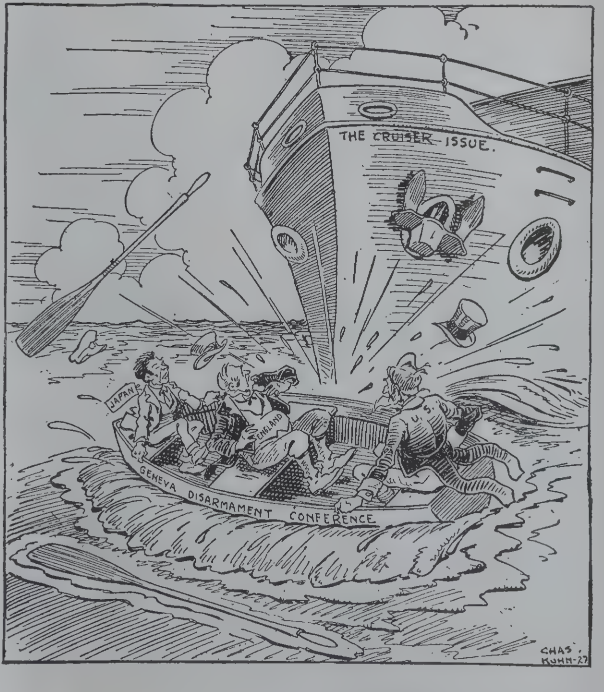
Q. I should like some information on Old Ironsides.

A. Old Ironsides is the nickname sometimes applied to the *Constitution*, a 44-gun frigate, the most famous vessel in the United States Navy, because of the hardness of her planking and timbers. She was launched on October 21, 1797, being one of the six war vessels ordered by Congress early in 1794 on account of Algerian piracies, but was not completed and equipped until the following year, when she put to sea under Captain Nicholson. During the war with Tripoli, 1801-05, she was Commodore Preble's flagship and in 1805 took part in three of the five bombardments off Tripoli. In July, 1812, under command of Isaac Hull, she escaped from a British squadron off the New Jersey coast after a spirited chase of three days, and on August 19, off Cape Race, fought her famous battle with the *Guerriere*, a somewhat weaker English frigate which she left a total wreck after a short engagement. On December 29, under the command of Captain Bainbridge, she captured off Bahia, Brazil, the *Java* (38 guns, Captain Lambert). On February 14, 1814, under Captain Stewart, she captured the *Picton*, 16 guns, and a convoy in the West Indies. On February 20, 1815, after a fierce engagement, she took the *Cyane*, 34 guns, and the *Levant*, 18 guns, on the Mediterranean between the Madiera Islands and Gibraltar. The English lost 19 killed and 42 wounded out of 320; the Americans, 6 killed and 9 wounded out of 451. Soon afterward the *Constitution* was closely pursued by a British squadron, which recaptured the *Levant*. Reported unseaworthy in 1830 she was ordered dismantled, but was retained in deference to the popular sentiment aroused by Holmes' poem, 'Old Ironsides,' and in 1833 was rebuilt. She went out of commission in 1855 at Portsmouth, New Hampshire, was subsequently used as a training ship, was again partially rebuilt in 1877, crossed the Atlantic for the last time in 1878, and was stored in the Boston Navy Yard in 1897.

* * *

Q. What was the treaty of 1857 with Denmark?

A. Before 1857 Denmark had imposed maritime taxes called 'Danish Sound Dues' on all vessels passing through the sounds connecting the North and the Baltic seas; these taxes were based, according to Danish interpretation, 'upon immemorial prescription, sanctioned by a long succession of treaties with foreign powers.' Contending that navigation of straits connecting open seas was free to all, the United States in 1826 had negotiated a provisional ten-year treaty stipulating that 'neither the vessels of the United States nor their cargoes shall, when they pass the Sound or the Belts, pay higher or other duties than those which are or may be paid by the most favored nation.' In 1855 before the renewal of the treaty for the fourth time the United States emphasized the fact that it would not pay for the privilege of using the maritime highway connecting two seas, but that it was willing to contribute its share for the maintenance of the 'lights, buoys and pilot establishments.' These aids to navigation were adjudged at $393,011 by the treaty of 1857 with Denmark.



—Kuhn in the *Indianapolis News.*

RAMMED.

* * *

Q. What was the origin of the word 'Boxer' as used in the Boxer war in China?

A. 'Boxer' is a very free translation of the name of the Chinese secret society 'I-ho-ch'uan,' the literal meaning of which is variously said to be 'Righteous League of Fists,' 'The Fist of Righteous Harmony,' and so forth.

* * *

Q. What part did Thomas Paine play in the Revolutionary period with reference to the founding of the United States?

A. After hostilities had commenced between the mother country and the Colonies, Paine, in 1776, wrote his well-known pamphlet *Common Sense*. The object of this pamphlet was to recommend the separation between the Colonies and Great Britain. After war was declared he gave up his position on the magazine on which he was working and joined the staff of General Greene. In 1777, while with the Army, he wrote the first of a series of political appeals called the *Crisis*, the first number of which started with the words: 'These are the times that try men's souls.' This was written at a time when the American cause seemed lost, but the burning words of Paine, which were also ordered read to the Army, aroused new courage. Other numbers of the *Crisis* were published at short intervals.

* * *

Q. How are giant redwood trees felled?

A. Felling one of these enormous trees is an operation requiring great experience and skill on the part of the woodsman who must cause the vast trunk to fall precisely where he intends it to lie, and must take care that it is not split or broken by the concussion, to prevent which a bed is smoothed and prepared for it. A platform is first erected surrounding the trunk, from six to eight feet above the ground. With a long saw in the hands of two men an undercut is made through the trunk, not quite to the center, and from the opposite side a crosscut is sawed, ending a foot or two above the undercut and leaving a section of solid wood between. When the exact place where the tree is to fall is selected the choppers ascend the platform and with axes hew out an angular-shaped piece having the undercut as a base. After this cut is made the crosscut is wedged till the tree topples.

BRIEFLY TOLD

Of all the coins struck from the presses of the United States Mint during the past fiscal year, the dime showed the greatest gain in numbers, rising from 41,131,000 in 1926 to 49,606,000 in 1927. Nickel coinage increased by some 6,000,000 and quarters by about the same amount. The number of 'bronze cents' fell off considerably as did also silver dollars. Half-dollars struck were merely for memorial purposes.

As a milling establishment at Johannesburg, South Africa, was destroyed by a blaze, firemen poured in tons of water. Great quantities of crushed oats began to boil, burst the walls and poured down the streets.

During a recent mirage at Cape May, New Jersey, ships that were twenty miles at sea, hull down beneath the horizon, were seen clearly. Persons walking on the sands at Cape Henlopen, thirteen miles away, could also be recognized.

Property of the English Crown is always marked with the broad arrow. So long ago did the custom originate that no one can tell when it was first used or what was its meaning. There is a penalty of £200 sterling for removing the mark from any article.

A water clock used by the British in olden times consisted of a bronze bowl with a small hole in the center. This was floated in a large pan until water entering through the hole at a regular rate made the bowl sink.

Oyonnax, France, has for several centuries been one of the world's important industrial centers for the manufacture of combs. At first the material employed was wood, later beef-hoof, real horn, tortoise shell, and at present celluloid. Today there are more than three hundred manufacturers of combs in this one town, providing employment for about five thousand persons.

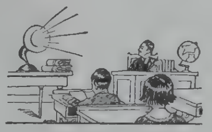
Testing the tempers of its railmen as an accident preventive, the Austrian State Railway gives each candidate twenty-five keys to twenty-five drawers. If a man can find the right keys to the right drawers without losing his temper, it is assumed he can be trusted to keep his head in an emergency.

Due to the readiness of the ape to imitate movements it is the opinion of psychologists of Yale University that a chimpanzee might be taught to talk with its fingers as do deaf-and-dumb people.

According to a Norwegian explorer, among some Eskimo tribes bad temper is considered a sign of being possessed by a devil, lying is a crime punished by death, and marriage is compulsory.

To protect women from being run down by automobiles at night, hats with designs painted in glowing chemicals that are visible at some distances have been fashioned in England.

A bald-headed man in Kansas who believes in realism has two wigs, one with somewhat shorter hair than the other, which he substitutes about every ten days to make it appear he has just been to the barber.



The principal of the Junior High School in Marion, Ohio, in order to avoid the necessity of running from room to room when he wishes to make an announcement, has had the entire building wired and equipped with loud speakers.

The six childless Presidents of the United States were Buchanan, Washington, Madison, Jackson, Polk and Harding. Buchanan was the only bachelor.

The magnificent gold plate used by the king and queen of Great Britain at state banquets consists of a dinner service for one hundred guests, complete with tureens, meat dishes, entrée dishes and covers, a fruit service, and a coffee service. Golden candelabra, from three to four feet high and branching in all directions, are used as table decorations.

A can of white lead caused the death of seventeen cows in Wisconsin. The cows thought the lead was salt.

Attacked by a large flock of crows, a pet cat in Jeanette, Pennsylvania, was literally torn to pieces.

The Sumerians who lived near the Tigris and Euphrates rivers made wheels for their chariots as early as 3000 B. C.

Fancy safety pins made by craftsmen of the bronze age sometimes weighed half a pound.

The United States uses about four-fifths of the world's gasoline production.

In the native quarters of China the streets are made crooked on purpose to confuse the Evil One, who is always supposed to travel in a straight line.

The will of Jarius Hillbornn who died recently in Minot, Maine, sets aside $30 a year for twenty-five years to defray the expense of an annual dance for the young people of the community.

Within the past year nearly nine thousand pairs of twins were born in England and Wales.

The Turkish calendar, based on the flight of Mohammed from Mecca to Medina, has been supplanted by the Christian calendar.

Omaha Indians donated the land for the first college in Nebraska.

Roads constructed of cast-iron plates with a slightly corrugated surface are being tested in France.

The adhesive postage stamp was invented May 6, 1840, in Scotland and adopted by America in 1847.

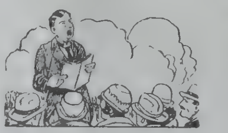
Football paid the University of Pennsylvania $314,956 during the 1926 season.

The average life span of ants is from eight to ten years, although some specimens in captivity have reached the age of fifteen.

An animal breeder of Olympia, Washington, believes that he has developed a species of barkless dogs.

It is reported from Pendleton, Oregon, that the younger generation of Indians are more interested in the modern dances and jazz music than in the old tribal dances.

On a farm near Miller, South Dakota, a cat adopted six young wolves after her own kittens were killed.



The ability to sing is an accomplishment rated highly by English politicians, for voters demand entertainment in connection with speeches. Even Lloyd George, it is said, is not above breaking into song when addressing public gatherings.

Nearly $3,000 in precious metals is reclaimed annually by a jewelry manufacturing company in Kansas City, by filtering the water in which the workers wash their hands.

It is claimed that wood wasps are able to bore through such metal as sheet lead.

Japan has developed a cherry tree that produces flowers and leaves the year around.

It is believed that the Phoenicians originated the art of soap making.

There are 7,083 islands covering a total area of 114,400 square miles in the Philippine group.

Letters written by Thomas Jefferson during his lifetime totaled about thirty thousand.

There is a fan in the possession of Queen Mary of England made from the wing feathers of woodcocks. There being only one such feather in each wing, 3,600 woodcocks were required to make the fan.

Instead of benches in the 'Church of the Rolls,' in the poorest section of Berlin, long rows of tables are provided and unfortunates are fed soup and rolls as the pastor delivers his sermon.

NOTES · COMMENTS · CRITICISMS

MR. FORD'S Page this week discusses the distinction between economy and use as a cure for waste.

* * *

The cover design has been specially drawn by Irving R. Bacon, apropos of the article on Dordrecht, Holland, which appears on page 21.

* * *

On page 2 of cover there is a poem by Katharine Marie Barton—'Gates' —'the low, blue gates of evening,' which has a subtle appeal in every simple stanza.

* * *

Few are aware that in the United States there are thousands of men and women who are without a country they can call their own. James J. Davis, Secretary of Labor, explains just how this is. These men consist of aliens who have not become naturalized Americans, and who have been so long absent from the country of their origin that they have lost their citizenship there. Many of these aliens are men of good standing, and Secretary Davis proposes remedies for ameliorating their lot and removing their disabilities. (p. 1)

* * *

William L. Stidger, traveler and preacher, shows forth the wonderful potentialities of Mexico in an article which shows the natural resources of that country as the 'pot of gold at the foot of the rainbow.' There is abundance of gold and silver and gems and oil, but the country seems unable to settle down to derive the benefit of these. This is where the stranger tries his luck, but the pot of gold seems as elusive as it is anywhere else. (p. 3)

* * *

There is a Shakespeare autograph in a museum in Boston that has a peculiar interest. It was found in the back binding of a very old book. Just how much it affects the Bacon-Shakespeare controversy cannot yet be estimated. But, after all, what good does it do the world to know whether it was Bacon or Shakespeare who wrote *Hamlet* or *Romeo and Juliet?* They are here to stay no matter who their creator was. (p. 4)

* * *

Reginald Poland, an authority on art, says that we can see beauty practically everywhere, if we so much as try to open our eyes. He thinks that art needs no apology, and that although it is 'long,' according to the Latin proverb, it is not 'long-faced.' A proper appreciation of art is essential to the well-being of a people. That is what art museums and galleries are for. (p. 6)

* * *

The Chinese are fond of gambling, and on the Pacific Coast the lottery is a favorite medium for trying their luck. George C. Henderson, a San Francisco newspaperman, thought he would visit one of the lotteries in Chinatown and see things for himself. He took a chance and the result is interesting. (p. 8)

* * *

What H. G. Salsinger, sports editor and writer, calls the bronzed super-runners of the Sierra Madre, Mexico, are the Tarahumaras, who live in the mountains 5,000 feet above sea level. They certainly have made some remarkable long-distance records, both men and women, and they do not pretend to be athletes either. Yet Marathon holds no marvels for them. The secret of the endurance of these Indians is fresh air and exercise. Mountaineers have it. (p. 9)

* * *

When one thinks of African natives one thinks of black men. But there are and have been white Africans and Africans that are descended from white men, although this may not be very apparent except in their mentality and general deportment. The Riffs of Morocco are examples of such a race. So are the Zulus and Mashonas. They have white blood in them, so anthropologists tell. (p. 12)

* * *

Mary Harrod Northend, whose quaint stories of New England have so often appeared in our pages, is the author of the story of a visit to Longfellow's ancestral home. The story affords an insight into the history of the poet's ancestors and how they got planted in New England. (p. 14)

* * *

A tourist who first went to Scotland to visit the scenes of *The Lady of the Lake* and then toured southern Indiana, would find many points of resemblance, and that is saying a lot. But on coming back to southern Indiana that part of America would appear to him to be on a bigger and grander scale than the celebrated Trossachs. (p. 16)

* * *

Holland holds great attractions for the wandering artist, especially where there are boats and canals and quaintly gabled houses; men in voluminous knickerbockers and women in amplified skirts. Dordrecht, a paradise for painters, is like that. (p. 21)

* * *

A chinchilla farm in this country is a novelty. There is one in California. These little animals are nearly extinct in their native Andes owing to the ill-considered raids of fur-hunters, but there has been enterprise enough in this country to take the matter up so that there is not now so much danger of chinchilla fur coats becoming so rare as the bird feather capes of the kings and queens of Hawaii. (p. 28)

REMARKS BY OUR READERS

Philadelphia, Pennsylvania.

Though I do not necessarily agree with all the opinions expressed in your excellent periodical, nevertheless I expectantly look forward to receiving each week's issue.

Your editorials are masterpieces of concise statements of salient facts and cover a range of subjects in a manner in which some of these subservient newspapers would not dare attempt for fear the circulation would fall off or their advertising revenue decline.

F. L. COWAN.

Madison, Wisconsin.

I am a subscriber to at least six different publications, but I am always eager to receive THE DEARBORN INDEPENDENT because all of the articles interest me, and I would appreciate very much indeed receiving it regularly. JACKSON REUTER.

Detroit, Michigan.

Received your form letter as to renewal of subscription. I should like to state, that I like your magazine very much and am still reading it. I did not renew my subscription because I haven't had the price to spare for a long time; however, I have somehow managed to secure my weekly copy from the news stands. A. HASSING.

Vicksburg, Mississippi.

I have to commend your magazine on the editorial 'Death by Mail.' The present laws of Mississippi impose a heavy penalty for carrying concealed weapons. It is necessary in order for a person to obtain firearms that the name and address and the number of the weapon be registered.

Notwithstanding this effort on the part of the state to protect its citizens it is a well-known fact that nearly every irresponsible Negro has supplied himself with firearms from mail order houses.

WALTER C. CLARK.

Pittsburgh, Pennsylvania.

Brother Louis has been receiving THE DEARBORN INDEPENDENT for the last year from you. He looks at the pictures and reads a few articles that interest him; I read everything from cover to cover each week. I think it is a wonderful magazine. Every article in it is very interesting whether on history, science, current events or what not, and it is well worth reading.

I carry mine to the office and back and read most of it in the street car. I subscribe to a lot of different papers, but THE DEARBORN INDEPENDENT is the only one that I find no fault with. RAYMOND E. KRAUS.

LINCOLN said that this Nation could not survive half slave and half free. The human race cannot forever exist half exploiter and half exploited. Until we become buyers and sellers alike, producers and consumers alike, keeping the balance not for profit but for service, we are going to have a topsy-turvy condition. Until society and its relation balance, the account is going to be wrong.

DESERT FANTASY

Glenn Ward
Dresbach

THE starry tide had risen
And covered, far and wide,
The sands; the moon had added
Her splendor to the tide.

Against the azure headlands
That lifted far away
The endless waves in silence
Tossed silver clouds of spray.

And as I watched, a moment,
It seemed the ledge must be
A little rock-bound island
In some enchanted sea.

So, like a shipwrecked sailor
From out the night, I came
To gather twigs of cedar
And sit beside the flame.

Why the LIQUOR INTERESTS *Went Unpaid*

Their Refusal *of a* Reasonable Compromise *Cost Them Dear*

By WILLIS J. ABBOT

MANY reasons are cited by individuals for their antagonism to the prohibition law. Very few are frank enough to confess that they oppose prohibition simply because it interferes with the satisfaction of their appetites for alcohol. Most of them base their position upon a passionate devotion to personal liberty, or a curious conviction that prohibition encourages rather than prohibits the use of intoxicating liquor. Some like to defend themselves on the ground that they begrudge to the bootlegger the profits which formerly, in the form of internal revenue, went into the National Treasury. Hardly anyone will admit any lingering sympathy for the saloonkeepers who were put out of business, although curiously enough many express the thought that the millionaire distillers and brewers were ill-used when the prohibition law was enacted.

Very recently I encountered an Englishman who held to the latter view. We were discussing not prohibition but democracy, and he suddenly turned the course of the conversation to what he held to be the brutal and indefensible things done by democracies.

'Take the United States, for example,' he said. 'At least twice in its history it has in the name of reform perpetrated abominable outrages upon property rights. It has violated its own Constitution by taking individual property, or at any rate destroying it without compensation. The two instances I refer to are the abolition of slavery without compensation to the slave owners who had acquired their property in what was at the time a perfectly legitimate manner, and then some fifty years later the Government comes along and destroys the value of the great breweries and distilleries of the nation, properties worth millions upon millions of dollars, without either compensation to their owners or the allowance of a reasonable time in which the sufferers could prepare for the disaster forced upon them.

'I don't think either of these cases was in accordance with justice or the American spirit, and I believe that had due compensation been offered for the slaves the Civil War might have been averted, and that today had more fairness and liberality been manifested in dealing with the brewers and distillers, the attack upon the prohibition policy would not be so savage nor promise so much of ultimate success.'

It sounded well, and the plausibility of the plea is enhanced by the fact that it is being made by very many anti-prohibitionists in the United States today—including some distillers and brewers who refused the very sort of compromise to which my friend referred.

For neither in the case of human slavery nor in the later overthrow of the drink slavery are the facts as he stated them. It is perhaps unnecessary to recount the discussion prior to the Civil War as to the wisdom of compensation for the slaves in the event of emancipation. It is enough to say now that this theory was rejected as scornfully by the slave dealers as it was denounced savagely by the ultra-abolitionists. A New England poet put the argument of the latter in one verse which went far toward ending the discussion:

> Pay ransom to the owner,
> And fill the cup to the brim.
> Who is the owner?
> The slave is the owner and ever
> was, pay him!

Perhaps not precisely that view arose to block the question of compensation to liquor dealers in 1918. Of course, the thorough-paced prohibitionists would listen to no suggestion of compromise with evil. But on the other hand the brewers and distillers, themselves arrogant in pride of power and possession, certain that they could defeat in Congress the people whom they described as Puritanical theorists and Blue Noses, repelled every suggestion of that sort.

ONE of the most active workers for prohibition, to whom I recently spoke of the currency of this complaint that there had been no effort at compromise, made the following account of a very interesting incident in the struggle. It seems to demonstrate thoroughly that the liquor interests were less desirous of accepting a compromise than the most rabid of the prohibitionists were of granting one.

'Two very interesting propositions came unofficially to representatives of the Anti-Saloon League while the Eighteenth Amendment was under discussion in Congress,' said he.

'The first came from a representative of the distillers. He wanted to make a compromise. Would the Anti-Saloon League be willing, he asked, if the distillers should quit fighting, to agree that prohibition should not go into effect until five years after ratification of the amendment? During the five years, according to his proposal, the Federal tax on distilled spirits should be doubled, half of the money to go into the Federal Treasury and the other half into a sinking fund from which, at the end of the five-year period, the Federal Government should purchase the distillers' properties.

'We received his proposition with some degree of astonishment and asked him to find out how many distillers would agree to such a proposal. He went away to canvass the trade but could get only a small number to agree. The great majority were unwilling to give up their chances for profit and preferred taking a gambler's chance at beating the Eighteenth Amendment.

'The Anti-Saloon League, of course, was entirely noncommittal to his proposal, but we were interested to find out if he could get unanimity of action from the camp of the wets which he represented. When it was entirely clear to this man that only a small percentage of the distillers would go along with his idea, which he considered a fair proposition, he went to New York and sold out all his interests in the liquor business.

'The second proposal was made to me by a representative of several large breweries. It was practically the same as the first proposal. I was sure he would not get any considerable number of brewers to agree to the plan and told him so. However, I asked him to canvass the industry and told him that if he could get a majority of the brewers to indorse the idea I would bring it before my colleagues for consideration. He resented my insinuation that he couldn't get a majority of the brewers to go along with him on any fair proposition to wind up their business. "You fellows who are fighting for prohibition," he said, "are so narrow that you can't conceive of a man in the trade being honest."

'I told him I believed the honest men in the brewing business were hopelessly in the minority; that he couldn't get a third of the brewers to indorse his plan. He left, seemingly confident that he could put the idea across.

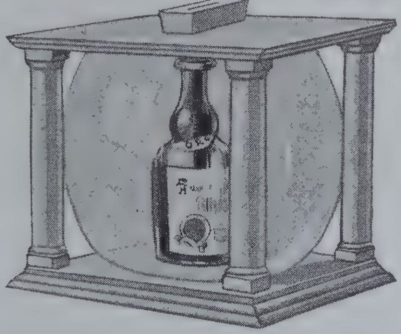
'After waiting a considerable time for a reply, I sent word to him that I should like to know of the progress he was making. No response came. This satisfied me all the more that he was in bad with his own crowd. Later I pressed him for a reply and he came to Washington to see me.

' "You seem to know more about the brewers than I do," he told me. "I have dealt with only one or two concerns. They were honorable and I naturally supposed that they all were. But I can't get 15 per cent of the brewers to agree to any proposition along the line of the one I suggested. They would rather take the chance of beating prohibition."

'At that time the Federal Government was collecting nearly $250,000,000 a year in taxes on distilled spirits and beer. The proposals made by these two men would have raised a sinking fund, if accepted, amounting, with interest, to more than $1,500,000,000 over the five-year period which would have been available for compensating them for the physical loss of their properties caused by prohibition.

'Possible compensation to the liquor interests had been the subject of considerable discussion in the press and by some dry workers. It has long been contended by some so-called middle-of-the-road advocates that if a provision had been made for compensation, there would not be the feeling against prohibition which is found today in some sections of the United States. The fact that the trade itself was unwilling to work out any compensatory plan but instead chose to fight it out to the bitter end without quarter partly tells why the question of compensation was not seriously considered.'

This statement, of course, gives no indication as to whether the officials of the Anti-Saloon League, who were in charge of pressing prohibition legislature in Congress, would have agreed to a compromise involving delay and compensation for the liquor interests. It does, however, indicate very clearly that the liquor interests themselves were unable to agree upon the presentation of such a compromise, and would undoubtedly have rejected it had it been proferred. It is, of course, not an unusual thing for powerful interests, when threatened by a popular revolt, to underestimate the power of the attack and to rely arrogantly upon the force and authority which they have been accustomed to find so effective.



No one familiar with the delays of the struggle at Washington, which finally put the Eighteenth Amendment in the Constitution, and the Volstead Act on the statute books, will ever forget the astonishment of the lobbyists for the brewers and distillers when they actually discovered that the power on which they had so long relied had lost its potency.

Whether it would have been better, viewed from either the standpoint of expediency or justice, to have compensated the liquor manufacturers for their losses is a matter that will always be debatable. Yet the judicial side of it has been passed upon by the United States Supreme Court.

Not long after Kansas had gone dry, the liquor interests of that state attacked the constitutionality of its prohibition law on the ground that it failed to provide for compensation. The case was fought all the way to the United States Supreme Court which laid down the final decision that no claim for compensation could be entertained because the man who went into the liquor business took a gambler's chance as to whether he would be permitted to continue that trade. The court put the business on the same plane with lotteries and decided that the distiller whose plant was closed by operation of law had no more recourse than did the Louisiana lottery when it was likewise put out of business by legislation.

Naturally this decision by the highest tribunal in the United States encouraged the advocates of Federal prohibition to go ahead without giving further thought to the question of compensation. But the progress of the struggle demonstrated irrefutably that even had a proposition of this sort been made to the liquor interests it would have been rejected. Defending an unworthy and even lawless occupation, they fell out among themselves with the proverbial result.

At one time the distillers turned savagely on the brewers with the charge that if the latter had not so multiplied saloons in great cities, and so developed the political power of the saloon, this storm of indignation would not have been aroused. The brewers in their turn denounced the distillers as producers of a fiery liquor which stimulated all that was worst in the human mind, and was responsible for nine-tenths of the drunkenness and crime laid at the door of the saloon. The rogues thus having fallen out, the progress of the reformer was made easier.

Perhaps as each side told so accurately and vigorously the truth about the other, the burden placed upon those who took the attitude, 'a plague on both your houses,' was materially lightened.

MARK TWAIN a Soothsayer of the SOUTH?

By HARRY E. BARNET

One of the more recent homes in Stearns.

Type of crude cabin abandoned for the new.

The houses snuggled in among the hills and the little railroad leading to the place where 'Squire Hawkins' talked to 'Nancy.'

IF YOU stray from beaten tracks in the phenomenal New South, you're bound to meet up with the quaint touch of the unexpected, because there's something Old South and unlooked-for along every byroad—as in the case of the coal mining and timber 'company town' of Stearns, Kentucky.

Although it is located across the boundary line in another state, Stearns is the metropolis of the aloof mountain region that Mark Twain observed, in the opening chapter of *The Gilded Age*, had a 'reputation like Nazareth, as far as turning out any good thing was concerned.' And with this hard name in mind when you're ranging southern Highlands, you reckon before you see it that Stearns must be a hellish sort of town, whose commonplaces are likely to be exciting events to a stranger. But when you arrive there, you're confronted by something more impressive: a well-balanced mixture of the element of production, with the intangible something that was the essence of the traditional land o' Dixie.

The spirit of Stearns is lithe. None of its social life is overwhelmed by its industries. The town glints many things. Now, a mite of the grand manner of old-time Natchez; and again, something gay and gracious from the Blue Grass country as Henry Clay knew it—these mingled with the kind of hustle and bustle characteristic of present-day Birmingham and Atlanta. The whole is a spirit that is congenial amalgamation of outward differences, welding five thousand mountaineers into a unity of purposeful and profitable living.

The artists go to Stearns on the hunt for new subjects; and sometimes wander in the adjacent mountains for weeks at a time, studying odd types of people, absorbing the spirit of the landscape, before settling to work. It was thus that one artist hobnobbed with a few anomalous characters through three months. Then he painted them in natural poses, which tell an original and lengthy story at a glance.

Art collections in America and abroad are spotty with sympathetic studies of various types of these mountaineers. Native-born who pose, as well as their neighbors who always watch them at it, get a big kick out of this artistic business. Bystanders and models are dead set for accuracy. They quickly point out slips of detail at the time they're made, although the slips are trivial. And the mountaineers think their own kind of thoughts about whatever goes on.

'Looky at that 'ar man, a-playin' he's God,' drawled a model the while an artist shaped his image in clay, 'a-bornin' me ag'in out o' mud!'

Stark necessity is the only reason for the individuality of Stearns. Production of coal and timber there is the basic idea. But to get it, the company that owns the town was forced to set up a community which would be a spectacle corresponding to the striped sticks of Jacob. Moreover, like Jacob, the company was compelled to wait.

In other words, some years ago the very thing happened (Continued on page 23)

Barefoot girls of Poland, whose education is being given more attention by the present republic than by the Czarist regime.

POLAND Revisited

By H. H. KARPINSKI

—Ewing Galloway Photos.

Polish peasants and their typical small thatched cottage in a farm district.

BORN in Warsaw, capital of Russian Poland, three-quarters of a century ago, I came to America when a very young man, 'strange wonders to see,' and remained against the advice and wishes of my family and friends. At the time and up to 1918 that part of Poland was under the dominion of Russia, and though I visited many times with my family we always met outside the Russian Empire, for my passport would not protect me against the pretensions of Russian police officials.

Being lately in Europe, and Poland having become an independent state, a republic, I visited the country after an absence of fifty years. I crossed Europe by way of Belgium and Germany and reached Warsaw, my native abode. Warsaw is a city of a million and a half inhabitants—of very prosperous appearance, of many beautiful palaces of former Polish aristocracy, some commercial buildings, in fact many of them more ornate than our commercial edifices; many splendid monuments, fine and extensive parks, a university, a polytechnic; a royal palace of one hundred and eighty rooms, filled with costly furniture, old-master pictures, statuary, Gobelin tapestries, antique clocks and valuable bric-a-bracs, only lately returned to Warsaw from St. Petersburg as a result of the Versailles Treaty; many very fine bridges across the Vistula River, an extensive and very efficient trolley system, and things too numerous to mention.

However, as a result of the long war and the German occupancy, the buildings present a shabby and dilapidated exterior, due to lack of capital for their reconditioning. The whole country, in common with all Europe, suffered from the war to a terrific extent. At the first sign of possible defeat the Russian Government confiscated all currency and capital of all the banks and carried it away to the interior of Russia. Then Germany occupied the territory for two years and in that time systematically robbed the country of its metals, textiles, machinery, and everything of value which was easy of transportation. The German military authorities made a house-to-house search, and confiscated everything made of brass and copper—samovars (tea kettles), kitchen utensils, even doorknobs (and to give them credit, they replaced the knobs and brass face plates with steel ones)—pretending to pay for the metal in German paper marks, valued at that time 100,000 marks for a cent. Otherwise Warsaw was not suffering from the effects of the war.

I met numbers of old friends and relatives and found them all without exception very much impoverished and mourning for lost sons, husbands, brothers and sweethearts, though I confess I was edified with their intensive patriotism and unshaken faith in the future, in face of the loss of their wealth and dear ones.

On the eighth anniversary of the republic, there was held in Warsaw a great parade and review of Polish troops by Marshal Pilsudski, and they truly presented an inspiring picture. Some of the regiments in the picturesque costumes of Polish Uhlans with their shakos, their lances, astride well-matched horses, brought tears to the eyes of many of the spectators, especially the older men and women, who never expected to see the restoration of Poland, though they had hoped and dreamed of it.

I went to the estate of my nephews (or what was left of it), situated very near to the Russian frontier. They had possessed a very progressive farm, furnished with up-to-date and expensive machinery. It consisted of more than three thousand acres, one thousand acres of which were in a forest of oak, spruce, and pine, with a very elaborate master house of many rooms and costly furniture, built within the last twenty years. The house was made of brick, for they had a brick yard on the farm; there were other buildings to the number of forty mostly of brick.

BUT what a difference in my reception at the railroad station of Terespol! I was met at the station by a nephew with a springless farm wagon to carry me over very bad roads sixteen kilometers distant to Kotezyu, the family estate. In 1903, when my son visited there he was greeted by a liveried servant and a fine carriage with four thoroughbred horses, besides a separate team for his baggage which consisted of only a hand satchel.

The Germans occupied this territory for two years and with characteristic efficiency brought with them a sawmill, established a narrow-gauge railroad to connect with the German system, and cut every available tree of oak, spruce and pine for building purposes, carting away to Germany thousands of flat cars of this valuable timber. Then the Bolsheviks came intermittently for two years and destroyed the rest of the buildings with all their contents. The livestock to the number of 300 cows, 75 horses, and lesser animals, were driven by the Russians into the interior.

Thousands of Poles suffered the same fate. In the adjoining county not a single master house was left standing, many of them, made of marble in the Renaissance style of architecture, filled with priceless treasures of Gobelins, paintings, statuary, costly antique furniture, et cetera.

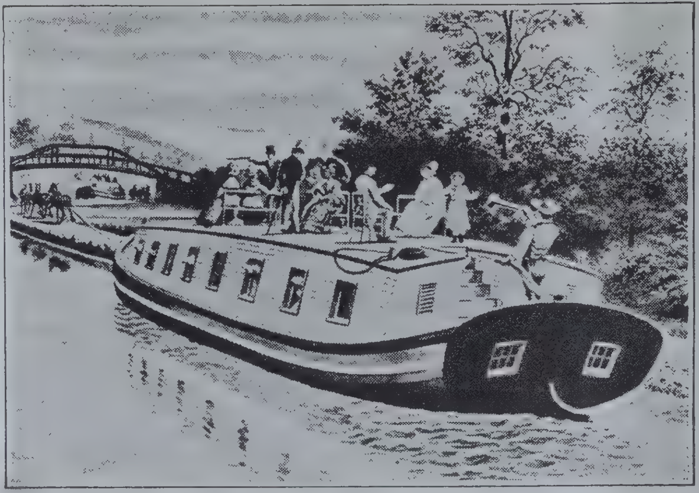
Among the owners of this destroyed property was Prince Sangusako, direct descendant of Polish royal families, an old gentleman of eighty years. He lived alone with his forty servants in a marvelous marble palace of one hundred rooms. The Bolsheviks came one night, dragged him out of the house, killed him, and in sheer wantonness set this wonderful palace afire, taking out of it only a few priceless Gobelin tapestries and cutting them into aprons and capes for their women. Besides their orgy of devastation and destruction they murdered men, women and children in cold blood.

THE Polish Government has, it seems, socialistic and communistic tendencies and in the new régime have ordered the parceling of large estates, allowing each member of the family of owners to retain only about five hundred acres, the rest to be parceled out to peasants and colonists. As the city markets are distant from such estates, between fifteen and twenty or more kilometers, five hundred acres is too much for a market garden and too small for commercial grain, milk or wool producing, upon which three products the large estates have depended for their income and taxes.

The visit had a very depressing influence on me. I lost all desire to see any more sights. One consoling thought is the wonderful patriotism of the people and their faith in the future. Not a word of complaint at their losses, at their hardships, at their necessary deprivation of former luxuries.

After a short visit at Christmas holidays with my son and his family I decided to return to America, the land of the free and the brave.

Free port of Danzig, on the Vistula River, since the year 997 contended for by the Danes, Swedes, Pomeranians and Teutonic Knights. In 1466 Danzig declared itself a free city, under protection of Poland. In 1793 it became Prussian, was taken by the French in 1807, and restored to Prussia in 1814.



Reproduction from an old painting, showing the luxurious packets on the old Erie Canal.

The Romance *of the* Barge Canal

Inland Waterways *as Aids to* Transportation

By WALTER H. MAIN

IN 1831 the first steam railroad train in New York State snorted its way from Albany to Schenectady, scaring the horses with its frightful noise and smoke, and burning the ladies' parasols with the sparks from its stack.

Then began the prodigious contest between water and rail transport which continues to this day.

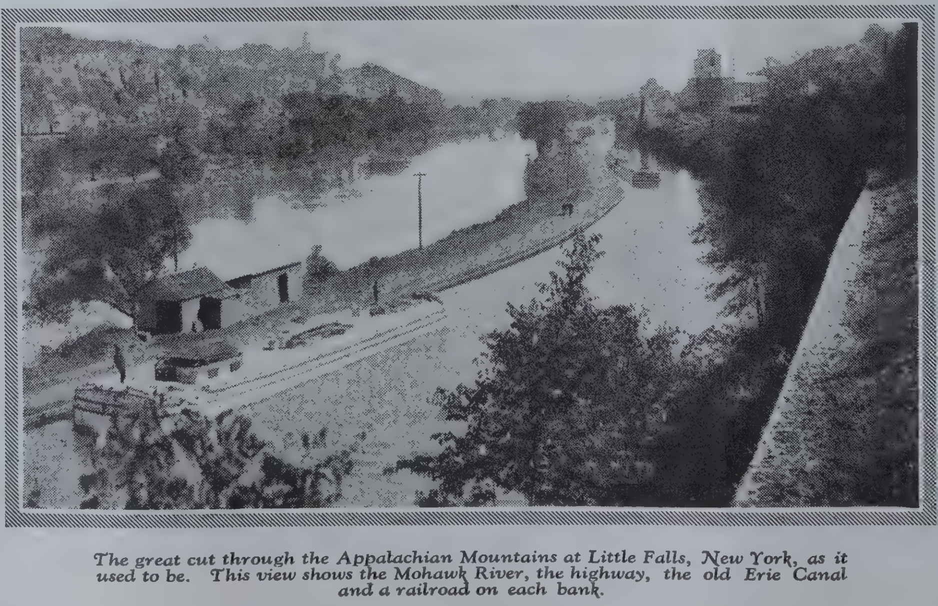
You know something of the fight over rail rates. You perhaps do not know 'Cap'n Bill Clark.' William Clark was the skipper of a line of boats on the Erie Canal. He was shrewd and made money. Came a day when Cap'n Bill Clark ran afoul the railroad. The story runs through many chapters and covers a score of years. It reaches to Wall Street and to the halls of legislation at Albany.

In substance, it amounted to this: Cap'n Bill Clark believed the railroads were using unfair means to prevent the Erie Canal and the boatmen he represented from getting their fair share of the grain cargoes from Buffalo to New York.

Cap'n Bill was a fighter. A skipper who could not fight had no place on the old Erie. But he had the audacity to carry his fight right into the legislature, into the railroad offices in New York. He would as soon stand up to a Commodore Vanderbilt or to a Chauncey Depew and call him a scoundrel as he would fight for first place at one of the canal locks.

The final issue of it was that his fight for the canalers cost Cap'n Bill his home, his boats, his savings, and everything he had. When I last saw him at his home in Constantia, New York, he was shattered in health, but he could still give from memory the dates of the passage of this or that canal legislation at Albany.

This or that governor has been named as being the originator of the Barge Canal—nothing of the sort; the Barge Canal was the child of the brain of great, hulking, big-hearted Cap'n Bill Clark. He helped them draft the bills. He was an invaluable source of information. He was the propagandist who sowed the seed in the newspaper offices up and down the state. Ask Don Seitz of the *Outlook* if this is not true.



The great cut through the Appalachian Mountains at Little Falls, New York, as it used to be. This view shows the Mohawk River, the highway, the old Erie Canal and a railroad on each bank.

The idea of creating a 1,000-ton Barge Canal across New York State was born of the consciousness that railroad competition, combined with political chicanery, was fast destroying inland water transportation. The case which Cap'n Bill Clark had carefully built up and propagated was taken over by the officials. While Roosevelt was governor of New York, engineering experts went over the whole question of a ship canal between the Hudson and the Lakes and found it unfeasible.

But something had to be done. The people had seen their waterways clogged and abandoned, victims of shortsighted competition. Bill Clark had pointed to the dried-up Chenango Canal which, extending from Utica to Binghamton, once had been the means of bringing coal at low rates from the mines of Pennsylvania directly into the heart of New York State. Its crumbling locks and filled-in channel were mute indications of the hostility of coal-carrying railroads. If that sort of thing went on, the people soon would have no waterways, no restraining competition on rail rates, no control over the commerce which had built up the great commonwealth of New York.

For it must be understood that New York State, as well as New York City, owes its preëminence to the canal. Within a zone measured roughly twenty miles each side of the waterway from New York to the Great Lakes are all the big cities and between 80 and 90 per cent of the population of the Empire State.

A period of about eighteen years, ending in 1918, was consumed in the construction of the Barge Canal, one of the marvels of modern engineering. Compared to this achievement, the construction of the Panama Canal resolves itself into a fight with the yellow fever. One single flight of five locks at Waterford, New York, lifting the Barge Canal 169 feet, is double the lift of the entire Panama Canal. Here is a waterway without counterpart in the world. Abandoning the course of the Erie Canal, with its magnificent aqueducts and stone masonry locks, enduring as time itself, the engineers boldly took the Mohawk River, the stream which in prehistoric times trickled its way through the mud bottom of the sixth Great Lake and with cunningly devised movable dams made a series of lakes extending halfway across New York State.

Canal builders theretofore had considered a canal a dug ditch: these engineers made their waterway out of a canalized river.

The great work was done in 1918, the year the United States was engaged in the World War. The Federal Government took over all means of transportation, and the State of New York turned over for national defense its waterway, which had cost in the neighborhood of $150,000,000. The period of subsidized traffic following the end of the war was not conducive to profitable canal operation. It was not until 1920 that the Federal Government handed back the Barge Canal control to the State of New York.

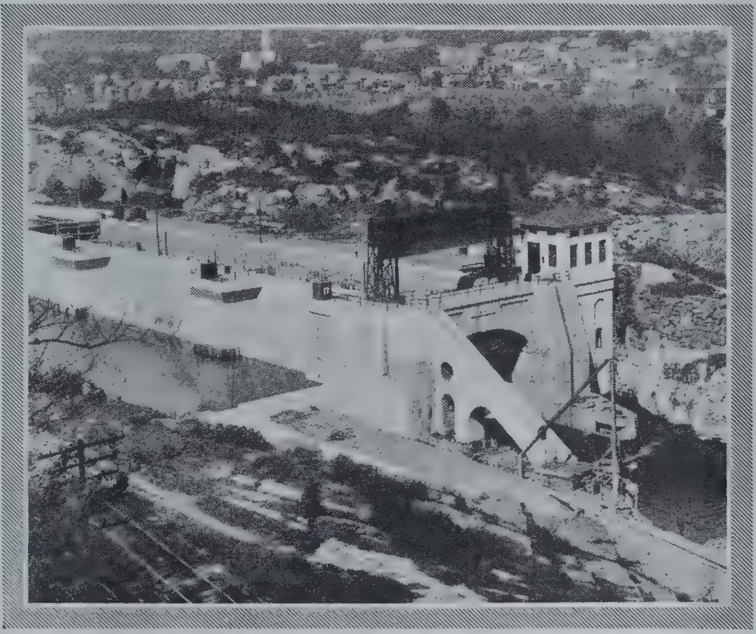
The seven-year period since 1920 has seen an amazing evolution in canal vessels.

To the older boat builders a canal was a canal, and a canal boat was a canal boat. To them a canal boat meant only one thing, namely, a snub-nosed wooden boat hauled by mules.

But here was a waterway, with no towpath for mules to walk on. Instead of locks 90 feet long, it had locks 310 feet long. Instead of six feet of water, it had twelve feet. Instead of making their placid way through an unruffled channel, canal boats began to find themselves hauled by steam tugs through rivers and the length of Oneida Lake, on which a canaler of the old school would be alarmed out of sight of land.

Gradually new and strange craft appeared on the Barge Canal. The Federal Government put a grain fleet on the waterway, the like of which never had appeared before on the face of the waters. Specially designed propeller boats, with oil-burning engines, came chugging up the canal. They were a cross between a submarine chaser and a canal boat, and each one hauled three consorts. The four constituted a unit, with a total carrying capacity of 2,000 tons. That is to say, every time four of these Government boats were locked through, it meant an equivalent of a train of eighty freight cars each of twenty-five tons' cargo.

When it is known that the water freight rate on grain from Buffalo to New York is from five to twelve cents a bushel lower than the rail rate, the anguish of rail carriers may be imagined, especially since water-borne freight makes better average time.



Little Falls as it now is. This shows one of the highest lift locks in the country, with a capacity to lift a 2,000-ton boat 41 1/2 feet.

When it comes to actual statistics on grain, the Farm Bureau Federation calculates that in 1921 the Barge Canal handled 13,619,958 bushels. During 1922 it carried 20,458,276 bushels, making a total for the two years of 34,078,234 bushels at a saving of approximately five cents a bushel, amounting to $1,703,911 in the two years.

In 1923, figured on the same basis, the 22,386,101 bushels of grain saved $1,119,305 in freight rates.

LUMBER cargoes from Oregon go around the continent, through the Panama Canal, transship in the Hudson River and go through the Barge Canal. Some of this lumber goes as far west as Duluth, saving even in that long water trip freight charges under rail rates over the Rockies.

Most important in the romance of the mountain pass is its influence upon mankind and upon the character of the nation. Cut off from the coast by the mountain chain, the region west of the Alleghenies was in danger of becoming a separate region by itself.

French influence had early been exerted. The line of outposts of the early French explorers extended from Montreal well into the region which later was peopled by the Yankee stock from 'down east.' It was the Yankee migration which ultimately determined the character of the West.

Then came the Civil War. Internal dissension was likely to rend the land in twain. Do you recall that the final draft which stemmed the rebellion came from the region of Michigan settled by New Englanders? Sons of men who had been swayed by the early abolitionists shouldered their guns to stay the onrush of the Confederacy.

Slavery itself came to its limits when it encountered the population of western states, whose forbears had migrated from the East, passing through this narrow defile in the mountains which has been fraught with so much human destiny.

To go back to the beginning of things, the rift in the mountain chain that has been so potent in welding this country into a single nation was not always there. It is only a matter of thirty or forty thousand years ago that the rocks were cleft.

Originally, geologists inform us, the Appalachian chain extended an unbroken range from north to south. Some of the oldest rock that exists on earth is found here. The Laurentian hills were, perhaps, the first land to appear above the surface of the water.

The years roll on into millions. The waters of the Great Lakes poured through the channel of the St. Lawrence. There came the latest glacial period. The ice fields, descending, clogged the St. Lawrence channel.

Then the waters of the Great Lakes, seeking outlet to the sea, flooded a great part of what is now central New York, creating a sixth Great Lake—Lake Iroquois on the geologists' maps. The great alluvial deposits, the muck lands of central New York, are the dried bottom of that great lake.

The waters poured through here long enough to wear an opening in the otherwise impenetrable mountain barrier.

And then the waters ceased to flow. The latest glacial period came to its end. The melting ice left boulders that adorn mid-New York meadows and left ineffacable marks of the grinding glaciers to tell the story. The Great Lakes returned to their original outlet, the now St. Lawrence channel. The sixth lake dried up. The floods had done their work.

Woodrow Wilson *in* Paris

By
CLIFFORD ALBION TINKER

AMID the crash of saluting guns the French convoy swept through the narrow channel into the wide and hospitable Rade de Brest. The *George Washington*, with her all-important freight, kept on through the lane of battleships and anchored in full sight of the great docks eastward of Vauban's age-old citadel. Cheers, triumphant cheers, rose above the boom of guns and dulled the accumulated blast of many whistles. Woodrow Wilson, the 'Man of Peace,' the 'Savior of France,' had arrived!

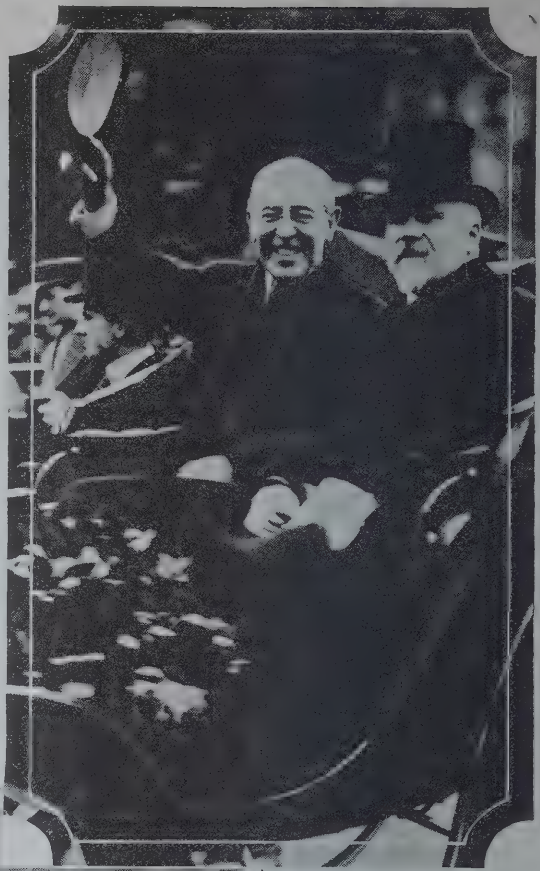
For hours the patient hordes of Breton folk waited. It was mid-afternoon before the presidential party came ashore; when it did, the President, Mrs. Wilson, and their entourage entered automobiles and drove rapidly to the train. A president's military escort preceded and followed the cars, nothing more.

It was all over so quickly. The ceremonies at the landing were brief. Immediately following the official greetings, the procession moved up the long graded ramp to the Cours, then a short half-mile to the Gare de Brest. I was sorry for the great throng that never even saw the Wilson car. Those who did gazed upon a personage of extraordinary character. The President looked every inch a man; a lion of a man. Brest, through centuries of historic experience, had seen many rulers—kings, emperors, consuls, and what not—but none more regal than Woodrow Wilson, President of the United States.

Cheers were hearty along the line of march. Flags were waved. But this was a reverent crowd; there were more prayers than cheers. There were more rosaries than flags. The peace-yearning peasants of western France had come to greet their idol, to give their blessing to him who so completely filled the rôle of peace bearer. The keynote of the hour was humility—hopes were high, but hearts were mellow. Thousands of the watchers, men and women alike, were in tears.

* * *

It is doubtful if the Riviera could have played a better meteorological rôle than Paris managed on December 14, 1918, the day that President Wilson entered the city to receive its spectacular and effervescent plaudits.



—Photos, Signal Corps, U.S. Army.
The one-day hero of Paris with President Poincare, December 14, 1918.

Carriage about to leave the Gare d'Auteil-Boulogne, bearing President Wilson and President Poincare on their epochal ride through the French capital.

The route of the presidential party was to be from the Place de l'Etoile, down the Champs-Élysées, across the Seine and back by the Alexander III and Concorde bridges, through the Place de la Concorde and up the Rue Royale to the Boulevards, and on to the Place de la République. To facilitate matters, the section of the Brest train with the Wilson car had been shunted off the main line to the little Gare d'Auteil-Boulogne, on the edge of the Bois. From this location it was an easy distance along the Avenue Victor-Hugo or through the Bois to the Arc de Triomphe et l'Etoile.

I stood near the Strasbourg statue. It was resplendent with tricolor bunting and banked with huge and gorgeous bouquets. Gone was the mourning crêpe and the funeral wreaths that had been its daily shroud for forty-seven years—the curtain had rung down, with the usual happy ending, on the Rape of the Lost Provinces.

It was an amazing demonstration. The frenzy, joyous to be sure, but frenzy nevertheless, which animated that enormous throng topped anything in my experience—and I had seen Armistice Day. Even the old sergeant of gendarmes who stood near me, and who had been stationed in or near the Place de la Concorde for more than forty years, threw up his hands and admitted that Paris never before had seen such a day or such a throng.

It was a long wait for the Parisians, but it did not lower that high note of ardent hero worship, which swelled to a terrific crescendo as the Presidents and their escort

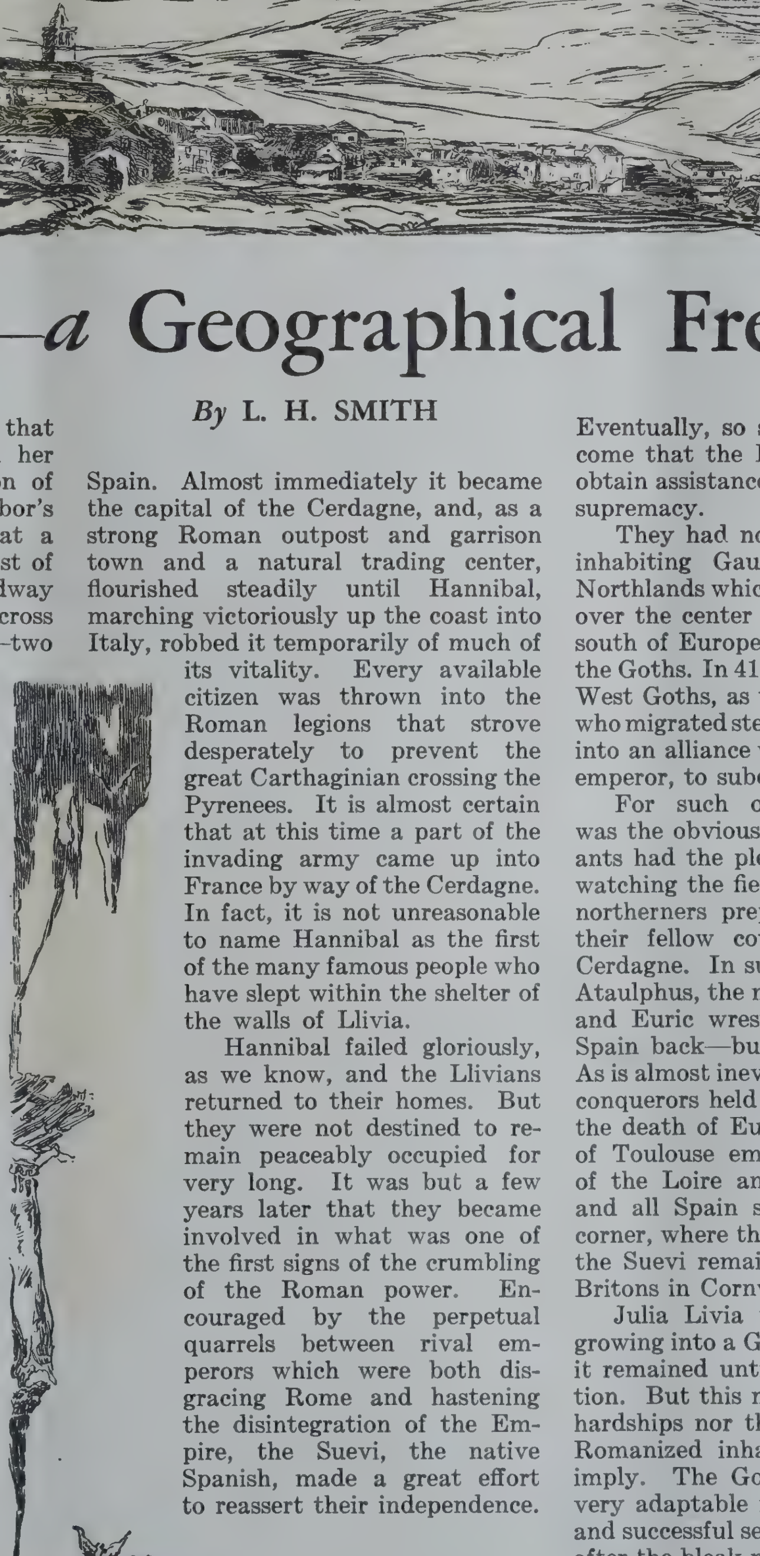
LLIVIA—*a* Geographical Freak

By L. H. SMITH

HOW many people know that France harbors within her frontiers a tiny portion of her next door neighbor's territory? A glance at a map will show you, somewhere east of the center of the Pyrenees and midway in the one wide valley running across these mountains—the Cerdagne—two frontier towns, almost joined. These are Bourg Madame and Puigcerda, in France and Spain respectively. If you let your eye travel slightly northeast from the former, you will see, if the map be good, a town called Llivia. And if the scale is fairly generous, you will find not only the town but a ring of dots marked all round it at a distance of about one mile. Inside that ring you are in Spain!

Now we have, of course, something much after this nature in England. For example, the little portions of Worcestershire straying into Gloucestershire and Warwick—two particularly adventurous pieces even reaching as far as Oxfordshire! But Llivia cannot be classed with these, for it is foreign territory inside the borders of another power. And the patriotism and cleverness of a mayor and his council have preserved, in this ancient town, a geographical freak which is probably unique.

Here is the story: Far back, in the days when Rome dominated the world, there was founded the town of Julia Livia—doubtless named, as was then the fashion, after the wife of the first governor. From the very earliest days Julia Livia was of considerable importance, controlling as it did one of the few gateways—and that probably the easiest—between France and Spain. Almost immediately it became the capital of the Cerdagne, and, as a strong Roman outpost and garrison town and a natural trading center, flourished steadily until Hannibal, marching victoriously up the coast into Italy, robbed it temporarily of much of its vitality. Every available citizen was thrown into the Roman legions that strove desperately to prevent the great Carthaginian crossing the Pyrenees. It is almost certain that at this time a part of the invading army came up into France by way of the Cerdagne. In fact, it is not unreasonable to name Hannibal as the first of the many famous people who have slept within the shelter of the walls of Llivia.



Hannibal failed gloriously, as we know, and the Llivians returned to their homes. But they were not destined to remain peaceably occupied for very long. It was but a few years later that they became involved in what was one of the first signs of the crumbling of the Roman power. Encouraged by the perpetual quarrels between rival emperors which were both disgracing Rome and hastening the disintegration of the Empire, the Suevi, the native Spanish, made a great effort to reassert their independence. Eventually, so serious did matters become that the Romans were forced to obtain assistance in order to retain their supremacy.

They had not far to seek. Mainly inhabiting Gaul was a race of the Northlands which was spreading rapidly over the center and penetrating to the south of Europe. They were known as the Goths. In 410, Ataulphus, king of the West Goths, as those came to be called who migrated steadily westward, entered into an alliance with Augustus, the then emperor, to subdue the Suevi.

For such operations Julia Livia was the obvious base, and her inhabitants had the pleasure, or otherwise, of watching the fierce, somewhat uncouth northerners preparing for battle with their fellow countrymen beyond the Cerdagne. In succession, the armies of Ataulphus, the more famous Theodoric, and Euric wrested the major part of Spain back—but not for the Romans! As is almost inevitable in such cases, the conquerors held their gains, and before the death of Euric in 485 his kingdom of Toulouse embraced all Gaul south of the Loire and west of the Rhone, and all Spain save for the northwest corner, where the scattered remnants of the Suevi remained, much as our own Britons in Cornwall and Wales.

Julia Livia was by this time fast growing into a Gothic town, and as such it remained until the Moorish occupation. But this meant neither the great hardships nor the vital changes to the Romanized inhabitants that it might imply. The Goths were themselves a very adaptable race as their migration and successful settlement in warm lands after the bleak north tend to show, and they, too, like the original Suevi Llivians, were not long in adopting the manners and customs of their predecessors.

Patience Must Go With Progress

THERE are a surprising number of people in the world who would be immensely relieved if you would simply do the thing they want done, and which they are sure is the only proper thing to do. This is a rather difficult matter to deal with because most of the activities proposed are good, with a promise of being useful.

But most of them will never be realized, because they will never be done by one person for all the rest, but rather by all the people for themselves. And another reason is: the people to whom the work is given have the habit of looking around for someone else to do it.

What we overlook is that only people can do things. It seems simple enough to say, and yet it is hardly simple enough to understand. Any number of individuals are buzzing around the world today under the delusion that people are the last element to be selected, on the theory that you can always get the people if you can get the money.

Indeed, that is the new process of beginning a 'good work'—induce somebody to give money, and then, after the money is given, the person who receives it will undertake to find people to do the human side of the work; the consequence being that in a short time you discover that 'the work' never had any human element at all, and that the money which it certainly had is gone.

> *THE destruction of evil and the progress of good must wait on the law of ripeness and decay, as much as any fruit does. Some people try to pick ripe reforms in green years. There is an impatience which is founded on fret and not on faith, although its cause is an anxiety for the progress of good and the removal of evil. When it is given a person to see what is wrong, that person is a sentry on the frontier over which that wrong may pass; he is stationed there until the main body of the army of reform comes up. He must wait and watch and then act with the others.*

The evils in the world are many, and perhaps the heaviest burden we have to carry is the wonderment that they are allowed to exist. But there they are. Everybody doesn't see them clearly. Everybody doesn't realize how these evils are eating into the life of the people; but to you it is painfully clear.

You can spoil your own life, sour your friends and bring your very vision into question by insisting that everyone see exactly what you see. They will see it when the time is ripe, but not until then, and you are very foolish if you fret about it.

There are sentries along the frontiers of all our problems, men and women here and there who are sometimes lonely, who wonder why they must pace their beat alone; but we know that where sentries walk now, the whole army will march soon.

Some people are sentries, to whom it is given to be on watch, this one on the frontiers of some deadly disease of the body, this one on the frontiers of financial diseases, this one on the new boundaries of statesmanship, this one on the limits of a new order of social life. Sentries all, but never so foolish as when they insist on calling the whole army out before the day dawns.

If it is given to a man to see that a certain condition exists, he is sentry at that point to give the alarm. Presently at the right time, the time set by the director of destiny, his work will bear fruit.

'Well, but,' the impatient spirit cries, 'what about the evil done in the meantime? We must do something to prevent that!'

Well, do it!

'But,' says the impatient spirit, 'I can't do it.' Rightly said; you cannot, neither can anyone else. You cannot ripen an apple faster than it will ripen, and you cannot rot it faster than it will rot. These things appear to be under the law.

The people have the evils they deserve, no more, no less. By 'deserve,' one does not mean the judgment which any human being can pass as to what is deserved; one means that all of us together have the sort of life that we have made, and we will continue to have it until we are fit to remake it of a better quality.

When people begin to feel evil; when there runs through society a new consciousness of the stupidity and the wrong of certain things; when false notes begin to irritate us; when the heat of indignant resentment begins to break out in thought and speech—these are the first streaks of the new day, or, to change the figure, these are the first flushes of color which begin to show that the fruit is ripening for the autumn.

What is needed by people who see evil is a still clearer sight; they need to see that the evil will collapse, utterly collapse. And what people of impatient spirit need to learn is that they must detach themselves from the system they despise and turn their efforts against it. All of us want to slay the giant with one dramatic stroke of our sword. As a matter of fact, the giant usually dies from self-generated poisons.

Whatever the moral judgment of a morally sensitive people is against, that thing is inevitably doomed. Indeed, when you see evil at the height of its popularity and power, when you see all who speak against it ridiculed and despised, you may be very glad—for from that apex the fall is swift and sure. Never forget that. That is the ripeness of the times for the fall of the fruit. It falls, it rots, its pulp fertilizes more wholesome growths.

The field will then produce much better fruit, and although no one may insist that the whole world be included in the scheme, much will be done.

OF THE DEARBORN INDEPENDENT

Calvin Coolidge

IT IS a reflection on the political type of mind that its first reaction to Calvin Coolidge's declination of a third term was to assume that it was a shrewd move on his part and amounted really to a bid to be drafted into the Presidency again against his will. Mr. Coolidge is an astute politician, but no one has ever found him trying to trick the people with words; his sincerity has never been questioned. And it is decidedly uncomplimentary on the part of the politicians to throw doubt on his intention now. Taken at its face value, with full allowance for the peculiar New England construction of the momentous sentence, the announcement means that Mr. Coolidge intends to adhere to the third-term tradition. Considered in relation to the time, it clearly indicates Mr. Coolidge's desire to give the American people ample opportunity to canvass the list of possible successors to the Presidency. And when it is remembered that he chose the anniversary of President Harding's death and his own sudden accession to the Presidency, the announcement has a peculiar solemnity which shames the ribald political speculation which immediately succeeded upon its publication.

We believe that the American people at large paid Calvin Coolidge the respectful compliment of believing that he meant what he said. His action has added to his reputation for common sense. He has been patriotic toward the nation and fair toward his own fame in this step. No man was ever so near the possession of power to break the third-term tradition as Calvin Coolidge has been. Yet at the height of this power he draws back and falls in step with patriotic American tradition. It is a really great act.

Sacco-Vanzetti

THE amazing thing about the Sacco and Vanzetti case was the six-year international fight put up in their behalf. Their names became the signal for a movement which reached round the world, and their fate was pondered by anxious millions in all lands. Yet they were two obscure men, without money or influential connections. Even now, though the public feels the utmost confidence that Governor Fuller and his advisors have acted in the fairest manner and on the highest principles, there remains a doubt whether the processes of justice did not miscarry in this particular case—so deeply has that doubt been driven in during the past six years.

It is obvious, of course, that Sacco and Vanzetti were not the *cause* but merely provided the *occasion* for the movement which arose in their behalf. Here was an opportunity to show civilized justice in a bad light; here was an opportunity to newly align the discontented classes against the established order; here was a new emotional door to social anarchy. Doubtless it is easy thus to account for one aspect of the matter.

But there is another which quite escapes such easy diagnosis. How many voices would be raised in behalf of justice if and when justice failed with reference to citizens of good reputation? How many American communities are capable of being moved to their depths, of long continued exertion, of costly financial sacrifices, because of the abuse of a citizen by the law? There are abuses of justice every day—is it left to the friends of obscure Italian criminals to show the only concern that is felt about it? Is it the new American habit to acquiesce in anything only providing that it be official?

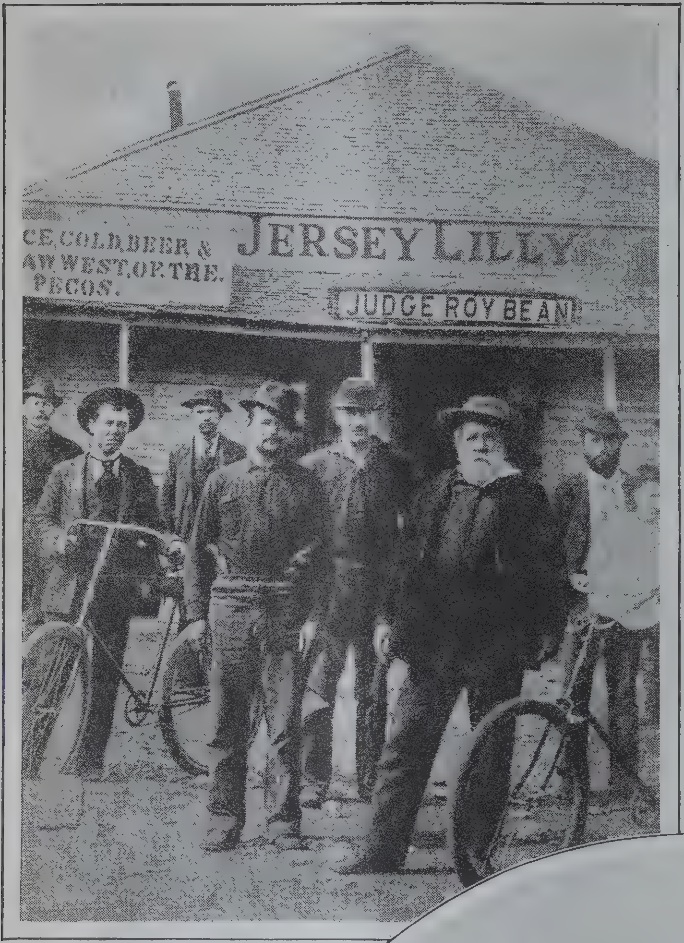
That is the amazing part of the Sacco and Vanzetti case as it has maintained itself before the world these last six years—the perfectly staggering amount of human sympathy and sacrifice it enlisted. Of course, there were other manifestations not so creditable. But it is impossible to close our eyes to the astounding fact that *human* sympathy has lately been given a more dramatic demonstration by what are called the underprivileged classes than we remember ever to have seen among the 'respectable' classes of society.

Smoking in Office

NEWS columns recently bloomed with the glad tidings that girls employed in the war offices of the United States Marines were permitted by their superior to smoke publicly during office hours. The superior said they had been smoking secretively. He could see no reason why men should be permitted to smoke at their desks and women should not. It turned out, however, at least so the news columns said, that the Marine girls did not avail themselves of the opportunity. Everybody said, 'How interesting!' No one, so far as we know, said, 'Washington is far behind in ordinary office efficiency if smoking is one of the recognized employments of the workers during office hours.' Good modern practice would have dictated, instead of an extension of smoking privileges to women employes, an abolition of the practice among men during business hours. No longer does the drug clerk hang over the customer, a cigaret drooping from his lips. No longer does the grocer stand behind his scales smoking a pipe. Shops do not permit smoking on the premises. Most offices of standing have an unwritten rule against it. The surprise is that Washington has not learned what constitutes good office practice.

LAW West of the Pecos

By MAX BENTLEY



—Lippe Studio, Del Rio.

Judge Roy Bean (right foreground) in front of his saloon at Langtry. Note the guns on the man on the judge's right.

THE 'Law West of the Pecos' has passed into the limbo of things that were, joining that sad procession of ghosts of the West which is ever increasing.

More than forty years ago when the Southern Pacific Railroad was completed, there was no semblance of order along the border at this point until the strangest character Texas has ever known moved to the town of Langtry with a portable saloon and pool hall and meat market—the town's first permanent citizen.

Here he had himself designated justice of the peace—by Heaven knows whom—and court was held in the saloon. His name was Roy Bean.

Judge Roy Bean was a double-fisted personage, majestic in appearance, dignified to a painful degree, but filled with grisly humor and a high resolve to make his office pay. The railroad contractors knew him well, perhaps too well—he had been supplying the inner demands of three thousand Irishmen all the way from San Antonio. He brought with him two pet animals, a lion and a bear, and a past reeking with atmosphere. The contractors gave the border country the low-down on his early life—strange, strange tales. But the atmosphere of his past was nothing to be compared with the atmosphere of his present. For twenty years he lived at Langtry dispensing justice and liquor with the same ready hand. He ruled officially for six years and unofficially until he died. He called himself the 'Law West of the Pecos,' and made it stick, too. The phrase is classic in Texas today.

JUSTICE OF THE PEACE LAW WEST OF THE PECOS

Judge Bean's frontier abode as it appears today.

Judge Bean has been dead nearly a quarter of a century (died March 19, 1903, at the age of seventy-eight), but his life and works took root deeply in the colorful and careless West, and the memory of him is as freshly green today as it was the day he died. Lately I walked through the cemetery of Del Rio, Texas, and stood beside two red headstones. There it was, the inscription, 'Judge Roy Bean, Justice of the Peace, Law West of the Pecos,' and on the other the name of his son, Sam, killed by a Mexican. And then I went to Langtry to learn what I could about the judge. And the tales I heard are true—there are many old-timers left to vouch for them.

When, in his middle age, he moved to Langtry, the Texas Rangers were having a terrible time keeping the Irish and Chinese railroad workers separated. Both crowds were always getting drunk on Bean's liquor, the Irish immoderately so, but Judge Bean dealt a stern hand. He adopted the expedient of having the combatants chained by the ankle to iron rods fastened to the wall of his saloon. Often fifty or sixty would be staked out all night. Next morning Bean would have them brought before him. After allowing them a sobering-up drink apiece he would deliver a learned lecture on the law: the law of homicide, the law of self-defense, international law, any kind of law. He had only one authority, a dog-eared volume, but he stretched it to cover every case brought to him for decision. Then he would fine the men fifty cents each and collect from the contractor.

Once an Irishman killed a Chinaman. Bean loved the sons of Erin for their free spending and had a corresponding contempt for the more thrifty Chinese. It was a red-handed murder, but the Irishman's friends sent word to the judge that an unfavorable verdict would result in two things: one, loss of patronage and, two, his place being wrecked. He had the prisoner brought before the bar (literally the way to say it—it was both bar *and* bar) and kept him shifting uneasily from one foot to the other, while he, the judge, pored through his dog-eared volume. Finally, 'Gentlemen, I find the law very explicit on murdering your fellow man, but there's nothing here about killing a Chinaman. Case dismissed.' The same day he married two Mexican couples, divorced them, and remarried each *hombre* to the other's former wife; for which he collected on three transactions.

AFTER a time business grew dull. Bean decided to move farther west. The country was beginning to settle up, people were learning orderly ways, and the federal judge at El Paso was snobbishly threatening to jail him for exceeding his authority. Besides, after

—Lippe Studio, Del Rio.

Along the Pecos Highway through Texas

getting regularly elected justice of the peace for three terms, he had suffered the crowning humiliation of his life: Jesus Torres, a rival saloonkeeper and Mexican (*there* was the rub) defeated him for reëlection. So he kicked the ties away and had himself switched to the main line; and, as the train crawled through the canyons, he played pool with the crew. However, he soon returned to Langtry (the name was too hauntingly dear to forget), bringing his pet animals with him.

The lion and bear were almost as famous as Bean himself. The lion could turn handsprings, while the bear could drink more bottled beer than any ten men in town. When Bob Fitzsimmons and Peter Maher staged their championship bout on the Mexican bank of the Rio Grande opposite Langtry, Ben cajoled the gatekeeper into letting him pass in, with a story that he and Fitzsimmons were negotiating for a free battle royal between their respective pet lions, after the main go. The pugilists and fans came to Langtry on two special trains. Bean had stocked up in anticipation of a record-breaking day of drinking, arrests and fines. But the freckled Cornishman put Maher to sleep with the first punch, and thirty minutes afterward both trains were gone and the town deserted. Bean was supremely disgusted.

BEAN kept his pets in a cage near the depot, on the theory that passengers would come over from the eating house to see them and perhaps buy a drink and get noisy and be subject to fine for disturbing the peace. One day a woman passenger strolled over. She had a dog, one of those hairless Mexican pups about the size of a rabbit. The dog sniffed too close to the cage and was promptly snaked inside by the bear. The woman screamed for assistance, and Bean said, 'Well, lady, you buy fifty cents' worth of meat from me, and I will feed it to the bear and he will forget about the pup'—all of which was done.

Judge Bean's memory began to fail as he grew old. That is to say, when he made change for customers he frequently came up short. There was one man, Will James, a lawyer from San Antonio, who, knowing Bean quite well, nevertheless laid down a gold eagle for a glass of beer. Bean handed over eighty-five cents change. That was *too* raw, and the lawyer delivered himself in picturesque language. Judge Bean convened court on the spot (that consisting of taking off his apron and producing his law book) and fined the lawyer $6.66 on each of three counts: disturbing the peace, abusive language, and contempt of court. 'The beer is on me,' he said grandly.

Now this incident had a sequel. Bean was devoted to his bear—would have loved him as a son if he hadn't three sons of his own, and two splendid daughters. He never tired of singing the praises of his children. Their filial obedience particularly delighted him, and often he gave them outlandish tasks to perform simply for the delight their ready compliance gave him. Not long after the Will James incident he met his victim in San Antonio and commenced to tell him about the splendid mastery he had won over his children, and how he loved them and the bear. The lawyer listened attentively, then excused himself to send this telegram to Sam Bean at Langtry: 'Kill my bear at once and ship hide to Will James, San Antonio, Texas. (Signed) Roy Bean.'

And Sam did it.

YOU are not to get the idea from the telling of these true stories that Judge Bean was a reprobate. Nothing like that. He was a hard character in a way, without education or higher notions, but his code was no more rough than the land and time in which he lived. And he made Langtry and the frontier about it quiet and law-abiding. His closest friend, W. H. Dodd, said this about him:

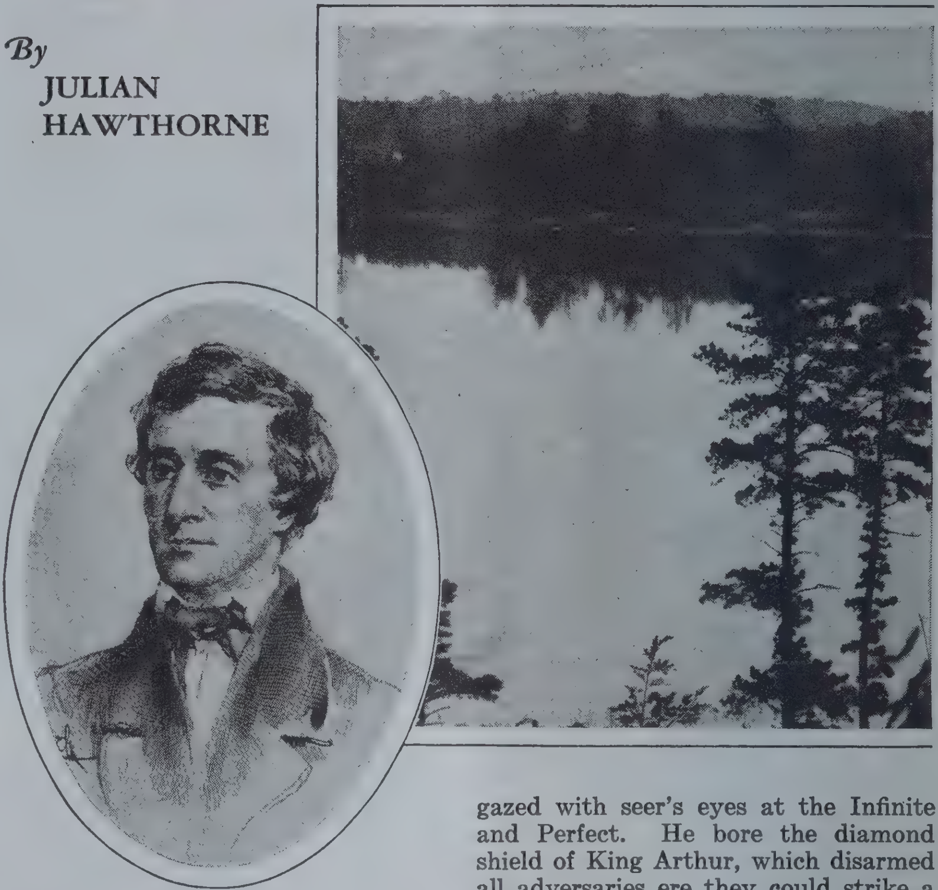
'Bean was not afraid of man or devil, but I never saw him in a single fight. He was notoriously soft-hearted.

'Why, he got more out of life than any man I ever saw, and he did not leave a nickel. He thoroughly enjoyed his fame. Tales of him spread from one end of the Southern Pacific to the other. After he was an old man in his late seventies, years after he had retired from office, tourists would get off the train to call on him. He would buckle on his gun, get out his old law book, and obligingly reënact one of his famous trials for their entertainment.'

Apoplexy carried Judge Bean off. He literally went out with his boots on, after serving the trade all day.

THOREAU—GENIUS

By
JULIAN HAWTHORNE



LATE on a wintry evening, a few days after Thoreau's death, we—sitting round the evening lamp to listen to the reading of some romance, poetry or history by my father—heard a light step on the porch outside the library. It was followed by a knock; but when I opened the door, no one was there. Through the dark was visible the faint whiteness of the remains of the winter's snow, the dark firs standing as a hedge along the highway, and the bare boughs of the mulberry tree on the lawn. I peered to right and left: no one!

But as I was about to return indoors, I saw a bit of white paper lying on the porch, held in place by a pebble. I picked it up and handed it to my father. He unfolded it, and found a pencil-written poem signed Louisa Alcott.

The poem is extant, though I cannot now lay my hand upon it. There were four or five verses—a requiem to Thoreau. I recall but one line—

> The Genius of the Woods is gone!

And that reminds me that Louisa was afterward prevailed on to submit the poem to the editor of *The Atlantic*, at that time, James T. Fields. He sent it back as acceptable all but one false rhyme: 'gone' was made to rhyme with 'forlorn.' Louisa was able to amend it:

> Spring mourns, as for untimely frost;
> . . . .
> The Genius of the Woods is lost!

And thus it was printed.

On a sunny day of that week, I had joined the crowd of Concord citizens at Thoreau's funeral in the white-steepled church where big, kindly, red-bearded Mr. Reynolds officiated; but on this occasion I think it was Emerson who spoke over the coffin. I hardly listened to him. I was deeply moved, as a boy realizing that he will never see a playmate again. The face, lying upturned there with closed eyes, surrounded with flowers, was the first dead face I had ever seen. Forehead, cheekbones and the hand which lay on his breast were waxen white; and the thought passed through my mind that perhaps this wasn't Thoreau after all, only his image. The mouth and lower face were hidden by the dark jungle of beard, which he had worn since his early manhood. The expression was serene, or, rather, quiescent, without definite expression, the face of one whose spirit has retired for a while to ponder some mystery of life. There was nobility in the rugged features, a kind of austere beauty not seen in life: his aspect had always been queer and unbeautiful, though impressive, especially in his later years; my father wrote of him somewhere as being physically very unprepossessing in his twenties.

But in his coffin death invested him with grandeur. He had foibles, but not petty ones; nothing to shame his memory. He had tried to find a practical and manly solution of the problems of existence, and he had had the courage of his opinions, and would have been a martyr for their sake in the martyr era of history.

IN THE New England of the 19th Century he had been able to do no more than go to the town jail for not paying taxes on his hut in Walden woods, built with his own hands. What right had the Government to meddle with him? The selectmen were embarrassed; but what are officials sworn to uphold the laws to do? So to jail the young Thoreau grimly marched, and there he might have stayed for the rest of his life, had not Emerson treacherously paid the tax. It was a favor which Thoreau found difficulty in forgiving. Emerson had committed treason against the higher philosophy which he himself taught.

However, Emerson was a person whom one could not help forgiving, he was so irresistibly good and innocent, and wise withal, with a wisdom which seemed, somehow, to be better than philosophy. He would smile when one attempted to argue with him, that spiritual, Emersonian smile, as he gazed with seer's eyes at the Infinite and Perfect. He bore the diamond shield of King Arthur, which disarmed all adversaries ere they could strike a blow.

Thoreau's dead body was brought to the Unitarian Church for the funeral ceremonies, though I don't think he had ever entered it in life. He was not a churchgoing man; indeed, none of the Concord personages of eminence were conventionally religious by the churchgoing measure. But Thoreau and the rest of them were religious enough in ways of their own: 'the groves were God's first temples' for them. Emerson thought the visible church was a good thing, and, aware of the force of example, would occasionally be found with the rest of his family in their pew, enduring the excellent Mr. Reynolds with a sublime expression. Mrs. Emerson was very churchy, and her brood followed her.

But Thoreau would tramp off among the pines, or sit beside Walden Pond, or roam over the Concord hills that overlook the vale, and listen to such sermons as he found there. His mood, to the outward eye, was habitually gloomy, but underneath the flesh he might be, I imagine, cheerful enough, happy at any rate.

He built his own barriers against his fellow men for the sake of the integrity of his theories: but privately he liked them well, and would do any valiant deed for the public good.

During the years of the Civil War,

# of the WOODS

The shores of beautiful Walden Pond, on the outskirts of Concord, where Thoreau lived in a hut. That this life was agreeable to him is indicated by his own words, 'Most of the luxuries and many of the so-called comforts of life are not only indispensable, but positive hindrances to the elevation of mankind.' The two portraits present the naturalist and author in different periods of his life.

though he would not enlist, he would do what was far more distasteful to him—go to the town hall and speak for the cause. He was an abolitionist, though not of the shrieking and murderous variety: a profounder man than John Brown, and with no trace of John's pleasure in the spotlight. For though Thoreau was congenitally egoistic, he was fierce against egotism: he revered himself as a man, but had a poor opinion of Thoreau. He was devoid of the dramatic instinct, and hated to be observed.

BIRDS, squirrels and hedgehogs were better behaved persons than men and women were: they had not lost the primeval courtesy. Oh, for a faun to pass the day with, occupied but silent! Thoreau had clever hands, and liked to be busy with them; to make things for civilized use out of raw, rustic material. But he would abhor any standardizing of his product: there ought to be a fine personal difference in all man-made things, as there was endless variety in uniformity in the infinite work of nature. The Indians, to foregather with whom he would sometimes tramp off to the Maine woods, were artificial enough for him. I don't know whether it be true that he discontinued making lead pencils when he had made a perfect one; more probably he was weary of the environment: and as for the story that he would pick up a handful of pencils, just so many and no more, thanks to the exquisiteness of his touch, any woman, and most men could do as much. But when we set out to hero-worship, anything the hero may do is heroic.

Thoreau had a French streak in him, whether of the peasant or of the aristocrat I don't know; if the latter, his morality corrected it. But neither was he peasant-like. He had no social place in the world, and, the world not being to his liking as at present administered, he could not be at his ease anywhere. Even in his lonely hut beside Walden, he could not help reflecting how much better off he was than city or village dwellers.

He probably read Rousseau, but he and Rousseau would not have harmonized, Rousseau being desperate enough, but self-conscious. He read Emerson, and conversed with him—lived in Emerson's house for a while—but though he could not, in spite of himself, escape from an Emersonian attitude, he made the best fight he could against it, and dreaded the man as much as he was magnetized by him.

His surest happiness was in discontent, and yet that was not his real happiness: he found that in forgetting himself and philosophy in the sweet intoxication of the woods, the impression spontaneously made upon his bodily senses by the sights, sounds and operations of natural things. He would have thought it no hardship could he have subsisted like the Prophet John in the wilderness on locusts and wild honey; and he might have left out the locusts, not as disliking their taste, but because they were alive, and he had no right to destroy life. I can imagine—and have even sometimes witnessed—his pleasure in a Concord swamp in spring. Concord was celebrated for its swamps, but during several years it was Thoreau who monopolized the celebrating: the farmers would have drained them, but capital, I suppose, was lacking, and there was enough cultivable land without them.

THE luxuriance of the vegetation had a tropical look in spring and summer, and in autumn the reds and yellows were gorgeous. Thoreau knew all of them by heart, and in their depths, and elsewhere, on the hillsides and in the woods, he found such a variety of unexpected flowers as to make him believe that Concord was the natural habitat of all the worth-while flowers in the world.

He himself was born in Concord, lived and died there, and probably saw more in it than did most people. But a flower, to win him, must be wild; he scarcely approved of cultivated gardens. His philosophy permeated every aspect and activity of his life.

He had been an undergraduate at Harvard, but was not happy there; he taught school for a while, but could not accommodate himself to the child mind. Land surveying, as an outdoor occupation, finally attracted him, but he must have regretted that the spaces which he thus defined were to be redeemed from wildness; it was treason to the great mother. He never became a go-getter in that industry: he must be waylaid and constrained. He would get into the little punt he had made for himself and go fishing on Concord River, or swim in the clear depths of Walden, or skate on its surface in winter, frozen smooth and black on a zero winter night. And then he conceived the idea of building his home in its margin, and there—till the selectmen interfered—he found happiness of the rather somber kind that was possible to him: but it was never the spontaneous, unthinking happiness of children, or of the faun of the Golden Age.

HE WAS hampered and prevented by a brain poisoned by philosophy. He brooded over the historical past of mankind, and over its problematic future. He could not help perceiving that his break with civilized custom was arbitrary and individual; he knew he was an eccentric, and not a herald of a new life. In his book, *Walden*, he proves himself right, but is secretly conscious that he is nevertheless wrong. Let him live as he (*Continued on page 28*)

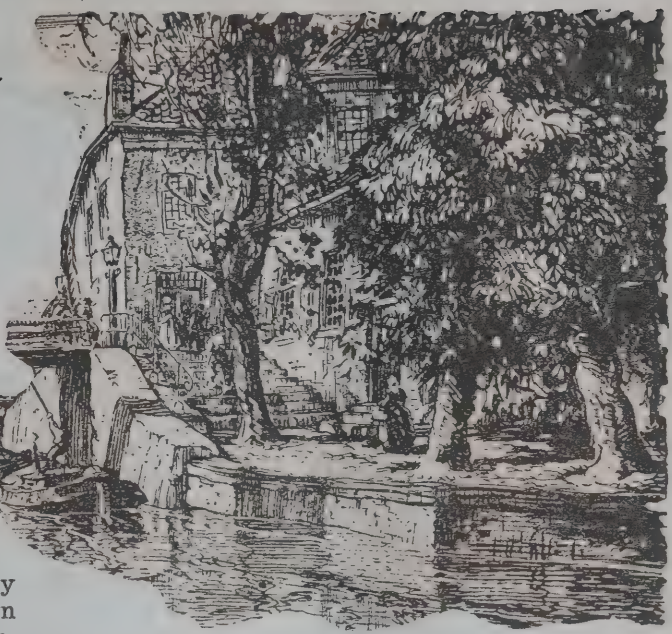
POLCHESTER—Dream City

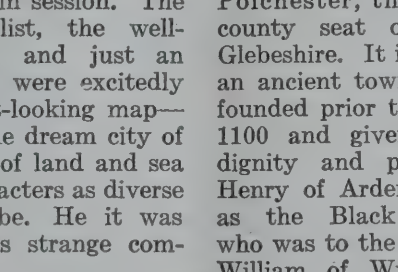
By
F. L. BLACK

Mapped by
PAUL HONORE



THE three members of the Polchester City Planning Commission were in session. The famous novelist, the well-known artist and just an ordinary business man were excitedly poring over an ancient-looking map—the plan of the city, the dream city of Hugh Walpole, maker of land and sea and a collection of characters as diverse as human beings can be. He it was who presided at this strange committee meeting.

In the beginning Hugh Walpole created Polchester, probably to Americans the second best known city in England. Over it he pictured marvelous heavens; he gathered the waters under the heavens together and formed them into a winding river which led away to the sea. The dry land he called Glebeshire and the waters he called the Pol. But Hugh Walpole had more to start with than most creators. He had an imaginary line and this line, which divides Devon and Cornwall, two sea-lapped counties of southern England, he split far enough apart to squeeze in the mythical county of Glebeshire, with its thick wooded valleys which give place with swift precipitancy to plains as bare as a knucklebone.



And the earth brought forth grass and the trees yielded fruit and it was good. And then the supreme creation of the novelist—for in his own image, in the image of Hugh Walpole, he created male and female. For who can say that a character is not one of the many complex personalities which must make up the sum total of its creator?

Five of Walpole's recent novels have described so graphically the heavens and hills of Glebeshire, its magnificent sunsets, its storms and rock-bound coasts, as to make it better known than our own New England coast. In *Jeremy, Jeremy and Hamlet, The Old Ladies, The Cathedral* and *Harmer John* we are led through the streets of the Cathedral City of Polchester, the county seat of Glebeshire. It is an ancient town founded prior to 1100 and given dignity and power by Henry of Arden, known as the Black Bishop, who was to the See of Polchester what William of Wykeham was to Winchester. It was in his time that Saint Margaret's Chapel was built, through his energy that the two great Western Towers of the Cathedral had risen. It is because of him that Polchester has one of the richest revenues of any Cathedral in Europe. His tomb can be seen today in the choir of the Cathedral.

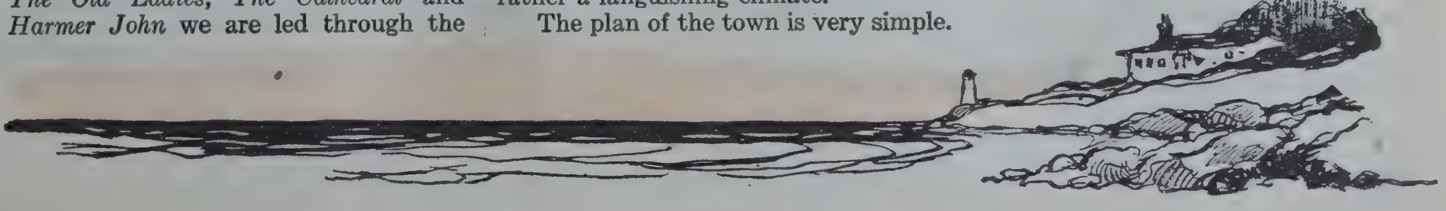
The little hamlet embowered in its protecting trees, defended by its beloved hills, the Rock rising gaunt and naked in its midst; then the Cathedral, the Monks, the Baron's Castle, the feudal rule; then the mighty Bishops and the vast all-encircling power of the Church; then the new merchant age, the Elizabethan salt of adventure; then the cozy 17th and 18th Centuries, with their domesticities, their little cultures, their comfortable religion, their stay-at-home, unimaginative festivities. That in brief is the history of Polchester.

It is still a country town where, the business of the day over, the smell of the fields, the woods, the hills, comes stepping lightly into the streets, pressing up the stairways, threading through the windows. The place is small and simple, lovable and friendly, with the Cathedral bells singing the time through the air as one goes home from work. It has been called by its critics 'a lazy town.' Partly true, for Glebeshire has rather a languishing climate.

The plan of the town is very simple. It is built, as it were, on the side of a rock, running finally to a flat top, on which is the Cathedral. Down the side of the rock there are broad ledges, and it is on one of these that the market place is built. At the bottom of the rock there once was a jumble of cottages known most erroneously as Seatown, and round the rock runs the river Pol, slipping away at last through woods and hills and valleys into the sea.

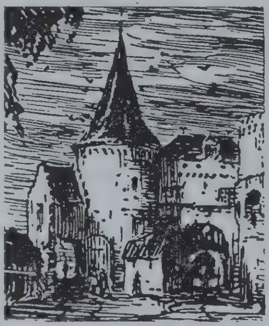
At high tide you can go all the way by the river to the sea, and in the summer it makes a pleasant and beautiful excursion. It is because of this that Seatown had, perhaps, some right to its name, because in one way and another sailors were wont to collect in the cottages and at the 'Dog and Pilchard,' a pleasant and democratic hostelry of thirty years ago. Samuel Hogg was the landlord then, and it was his daughter Annie who eloped with Falk Brandon, the son of one of the Cathedral's greatest archdeacons.

Because the market place is halfway down the Rock, and because the Rectory of St. James' is just below the market place, the upper windows of that house command a charming view both of the hill, High Street and the Cathedral above it, and of Seatown, river and woods below it. It is said that it was up this very rocky street from the river, through the market, and up High Street that the armed enemies of the Black Bishop had fought their way to the Cathedral on that great day when the Bishop had gone to meet his God, and a rock is still shown to innocent



visitors as the place whence some of his enemies, in full armor, were flung down to the waters of the Pol.

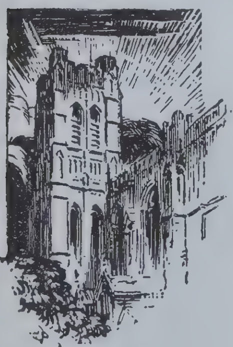
The main line of the railway runs to Polchester from Drymouth and the Polchester railway station is to be found in a little square at the south end of the town. The railway did not bring many sightseers to the ancient town until recent years due to the inconvenient and uncomfortable hostelry, the Bull. Recently, however, a golf course has been laid out and a new hotel, the St. Leath, on Pol Hill. No more has ever been done to encourage strangers. The town itself revolves between two great events of the year—the summer Polchester Fair and the winter County Ball, both of which have been conducted in every detail and particular as they have been for the past hundred years.



On the second high hill above Polchester stands the Castle of Lord St. Leath, owner of most of Glebeshire. Another great family are the Twewithens, but they and the St. Leaths are, for all practical purposes, one and the same family, and divide Glebeshire between them.

Of prime consideration to the stranger is the Cathedral. It must be known to understand the town and its people. For young Polcastrians the spirit of the town is not more potent than the spirit of the church. Through it they have acquired two things—a sense of romance and a sense of the past, and these two things are only one and the same thing for some people.

To be fully realized the Cathedral must be seen in its many moods. Take one of those September evenings when autumn mists seem to be on some secret mission, as though they shrouded the earth with their vapors that they might the better, undisturbed, go about their purpose of preparing the way for winter. Then the long stretch of the Cathedral Green is faintly gray, the row of old houses on the Precincts' farther side show here a gable, there a rough chimney, here a square of shrouded light, here a roof faintly glimmering under the prophecy of an early moon.



The Cathedral itself towers gigantically above the pattern of gray shadow. It is dark like ebony and the buttresses go flying off into the mist as though they were the limbs of some great beast straining muscles in some urgent progress.

On dank days the mists come up from the Pol and wreathe themselves about the town. On these days from the Arden Gate, which opens from the Precincts to High Street, the Cathedral appears to hang like a huge ship sailing through opalescent mist.

In full daylight the nave perhaps, as is the case with all English cathedrals, lacks color and seems cold and deserted. In the dusk of evening it is full of mystery, and the great columns of the nave's ten bays, rising unbroken to the roof groining, spring, it seems, out of air, superbly, intolerably inhuman. Then one is held by the mysterious majesty of the place.

On a lovely evening on entering the Cathedral one is caught by the beauty of the dusky walls and pillars and the suddenly flaming windows near the King's Chapel, six of them, the windows known as 'The Virgin and the Children.' These are, with the exception of the great rose window in the east end, the oldest in the Cathedral. The Black Bishop's tomb, already referred to, stands between the pillars at the far east end of the choir in the eighth bay from the choir screen.

The stone screen which surrounds the tomb is of most elaborate workmanship, and it has, in certain lights, the effect of delicate lace. The tomb itself is made from a solid block of a dark-blue stone. The figure of the Bishop, carved in black marble, lies with his hands folded across his breast, clothed in his Episcopal robes and miter, with crozier on his shoulder. In has often been remarked by visitors to the Cathedral how curiously the tomb catches light from all sides of the building, but this is undoubtedly due principally to the fact that the blue stone of which it is chiefly composed responds immediately to the purple and violet lights that fall from the great east window. On a summer day the blue of the tomb seems almost opaque, as though it were made of blue glass, and the gilt on the background of the screen and the brasses of the groins glitter and sparkle like fire.

Vying in interest with the Black Bishop's tomb in the Cathedral is also to be found the monument to Henry, eighth Marquis of Brytte. The history of the monument is a strange one. Henry, the last of his family, the oldest perhaps of all Glebeshire's great families, spent the last years of his long life at Brytte Court, ten miles from Polchester, and died in 1735. He had done many things during his lifetime for the town, which he loved, and, of course, he was given a monument. A curious thing happened. A local artist was discovered, a young man named Simon Petre, a protégé of the old Marquis, who, learning of the boy's talent, had sent him to London, Paris, and finally to Italy. He came back a sculptor of fine promise. His benefactor's monument was his first public commission. He worked at it for a year and a half and died of some queer fever a week or two after finishing it.

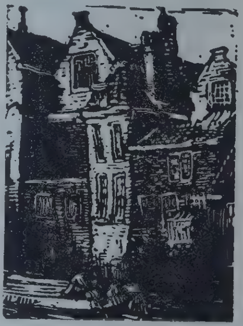
King Harry Chapel is to the right of the choir. This chapel is a place put aside for private prayer. It is infinitely quiet with a special air of peace and beauty as though all the prayers and meditations that had been offered there had deeply sanctified it. At the corner of the Chapel there is a little wooden door, which leads to the King Harry tower by a winding stair, black for a space, then lighted by a window, then black again. This leads to a little, spare, empty room with a wooden floor. One side is open and railed in. When looking down from this height, the floor of the nave seems a vast distance below. The dim haze of the candles just touch the misty depth with golden color. Above, the great roof seems close and menacing. Everywhere pillars and buttresses rise out of space. Far below, the white figured altar, the brass of the Black Bishop's tomb, the glitter of Saint Margaret's screen strike in little points of dull gold like stars upon a gray inverted sky.

Perched on the porch of St. Margaret's Chapel are two gargoyles. Once inside the chapel one can see in the faint half-light, the rosy colors of the beautiful Saint Margaret window. Little remains now of the original Chapter House which had once been a continuation of Saint Margaret's Chapel. Some extremely fine Early Norman arches which were once part of the Chapter House are still there and may be seen at the southern end of the Cloisters. Here, too, are traces of the dormitory and infirmary which formerly stood there.

The present Chapter House consists of two rooms adjoining the Cloisters, once a hall used by the monks as a large refectory. There is still a timber roof of late 13th Century work, and this is supposed to have been once part of the old pilgrims' or strangers' hall. The larger of the rooms is reserved for the Chapter meetings, the smaller being used for minor meetings and informal discussions.

The usual church services are held at the Cathedral. At a morning service, as half-past ten approaches, little groups of people cross the Precincts and vanish into the mouth of the great west door with its representations of the Twelve Apostles. A rustling of skirts, and the aristocracy enters in ones and twos from the side doors that open out of the Cloisters.

An inspiring view is to be had from the Cathedral at night. Then over the low wall that bounds the Precincts one sees the lights of the town far beneath. Among several rather pretentious houses to be found facing the greensward of the Close, are those once occupied by the late Archdeacon Brandon and Canon Ronder. The back of the Ronder house overlooks the river while the big Brandon place stands by itself at the farther corner of the Precincts.



Facing the great western door of the Cathedral are some old houses that run at a half-moon round the Close. These are surrounded by little gardens in which bloom hollyhocks, pinks, tulips, sweet Williams, stocks and other old-fashioned flowers.

The Meads fall in a broad green slope from the old Cathedral battlement down to the River Pol. Their long stretches of meadow are scattered with trees, some of the oldest oaks in Glebeshire, and they are finally bounded by the winding path of a rope walk that skirts the river bank. The meadows back from here and behind the Precincts have been the scene of traveling circus performances for many a year.

To the east of the Cathedral is Canon's Yard, where are to be found the oldest houses in Polchester. This Yard can be entered from either the Cathedral Close or from Orange Street. From either entrance one passes through funny old-fashioned turnstiles into the Yard. The latter approach is down through Green Lane past the Orchards, and up by a steep path into Bodger's Street and the small houses that have clustered for many years behind the Cathedral. Here once was Saint Margaret's Monastery utterly swept away by Henry the Eighth's servants, until not a stone remained.

Saint Margaret's memory still lingers in the Saint Margaret's Hostel for Women at the top of Bodger's Street, but even that has now a worn and desolate air as though it also were on the edge of departure. In truth, this part of Polchester is neglected and forgotten; it did not sink like Seatown into dirt and degradation; it has still an air of romance and color, but the life is gone from it.

Canon's Yard is behind the Hostel and is a little square, cobbled place with tall thin houses closing it in, with the Cathedral towers overhanging it. Rooks and bells and the rattle of carts upon the cobbles make a perpetual clatter here, and its atmosphere is stuffy and begrimed. From the high windows of the Yard there is a fine view of orchards and hills and distant woods—a view not to be despised.

Foster, once one of the powerful canons of Polchester, lived in one of four tumbledown buildings in Canon's Yard. Not far distant is an old grass-grown street known as Pontippy Square. Here quite a number of years ago stood a rickety building where once lived 'The Old Ladies,' Mrs. Amorest, Miss May Beringer and Mrs. Agatha Payne. For a long time there was an air of mystery surrounding this place, due, so the local gossips said, to a piece of red amber which belonged to one of them but was coveted by one of the others.

High Street, on a slope of considerable sharpness, the principal thoroughfare of Polchester, is like any main street of a small Cathedral town. In the early evening the people walk with the air of being unusually pleased with the world. There are lights behind the solemn panes of Bennett's the bookseller's, a fine shop whose first master saw Sir Walter Scott in London and spoke to Byron. The shop is always in a half-dusk and the gas is burned in its dim globes during most of the day.

At the very top of High Street is Mullock's the pastry cook's, gay with its gas, rich with its famous saffron buns, its still more famous gingerbread cake, and, most famous of all, its lemon biscuits. Also at the top of the street is to be found the Conservative Club. In contrast to the noisy cobbles of High Street is the quiet solemnity of the Precincts' asphalt. It was laid at the insistence of the former Archdeacon Brandon in spite of the complaint of the old residents that to take away the cobbles would be to rid the Precincts of all its atmosphere.

The Polchester Free Library is between the market and Arden Gate on High Street. It was given to Polchester in 1900 and is located near Cooper's Art Gallery and Dennison's Stores.

Along High Street nearer the market than Bennett's, is to be found Poole's, the bookshop. Then there are Manning's the hairdresser's, Rose the grocer's, Coulter's the confectioner's, Gummridge's the stationer's, and others on this street.

Coming out from Arden Gate of the Cathedral Precincts on a summer day one sees the High Street all shining with the sun, running down the hill into glittering distance. At the bottom is the market square where, when the day is in full bustle, are to be seen an old apple woman arranging her green umbrella, cabs drawn up in a row alongside the cobbles, stalls in the dark cloister market; the toy man with the clockwork monkeys, the flower-stalls and the vegetable sellers; in the center of the square, sheep and pigs are penned. Dogs bark, stout farmers in corduroy breeches walk about arguing and expectorating, and suddenly, above all the clamor and bustle, the Cathedral chimes strike the hour.

From the market place one steps aside into Pinner Street, through the first door up a broad stone staircase to the second floor where the Swedish gymnasium professor, Harmer John, once one of the town's famous characters, had his gymnasium. Very near the market is the Town Hall where the lectures of Harmer John were given in 1907, and also the Assembly Rooms where for many years the 'Dick Whittington' shows were held. These are still talked about by the older folk of the town. The rooms are now occupied by a cinema. The Blue Boar is a stuffy little hostelry at the south end of the market, and located at the market turning is the brewery. A new and better appointed inn, 'The Three Feathers,' is now to be found on High Street.

The steepest street in Polchester, in fact the steepest in southern England, is Orange Street. It runs uphill southeast from the market place. The street climbs straight into the sky, a broad flat sheet of gold, if viewed from the bottom on a late summer afternoon.

It is the street of the doctors, the solicitors, the dentists, the bankers, and the wealthier old maids of Polchester. The gray stone is of a charming age. The houses with their bow windows, their pillared porches, speak eloquently of the day when the great Janes, Elizabeths and D'Arcys, Mrs. Morrisses and Misses Bates found the world in a teacup. But more than this is the way that the gardens and lawns and orchards run unchecked in and out, up and down, here breaking into the street, there crowding a church with apple trees, seeming to speak, at every step, of leisure and sunny days and lives free of care.

At the top of Orange Street is a monument whose frock-coated hero seems to bend forward to give passers-by a special gracious bow. At the bottom of the street is the beginning of shops, the really smart shops, shops as smart as any in the High Street—Polrudden's, the hairdresser's, Crack's, the confectioner's.

The tiny house of Mrs. Bond, the social leader of the town, is near the bottom of this street just before you come to the river.

On the left as one ascends are found lanes and paths. Here when the spring evenings with their pale primrose lights begin to steal upon the town, one often sees the young people strolling. On the other side Orange Street tumbles pell-mell into the roofs of the town.

Nearly at the top of the street just below the monument is St. Paul's Church. The rectory of the church, once occupied by Tom Longstaffe and his daughter Mary, is a square, gray-roofed building standing back from Orange Street with a lawn and two old trees in front of it. To the left and almost touching it is the church, and to the right, Hay Street, where is located the famous Polchester High School for Girls.

The Dean's house surrounded by high elms is near the top of the street. The dining room here looks over sloping lawns down to the Pol and up again to the woods beyond. On the right-hand side at the very top is a large stone house. It was here that Jeremy Cole was born and lived with his dog 'Hamlet,' while Bentinck-Major, once one of Polchester's well-known canons, lived near the Coles, in a fine house with a garden.

Green Lane, which runs north from the monument, is lined by trees which cluster over one's head. In the evening light it has a fairyland air. Bodger's Street, crowded and smelly and rocking with noise, has already been mentioned. The fields behind Bodger's Street and Canon's Yard slope down the hill and then up again out into the country beyond.

Of the many delightful walks about Polchester none are more beautful than the lanes: Green Lane, Orchard Lane, Grass Lane, and others. One in particular runs above the villas over the top of the town high to the north above Orange Street. There above the lane, with only a step or two, you reach a higher point where on a clear day, you can discover the sea. Where the lane allows the gates to intercept its high hedges you have a splendid view, the green fields sloping to the town.

Going out Orange Street past the Monument one also reaches the St. Mary's road above the town. Coming to the first turn it is worth while to look back. One then sees Polchester, like a child's collection of colored bricks huddled into a green basket, far below, and from its heart a pennant of blue, the Pol, streaming out to the hills, and the Cathedral riding over all.

Near this point is Parmiter's Field, a famous spot in Glebeshire, because there you can have one of the fairest views in all the country. From this field on a bright day you can draw within your arms a vast sweep of hill and valley, black

bunches of wood, isolated farms gleaming white through the trees, streams of silver thread, and, best of all, the slow, rounded shoulders of the Downs. Propter Hill out this way has enough snow some winters for tobogganing. It is then the most popular place about Polchester.

Another beautiful walk out Orange Street is to strike off into the Drymouth Road. Here is a signpost that points to Drymouth, to Clinton St. Mary, to Polchester. A little way on there is Rocket Wood, a place beloved by the children of Polchester for picnics.

Pybus St. Anthony is a little village three miles out of Polchester. A very beautiful village it is, with orchards and a stream, old-world cottages and a fine Norman church. But not for its orchards nor its stream nor its church is it famous, but because for many years its living has been regarded as one of the most important in the whole diocese of Polchester. It is the tradition that the man who goes to Pybus St. Anthony has the world in front of him. When likely men for preferment are looked for, it is to Pybus St. Anthony that men look. Heaven alone knows how many canons and archdeacons have made their first bow there to the Glebeshire world; three deans and a bishop have, at different times, made it their first stepping-stone to fame.

St. James' Church, where the Reverend Herbert Cole, Jeremy's father, once preached and after him the Reverend Mr. Morris, is located on West Street, just west of the market place. Between the church and the market place the houses run forward shutting the church away from the market. St. James' Rectory, formerly the residence of Mr. Morris, who is remembered in Polchester for the scandal he created by running away with Archdeacon Brandon's wife, is the last of three houses all squeezed on the edge of the hill. Because it is the last, it stands square to all the winds of heaven.

Although the house is so close to the market, even on market days one does not hear a sound. The rectory is mentioned here particularly because of the view it affords of the Cathedral. At the end of the passage on the second landing there is a window which is in such a position that through it you gaze behind the neighboring houses, above some low roofs, straight up the twisting High Street to the Cathedral. The great building seems to be perched on the very edge of the rock, almost, you feel, swinging in mid-air, and that so precariously that with one push of the finger you might send it staggering into space.

On the south side of Polchester overhanging Seatown there is a little public garden. Thirty years ago it was a very small and overgrown little place with a tiny battered rococo temple, and some stairs and rain-washed garden seats. Now it has been changed into a fine public park, and once again, after more than a hundred years, the streets beneath it have become fashionable.

Seatown long ago—when there were only the Cathedral, the Castle, the Rock, and a few cottages down by the river, when, at night tide, strange foreign ships came up from the sea, when the woods were wild forest and the downs were bare and savage—had its romance, but that was long ago. Seatown, in its latter days, was a place of bad drainage, bad drinking, bad living and bad dying. The men who haunted its dirty, narrow little streets were loafers and idlers and castaways. The women were, most of them, no better than they should be, and the children were the most slatternly and ill-bred in the whole of Glebeshire. Small credit to the canons and the town councillors and the prosperous farmers that it was so, but in their defense it might be urged that it needed a very valiant canon and the most fearless of town councillors to disturb that little nest. And the time came when it was disturbed . . .

Even the Pol, a handsome river enough out beyond the town in the reaches of the woods, was no pretty sight at low tide when there was nothing to see but a thin, sluggish gray stream filtering through banks of mud to its destination, the sea. At high tide the river beat up against the crazy stone wall that bordered Pennicent Street; and on the farther side there were green fields and a rising hill with a feathery wood to crown it. It was over here that Cousin Francis, of *The Old Ladies,* had his old-fashioned, ample home. From the river, coming up through green banks, Seatown looked picturesque, with its disordered cottages scrambling in confusion at the tail of the rock and the Cathedral and Castle nobly dominating it. That distant view was the best thing to be said for Seatown.

Turning off from the market to reach Seatown a generation ago, one plunged down into Bridge Street as into a damp, stuffy well. Here some of the houses had once been fine; there were porticoes and deep-set doors and bow windows, making them poor relations of the handsome benevolent Georgian houses in Orange Street. The street, top-tilting down to the river, was slovenly with dirt and carelessness.

Bridge Street in turn tumbled with a dirty absent-mindedness into Pennicent Street. This, the main thoroughfare of Seatown, must have been once a handsome cobbled walk by the riverside. The houses, about fifty in number, more than in Bridge Street, showed by their pillared doorways and their faded red brick that they had once been gentlemen's residences, with gardens, perhaps, running to the river's edge and a fine view of the meadows and woods beyond.

From here one found the 'Dog and Pilchard,' the Seatown Inn, easily enough and also the 'Sucking Pig,' an inn a mile farther out on the border of a strip of moor known as Humpathumb. Both of these now belong to past history. Up above the 'Dog and Pilchard,' the river was caught into a kind of waterfall by a ridge of stone that projected almost into midstream. At high tide it tumbled over this obstruction with an astonished splash and gurgle. Even when the river was at its lowest there was a dim chattering struggle at this point.

Seatown had been for many a day the place of outlaws, nor were these outlaws of the picturesque and romantic kind. Rather were they the offscourings of the district—loafers, idlers, thieves and prostitutes. In 1902 a disturbance had been made, and it seemed for a moment as though the whole place would be uprooted, but other influences had prevailed, a few cottages at the far end of Pennicent Street had been pulled down, and that was all.

The town councillors and aristocracy were not easy about the Seatown conditions—the trouble in 1902 had showed that—but once begin to change things and you stirred up a whole world of responsibilities, slanders, accusations and denials. Anything better just now than a public scandal—and just now was always.

To those who know Polchester now, in these chilly postwar days, it will seem incredible that so recently as 1907 it should have possessed anything so medieval as the old Seatown. The modern river street with its neat line of workmen's cottages and gardens, its border of young trees and its low wall of pearl-gray stone, is altogether admirable. To quote the Polchester *Courier* for March 10, 1924: 'We have here something of which we may be proud—modern and yet beautiful; practical and yet dignified; modest and yet artistic. The pretty gardens rich with lovely flowers, the fine asphalted road, the raised walk that gives the visitor an opportunity of surveying the beauties of Nature in a practical and commodious manner, the cottages themselves with their pale stone, their dignified outlines, their perfect sanitation—these are things, we repeat, of which the Polchester citizen may well be proud.'

The story of the change from the old to the new Seatown is one that will be repeated by Polcastrians for generations. It all started with the coming in 1907 of the Swedish gymnastic instructor referred to above. Hjalmar Johanson was his name but this was difficult to pronounce, and he was called by both big and small, 'Harmer John.' Harmer John's ambition was to pull down the slums, Seatown and the rest; build magnificent streets up from the river with statues and towers; to have the most splendid architects, the most wonderful sculptors start a school in the town. To develop a school of craftsmen, 19th and 20th Century craftsmen, who would work with their hands as they did in the Florence of the Renaissance—no machinery, no ceaseless reproduction of beautiful things, but beautiful things themselves, each one made by the loving hands of the loving craftsmen.

In his attempts to carry out these ambitions he gained the enmity of Samuel Hogg, the one-time landlord of the 'Dog and Pilchard,' and others of the worst Seatown element. Several attempts were made to discredit Johanson but these were only partly successful. Finally a riot was staged under cover of which he was killed.

HIS death, however, was not in vain, for on October 7, 1913, there was formally opened by the Mayor of Polchester the new street of houses facing the Pol. This, the former Pennicent Street, is now known as Riverside and as was stated in the local Polchester paper, 'It promises to be one of the finest streets in Glebeshire, bordered, as it is, by the waters of the Pol and faced by a beautiful bank of rising fields and woods.

'Formerly the site now occupied by the new street was covered with one of the worst slums in Great Britain, long felt by the citizens of Polchester to be a scandal utterly unworthy of this Cathedral city of great traditions.'

'Many efforts,' states this publication in its announcement of the celebration, 'were made to rid the town of this eyesore, but no effective steps were taken until a shameful riot, on October 7, 1907, opened the eyes of everyone to the urgency of the matter. It is felt, therefore, that the civic ceremony could not take place more fittingly than on October 7, just six years after the original disturbance. After the formal opening of the new street by the mayor, a tablet to the memory of a foreign resident of the town who lost his life in the riot of 1907 will be unveiled.'

This second ceremony was the unveiling of the tablet to Harmer John. This was just in front of the house where, during the last months of his life, he had lived, and near where he had uncovered a beautiful, small, long-hidden fountain, which is now pointed out to all tourists. It makes a deep impression, looking so brave and handsome and noble in the sun, a dark, friendly tree standing over it, the old gray wall behind it. And on the wall is a little brass tablet, with this inscription:

HJALMAR JOHANSON,
FRIEND OF THIS TOWN,
DIED OCTOBER VII. MCMVII

* *

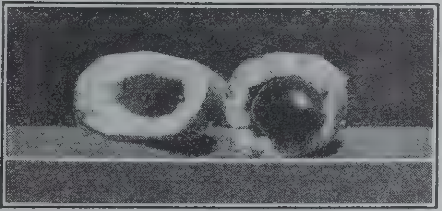
And thus ends the description of Polchester, taken from the books of Hugh Walpole and mapped by Paul Honoré. The meeting of the City Planning Commission was ready to adjourn, but before doing so Mr. Walpole, the famous novelist, and Mr. Honoré, the well-known artist, as a matter of politeness asked the third member of the Commission, the ordinary business man, for his opinion of the description and the map of the city; and since this business man has a reputation for being very practical, although undeserved and greatly overestimated, his approval made possible the submission of the accompanying map to the public.

Getting Things Across

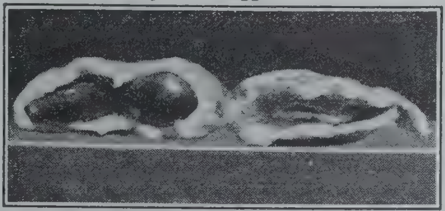
A SPANISH term *picudo*, meaning 'long-nosed, nosey individual' is the sobriquet applied by Mexicans to inspectors of the U. S. Federal Horticultural Board who enforce quarantine regulations governing the importation of cottonseed and fruits across the Texas-Mexican border. The word is a tribute to an inspection service entailing the examination of 15,000 persons daily as precaution against the introduction of injurious insects and fungus diseases from the southern republic.

Cottonseed from Mexico is prohibited from entry by reason of the pink boll worm, a pest that would jeopardize the cotton crop of the South. Mexican fruits—oranges, sweet limes, grapefruit, mangoes, peaches, plums, et cetera—are banned on account of the Mexican fruit fly. The avocado, or alligator pear, is denied admittance because of a weevil peculiar to this fruit. Federal plant quarantine inspectors are stationed on the Texas-Mexican border to enforce the quarantine.

A group of four women presented themselves at the footbridge for entry into the United States. Their deportment aroused the suspicion of the custom inspectress who detained them for minute examination. Inspection of the hand baggage failed to reveal any outlawed fruits. A search of their clothing, however, disclosed two cloth bags, their shape and size facilitating easy concealment, tied about the waist of two of the women. These bags contained twelve avacados and three mangoes. On another occasion a Mexican woman aroused suspicion. Acting on intuition, a federal inspector examined a loaf of bread which she possessed. The disguised 'staff of life' really contained Mexican fruit, a thin crust concealing the prized products.



Avocados concealed in half-baked bread taken from smugglers.



Freight trains, unwittingly, lend themselves to smuggling cottonseed contaminated with the pink boll worm. An express car containing one million dollars in money in transit from Mexico to San Francisco, was found to cloister scattering lots of cottonseed which harbored the outlawed pest. A tank of oil, supposedly free from contaminating influences, was the depository for cottonseed. Crevices and cracks of railway cars are ransacked by the force of inspectors, one man frequently examining scores of freight containers in a single day.

OPPORTUNITIES IN
Salesmanship
Become a Salesman
Every phase of business revolves around selling. The trained salesman is in demand—he can fix his own hours, choose his own field, control his own pay. His income depends only upon his results—there is no limit to what he can earn. We train you to sell successfully thru the LaSalle problem method under supervision of expert salesmen. Train in your spare time. Low cost; easy terms. 64-page booklet, "The Modern Salesman, Ambassador of Progress," free. Send for it today.

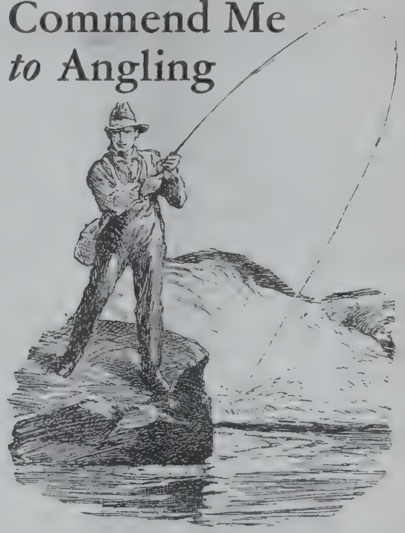
Of All Sports Commend Me *to* Angling



EVERY stream has its whims and peculiarities.

Once while I was fishing an enormous hatch of May flies appeared upon the stream. The trout started to rise to the flies in all directions. For one hour, I tried almost every fly I had, some of them very accurate imitations of the natural insects; but I could not 'fasten' to a single trout. Few experiences in the annals of angling more exasperating can be imagined!

Another time, on the Beaverkill, when it was low and lazy, the situation seemed very unpromising for an angler. Scarcely any insects could be seen, nor a sign of a 'rise.' I cast a dry fly upstream and without result; I repeated and the third time a twelve-inch brown trout rose lazily to my fly and 'sucked' it in. In less than five minutes, I took another fish from the same pool. I waded up the stream casting on every likely looking pool and in one hour I had three brace of the finest trout I have ever taken.

It is this characteristic fickleness that furnishes the major share of the sporting elements of trout fishing. A trout's undependability may always be depended upon.

Memories of Vanished London

By DUNCAN MacCONNELL

THE traveler may commune with the vanished city of London but he will not see it. If he walks from Westminster along the Strand, he comes to a point called Temple Bar, one of the portals of the old town. There is a monument here to mark where Temple Bar once stood, but the Bar itself is there no more. It was removed, some years since, because it was an obstruction to traffic.

Temple Bar naturally suggests a London of older centuries, for at Temple Bar today, as of old, you enter London City. Off the street, for the Strand here changes to Fleet Street, are the buildings of the Templars, and the Temple Gardens, where grew the red and white roses which became the symbols of the war between the House of York and that of Lancaster. The Temple Church is there, with its tombs of knights who fought for the Holy Sepulcher. But while the memorials are here, and the tombs, no doubt the Crusaders are not. And though the unguided wanderer may stumble on the grave of Oliver Goldsmith in this ground, and learn that much of his wayward London life was lived in this vicinity, there is now no space for a poet's home in the matter-of-fact streets of the neighborhood.

Not far from here, in Crown Office Row of the Inner Temple, Charles Lamb was born. Goldsmith lived not far from here, and Blackstone in the same house, and later Thackeray in the same neighborhood. Even today one does not have to travel far to find literary men—for a little to the west, in a region of Westminster parallel to the Temple Gardens, George Bernard Shaw and Sir James M. Barrie live across the street from each other. But the London of the poets is gone with the poets, and now Charles Lamb and Goldsmith mingle at a little distance with the now-peaceful company of the mailed Crusaders.

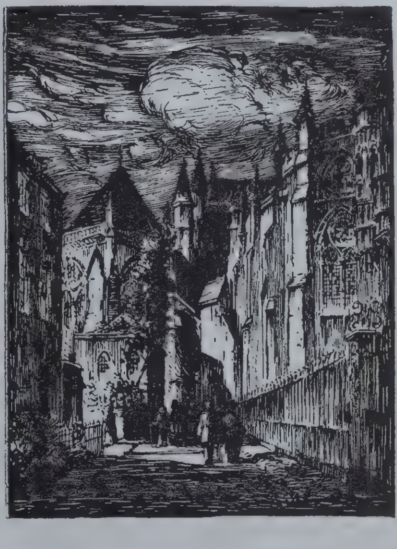
'Let us walk down Fleet Street,' said Dr. Johnson often to Oliver Goldsmith, but the Fleet Street of Johnson is changed and all but disappeared. It has not quite vanished, like the Fleet River which once flowed toward the Thames, and which now flows underground as a sewer. The Fleet Prison for debtors, a home of ancient horrors, has gone. But Fleet Street has been widened, not once but several times. It has been equipped with the conveniences and sanitations of modern life. The Olde Cocke Tavern, which has some associations with Johnson, remains, and one can find the street where he lived and toiled in poverty at his great dictionary.

The London of these former generations was a city like other cities, where people worked and lived. The City covers an area equal to a little more than one square mile, and every street and square seems to have made some contribution to the greatness of mankind.

John Milton was born here and here he died. You do not expect to find that a great poet was born in the London of our time—yet London is a mother of unexpected sons.

The poets who glorify English literature came from that very commercial world, from the shops and stores of the old city. Chaucer was descended of a family of vintners. The very poets who have left us memories of open spaces and rural peace, like Gray and Keats, were native Londoners, Cockneys of the Cockneys. The London of their day could be expected to produce some distinguished sons, because it was a large town. Today their London is in population a village, and more strikingly so because around that village has gathered the hugest mass of human population ever congregated in one place upon the globe.

When one has come to London with remembrances of Boswell's records of Johnson, of Dickens' unforgettable pictures, of the dreamy wanderings of Irving, he will perhaps find himself looking with some wistfulness for that vanished London. This is the selfishness of any traveler who longs to have the whole world prepared for his sight-seeing rather than for the comfort of those who dwell therein. But no one who looks at the London of today can doubt that the changes are for the best, and that by making these changes the modern Londoners show themselves worthy of their inheritance of zeal and enterprise.



For example, one place at London which is visited by every American who can is Smithfield. Perhaps some expect to find there evident remnants and traces of old days of religious persecution—but there is nothing in this park to indicate that here, just outside the old city walls, was a field where tournaments were held. The place is marked in history by many deaths, but he who visits Smithfield today finds a park, with a sandpile in which children play, and one of the great stations of the underground railroad.

One can go off Smithfield into Giltspur Street, but he will meet not gilt-spurred knights. He goes a little farther and comes to the site of Newgate Prison and the old Bailey courts close at hand, and these also are gone. Alexander Pope, most observant of all Londoners, or Samuel Pepys, immortalizer of trifles, would never have known, as they went a little farther on, that this Farringdon Street is the channel of the old Fleet River. Yet no one who has read Pope's description of that foul stream would wish to see it again brought to the surface from its present underground sewer channels.

The Victoria Embankment and its highway replace the muddy and marshy river shores of old time. Toward London Bridge one comes into Victoria Street and sees the monument to William IV. To open this highway and build this monument the site of the Boar's Head Tavern of Shakespeare was obscured—but the present thoroughfares are better for all.

It would be interesting to remove the centuries on Cheapside, that quarter-mile lane which has given all English-speaking buyers and sellers a bargainer's word. But the busy life of Cheapside is gone, and on a Sunday afternoon, when the street is still and empty, he may have some of the feelings which one has in entering excavated Babylon, and walking beside the deserted palaces and temples of the Sacred Way.

The burghers of the town do not now gather in St. Paul's Churchyard to elect the Lord Mayor. Yet the Lord Mayor is still elected by the old authority, and he is Lord Mayor of London even though his ordinary residence be outside of the old town. The City still lives by its ancient institutions, still glories in its seventy-nine liveried 'companies,' whose inheritance from centuries of tradesmen and artisans leaves many of them with vast wealth, used consistently for public good. The twenty-five aldermen still represent the city wards, though the wards and their problems are far different now.

The stranger can also go into the newspaper district below Fleet Street, where streets bear names of old monasteries. This region became known as the haunt of thugs and bullies, who first gathered there to claim protection of sanctuary in the monastery chapels. There is now no longer an Alsatia, and modern London has been delivered from that ancient peril. Thus the past leaves to us all that was permanently good in the sterling worth of the City, and lays away evil memories with the dead beneath the chapel floor.

Mark Twain a Soothsayer of the South?

(*Continued from page 3*)

in Stearns that at the present time is vivid in the emergence of the phenomenal New South, and that is the application of Holy Writ to the practical and satisfactory solution of modern problems. The why and how of it in the case of Stearns run first into some memories, which also account for the strength of the Old South element in the character of the town.

The Old South of the Highlands was the mountain country. On dry land, it mimicked most of the high spots of the water phase. The look of the Highlands was exorcistic. People were isolated. The mountains were crisscrossed with trails, which led from indifferent roads to cabins ensconced in coves and crannies. These cabins also overflowed with big families, which were bound to increase.

The 'unbought grace of life' was at full strength in all of the Old South's phases. Hence, it was the rule in the mountains that hospitality must go the limit of human possibilities—if you were vouched for. That was also the case in the storied Old South.

Wandering strangers, therefore, were welcomed by the better-class mountaineers, just as they were welcomed by plantation owners, and for much the same reason: the strangers brought in news and songs, like troubadours of other wheres and other times. Highland pride matched other Old South pride. Personality and force of Highland leaders equaled these qualities of similar men anywhere.

HOWEVER, the highlands were infested with criminal and shiftless elements. Long ago, mountain pirates waylaid western-bound settlers, and robbed and slayed them. The record of these land robbers parallels the record of Lafitte, and other pirates, in far southern waters. Descendants of the mountain pirates kept outlawry on the go there. Long ago, also, a despicable class of Europeans fled into the Highlands. Their descendants remained, equally despicable. In large part for these reasons, you still hear of wild doings. 'We only had a few fights,' remarked an old mountaineer, who was commenting upon the celebration of the past Christmas in his neighborhood of the region Mark Twain described.

'Two men shot in that settlemint off yonder,' he detailed, 'an' one killed over thar; one killed jes' east o' hyar; two killed below hyar. This year everything was moughty quiet.'

Although it was unlike the average of Highlander conduct, the behavior of the criminal and shiftless elements hung an inglorious name on all southern mountaineers. The overwhelming number of them were God-fearing, straight-living people. Last summer, to carry the idea of the character of their descendants, the region of the scene of the opening chapter of *The Gilded Age* endured an almost unprecedented drought. When it was broken, a Highlander of the better class drawled: 'I wonder if them what has been a-cryin' fer rain thanked God when th' good rain, hit come last Monday?'

The children of Stearns have forsaken such environment of this early period.

One side of probably the greatest contrast presented by the Old South was the cheerful and cultured traditional land o' Dixie. The other side of the contrast was the Old South of the Highlands. The mountains were broodingly mysterious; their people woefully primitive. In the opening chapter of *The Gilded Age*, Mark Twain penned the picture, not only of the section of which Stearns is the center, but also of the Highlands in general.

'Squire Hawkins,' he began, 'sat upon the pyramid of blocks called the "stile," in front of his home, contemplating the morning.

'The locality was Obedstown, East Tennessee . . . You would not know that Obedstown stood on the top of a mountain, for there was nothing about the landscape to indicate it—but it did: a mountain that stretched abroad over whole counties, and rose very gradually . . .

'The squire's house was a double log cabin, in a state of decay . . . Rubbish was scattered about the grassless yard; a bench stood near the door with a tin wash-basin on it; and a pail and a gourd; a cat had begun to drink from the pail, but the exertion was overtaxing her energies, and she had stopped to rest.

THIS dwelling constituted one-fifteenth of Obedstown; the other fourteen houses were scattered about among the pine trees and among the cornfields in such a way that a man might stand in the midst of the city, and not know but that he was in the country, if he depended upon his eyes for information . . .

'In a little while, the male population of the village had assembled . . . As a general thing, they were dressed in homespun "jeans," blue or yellow—there were no other varieties of it; all wore one suspender, and sometimes two—yarn ones were knitted at home—some wore vests, but few wore coats. Such coats and vests as did appear, however, were rather picturesque than otherwise, for they were made of tolerably fanciful patterns of calico . . .

'Every individual arrived with his hands in his pockets; a hand went out occasionally for a purpose, but it always went back again after service; and if it was the head that was served, just the cant that the dilapidated straw hat got by being uplifted and rooted under was retained until the next call altered the inclination; many hats were present, but none were erect; and no two were canted just alike . . . Few of the men wore whiskers; none wore mustaches; some had a thick jungle of hair under the chin . . .

'Squire Hawkins went in and talked to Nancy about the latent wealth of the region; the fact that the natives were unconscious of it; and he stressed the importance of holding on to the land that he owned there. Then he went on:—

'"There's the railroad. These worms have never even heard of it—and when they do they'll not believe in it . . . Some day . . there'll be a railroad stretching . . . all the way from the cities of the Northern States to New Orleans—and it's got to run within thirty miles of our land—and maybe even touch a corner of it.

'"Well," he continued, "do you know that they've quit burning wood in some places in the Eastern States? And what

Natives of the region of The Gilded Age. Crew from the coal-and-timber railroad.

do you suppose they burn? Coal! . . . There's whole worlds of it on this land! You know the black stuff that crops out of the bank of the branch? Well, that's it. You've taken it for rocks; so have everybody here . . . Pine forests, wheat land, corn-land . . . coal—wait until the railroads come . . . "'

In the last five words, by way of an aside, there's something else to think about. 'Wait until the railroads come,' together with the character of Stearns, may serve for answer to the recent question of the editor of an influential southern newspaper.

'Was Mark Twain any great shakes as a soothsayer of the South?' he asked during some talk about sundry odd topics.

'That is to say,' the editor went on, 'have you come across a place down here about which Mark Twain caused a character to indulge in a piece of divination that worked out—or is working out—in a really big way?'

Leaving the question of prophecy in the remark of 'Squire Hawkins' for you to deal with as you like, about fifty years ago, the through railroad came along, almost where the squire located it in his talk. Its presence, however, made but few changes in ways of living. Mark Twain's description was much the situation a quarter of a century later, when the company which owns Stearns attempted to begin to dig coal, and cut timber.

Native labor was almost inert. Money went a long way. Mountaineers of the region worked three or four days; quit, and drew their pay. With it, they bought slabs of salt pork, some cornmeal and beans. Their larders thus stocked, they hunted or fished and lazed until the cupboard was bare, when they returned to work for three or four days. That was the routine. Any application of the doctrine of do and don't to bring about a change in habits of work was out of the question. The temper of these mountaineers prevented importations of labor, although the latter was of nearby old American stocks. Production of coal and timber hung around a low mark.

These mountaineers, however, were responsive to what they saw. Especially, the women. The executive and administrative forces that the company brought in from cities, and elsewhere, were dressed accordingly. Their homes and food were comfortable and something new. The mountaineers observed without comment; and occasionally imitated a small detail. This trait was a hint.

The power of suggestion as it is outlined in the Biblical story of Jacob and Laban was put to work as the last resort to pull several thousands of people out of their primitiveness, and thereby secure production. At the outset, a display was made of a few elemental things that the mountaineers fancied and wanted. They worked to get them. The display was gradually enlarged, until habits of sustained industry were formed.

Stearns was built from a typical settlement with another name, which was changed to the name of the company. From the beginning of the striped-stick-like experiment, operations were carried on with the least possible disturbance of the land, in order to preserve the surroundings to which generations of Mark Twain mountaineers were accustomed. For the same reason, homes were haphazardly placed. This policy laid the base of contentment. It also accounts for the points of similarity you noticed in the descriptions of Stearns and 'Obedstown.'

Changes in ways of living have been accomplished in silence. Mountaineers are not given to talk; and they don't care to hear very much chatter from other people. Hence, there never has been any 'inspirational' windjamming. Year after year, this mite and that bit of civilization has been spread out to mountaineer view, and absorbed, without a word being said about it on either side. This was done in a natural, matter-of-fact way. The professionalism of a social service worker has always been absent.

Because mountaineer diet was restricted, and not always wholesome, the experiment started with sensible foods. They were shown in company stores without comment. The mountaineers looked at them; eventually bought, and included them in their regular diet. Then the experiment ran into sanitation. Mark Twain's description of the cat drinking from the pail which held the Hawkins' supply of drinking water was a commonplace.

It has taken nearly twenty years of hard work to make laughter a commonplace, for mountaineers are naturally gloomy. The sluggish and woebegone look has been replaced by one that is alert and cheerful—especially as far as girls and women are concerned. Girls no longer face the blank wall that saddened their mothers—early marriage, a new baby every year.

Of course, the experiment was slow-going. Several times it appeared that the hypnotic primitiveness would overcome imported civilization, and even those who came from the 'outside' would slide backward. Nevertheless, the experiment was kept up. The effect has been similar to the work of an artist, who painted a panorama as events occurred, showing the progress of the nation from Colonial days to the present time.

The story of Stearns is the story of the entire region of the opening chapter of *The Gilded Age*. The influence of the town is far-reaching. The company established an experimental farm, for example, and got a real farm man to run it. Fruit trees, and whatever else is adapted to that soil, have been planted and properly cared for. Mountaineers were generally indifferent farmers. The experimental farm is like a striped stick. The superintendent discusses farm problems with any man who gets to the point of making inquiries. The result in Stearns is better native fruit, and more varieties of home-grown vegetables—which was why the farm was started.

Less than ten years ago, the mountaineers were uninterested, even in local affairs. A newspaper established by the company was a striped stick. At first, no one would take it. Nowadays, children bring this paper, and particularly newspapers published in Louisville, from school, and read them aloud to illiterate old folks. Hence, you're surprised to have these old folks talk intelligently to you, not alone about county affairs, but also, for instance, about the situation in China, and suggest solutions that are based on common sense. Where we of cities skim the headlines, and get a hasty glimpse of events, these illiterate people listen to every word, and meditate upon what they've heard.

Stearns is something decidedly Old South and unlooked-for along a byroad of the phenomenal New South.

Shooting Martens *With a* Camera

By E. R. GAMMAGE

FOR many centuries, the women of the world have been wearing fine furs, and among the very finest of them is the marten fur. The martens are very shy; it is therefore extremely difficult to get satisfactory 'close-ups' of these little animals which make many a woman happy and many a man's pocketbook as flat as an elephant track.

The marten which is shown in the picture was photographed in Old Mexico while the camera man was on a picture-scouting trip. As you will notice, the little fellow is very much interested in the food which he is greedily devouring. This is some honey which has been given him to hold his attention so that he could be photographed as close up as possible.

Marten is the common name for a number of closely related animals which are widely known on account of their fur. They all belong to the genus Mustela. Besides the fur which bears the name of 'marten,' all sables come from these animals. They thrive abundantly in the northern portions of both the Old and the New Worlds. They have long, slender bodies and short legs and they live for the most part in trees. Their outer coat is long and glossy, and makes one of the finest furs in the world. The under fur is long, soft and abundant.

There are two species of the marten in North America with a variety of local names. One species, the 'black marten,' 'black fox,' 'fisher' or 'pekan,' as it is variously called, is the largest of the group, being from two to three feet long with a tail one foot in length. It has no immediate relatives in the Old World. It feeds on mice, frogs, porcupines, and also on the frozen fish which it steals. The other species, the 'pine marten' or 'American sable,' is about the size of a large house cat. It lives in the dry spots of pine forests as well as among other trees. It is similar to the pine marten of Europe.

The 'stone marten' is another common variety. Its tail is somewhat gray and its breast is pure white. The Asiatic sable, however, furnishes the celebrated sable which is the most costly of all furs. A set of these furs of even inferior quality will command a price of $250 while a perfect set of natural, bloomy black will swell the figure to $2,000.

America's Passion Play

By JOHN SLOAN

WHAT is regarded as the only pageant in the New World to approximate the Passion Play of Oberammergau in the Old, belongs to the people of this country for all time. This is the Mission Play, written back in 1911, by John Steven McGroarty, born in Pennsylvania, of early American stock and transplanted to California while yet a young man.

The play was first presented in 1912, near the Mission San Gabriel, in the ancient *pueblo* of San Gabriel, in southern California. It has been presented continuously, with ever-increasing audiences, every year since. All the rights in the play belong to a nonprofit organization of public-spirited citizens called the Society of the Golden Scroll.

Except for the cost of the theater where it is shown, all the net returns from the play through future years will be applied to the restoration of the chain of Franciscan Missions, reaching more than 600 miles along the California coast, from San Diego de Alcala on the south to San Francisco Solano on the north.

Some years ago an effort was made by leaders of intellectual life in California to have the state restore these Missions, but members of a creed with headquarters in Boston blocked the movement. Two of the Missions have fallen into well-nigh irreparable decay, while the score still standing have almost lost the fight against time, the elements and vandalism since 1833, when Mexico took over these historic monuments and drove out their builders. Now, with the income available from the most important and most prosperous of all the amateur stage productions of America available, it seems that these stations will be preserved, just as, through the vision and generosity of certain wealthy men, other historical structures on the Atlantic Coast have been saved.

The Mission Play, too, is unique. Admittedly, it violates all the established 'rules' of the drama. When it was first written, no theatrical producer would accept it.

La Purisima, typical of the ruined missions which the play-pageant contemplated restoring with its earnings.

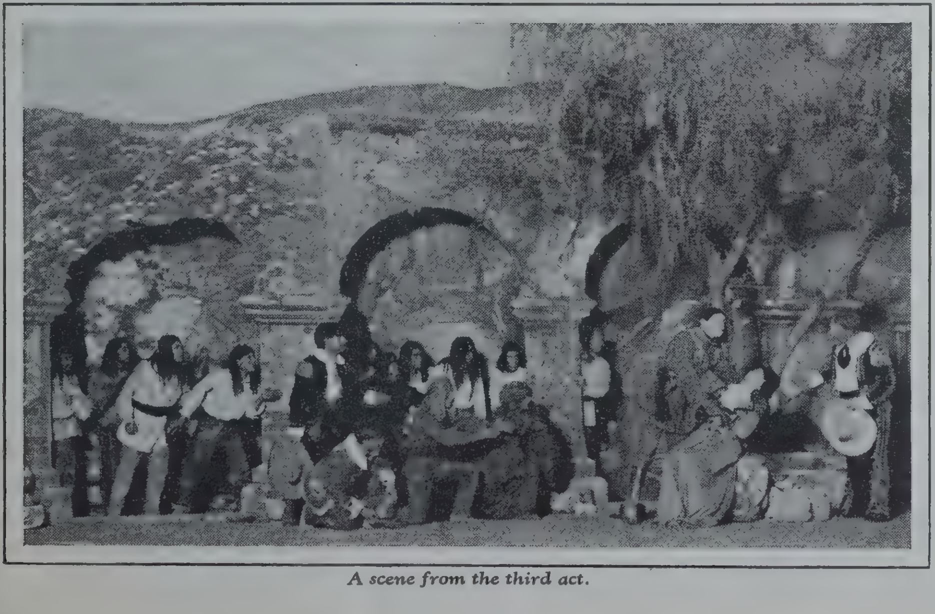
The Mission Play, from the first performance, has paid its own way, without a cent of backing beyond the credit of the author, and without subsidy, either religious or secular. It has played more performances than the world-famed Passion Play of Oberammergau. More people, from different countries, have traveled longer distances to see it than any other play in the world. It is one of those productions which is actor proof; not a line has been changed from the original, written eighteen years ago. Iconoclastic dramatic critics and dignitaries of Protestant and Catholic churches have praised it.

As a pageant drama, born of an hour of dreaming at the foot of the Serra Cross on Mount Rubidoux, in southern California, the Mission Play tells the bringing of Christian civilization to the western shores of America. It is the chronicle of that marvelous enterprise which, begun in 1769 and ending less than a century later, converted an entire race, made up of many tribes, from a low form of heathenism to Christianity. 'It remained for a Pennsylvanian and a Celt, a poet and a historian,' says Dr. Henry Van Dyke, 'to tell the story of California to the world as it should be told, in his wonderful Mission Play, the greatest of the world's pageant dramas.'

Preceding the play are three pantomimes, symbolizing the great epochs portrayed in the production: First, a savage, sensing the approach of white men, and feeling that they will become his masters; second, the specter of the faded glory of the Spanish Conquest; and, third, the spirit of the ever-living faith in Christ. These pantomimes are thrown against a soft, luminous blue Spanish curtain, with no other setting or background. Then, rather abruptly, the curtain rises and Act 1 opens on the shores of the Bay of San Diego (Saint James) in the historic year of 1769.

Fifteen years pass in the five-minute interlude between the first and second acts, and the curtain rises again on the beautiful church of San Carlos Borromeo, overlooking the bay at what is now Carmel.

It seems almost that it has remained for the Pennsylvania-born Celt to preserve, better even than the six-foot walls of the Missions have preserved it, the memory of the self-sacrificing father of all the Missions.



A scene from the third act.

Woodrow Wilson in Paris

(*Continued from page 8*)

came down the Champs-Élysées and, making their short detour, turned into the Place. A struggle began between the units of the Garde Républicane and the throng which had taken possession of the right of way. Such a riding-down and use of sabers; yet it ended as those contests usually do—the throng gave way, the procession crossed the square, entered the Rue Royale and passed into history as far as the Place de la Concorde was concerned. So great had been the crush, so close did the crowd press the line, that all I saw of the cavalcade was the black-plumed heads of the mounted escort. I did not see President Wilson, nor one of his party. (I am not sure whether the President's wife rode with him or sat in Poincaré's lap.) All I know is that a million others shared my luck and never saw so much as Wilson's shiny top hat.

The parade ended at the Place de la République. President Wilson and his official family retired to a palace provided by the Republic of France, while the mighty crowd jammed the Boulevards, threw tons of confetti, danced and sang themselves to weariness, and went home in the wee sma' hours to cool off. They had given an exhibition of hero worship unequaled even in Paris. But they readily slept it off; witnesseth, two days later, when President Wilson was presented with the keys of the city and rode from the Hotel de Ville down the Rue Rivoli to the Place de la Concorde, accompanied by Mrs. Wilson, President Poincaré, and a host of maréchals, generals and admirals, he attracted no more attention than was usually granted to a battalion of poilus hoofing it across the city from the Gare St. Lazaire to the Gare D'Orsay. As a visiting hero-President he could shine once, but as a mere peace commissioner ———.

Llivia—a Geographical Freak

(Continued from page 9)

Then passed many peaceful years in the Cerdagne valley, with Julia Livia the center of the growing trade between Gaul and Spain, and prospering herself in like proportion. But just as the Roman Empire gradually weakened with the effort of the subjection and defense of enormous territories draining the lifeblood of her armies, so the Goths found the acquisition of Spain and much of Gaul and the maintenance of order therein so exhausting that it eventually erased them, as a nation, from Europe. Most of their possessions in Gaul were lost early, but Spain was firmly and successfully held until the death of Leovigild in 586, when the Gothic power began to wane steadily.

FOR a new enemy, infinitely more to be feared than either Suevi or Roman, swarmed across the narrow seas that separate North Africa from the south coast of the Peninsula. These, the Moors, drove the Goths steadily back, year after year, until the final Moorish wave spent itself almost exactly at Julia Livia.

It was in the year 711 that the Llivians first saw the dreaded turbans and dark-skinned faces outside their walls. It was then, too, that they bade goodby forever to the Goths, who fled northward and so out of history. But ceaseless Moslem triumphs had at last roused Europe to a sense of her danger, and the Moors were seen in the smiling Cerdagne and its chief town for little more than fifty years. Today, practically no trace, either in the people or in the architecture, can be discovered of this short-lived occupation.

It was probably just after the Moors had fled southward that Julia Livia entered into the period of her greatest glory and enjoyed the fullest measure of prosperity. For many years the headquarters, and later the base of the Christian armies, there was gathered within her walls, living in her tall, white, balconied houses, and promenading her narrow, cobbled streets, the very flower of Christendom. For it was from Julia Livia—shortened by that time to the more familiar Llivia—that, in 778, a mighty host, led by the valiant Charlemagne himself, swept down the Cerdagne and made a beginning of freeing the Iberian Peninsula from Moorish domination.

In conjunction with his ally, Alphonso the Second, King of the Asturias, Charlemagne twenty years later, having rid northern Spain of the Moors, formed what was known as the 'Spanish march'—a wide strip of territory extending from Pamplona to Barcelona—to prevent any incursion of the enemy. And here again, in the provisioning and maintenance of this fortified barrier, Llivia played a most important part, controlling as it did the natural entrance to the very center of the 'march.'

Twelve years later Charlemagne finished his great work by the conclusion of a treaty of peace with El-Haken, the Emir of Cordova. By this treaty the Moors definitely surrendered northern and the greater part of central Spain, and at long last the sights and sounds of war departed from the Cerdagne, and left Llivia to her farmlands and peaceful commerce. And so stayed this happy and growing little community for the next 350 years. Dwelling securely under the flag of Spain as they did, the Llivians prospered quietly, while all remembrance of turmoil and bloodshed gradually slipped from their minds until it was practically nothing but a series of legendary stories whispered round the fireside. The story of this ancient town might have ended so, in peaceful oblivion. But it was not to be. The district of which Llivia was the capital was far from forgotten. It was eagerly coveted by France.

It is natural to wonder why a powerful country should concern herself with such an apparently insignificant piece of territory. But there was a reason, and that a good one. To appreciate it fully the map must once again be consulted. It will be seen that Llivia is the center of a fertile plain, practically surrounded, on the French side by the Pyrenees, on the Spanish, by the Sierra del Cadi. And not only did Llivia command the passage between the two countries, but it provided the only means of direct communication between the Valleys of the Tet and the Ariege, both in French territory.

The importance of this can readily be seen by a glance at the map. It meant that transport of any kind going from the western Pyrenees to the east coast would naturally follow the one direct route, Ax-les-Thermes—Col de Puymorens—Llivia—Saillagouse—Col de la Perche, and so to the Rousillion and its capital, Perpignan, or vice versa. There are no other practicable passes save for the two mentioned, as France had found to her cost, both from the military and the commercial side, and the alternative route—via Carcassonne—added many miles to the journey.

SUCH a situation, from the point of view of the French, was intolerable. So France bided her time. And her opportunity came with the formation of the league of the Rhine by Mazarin. Spain, in the throes of civil war, was powerless against this formidable combination. By the Treaty of the Pyrenees, signed in 1160, the astute Cardinal gained his point, and Spain was forced to cede the thirty-two villages comprising the upper Cerdagne, and of which Llivia was one of the southernmost.

It seemed that the Llivians were once more destined to acknowledge new masters, and deep and bitter was the sorrow when the news was known. But Mazarin had reckoned without a country mayor and his council. As the latter sat despairingly in their town hall preparing to surrender their beloved Llivia, the mayor suddenly sprang to his feet and electrified the assembly by claiming that the French occupation was contrary to the articles of the treaty. By this, he agreed, Spain ceded thirty-two villages in the upper Cerdagne. *But Llivia's ancient charter recognized her as a town!*

The French protested, but in vain. The treaty had been signed and was unalterable unless they were to resort to force of arms again. So Llivia was for good and all designated as a town and her claim was upheld. She should remain Spanish.

And that is why today, when you walk along the straight, white, dusty road that leads from Bourg Madame to Ax-les-Thermes over the mighty Col de Puymorens, and runs parallel with the newly constructed railway linking France with Spain, you will see on your right, after about a mile, a sentry box, occupied, and a signpost which announces that this turning is a neutral road leading to Llivia (Esp.).

After a careful scrutiny of your passport, and, if you look at all bulky, of your person also, the French sentry will allow you to proceed. At crossroads farther on you will find yet another sentry of the same nationality; Llivia being ringed with them on every road that connects her with the outside world. Eventually, when the famous town comes in sight, a mile away, silhouetted against the hill that rises sheer behind it, you will see a post which tells you that you are henceforth in Spanish territory once again.

LLIVIA is now sadly shrunken, but there is a melancholy pleasure in walking through this last outpost of Spain. It is like a town that has been stricken with some paralyzing disease. The cobbled streets, the narrow lanes, seem to have stayed still for century after century, save that the ring of some gallant steed's hoofs is now supplanted by the slow, 'clip-clop' of the ungainly ox- or mule-drawn wagon. The high, balconied houses, leaning toward each other whisper of the glorious sights they have witnessed in the dim past.

Yet your sympathy would be wasted on the people. Despite virtual separation from their country, you will find the Llivians fiercely, proudly Spanish. No other language is tolerated. No other coinage is welcomed. There is little or no social intercourse with the people of the surrounding country. Intermarriage is practically unknown.

But there is just one glory that is Llivia's still—her fortified church, standing boldly up amidst her sadly diminished flock. Go inside. It is an object lesson, a silent reproach to the petty jealousies, the quarrels of men. It is much too big now for the Llivians. If every one of the 850 inhabitants worshiped there at one time you would still find ample room. The richly gilt altar pieces, the high windows one blaze of color, the lofty, exquisitely carved roof, the wondrously decorated side chapels—almost little churches in themselves—where kings have lighted their candle to their patron saint in the hope that fortune would smile upon them in the battle—all mutely, but only too effectively, tell the story of Llivia's vanished glories far better than any words.

Poor Llivia! Once the resting place of emperors, the headquarters of mighty armies. Once the hope of Christendom itself. Once a name that was heard often; to be spoken of with immense respect in all the courts and chancelleries of Europe. And now, to the outside world it conveys—nothing. To the Spanish, it brings a thought of sorrow, tinged however with a certain pride. To the French, it stands for one thing only—that pet abomination, smuggling.

For that is what the Llivians have come to. Their tiny piece of territory is insufficient to keep life in them. It is their last resource—smuggling! Poor Llivia!

Keeping Ice Cold *in the* Ice Box

By ROBERT H. MOULTON

WHEN artificial ice is being made, the water which is to be frozen into blocks is drawn into a large feeding tank where it is thoroughly filtered and, if necessary, softened. From the feeding tank it goes to a fore-cooler where it is brought to a temperature just above the freezing point. Water begins to freeze at thirty-two degrees Fahrenheit; hence if the supply in the feeding tank is kept near this point, the actual freezing, which takes place in smaller tanks, can be accomplished more quickly.

The fore-cooler is a tank equipped with many rows of pipes through which ammonia circulates. Since the ammonia has a very low temperature, it gradually absorbs the heat of the water surrounding the pipes until the temperature of the water is near thirty-two degrees. From the fore-cooler the water is drawn directly into the cans into which it is to be frozen. The standard sizes of these cans are for either 300- or 400-pound blocks of ice.

The freezing cans are usually arranged in groups, each group being sunk into a larger tank set just below the floor. Each individual freezing can has its own cover, and attached to each is a brass tube through which dry, clean air, under high pressure, is blown into it through the bottom.

The large tank in which the freezing cans are sunk is filled with a 25 per cent solution of sodium bromide, called the brine. To keep the brine in constant circulation around the cans, a propeller, similar to the propeller of a boat, is used.

During the freezing process, the air blown into the freezing cans drives all the tiny particles of minerals and impurities to the center; this makes the ice absolutely pure and transparent. When the freezing is almost completed there remains at the center of each can only a small amount of water into which the particles of foreign matter have been driven. This is called the core. This core, withdrawn by a suction pump, is replaced with clear, pure water. The freezing is then continued until the whole block becomes a solid mass.

As soon as the freezing is completed an overhead traveling crane lifts the can out of the brine and carries it to a dipping vat, where warm water melts the block of ice sufficiently to allow of its being lifted from the container. As fast as they come from the freezing cans the blocks of ice are chuted into a storage room where they are kept in a uniformly cool temperature to await distribution to the consumer.

While all housewives undoubtedly realize the importance of keeping their refrigerators spotlessly clean, a great many do not know how otherwise to properly care for them in order to secure the best results. They think, for instance, that it is only necessary to fill up the ice chamber and that then the refrigerator will take care of itself until the ice is nearly all gone. In doing this not only do they take a chance of having their food spoiled when the ice supply becomes very low, but they actually use more ice in the long run than if they had kept the ice chamber well filled at all times.

When the ice supply gets low, the refrigerator naturally grows warm and requires just that much more ice to bring its temperature down again to the point of safety. This point is reached only when there is a constant circulation of cold air across the top of the ice, down its sides, down the side of the food compartment, across the floor of the refrigerator, up through the food compartment, and over the ice again, purifying and preserving at every stage of its journey.

There are a few cardinal points in the care of a refrigerator which every housewife should know. In the first place, the refrigerator should be large enough to hold all necessary food without crowding. It is not so much the size of the bow as it is the quantity of the food, which consumes ice. Food should never be put in the ice chamber, and hot food should be allowed to cool a bit before being placed in the food compartment.

The doors should be tightly closed to prevent warm air from seeping in, and be opened as infrequently as possible. Tests have shown that in the opening of the door the temperature inside rises at least two degrees.

Counting *the* Dust

By S. R. WINTERS

A FASCINATING device is the Owens dust counter, used to take the census of the tiny particles which float between earth and sky. It was by this machine that Uncle Sam's Weather Bureau proved that as many as four thousand particles to the cubic centimeter circulate in the atmosphere.

A dust counter, invented by Dr. J. S. Owens of London, was employed. It includes a dampening chamber, or a tube open at one end, and is lined with blotting paper, thoroughly saturated with water. The other end is almost closed by a screw-threaded head.

Air is passed through the slot from the dampening chamber at a relatively high velocity; and is cooled below dew point. Thus, moisture is condensed upon the particles of dust. The moisture-laden particles impress themselves upon the microscopic plate at great speed. Removal of the cover glass of the microscope then reveals a line of moisture. This rapidly disappears, leaving an invisible collection of dust particles.

A high-powered microscope was next used. The first observation made was to locate the dust. This was done with an eyepiece capable of magnifying eight times, in this instance, causing an enlargement of 125 diameters. Actual counting of the tiny bits of dust required the use of a 1.8-millimeter objective, employed with oil immersion, able to magnify 1,000 diameters. This magnification makes possible the counting of a bit of dust as fine as 0.0002 of a millimeter in diameter—so infinitesimally small as to defy the use of the metric system.

Census at Long Island, a manufacturing center, yielded 2,036 bits of dust in each cubic centimeter of air. Determinations made at the Federal Building, in Chicago, indicated the atmosphere was burdened with 7,180 particles of dust to the cubic centimeter, while a count at the University of Chicago showed the presence of only 4,800 bits of dust for each cubic centimeter. These were maximum figures.

The size of the particles decreased in relation to the altitude at which they were collected. The average diameter of the minute portions of dust at the surface of the earth was four times that of those at an altitude of 10,000 feet.

Thoreau—Genius of the Woods

(Continued from page 15)

would, the world would go on its way unmodified by his rebellion. His rare faculties, his superior intellect, were wasted like a perfume in the desert.

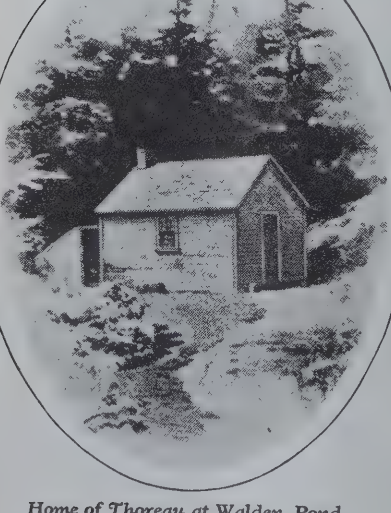
It would not much have cheered him could he have foreseen the present resurrection which the idle whim of the present day has effected for him: he would have resented being the subject of even a benevolent curiosity. Nothing less than to be recognized as a Messiah would have contented him, and he knew that he never could be that.

Perhaps, could he have been a religious fanatic, he would have prospered better. He had no small mixture in him of the fanatic. But his faith in God was not that towering flame which the great religious reformers have manifested; the acid of rationality was too strong in him. He was no barren atheist, but he had not fathomed the great secret, and he could not preach without it. He had almost a rage for sincerity—to be as sincere as a bird, a tree, or a wolf; and the compromises and skilful locutions of the church revolted him. If we cannot explain the Trinity, let us not affirm belief in it. He accepted the designation of Transcendentalist as committing him to nothing, but he did not regard himself as a disciple of Emerson or Alcott. His virtue was, that he was a misfit anywhere in human congregations; he must be himself, and nobody, not even he, knew exactly what that was.

It was my privilege, as a boy, to accompany Thoreau on some of his walks, not as a companion rightly so called, but as a walker beside him. He would speak but few words during these tramps, and I was quite as taciturn as he, which, I think, was the main reason why he tolerated my presence.

ONCE, when I was seven years old, he came to the Wayside to make a survey of our land, bringing his surveying apparatus on his shoulder. I watched the short dark unbeautiful man with interest, and followed him about all over the place never losing sight of a movement, and never asking a question or uttering a word. The thing must have lasted a couple of hours; when we got back, Thoreau remarked to my father: 'Good boy! sharp eyes, and no tongue!' On that basis I was admitted to his friendship. Nearly twenty years afterward I became a surveyor myself; and I was always devoted to 'natural history'; but I cannot say that Thoreau was the reason. My liking for him as a man was never great; but he had a fascination for me, as of one who knew things I didn't know.

The outlook from Thoreau's forest cabin.



Home of Thoreau at Walden Pond.

NATURE absorbed his attention, but I don't think he cared much for what is called the beauties of nature: it was her way of working, her mystery, her economy in extravagance; he delighted to track her footsteps toward their source, and to watch her growths and developments. He liked to feel that the pursuit was endless, with mystery at both ends of it. But of color and form as valued by artists I doubt whether he took heed. He was able to say of a girl's smile, 'What is it but showing me bare bones?' That may indicate a radical defect.

It may be one cause of his having never married, or shown interest in women, unless it were in Margaret Fuller, and no one could be interested in Margaret as a pleasing physical object. She was a conversationalist; the mental or emotional attrition of a group of people would warm to action, or sometimes perhaps create, her own thoughts. She would often say a 'good thing' which was in truth but a clever paraphrase of what some one else had suggested. It was a sort of flattery, when you saw through it, and she may have flattered Thoreau in that way; but I never was a listener at their colloquies.

The only other women who can be traced to his neighborhood were his two excellent sisters, of whom no statistics are extant. After Thoreau gave up the Walden hut, he and his sisters lived in a little white cottage on the broad, avenued street that lay westward from the village center; it stood on the south side of the way and was unnoticeable. I never went there; it would have seemed unnatural to find Thoreau there.

Gambling Scheme *as* National Pastime

By WALTER M. WOLFF

THE young people of today scarcely know just what a lottery is like and even among the older folk there is still a vague recollection that lotteries have something to do with numbers or chances and a drawing, and so on. Few recall the Louisiana lottery days before our Constitution was amended to prohibit all schemes of this kind in 1895. In Europe, however, a different situation has long prevailed. At the beginning of the 16th Century the lottery appeared in Holland; in 1530 one is said to have been popular in Florence, Italy; and France established the lottery in 1531.

In 1569 England supported the lottery as an aid to the maintenance of several important seaports and Paris conducted a similar scheme in 1572 to assist poor girls in securing a dowry. It was not long, however, before the various countries began to see possibilities of enlisting the lottery in the raising of revenues and soon the governments usually secured a complete monopoly, and heavy taxes imposed thereafter aided very materially in filling the states' coffers.

Although no strictly valid reason for the existence of lotteries persists, they were not abolished in any country until public resentment had risen against them after some had fallen into disgrace through swindle or mismanagement.

In America that lid has remained closed and is likely to stay so indefinitely, but the Europeans have several reasons which they consider important enough to warrant the continuation of lottery schemes. One reason is that the state needs funds.

Germany, for instance, still maintains several prosperous state lotteries which aid the state financially to a great extent as heavy taxes are levied on the chances sold.

Not long ago there appeared in the Italian news columns the story of a man who had won a very large prize through playing a number alleged to have been revealed to him in a dream by his aunt. This episode calls to mind the experiences of a servant girl who won a small fortune because of her deficiency in arithmetic. She had placed her stake on No. 26 and when questioned as to her reason for selecting just this number answered with a sly chuckle, 'Didn't I dream three nights about the number "9" and since three times nine makes twenty-six I played this number!'

Less fortunately fared a policeman of Florence, Italy, who had seen to his great glee in the morning paper that his lottery ticket had won a prize of 500,000 lire. In a fit of ecstacy over his sudden good fortune, as he supposed, the amiable officer of the law immediately invited all his friends to attend a grand banquet to which he was to be the host on the following morning.

At the close of the event he presented each one of his guests with a gold watch in commemoration of the auspicious occasion. In high spirits the 'lucky' man then set out for the lottery headquarters to collect his prize. To his great horror and dismay upon presenting his ticket for payment he suddenly became aware of the fact that he had mistaken a 5 for a 3 in his number. With one loud shriek he dashed off in a desperate effort to recover at least the gold timepieces.

CHATS WITH OFFICE CALLERS

'America has taken a long time to learn that art—as one of the old Greeks defined it—is anything that is well done,' said the ***Connoisseur,*** 'whether it be the painting of a mountain, the drawing of a molecule, the building of a bridge, the composition of music, the writing of a book, or the cooking of a dinner.

'We are beginning to discover for ourselves that the daubing of oil colors on canvas, the setting down on paper of a lot of connected noises and calling the result music, the stringing together of words until they reach the accepted volume of a book, or the chopping of some fanciful figure from a block of marble, may or may not be art, according to whether—to put it bluntly—the job is well done.

'This discovery has worked some havoc with the cubists, the futurists, the impressionists, the syncopators, the jazz artists, and other similar bacilli of decay in American art, and it is quite well on its way to doing further damage to these largely alien "artists." But, on the other hand, the majority of the people of America are beginning to believe that, after all, Wagner is a greater composer than Berlin, Shakespeare at least equally great with Chambers or Elinor Glyn, Raphael and Titian and Corot more permanent than cubism, and Forbes-Robertson as competent as Al Jolson.

'This is something, but it has led to something even more important; it has brought us to the borderland of desire to see more frequently, and to know better, the works of those who were able to do their own jobs perfectly well, to leave to us a legacy which may in truth be called "art."'

* * *

An ***Englishman*** brought an interesting tale of a Hindu celebration: 'Every twelfth year, at the conjunction of Jupiter and Aquarius, occurs the Kumbh Mela Fair at Hardwar, a great Hindu bathing pilgrimage during which thousands bathe in the Ganges. This year the event occurred on April 13, and was marked by a tragedy when thirty-five persons were crushed to death in the rush to reach the bathing pool. There was also a disturbance due to resentment at the presence of non-Hindu police on a jetty built out into the bathing pool. These police supervisors wore boots of leather, which is contrary to Hindu scruples against the killing of cattle. It was further objected that these officials offended the modesty of women bathers, though it was generally conceded that such safety measures were necessary. Thousands of pounds were spent by the British Government on safety measures, including special barriers, water supply, sanitation, electric lighting, hospitals, doctors and police, though not a soldier was used. The rush to be first in the pool is always dangerous; in 1915 twenty-three lives were lost and in 1819 it is reported that 430 persons perished.'

'One of the priceless possessions of the American Negro is his wealth of folklore,' said the ***Southerner.*** 'Unfortunately, most of this so far is uncollected. In *Uncle Remus,* Joel Chandler Harris unearthed a gold mine of it, but, outside a few studies of Negro folk life, published during the Abolitionist period, it is a field the virginity of which is just beginning to excite the attention of Negro scholars.

'Of course in the realm of folk music or the "spirituals," there has been a great deal of research, but the history, the archeology, the folk life of the American Negro is practically unexploited.

'In the Negro colleges, too, courses are being offered in African history and civilization. Howard University of Washington, D. C., was the first institution to inaugurate it, having at the head of its department a very capable young man, Professor William Leo Hansberry of Harvard.

The realization of this ideal is a fitting climax to the growth of racial consciousness among the Negroes following the war. Before the war there were two societies concerned with the subject, namely, the American Negro Academy which had in its councils eminent Negro thinkers, writers and scholars, and the Negro Society for Historical Research, Yonkers, New York.

'In 1915, however, there was formed in Chicago the "Association for the Study of Negro Life and History" the purpose of which was: first, to collect sociological and historical documents; second, to publish books on Negro life and history; third, to promote the study of Negro life and history through schools and clubs; and fourth, to bring about harmony between the races by interpreting the one to the other.

'Under the leadership of Professor Carter Woodson the association has been recognized by thinkers and writers on the subject here and abroad as the principal authority on Negro life and civilization.'

THE SEEDS OF REBELLION.

* * *

'I was amazed on a recent visit to New York,' the ***Traveling Man*** said, 'by the unusual number of real or alleged cripples, beggars, and blind men who infest the channels of trade and traffic. As a rule every uptown and downtown subway station has from two to four exits. These exits are favorite spots of the solicitors for public charity. Their number must be legion. Some are genuine, of course, but a lot of them are fakes. While I was there, they caught one fellow who was "leading the double life." It appears that he spent one half of it in the dusk of street corners, with a hand outstretched for alms, and the other half having a good time in the night clubs and cabarets along Broadway. And in his private hours he stopped under an assumed name in the largest hotel in the city. In his begging hours, he lacked his left leg below the knee, but at night his friends never noticed this defect. Begging was profitable, and the simple toll from one person out of several hundreds that passed him on the sidewalks of Broadway amounted to an income more than sufficient even for the gay life he was leading.

* * *

'People who work in glue factories think they would be happier bottling perfumes, and perfumers get so sick of the nauseating stuff that they get out at four o'clock in the morning to stand in line before the employment offices of tanneries.

'Maybe that is why,' continued the ***Easterner,*** 'I am so thoroughly enraptured with Los Angeles. Everything is *too* beautiful—the palms, the roses, the sunshine, the skies. The beauty of the city is due primarily to its architects. Their bungalow designs are as captivating as they are extraordinary. When an Eastern man builds a bungalow, he builds a wagon shed with a porch in front. When a California architect plans a bungalow, he plans something exquisite, and if the builder takes the trouble to install floors that will not fall—as they usually do—the result is all that could be desired and more.

When one rides through the bungalow section of Hollywood he is entranced. Every bungalow is a startling innovation. On a warm, moonlight night in winter, the effect is one never to be forgotten. Which leads me to say that quiet, beautiful Hollywood is about as far removed from the popular conception of it as anything could be. There was not a single woman murdered while I was there, nor did I see any gentlemen riding through the streets with their feet out of the windows of taxicabs. It is as quiet and orderly as an Iowa town—and *that* is about what it is.'

CAN YOU TELL ME?

Question. Are battleships of the Colorado *class identical with those of the* California *class and if not, wherein do they differ?*

Answer. No, there is a difference between these two classes of vessels. In the amount of armament the *California* has: Twelve 14-inch 50-caliber guns; twelve 5-inch 51-caliber guns; eight 3-inch anti-aircraft guns; four 6-pounders; two 1-pounders; two 21-inch submerged torpedo tubes.

The *Colorado* has: Eight 16-inch 45-caliber guns; twelve 5-inch 51-caliber guns; eight 5-inch anti-aircraft guns; four 6-pounders; two 1-pounders; two 21-inch submarine torpedo tubes.

In the matter of armor the *California's* main belt is 14 inches and the main belt of the *Colorado* is 16 to 14 inches. The funnel bases of the *California* class are 15 to 9 inches, while the funnel bases of the *Colorado* class are 16 to 9 inches. The turrets in each class are the same being 18 to 9 inches, as are the conning towers which are 16 inches. In the matter of under-water protection and protective decks the *Colorado* class has somewhat more complete protection than that of the *California.*

* * *

Q. What was the nature of the contract England secured with Spain in 1713 with regard to slavery in North America?

A. This was the '*assiento*,' a term especially applied to an agreement between the Spanish Government and a foreign nation to import Negro slaves from Africa into the Spanish colonies in America, for a limited time, on payment of certain duties. The English were the sole possessors of this agreement till 1701. In 1713 the celebrated *assiento* treaty was concluded between Spain and Great Britain for thirty years at Utrecht. By this contract the English, among other privileges, obtained the right of sending a permission or *assiento* ship, so-called, of 500 tons every year, with all sorts of merchandise, to the Spanish colonies. By the treaty of Madrid, October 5, 1750, the contract was annulled.

* * *

Q. I should like to know something about the last of the six-masters.

A. This is the *Edward J. Lawrence* of Portland, Maine, the only six-master afloat today. She was built in Bath in 1908 at a cost of $165,000 and no pains were spared to make her seaworthy and beautiful. From stem to stern she measures 340 feet with a jib boom extending 92 feet beyond. Her beam measures 51 feet 6 inches, and her great masts, 30 inches in diameter and 122 feet high, are of Oregon pine and are surmounted by topmasts measuring 65 feet. Her sails, when unfurled, spread 11,000 square yards of canvas. She is commanded by Captain Joe York.

> *In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.*

Q. Is it necessary in applying for a patent to send a working model to the Patent Office? If so, what protection can one have while such a model is being made?

A. A model is not necessary, but it is advisable to apply for a patent through a reliable patent attorney and it will be necessary to furnish him with such data regarding the invention as will enable him properly to describe it in the patent. There is no legal protection for the inventor during the period that he is working out the invention, and in the event that he is granted a patent, his protection dates from the issue of the patent. While the invention is being worked out it is advisable to make dated and witnessed records of its progress and these records should be subsequently filed away with the patent application file.

* * *

Q. What are the entrance requirements for West Point and how are appointments made?

A. The maximum authorized strength of the Corps of Cadets is 1,378, selected from candidates between the ages of 17 and 22 years, nominated as follows: 2 by each United States senator, 2 by each representative in Congress and territorial delegate, 2 by the Vice-President, 100 by the President, 20 selected from among honor graduates of 'honor military schools,' 2 from natives of Porto Rico, 4 from natives of the Philippine Islands, 4 from the District of Columbia, and 180 from among enlisted men of the Regular Army and National Guard. Those from the last-mentioned class are required to be between the ages of 19 and 22 years and must have served in their respective organizations for at least one year. Each candidate must pass a rigid physical examination and none is accepted who has any defect or infirmity which renders him unfit for military service. In addition each candidate must pass an examination in the subjects of algebra, geometry, English grammar, composition and literature, and history. Graduates of first-class high schools and students at universities and colleges of recognized standing may, however, submit educational certificates which will be considered by the academic board, and if satisfactory may be accepted in lieu of the mental examination. The course, which is four years in length, is largely mathematical and professional. The principal subjects taught are mathematics, English, French, Spanish, drawing, drill regulations of all arms of the service, natural and experimental philosophy, chemistry, mineralogy, geology, electricity, history, international, constitutional and military law, civil and military engineering, art and science of war, economics and government, and ordnance and gunnery. Each cadet when admitted to the academy signs an agreement to serve for a period of 8 years, unless sooner discharged by competent authority. Upon graduation cadets are commissioned second lieutenants in the United States Army, with the exception of the Filipino cadets, who are eligible for commission only in the Philippine Scouts. The pay of a cadet is $780 a year and commutation of rations, at present fixed at 80 cents per day. Detailed information may be had upon application to the Adjutant General of the Army, Washington, D. C.

* * *

Correction. In our July 30 issue in answer to the query, 'What is the pay of a sergeant in the army?' the answer was erroneously given in accordance with the monthly pay schedule of enlisted men of the Philippine Scouts instead of that of the Regular Army. The correct base pay in the Regular Army for first grade, master sergeant, is $126; for second grade, technical or first sergeant, $84; for third grade, staff sergeant, $72; and for fourth grade, sergeant, $54. The rate of pay at the end of every four years of service is permanently increased at the rate of 5 per cent of the base pay until the total increase reaches 25 per cent of the base pay, after which no further increases in pay are granted.

Q. Can you tell me why Pennsylvania is called the 'Keystone State'?

A. Pennsylvania was designated the 'Keystone State' because it occupied the center of the arch formed by the Original Thirteen States.

BRIEFLY TOLD

In Great Britain the right to print the King James Version of the Bible is restricted to the King's printer and to Oxford and Cambridge universities because this version was published at the expense of the Crown.

We say a person is 'cool as a cucumber' because the temperature of that vegetable is usually one degree lower than the surrounding atmosphere.

A traveling case containing $4,000 worth of jewelry, recently left standing at the curb between Sixth and Seventh avenues, New York City, remained untouched for five hours. At last one man's curiosity moved him to investigate. Upon viewing the contents, he hurried the bag to the police station, where it was later claimed by a jewelry salesman.

Amber, fossilized gum of plants that died millions of years ago, is used in pharmacy, the arts and as a gem. It is found principally in the United States.

A patient in an Australian hospital, after listening to a radio talk on wrestling, surprised the surgeons when, under an anesthetic, he gave a demonstration of wrestling skill, finally springing off the operating table to compete with an imaginary opponent.

India once possessed the knowledge of inlaying steel blades with gold without impairing the strength or spoiling the temper.

More than 10,000,000 meteors strike the earth's atmosphere daily, says Dr. Harlow Shapley, director of the Harvard observatory. Although a meteor weighing 31,000 pounds was discovered at Willamette, Oregon, most of them are so small that they add to the earth a total weight of only 36,500 tons a year.

A gasoline tax ranging from one to five cents a gallon is imposed in all but four states. Revenue collected from this source during 1926 amounted to more than $187,000,000.

Among the old violins owned by Johannes Robey, a well-known collector, is one which contains an odd label in Latin. Interpreted, it means: 'I was living in the forest; the cruel ax slew me. While I was alive I was mute; dead, I sweetly sing.'

A New York dealer in autographs and a Philadelphia bookseller have purchased jointly the only known autograph manuscript of Edgar Allan Poe's 'Raven' from the family of Mrs. Edith D. Whitaker of Philadelphia.

Native Negro tribes of Africa have known something of metallurgy since prehistoric times. In making their favorite ornaments, doubled-link chains of copper wire to be worn as anklets and armlets, they use only clumsy pairs of pincers, yet the finished product is as delicately fabricated as many present-day watch chains.

More than one-half of the worst insect pests in the United States have been imported from foreign countries.

Bowlegs, Oklahoma, a thriving oil-boom town with a population of 750 persons, is named for two pre-boom Indian settlers, Billy and Lucy Bowlegs. Plans are under way for publication of a newspaper to be known as the *Bowlegged News.*

The human heart makes ten less strokes a minute when the body is in a recumbent position than when upright.

Deaf bicyclists of Germany number nearly twenty thousand. For their benefit and protection the Bicyclists' League has introduced a distinguishing symbol, a metal plate screwed to the rear bar of the wheel with three black balls in a triangle on a yellow background.

Four tons of worn-out paper money are returned to the Treasury Department each day.

Lord Howe Island, one of the Society Islands located south of Australia, is suffering from a rat pest which threatens to destroy its principal industry—the production of palm seeds. Using cats to combat the rats proved unsuccessful, so the inhabitants are trying another remedy—a shipment of rodent-eating owls imported from San Diego, California.

The elaborate funeral electric street car bought by Laredo, Texas, in 1889, is now used as a chicken house.

Uraguay's national anthem has seventy verses.

After working for most of his life on the Aeneid, Virgil was dissatisfied with it and expressed at death the wish that it be burned.

Between June and October the American public spends more than $1,300,000 a day for ice.

Fenian Ram, the world's oldest submarine, has been sold as junk for $100 to an antique dealer. Built in 1879 by John H. Holland for friends of Irish freedom, it was calculated to destroy the entire British fleet, but failed to fulfill its mission owing to a lull in Irish agitation.

Egyptians in the time of the Ptolemies were so violently opposed to red hair that they burned a red-haired maiden once a year.

Fifty years ago a textile plant of Chicopee, Massachusetts, resorted to the use of silver to replace all bills up to five dollars. Some 1,500 silver dollars, or 'cartwheels,' most of them the same coins put into circulation a half-century ago, are still moving about in this town.

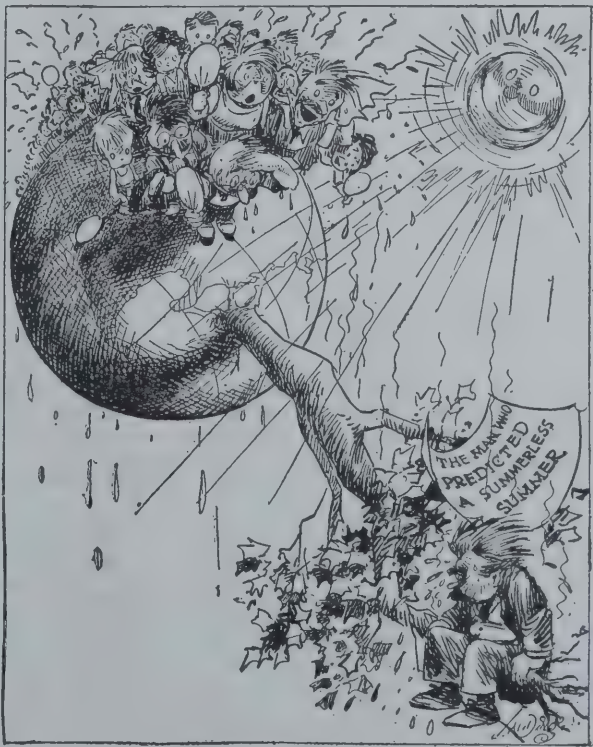
Nathaniel Winkle, the only cat in the world successfully to use a wooden leg for over a year, died recently at the age of twenty years.

So scarce are tea tasters becoming in London that the County Council is to be asked to establish tea-tasting classes in night schools. The shortage of experts in this line, a broker explains, is due to the fact that parents are unwilling to send their sons into a business requiring seven years' apprenticeship without pay, despite the fact that a trained tea taster can earn a salary of £1,000 a year, plus commissions of perhaps £8,000 more.

Goldfish do not exist anywhere in the wild state, but are a product of selective breeding. Centuries ago Chinese fish culturists interbred light-colored specimens of the carp family, producing many beautiful specimens, among them goldfish. Today they are produced in commercial aquariums from the same species of wild fish.

Oxford University, England, has adopted a rule limiting the number of its women students to one for every four men.

One pair of English sparrows multiplying for ten years without hindrance would number more than 275 billion descendants at the end of that period.



THE MAN WHO PREDICTED A SUMMERLESS SUMMER

—Darling, in the *Detroit News.* (c) N. Y. *Herald-Tribune.*

NEVER MIND, THERE'S ONE MAN WHO FEELS THE HEAT WORSE THAN WE DO.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S page this week discusses the desirability of the element of patience in connection with reform.

* * *

This week's cover design, by Gerald Van der Heyden, is quaint and original. It represents a group of wandering minstrels in full blast, including the 'one man band,' which used to be heard and seen in our towns and villages much more frequently than it is now.

* * *

A poem—'Desert Fantasy'—by Glenn Ward Dresbach, one of the younger school of poets, appears on page 2 of this cover.

* * *

When prohibition became law many people sympathized with the distillers and brewers because they were put out of business without compensation or adequate time to dissolve. Willis J. Abbot gives the inner story of the battle between the prohibition advocates and the liquor interests which preceded legislation and shows just why the liquor interests went unpaid. (p. 1)

* * *

Many years ago Mark Twain wrote about the South, more particularly the mountainous district of eastern Tennessee. Here was the village where Squire Hawkins talked to Nancy about the future, indicating what the coming of the railroad would mean to the place. Whether or not Mark Twain was a true prophet the reader must judge. But certainly improved transportation and good roads act like magic in a backward neighborhood. It takes contact with the outside world to remove cobwebs from sidetracked civilization. (p. 3)

* * *

When H. H. Karpinski, the father of Professor Karpinski of the University of Michigan, left Poland years ago, it was a dismembered state, choked in its development through being distributed among Russia, Germany and Austria. Since the World War it has been altogether different. Poland, reunited and rehabilitated, has regained the right to govern herself. Mr. Karpinski, himself a Pole, throws much light on present-day conditions. (p. 4)

* * *

One does not usually associate romance with barge canals. Nevertheless the waterways running from one town to another or from one state to another have become as much the medium of romance as have the highways and byways. They have also been the means of the avoidance of natural obstacles which lie between the ocean and the Great Lakes. Water transport in spite of railroads and motors is likely to be revived on a greater scale than ever. (p. 6)

* * *

When Woodrow Wilson went to Paris on his peace mission he was hailed by the French people as their deliverer from years of war. Hero-worship is too prosaic a term to use in defining the reception accorded to him and the enthusiasm that prevailed. War debts were spoken about then, but not by the people. This subject was only discussed behind closed doors until later. It is only now that the people are beginning to realize what Wilson tried to do for them. (p. 8)

* * *

How many people know that France harbors within her borders a tiny portion of her next-door neighbor's territory? Somewhere east of the center of the Pyrenees, Llivia was once a city which was the resting place of emperors and the headquarters of mighty armies. Smuggling is now the principal industry. (p. 9)

* * *

Not so many years ago certain portions of the West were wild if not exactly woolly, and the Southwest had both characteristics. Under these conditions there flourished 'Law West of the Pecos.' A justice of the peace of a unique personality not only administered the laws but made them. His jurisdiction was unlimited and he enforced his decrees without fear or favor. There was no one to dispute his decisions. This was in Langtry, Texas. Max Bentley, journalist and magazine writer, tells the story. (p. 12)

* * *

No one has drawn a better picture of Thoreau as the genius of the woods than has Julian Hawthorne, son of the famous novelist. In a series of intimate pictures, we are shown just what manner of man Thoreau was. Nathaniel Hawthorne knew him. Julian Hawthorne knew him still better because he followed him to the woods and watched him as a land surveyor as well as a naturalist. Young Hawthorne was a silent admirer and silence pleased Thoreau. (p. 14)

* * *

Those acquainted with Hugh Walpole's novels must know Polchester, with its cathedral, canons' houses, feudal castle and Seatown. F. L. Black has compiled the story of Polchester and its people from the creations of Hugh Walpole, and Paul Honoré has mapped out the city in all its medieval dignity. (p. 17)

* * *

Among the shorter articles in this issue are 'Memories of Vanished London' by Duncan MacConnell, a story which recalls Shakespeare, Dr. Samuel Johnson and other literary giants (p. 22), and an interesting column or two on page 25 about America's Passion Play; and on page 27 there is something that furnishes useful information to housewives: how to keep ice cold in the ice box.

REMARKS BY OUR READERS

Latta, South Carolina.

I cannot hesitate longer to praise THE DEARBORN INDEPENDENT. As a teacher, with the colossal task of interesting pupils in history for the first time, I know of no other magazine so valuable. It has always a store of historical articles written in such a way as to catch the interest of the pupil and with illustrations better than our texts can afford.

The pictures are wonderful as teaching aids in geography; economical questions are made simple for young minds. In the last number I see three articles I can use in my grade work this year, dealing with history or geography, to say nothing of the articles on good manners.

By the way, we had guests when the number containing the article on good manners came, and my son checked them up according to that article. The first article in the same number, 'The Abdication of the Russian Emperor Nicholas II,' giving the royalist view is nothing but fair. I believe in giving both views and in that way get an unbiased opinion or view. What could teach children more of the Mississippi River than 'In the Wake of the Flood.' Not only geography is taught in a first-hand vital way but health, sanitation, welfare work, et cetera.

To give children the article 'The Conqueror of Difficulties' will make the winner of our great northwest a real figure in history, and the delight of children to find their heroes in magazines is unbounded.

Probably it is an old idea but I have found that it works beautifully—the plan of teaching children to keep a scrapbook. I announce at the beginning of a term that we will keep a scrapbook. I give credit for any article about which we have studied, these to be cut from any newspaper or magazine. However, all articles are not eligible for the book. This is to stimulate the use of newspapers, to evaluate material, and broaden the mind. It is thrilling to have an apparently uninterested child come to school with a beaming face and a bit of the morning paper saying Edison got off the train for a few minutes for exercise, after having studied Edison's life a few days before.

I do not hesitate to say that more articles for our scrapbooks are found in THE DEARBORN INDEPENDENT than in any other magazine. Ever since the paper came to my attention I have tried to have them and periodically my husband, a Ford dealer, will want to give some of them away to friends and we come near a family squabble.

I wish I had them all. I'd make a scrapbook worth while, a historical and geographical reader for the grammar grades. I want to thank you for helping me to make history and geography more human for my boys and girls.

Sincerely,
MARY BELLE MANNING BETHEA.

The Rider

By GAMALIEL BRADFORD

I WAVE my cap, I shake my reins,
I flit across the heather.
The light blood sparkles in my veins,
Mine and my steed's together.

What turn of fortune's giddy wheel
Awaits us as we wander,
I do not know. I only feel
Something that calls me yonder.

A merry-hearted maid to woo,
A fox to chase with ardor,
Perchance the flash of bright steel too—
'Strike, boy, and I'll strike harder.'

I know not, care not, what remains,
I flit across the heather.
The light blood sparkles in my veins,
Mine and my steed's together.

Looking down the canyon at the proposed dam site in Boulder Canyon.

The Political Issues of the Colorado River

By HUSTON THOMPSON

THE Colorado River is in politics. It is not mere petty politics but smashing big national politics, commensurate with the size of this great river. What caused the political contest is not definitely known. The controversy, however, started shortly after the war. Perhaps Muscle Shoals and its hydraulic electric possibilities awoke politicians and power companies to the great prize that was at stake. At any rate, whereas Government officials, and particularly the men in its administrative departments previous to the war, had aroused little interest through their investigations, reports, and recommendations about this Red River of the Rockies, the situation is now seething.

As practically all of the soil fit for farming in the great watershed of this river is arid, the value of water for reclamation purposes is almost priceless. In addition to farming, the states in the upper regions of the river, like Colorado and Wyoming, will need water for domestic uses, if they propose to take care of large populations in the future. Cities like Denver have already absorbed about all of the water they can get from the eastern slope of the Rockies. It has become necessary to look to the watershed on the western slope that runs down into the Colorado River.

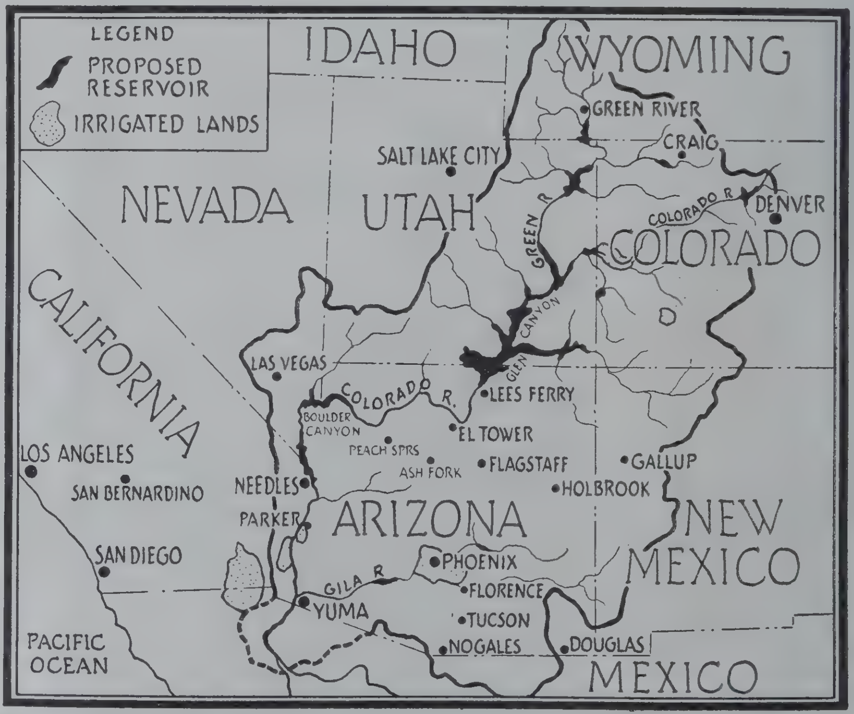
Becoming nervous over the possibility that those in the lower states might acquire prior rights under the law by virtue of application and use of the water, citizens of Colorado began to agitate for some sort of an agreement between the states, whereby a division of the water would be made for the future, which would let the people of Colorado, Wyoming, Utah and New Mexico rest in peace so far as their future development was concerned.

The agitation of the people of these states pressed down upon the Secretary of the Interior, who was making an investigation of the river under an Act of Congress of 1920, and in response thereto in his report to Congress the Secretary of the Interior urged, among other things, the enactment of a law permitting the states in the watershed of the Colorado River to enter into a treaty or compact to divide the flow of this stream.

In answer to this recommendation, Congress passed an act committing itself to such a procedure on the part of the states. The legislature of each of the seven states—Colorado, Wyoming, Utah, New Mexico, Arizona, Nevada and California—in turn authorized representatives of their respective states to meet and to draw up a compact between the states making a division of the water of the river for the future, with a proviso that the compact must be ratified by all the states before it can become effective.

At last, after recommendations dating back as far as President Roosevelt's time, a real start was about to be made by the states interested in controlling the acts of the Colorado River for the benefit of the citizens of these western states. Their representatives gathered for action at Bishop's Lodge, formerly the home of Bishop Lamey and now a charming hostelry situated among the hills three miles outside of the town of Santa Fe, New Mexico.

AFTER much travail, this assemblage of state representatives, together with the Honorable Herbert Hoover, representing the Federal Government, brought forth what has become known as 'The Seven-State Compact.' This compact divided the great watershed into two basins. In the northern area there were grouped together Colorado, Wyoming, Utah and New Mexico and in the lower basin the states of Nevada, California and Arizona. The point in the watershed on the river where the basins divided was at Lee Ferry, a short distance below the Utah line in Arizona. At this spot it was provided that water equivalent to 75,000,000 acre feet must pass during a period of 10 years for the benefit of the states in the lower basin. Figured annually, this meant 7,500,000 acre feet of the water not already appropriated to be divided among Arizona, California and Nevada. They were to have an additional million acre feet a year already put to a beneficial use. The northern group of states was to have a like 75,000,000 acre feet from the river.



Colorado drainage basin, based on a U. S. Geological Survey.

Apparently satisfied after their arduous labors at Bishop's Lodge, the commissioners departed for their respective states in peaceful and apparently confident frame of mind. Very shortly thereafter, six states had ratified the compact, but the State of Arizona refused and upon its refusal the political fat slipped into the fire where it has been ever since.

Being unable to get the compact ratified by Arizona, the remaining six states drew up what they termed a 'Six-State Compact.' When it came to ratification, however, the State of California insisted that with its ratification were to go certain requirements regarding the building of a reservoir at Boulder Dam in Arizona for the purpose of holding back the flood waters of the river and protecting the Imperial Valley from floods; increasing the supply of water for irrigating the Valley; creating power at the dam, and the lifting of water up on a lofty plateau to supply additional requirements of cities in southern California.

THIS move on the part of California reacted on the State of Utah, which, in turn, withdrew from the compact, leaving but five states that have ratified the compact and are willing to stand by their ratification.

It should be borne in mind that those states in the upper basin had declared that the interest which moved them was the reservation of enough water to assure them the reclamation of their arid lands; a domestic water supply for their cities and power requirements. They were not interested in the dispute between California and Arizona over the location of a storage and power reservoir in Arizona. Of course, they were all motivated by the desire to protect the people of the Imperial Valley from injury through floods.

Arizona's state of mind was very acute and real to its representatives. Instead of a dam located at the Boulder site, they asserted the necessity of one located hundreds of miles above it at Glen Canyon. With a diversion dam in Bridge Canyon several hundred miles below, they assert that they can create electric power as readily as at the Boulder Dam site. Moreover, they argue that with a tunnel seventy miles long through a rocky area they can reach and reclaim 3,000,000 acres of land in the heart of Arizona. They also assert that, as the dam will be located and the water stored in their state and power created there, they should have the right to tax such power, just as Pennsylvania has the right to tax anthracite coal that is mined in that state. It is calculated that the revenue from taxation would amount to approximately $3,000,000 a year.

IN attacking the position of California, the representatives of Arizona contend that the idea of raising water 1,500 feet and using, as they assert, several hundred thousand horsepower to do so, so that the water may be carried by canal to Los Angeles and to other California cities, is preposterous. They say that California has watersheds of her own, which can be tapped for her cities. They assert that if the water stored at the Boulder Canyon is used for power, there will have to be a continuous flow so great that it will give to Mexico, to which the overflow will go, far more than it has at present, while at the same time it will deprive Arizona of this water. Why, they ask, should California dominate the situation and get the use of three-fourths of the water stored, when none of the water of the river comes from her watersheds? Finally, they say that they are willing to enter into a compromise with California, distributing the amount allotted to the three states in the southern basin, giving Nevada all she has asked for and dividing the remainder on a fifty-fifty basis between California and Arizona. This, they state, is as far as they will go and unless the other states meet *(Continued on page 27)*

CORA RUBIN, CLERK

United States Senate
COMMITTEE ON FOREIGN RELATIONS

June 17, 1927.

F. Hunter Creech,
#623 Munsey Building,
Washington, D.C.

My dear Mr. Creech:

I trust you will pardon the delay in answering your letter of June 10th. But the situation has been such that it has been rather difficult to attend to my correspondence.

On January 22, 1927, I sent a telegram to the President of Mexico and on January 24, 1927, he replied, as per copies enclosed.

It will be observed that I asked for a statement of facts and that he in reply gave the facts. It was in violation of no law or no rule of propriety. As a Member of the Senate, a body which is always vitally interested in foreign matters, and as Chairman of the Committee on Foreign Relations, I claim the right, and shall exercise the right at all times, to acquire information touching matters of vital concern in our foreign affairs through any channel I may choose to use. I look upon the matter of acquiring information as wholly separate and apart from that of undertaking to negotiate.

I am thoroughly convinced it was not the communication which disturbed certain people, but the information which the communication brought forth,-which information was in direct conflict with the vast amount of propaganda being put out in this country for the sole purpose of estranging the relationship between this country and Mexico.

You are at liberty to make such use of this as you may choose.

Very sincerely,

Wm E Borah

A READER of our 'Can You Tell Me?' page inquired as to what senator had written to an official of a foreign government asking that official for information. Further, if such senator had violated any law in so doing, or should he have requested the information through the State Department? Senator Borah being the senator involved, our Washington representative addressed a letter to him requesting information concerning the matter. We feel the senator's cablegram and the reply are sufficiently interesting and important to pass on to our readers.

January 22, 1927.
'To the President of Mexico.
Mexico City, Mexico.

If agreeable may I be advised as to the exact facts relative to oil companies accepting the new petroleum law? How many have accepted and how many have not yet accepted? I would like also to be advised the names of the more important companies which have not accepted.

WM. E. BORAH.'

Mexico, Jan. 24
'Mr. Wm. E. Borah,
Washington, D. C.

I reply with pleasure to your message of the day before yesterday, submitting the following data: The companies which have accepted the petroleum law are 380. The companies which have not accepted the petroleum law are only 22, and of these the most important are the following: "Standard of Indiana," Huasteca Petroleum, Mexican, Tuxpam Petroleum, Tamiahua Petroleum, Doheny and Bridge. "Sinclair" Mexican Sinclair. "Standard" Atlantic, Cortez Aguada, Mexican Crude, Capuchinas, Panuco Boston. "Gulf Coast" Mexican Gulf, American International. The companies of Doheny and Bridge, Atlantic, Capuchinas and Mexican Crude are Mexican companies organized in Mexico under the control of the constitution of 1917. Of the 380 companies which have accepted the petroleum law, I can quote to you as the most important, the following: Compañia de Terrenos "Imperio," Gulf Coast Co., Southern Fuel and Refining Co., Compañia Mexicana de Petroleo "El Aguila," Compañia Mexicana Holandesa "La Corona," Compañia Unida de Petroleo S. A., P. J. Gujker S. E. N. C., International Petroleum Co., Compañia de Inversiones Petroliferas, Jones and Co., Compañia "Franco Española" S. A., East Coast Oil Co., "La Espuela" Oil Company, The Texas Co. of Mexico, S. A., New England Fuel Oil Co., of Mexico, S. A., New England Fuel Oil Co., Penn. Mex. Fuel Oil Co., Continental Mex. Pet. Co., Compañia Mexicana de Combustible. These 380 companies have solicited on the whole 643 petroleum concessions on lands with claims previous to May 1, 1917, when the present constitution came into effect in accordance with the provisions of the petroleum law. These concessions embrace a total of 26,835,000 acres. The lands with claims prior to May 1, 1917, which the 22 companies possess who did not comply with the petroleum law embrace a total extent of 1,661,000 acres. Consequently the lands which have not complied with the petroleum law represent approximately six per cent of the total area of land on which claims exist prior to May 1, 1917. I will send you by mail fuller and more detailed information. I am pleased at the interest which you are taking in this matter and God grant that the data submitted to you may be of use.

Affectionately,
PRESIDENT CALLES.'

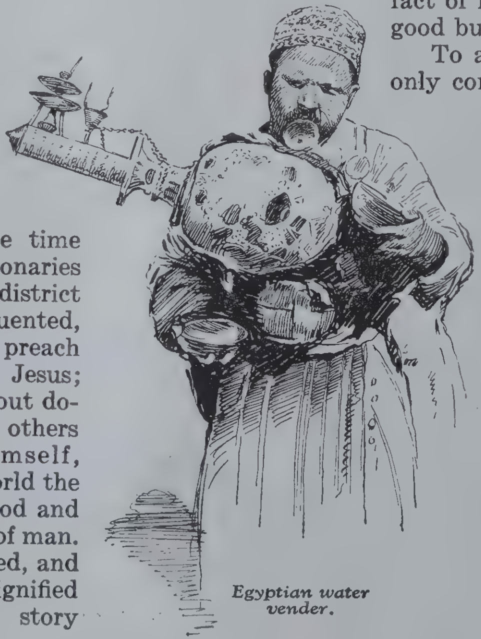
The OTHER FELLOW

By A. M. SPOER

A STORY is told that some missionaries had among them a native teacher who did not give them satisfaction. They did not question his honesty or good intentions but he committed indiscretions which were a bad example to the people among whom he worked. He could not always give account of money intrusted to him for charitable purposes; he parted with it on impulse, often in such ways as he thought would do most good; he would fail to return, when expected, from a journey, remaining to nurse the sick, or comfort the sorrowful, instead of acting in obedience to his instructions. He was considered disorderly and inexact, was dismissed, and disappeared. Some time later the missionaries went into a district hitherto unfrequented, and began to preach about the life of Jesus; how He went about doing good, loved others better than Himself, showed to the world the Fatherhood of God and the brotherhood of man. The hearers smiled, and nodded, and signified that the whole story was familiar. 'It is all true,' they said; 'who should know if not we? He lives among us, we all love Him.' And they fetched the dismissed teacher.



Egyptian water vender.

How many comments might be made! Truth is personal to the mind that thinks it. To one race or time one particular truth has more value than to another race or time. What to one man is the greatest thing in the world, to another is a secondary matter, while the truth which, to him, is the saving fact of life, appears to another good but not supreme.

To acknowledge this is the only condition upon which we can enter into the lives of those who differ from ourselves, particularly in the Near East, where many things look to us morally, as well as physically, upside down. The Semitic people begin to read a book at the end; they write from right to left; they put carpets on the walls and pictures on the ceilings; the men, rather than the women, perform religious duties, and, in the villages, you recognize a man by his petticoats and a woman by her trousers.

'But,' we say, 'these are matters of custom. Matters of principle are the same the world over.' We consider perhaps that the Oriental has little regard for truth. A servant who leaves you to better himself will tell you with tears in his eyes that he is grieved to leave you but he is needed at home. We are shocked when we discover his deceit, as much shocked as he would be to appear inconsiderate or ungrateful. He puts one virtue to the front, we another, and we both consider ourselves in the right.

I have even heard it argued that to tell a lie injures only oneself; to say what is unkind injures another. The Koran lays great stress upon kindness and pleasant manners. The Koran, Turk, or Arab, will give you a pleasant answer even if it be after the manner of the courtier who, on being asked about the weather, replied, 'It is whatever weather your majesty pleases.'

A certain John Antes, a Moravian, wrote a book in 1800 which showed more intelligence and honesty than those of many travelers. 'I frequently observed,' he says, 'that travelers, even such as had otherwise all the advantages of learning, gathered their materials not only to satisfy their own curiosity but to compile a narrative for sale. I have myself often advised them not to note down all they heard from unqualified persons, knowing, by my own experience, that the Arabs will never leave you without an answer, though they do not know or care if there be any truth in it.' This, of course, is showing the worst side of the picture, but it is certainly true that the Oriental is seldom at a loss. He, like the Chinaman, is an expert in 'saving his face.'

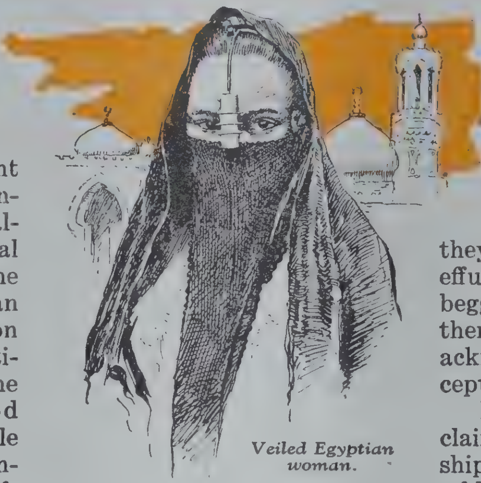
I once left a luminous matchbox in my room and happened to overhear the exclamations of two maids who came upon it in the dark. The younger screamed '*Yammer Yammer*,' that is, '*Ya Ummi*' (O my mother!), and ran away. The elder retired discreetly and fetched a light, and then I heard her expressing perplexity as to what had become of 'the devil with the square white eye.' I showed her the box, and explained the matter as best I could. Later, the younger girl refused to go upstairs to face the *shaitan* (devil), upon which the elder observed contemptuously, 'It is nothing but a tin box. All day long it eats the sun, and at night it spits it out!'

I asked an Egyptian why the sun should be feminine and the moon masculine in Arabic, when, with us, the reverse is the case. 'In my country,' he answered with some disdain, 'we should not think of allowing a lady to go out alone at night!'

Shopping crowds on a street in Cairo. —*Ewing Galloway Photo.*

A Christian visitor to Jerusalem once observed to me that in view of the great variety of Christian sects gathered in the Holy City we ought to use the Litany daily, so as to pray against 'false doctrine, heresy and schism.' Knowing the place, and indeed the Christians of the Levant in general, better than she did, I suggested that the more important suffrage was that against 'evil-speaking, lying and slandering.'

I once had occasion to apologize to a Moslem gentleman of high rank who had been obliged to listen, in my drawing-room, to the conversation of two ladies who were destroying the reputation of a third. 'Pray do not suppose,' I said, 'that it is because they are Christians that they talk in this way; it is because they are vulgar and ill-bred.' With true oriental politeness he assured me that he did not criticize them. 'Every country has its own customs,' he said. 'We do not do that because our religion condemns it.' I was too much humiliated to dare to quote the Golden Rule.



Veiled Egyptian woman.

The question of difference in the point of view should be considered when it is alleged that the Oriental is not grateful. The teaching of the Koran is very definite upon the subject of gratitude toward God, the Giver of all good things, but the people think that they are entitled to the good offices of their fellow creatures, but have no claim upon the mercy of God.

The Egyptian traveler Lane tells that he once gave shelter to a Bedu—a man of the desert—who was in fear of his life, and who on parting uttered no word of thanks. 'Had he done so it would have implied that he thought me a person of mean disposition who regarded a positive duty as an act imposing obligation.' Hence the Arabs usually acknowledge a benefit merely by a prayer for the life, or the posterity, of the benefactor. It is only the beggar, they say, who thanks effusively. He has begged for a favor and therefore is bound to acknowledge its reception.

Every man has a claim upon the friendship of another. One seldom receives a request direct from the would-be recipient. A third person pleads his cause. 'He is my friend,' he will say. Not an old friend, nor a dear friend, but simply 'my friend.' If one thanks for favors one is answered, 'It is my duty.' We have often received important kindnesses even from strangers, with no other claim than that.

The question of honesty, which seems to us so simple a matter—'Thou shalt not steal'—has also its complications. The men of the desert will risk their lives to steal, but they will never contravene the law of the wilderness. If a wayfarer's camel should sink and die beneath his burden, the owner will draw a circle round the animal, in the sand, and follow the caravan. No Arab, Syrian nor Egyptian will presume to touch the lading however tempting.

When Britain was at war in Egypt with Mehemet Ali, he forwarded the British mails to India with the utmost fidelity, a standard of civilization from which we have fallen away widely in these latter

LITTLE ESSAYS *From a* NORTHERN COTTAGE

The NOVELIST *and His Friend the* CRITIC

By HUGH WALPOLE

NEXT year will be the twentieth since the publication of my first novel and, sitting here in this marvellous tranquillity, watching the wind lift the surface of the lake as though with inquisitive fingers and then with caressing hand straighten it all out into blue glassiness again, I start wondering about that old, old business, never to be settled so long as this life lasts, the relation of creator and critic.

In my twenty years' experience how much of the criticism that I have received has helped me to better creation or how much has angered and embittered me? And then, looking out beyond my own little experience, has English criticism during these twenty years been on the whole a fine and inspiring affair? And then beyond that once more is criticism today creative at all, is it tending, as a friend of mine insisted the other day, more and more to become simply the bell-ringing town crier, is real creative criticism in these days harder and harder to find?

SOME paper had a symposium the other day asking writers to give honestly their opinion as to the use that criticism had been to them in their careers and, with one voice loudly lifted, the writers declared that it had been of no use to them at all. I have talked to many fine writers in my time and to one or two great ones and, without any exception, they have expressed themselves as contemptuous of criticism, and this, I am sure, not through cowardice nor jealousy nor natural human impatience at being rebuked nor from any great conceit. The better the writer the more modest he is, in the real sense of the word. Arnold Bennett, for instance, has a reputation, I believe, for cocksureness and self-assertiveness; speak to him about the colour of a waistcoat or the work of a modern French painter and he is as arrogant as you please; let the most Arcadian young idiot criticise to him *The Old Wives' Tale* and he will listen with charming patience and perfect courtesy.

No, writers who have a long career behind them are not conceited, they know too much and have suffered too deeply the eternal disappointments of the elusive dream; it is not from conceit that they disregard criticism; it is rather from their own knowledge of their own impulse of creation. Be they small artists or great, successful or unsuccessful in the worldly sense, they are aware that they are in contact with something most profoundly private and secret. They may drag out from this private store treasure so slight and insignificant as absolutely to justify the critic's scorn but it is not their own little prize that keeps them remote but rather their personal contact with something greater and richer by far than they can themselves display.

And to this the critic answers quite naturally: What business have I with your private experience? My function is to test your public production, to apply to that certain tests that I have found to be worthy ones; I am concerned neither with your private life nor with your secret hopes; I am one of the policemen of the arts helping to direct the ignorant mob.

And to this the creator in his turn replies: Very good; I acknowledge your function, I will agree also that at its finest your art is as creative as mine, only your policeman's outstretched hand is not for me, I must obey another commander. Here we arrive, I fancy, at the roots of the quarrel between the two; the critic develops—he must develop if he is going to be any good at his job—a critical mind; he has trained himself to apply these works that come before him to the tests that he has found to be adequate; his critical mind, even when it is at its very freshest, is naturally more concerned with the rules that he is applying than with the work that he is judging. At least this is so unless some personal enthusiasm for the work is so strong that he allows this critical apartness to be invaded by the warm blood of enthusiasm; it is then that he has his best times although it is not then, as a rule, that he produces his best judgments, but it is almost always then that he achieves his best creative work.

One must also sadly admit that, on the other hand, being only human, he is invaded sometimes by his personal piques and prejudices. I remember once, when I was very young and had more critical work to do than was suited to my tender years, meeting a well-known novelist at a tea party and thinking, because his countenance did not light up with pleasure at being in my company, that I had been neglected, and for several years afterwards I reviewed his novels, I am afraid, with chilly scorn. I thought that I was being just; I prided myself, I remember, on my critical honesty.

The critic in fact has to meet a thousand dangers and it is not astonishing that he falls before some of them. Most difficult of all to discipline is the personal preference or distaste, something that comes from I know not where, something that is part of one's very heart and lungs. Why is it, for example, if I may make this personal for a moment, that the novels of Edith Wharton are to me false, artificial and hard (always with the exception of *Ethen Frome*), while the stories of Virginia Woolf are a perfect glory and delight? In abstract criticism I know that the books of Mrs. Wharton have many virtues; I recognize their adroitness and technical slickness, their ironic view and sharp sophisticated dialogue, but I am sure that I should be acting falsely were I to consent to review one of her books; there is something in me too personally prejudiced here to permit fair criticism.

THE other great danger that confronts the critic, especially today, is that he has so much to do. How can he consider book after book, day after day, and retain any kind of freshness? It is insisted too more and more today that his criticism shall have the personality of news.

In England at least books are increasingly noticed not because they have this or that critical value but because they are news, just as the swimming of the Channel or the flying of the Atlantic or the discovery of a dismembered corpse in a trunk at a railway station is news. Within the last few months how many papers in England, whether daily, weekly or monthly, have given adequate consideration to that beautiful work of art, Virginia Woolf's *To the Lighthouse?* I have myself seen only two comments in any way adequate, one in *'The Times* Literary Supplement,' the other in *The Spectator.* How many papers last autumn recognized in Vita Sackville-West's poem, 'The Land,' how fine and noble a thing it was?

This is perhaps inevitable; we may even require that books shall be on the way to become news just as murder and adultery are, but it is making the case for the critic ever more difficult. The creator, if he has

Your Mirrors of the World

By **EARL C. REEVES**

SEVERAL years ago a young man employed by a press association was walking along a street in lower New York. He noticed smoke pouring from the windows of a building. There were calls of 'fire.'

Almost instantly, it seemed, flames were visible; tiny wisps at first, and soon great billows of fire. The clang and clatter of fire apparatus and the shrieks of girls mingled in indescribable pandemonium. White-faced figures cowered on window ledges, an inferno behind and hard pavements below. One jumped. Then another.

By this time the young man was standing at a telephone, fortunately placed in the window of a corner drug store within full view of the burning building, and was dictating the story of one of the great fires of history.

Callous to what was happening? Not at all. His story showed he was not. There was no heroic deed he could perform: this was his job and he was doing it, and doing it well. Maddened by the heat, other girls jumped to instant death. The reporter counted and observed; and dictated to his office and almost directly into hundreds of newspaper offices, the moving story of the Shirtwaist Fire—the fire that did more than anything else in history to wipe the fire traps out of our cities.

Harry Thaw escaped into Canada. Canada decided it would not have him, so in the darkness of early morning it bundled him into a car, raced him across the border and deposited him on the soil of his native land. Thaw was 'big news,' but it happened that only one correspondent was in on the deportation proceedings. He sent what is known as a 'Flash'—a bare announcement of the fact in the fewest possible words—and thereafter was so busy being 'with' the deportee that he gave his office no further details for hours. With a map in front of him and a telephone at hand an executive of a competing association literally combed northern New England, and finally found that a village constable had arrested Thaw at a New Hampshire crossroads town. The officer came to the phone, told his story; it was written and became a classic beat. The man who scored the beat was in New York; the man who was beaten was at Thaw's elbow, near the Canadian border.

During the war an American press association correspondent in London worked for weeks trying to get an interview with Admiral Sims. He suggested certain things which the admiral might talk about in an interview. After many conferences with aides, the correspondent was told that probably the admiral would authorize the interview. It was suggested that the correspondent write and submit it; then later see the admiral and work it over if necessary. The correspondent wrote and submitted the tentative draft, and waited for a promised call from the admiral's aide.

A few days later this correspondent's boss, the chief London correspondent for the association, learned with amazement that Admiral Sims had talked for publication at a 'conference' of American correspondents, and no invitation or notification had come to his office. Investigation proved Sims had liked the prepared interview so well that he decided to give it out to everybody; whereupon the correspondents were notified by telephone—but the young officer who did the phoning *forgot to notify the man who had written what the admiral was going to say.* Accident—but what an accident!

Decoration by
GERALD VAN DER HEYDEN.

As the Chinese cook remarked in one of Harry Leon Wilson's stories, 'Can happen.' Such things as this not only can, but do happen with some frequency in the press association business. It is a business containing a very wide element of chance, for the world is big and a great deal of its most interesting news rather carelessly refuses to 'happen' where it can be covered handily. But these things are cited more for their contrast than as being typical of the day's work of the news agency.

The press association has nothing to sell except teamwork and skill—a system of coöperation and personal services. It follows that the question of personnel, or staff, is very important. The Associated Press has had by far the most perfect organization, built up on many decades of precedents, copper-riveted with 'general orders' and safeguarded with rules and regulations; its aim is to prevent mistakes and insure machine-like precision in meeting the news delivery tasks of any given day. Under Melville Stone, who did so much to develop the A. P., all key positions and many minor jobs were filled by mature men, schooled in A. P. ways—safe, sane, but not always fast or brilliant, and often sluggish in meeting an unprecedented situation. Under his successor, and in the face of opposite tactics by competitors, the staff of the A. P. has been speeded up a great deal in later years by the use of younger men.

CAPITALIZING youthful enthusiasm was the formula of the late Scripps, millionaire publisher who owned the United Press; and Roy Howard, when he became head of the organization, intensified it, if anything. Himself so youthful in appearance that on one occasion when he was in a national convention city at the head of his staff, a bartender asked whether he was of age before serving a drink, Howard hired very young men, at very low salaries, and used them *thoroughly.* One man should not remain in one job as long as six months, else he might go stale; so United Press young men (some old enough to vote and some not) moved about the country, not only fresh but verdant, and giving each new job a sound licking by way of proving that they were on their way to the two or three top jobs.

Howard has a good many unfriendly ex-employes because this system was a terrific drain upon youthful energies; but he drove himself as hard as anybody else, and members of his alumni association can thank him for very sound training.

Quite a large chapter of this alumni association is to be found within the International News Service organization, owned by William Randolph Hearst.

IN THE New York office of each association are wall maps which picture the wire organization of the association. Heavy lines streaking across the country from one key city to another represent trunk lines of leased wire—in many instances double wires as there are double-track railways. Heavy black dots represent bureau cities, or cities in which the press association maintains its own staff men; and these may vary in

(Continued on page 20)

Thomas Lake Harris, Mystic and Grape Grower

By ARTHUR HUGHES

One of Thomas Lake Harris' favorite photographs of himself.

THOMAS Lake Harris was once called by the late William T. Stead 'the greatest seer of the modern world.'

He had been dead twenty years, and at least two books about him have been written and published in England since his death. While he was alive, the world seemed to pay no attention to him, though he wrote and published forty books and perhaps five hundred hymns. But he made no effort whatever to circulate what he had written, declaring that when the world was ready it would find and read what he had put on paper.

Thomas Lake Harris was born in England in 1823 and died in New York in 1906. That he died at all was a great surprise to him and his followers. He and they believed he had evolved to the point where he could pass over to the spirit world without undergoing death. Harris came to America at the age of five and thereafter made this country his home. His mother died while he was still a child.

Harris' boyhood was unhappy. He left home at the age of nine and thereafter supported himself, working during the day and studying at night. At the age of twenty-one, he became a Universalist preacher in New York.

NO CREED long satisfied him. As often as he became dissatisfied, he changed to another. When he was twenty-four years old he became the minister of what was then known in New York as the Independent Christian Congregation. While he was preaching he was also studying spiritualism under Andrew Jackson Davis, some of which impressed him as being good and some as dangerous. Also, he studied Swedenborg. He did not know what he was doing, but he was preparing himself to evolve a creed of his own, which he later did. This creed, which he called the 'Brotherhood of the New Life,' was thoroughly Christian in its basis, yet heavily tinctured with the occult philosophy of India, Chaldea, Egypt, Persia and elsewhere.

Early in his career he bought a mountain farm near Wassaic, in Dutchess County, New York, about seventy-five miles north of the great city and twenty miles or so east of the Hudson. Harris' idea was to make a home for himself and a few disciples who wished to form the Brotherhood of the New Life. The mountain farm was to enable him to experiment in the culture of wine grapes. Harris wanted to produce wine because he had a theory that the worker, quite unconsciously, put whatever was in his heart into the product of his hands and thus communicated his state of mind and spirit to the consumers of his product. He believed the sweatshop worker's misery was first put into the clothing he made and by the clothing transferred to the wearer of it. Also, he believed that the joy and the goodness of the worker were thus communicated to his customers. So Harris and his disciples, filled with the desire to know God and do His bidding, determined to make wine in order that what was in their hearts might be put into something that was destined to enter the very blood streams of human beings.

The country around the east bank of the Hudson proved too cold and was otherwise unsuited for grape culture. Harris sold out and settled at Brocton, New York, near the shore of Lake Erie about fifty miles west of Buffalo. After two or three years in Brocton, the colonists, forty in number, moved on to California where, on the hills a mile north of Santa Rosa, Harris found just the conditions that he wanted for the culture of wine grapes. He had some money of his own and also the proceeds of the eastern experiment which belonged to the colonists. Everything was invested in the Santa Rosa venture. Most of the land he bought for $50 an acre. For a little he paid $100 an acre. None of it could now be bought for less than $500 an acre. Much of it would bring $1,000. Harris bought 2,000 acres, built a fine house that is still standing, set out a grove of splendid eucalyptus trees that are now grown great, utilized a mountain spring to create two fountains near the house, named the place 'Fountain Grove' and began setting out grapevines. That was in 1874. In 1891 he left for New York to spend the remainder of his life.

HARRIS believed that the earth would eventually be purified and again made orderly and innocent by the destruction of the evil and the unfit. He divided man into three classes: The selfish, the unfit who comprise the great bulk of the human race, and the altruists who live to serve others and suffer accordingly. He said the crisis might be sudden and catastrophic or that it might be spread over a period of years during which the evil and the useless would gradually be eliminated.

Fountain Grove, a 2,000-acre estate, is the home of Harris' adopted son, the Japanese Kanaye Nagasawa. Mix these words up in your mind and you have the picture: California, sunshine, indigo sky, balmy air, 400 acres of grapevines, green hillsides, a moderately large white house surrounded by towering eucalyptus trees, and, away below, the broad, flat floor of Sonoma valley, with the little city of Santa Rosa, a mile or two distant, apparently sleeping in the sunshine.

It was here that Harris and his little band of religious disciples, chief of whom was Nagasawa, gathered fifty years ago, when what is now a million-dollar vineyard was wild land. It was in this house that Harris' sleeping body lay when his soul—so he said—went to other planets to get information. It was at Fountain Grove that Harris said Jesus appeared to him, many times. It was here that forty young disciples lived until they became old disciples—and all but three, dead disciples. Nagasawa and two others are the sole survivors, and he is the only one who still lives at Fountain Grove.

A MAN once deeply wronged Harris and friends urged him to prosecute him for slander. He refused, declaring that God's will on earth would not be hastened by an appeal to the courts. Nagasawa's spirit is the same. He was born a Samurai—a fighting man—but the spirit of Harris calmed the gales that swept his soul. They seldom blow any more, but when they do, he holds them.

Early one morning, he telephoned to George F. King, his lifelong friend and business adviser in Santa Rosa, asking him to come up to Fountain Grove. When King entered the house, Nagasawa was sitting in his library, his face almost black with a rush of blood that betokened suppressed rage. To King's greeting, Nagasawa made no reply except to toss over a telegram that represented somebody's attempt to impose a dishonest business arrangement upon him. King gave whatever advice he had to offer, but Nagasawa said nothing—and stayed black. Nagasawa's silence finally got on King's nerves and he asked him if he would not go with him for an automobile ride. Nagasawa shook his head.

'Oh, Kanaye,' said King, 'you do not mean to say that you will not go for a ride with me?'

That brought Nagasawa to—restored his equilibrium. He would go. They went. In a little while, Nagasawa began to talk. The gales had been put down. By the time they got back to the house he had forgotten the whole matter and was himself again. The Samurai of sixty years ago had surrendered to the spirit that Harris put into him.

I saw a flash of that old spirit one day when Nagasawa showed me a sword, 700 years old, that friends in Japan had given to him. It came out in the way he withdrew the glistening blade from its scabbard. He withdrew it with a quick, vigorous movement as he might have done if he were about to decapitate somebody. It was only a little thing, but it showed a momentary awakening of the old spirit that had slumbered so long. Nobody else would have unsheathed the sword as he unsheathed it. Anybody else would have withdrawn it slowly, gingerly.

Nagasawa was never married. I never asked him whether he has a divine counterpart, a dual feminine soul that lives within him, but I take it that he has. As the master and owner of Fountain Grove, he has property that is worth a million dollars—a little kingdom flung down upon some hills and valleys—400 acres of grapes, 50 acres of fruit trees, 175 acres of agricultural land and the rest of the 2,000 acres devoted to grazing. The place exists because Nagasawa exists. To make it thrive he studied for years to become expert in viniculture, horticulture, floriculture, domestic science, poultry and stock-raising. Twice, when insect pests got at his grapes, he tore up the entire 400 acres of vines and set out new ones. In addition, he set the type, printed and bound all of Harris' books, which ran into the scores. The work was well done. I never found even so much as a typographical error in any of them.

Nagasawa at the age of 34 years, when he first returned to Japan for a visit.

The house built by Harris and occupied later by Nagasawa, who stands third from the right in the group.

I ASKED Nagasawa where he learned to set type. 'Here,' he said. One may still see the old blacksmith shop in which Edwin Markham, the poet, worked for a little while, when he lived at Fountain Grove, forty years ago. Markham, so I was told, was once a disciple, though he did not remain long at the Grove. Nagasawa told me, however, that Markham still believes in Harris' teachings and is engaged in the preparation for publication of a new edition of Harris' works, with some observations of his own with regard to the philosophy of the great mystic.

Harris left Fountain Grove for the last time in 1891, intending to do the remainder of his work in England, though as a matter of fact, he shortly returned to New York where he remained until his

(Continued on page 23)

MR. FORD'S PAGE

OF THE DEARBORN INDEPENDENT

Where Credit Is Due

THE person who is overanxious about getting credit for what he does is not an impressive person, to say the least. But he may not be entirely blamable either. He may be the product of that false philosophy of life which teaches that a man is successful only in so far as he gets credit for being so; and believing that, he may perhaps also have the experience of credit unjustly withheld from him, and so he grows overanxious. The sense of personal injustice is one of the most painful burdens a man can bear about with him.

The desire for recognition is natural. But it is far from being the highest desire. The real workman knows that his work is his unanswerable witness. Far higher than the desire for recognition is the creative desire, which finds its satisfaction in work well done whether anyone sees that it is well done or not.

Just where to draw the line between a laudable desire for recognition and an overweening thirst for credit is not easy to do; the one is normal and the other is abnormal. But we should say that the line of demarcation exists somewhere in the individual's attitude toward the work he is doing. If his inclination is to do his work well whether he foresees special credit or not; that is, if he has a pride in his work quite apart from its possible relation to other men's opinions, then it would be probably safe to say that his desire for recognition would be normal.

> *DOING a job well for its own sake is better than doing it for the credit one may get out of it. A good workman is soon recognized and does not have to hang out signals to attract attention and admiration for his work. One who is overanxious about getting credit for what he does generally fails to make an impression. It is his personal advancement which is uppermost in his mind and not the performance of better service. A laudable desire for recognition may be very well, but it must not take the place of efficiency. To make the work secondary and the recognition primary is unfair to the work.*

But if his work means no more to him than a token with which to attract attention, if when without any hope of recognition for the particular job on which he is engaged, he slurs it over and neglects it, then it is apparent that his desire for recognition is not born of high workmanly pride, but of selfish personal interest of a rather small caliber.

There is far too much work produced for all of it to be accurately judged, but a good workman is always seen and recognized. All the carefulness, dependability, honest pride and power he builds into his work is somehow built back into himself. It is a matter of character then, not merely of articles of manufacture.

If men were certain that their livelihood and respect as members of society were assured from the beginning, we should have a sounder foundation on which to appeal to them to make their advancement within the limits of their work.

The matter of personal advancement is one that is not considered as carefully as it ought to be; and much of the misconception concerning a man's credit for his work grows out of the kind of idea of advancement which he may hold. It may not mean to him becoming a better workman at what he is doing; it may mean becoming a workman at something else, at a higher rate of pay, and with a greater degree of respect attaching to his rank. It may mean the kind of advancement which brings more of the comforts of life and the desirable opportunities which it would give to his family.

A number of men do not consider their work alone, they are also considering the methods—fair and unfair—by which they may attract attention, win favor and gain advancement. If men felt that their livelihood and respect as members of society were assured from the beginning, there would be a sounder foundation on which to appeal to them to make their advancement within the limits of their work.

It is most unfortunate when a man is under the influence of the idea that to catch somebody's eye, to attract admiring attention, to get full credit for what he does, is the one element which he must not omit from any effort he may make; that to do a piece of work and get no credit for it is little less than a calamity.

One result of this, as far as the work itself is concerned, is that it becomes a secondary consideration. The job a man is doing, the article he is producing, the special kind of service he is rendering, turns out to be not his principal work at all. His main task is to bring about his personal advancement. The thing he is doing is not being done for its own sake, the service he is doing is not being done because it is a service, but because it is a platform from which he may practise the art of catching somebody's eye, the art of attracting credit-bringing attention to himself.

This habit of making the work secondary and the recognition primary is unfair to the work. It makes recognition and credit the real job, while the job which a man is paid to do is used merely as a kicking-off place.

If a man's advancement were to depend upon his good fortune in catching some individual's eye, one could readily foresee what it would lead to. Men would work with the idea that if they failed to get credit for what they did, they might as well have done it badly or not to have done it at all. This is a most unfortunate misconception, for by doing well the thing for which he knows he may get no credit, a man is doing something which will never be lost to him—he is building certain qualities which cannot be hidden.

Safeguarding Peace

WAR will never be stopped by the pacifists and peace will never be won by the war makers. Both are products of the same disease that is seeing its last phase in human society. As long as there exists on earth the warring type of mind, and it has the instruments to execute its purpose, war is possible. But, as was shown in the last war, the military strength of the peaceable, the non-war-making nations, is greater than those of the war-making nations. And, strange as it may seem, that strength has increased.

One sign that the world is growing better is that the non-war-making nations are strong enough to curb the war-making nations. War, as a method of accomplishing anything, is now resisted and in the future will be more and more resisted, until even the war-making mind will learn the futility of it.

That is the fallacy of disarming the non-war-making nations. Can you imagine the United States starting a war? Can you imagine the United States refusing to crush a war started against it? With these two views, can you imagine anyone starting a war against the United States?

It is not our well-known inclination to peace that guards us, it is our well-known disinclination to stand for anyone disturbing our peace.

The Job of Not Growing Old

THEY say I am too old to work.'

These were the words of a man who told his story recently in a newspaper office. It was a story of slipping backward through the years until he became a messenger boy. And then, nothing. He wanted but seven dollars a week: he could live on that.

And this man was but fifty-seven.

In a hospital, about the same time, doctors and nurses gave a birthday party. There were flowers and books and fruit and candy; and a cake that was topped by twenty-five candles. Everybody at the party joked about that. It was all the candles the cake would hold.

The number was an odd circumstance, coupled with the case of the man mentioned above. When the birthday guest of honor was twenty-five the other man had not yet been born.

The smiling man on the cot was eighty-four. Weeks before he had arrived, alone, from his home, six hundred miles away. With an interval of rest he had had two operations, the second rather serious; and here he was, chipper and contented, reading novels voraciously and writing several letters a day to his wife, children or grandchildren.

After a time he got up out of bed, jollied his nurses, and strolled off home.

And there you have one of the big jobs the human race has set itself.

It is the job of not growing old.

We have come a long way already, and not all our progress has been due merely to the cold science of diet, exercise, ventilation and sanitation.

In the two cases mentioned above the difference was very largely a state of mind: the faces of the two men show it, as well as their histories.

These Reckless Drivers

A HIGHWAY engineer was talking. He pointed to a map showing an acute curve in a roadway which dived blindly through a cut through a railway embankment.

'We rebuilt that road in such a manner that the thousands of cars which travel it on a big football day could be moved around what had been known as "Dead Man's Curve" at thirty miles an hour.'

He thought in terms of getting traffic moved. To him thirty miles an hour on that curve was safe when he had rebuilt it so that it was 'blind' at no point.

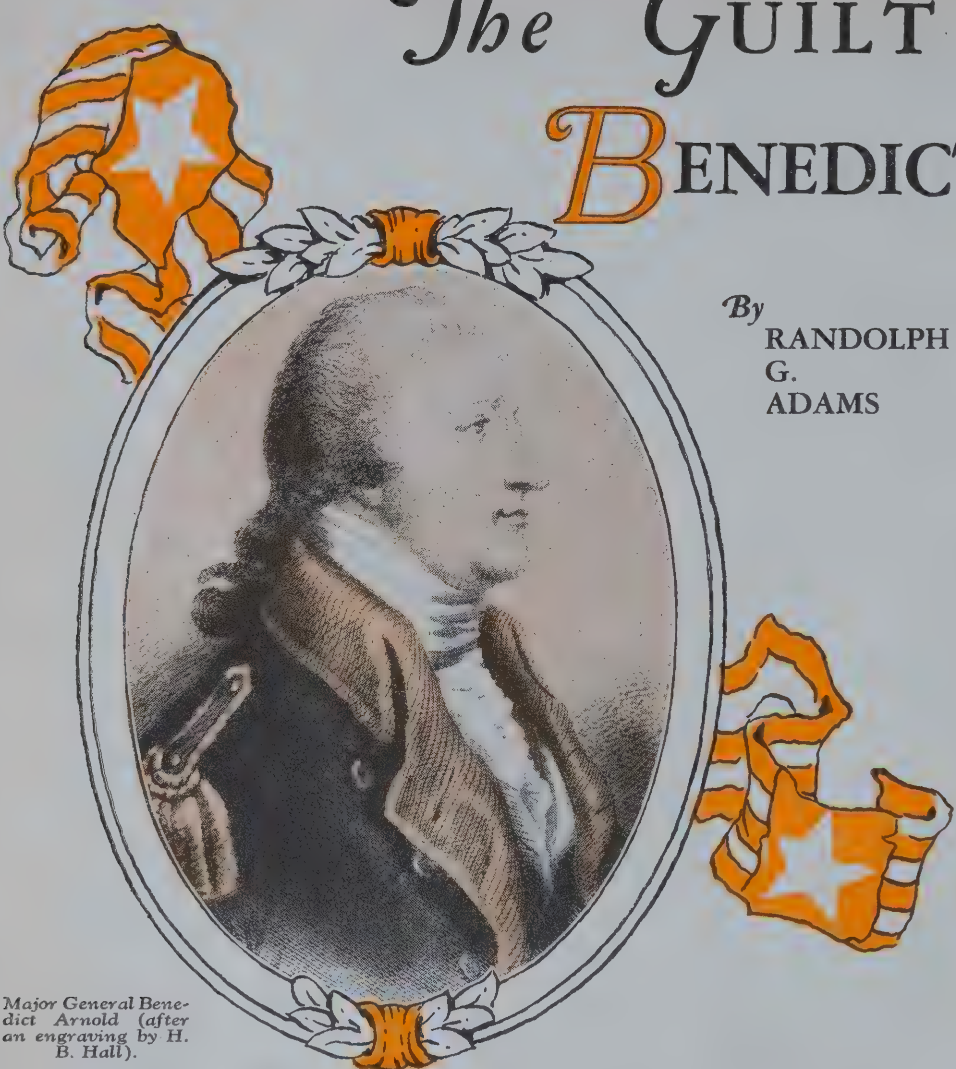
This is a lesson worthy of study. Town and county fathers have come to have a great faith in regulation, signal systems and heavy policing expenditures.

In many instances one good whack at a horse and buggy curve still doing duty in a motor age would add years to the expectation of life of members of the community. But sizzling motorcycle policemen, whose mere appearance on a road will slow motorists from a legal thirty to a twenty-mile gait that is no more legal and no safer, are considered to be infinitely more important.

No sane person holds a brief for reckless speeding; but the most experienced drivers will tell you that fast driving is not the only menace on the highway today. There is the very 'safe' driver who turns suddenly without signaling to the car behind. Then there is the meandering individual who signals a turn to the left, swings the car to the left, then turns to the right. Also the timid soul who has never yet driven faster than twenty miles an hour and who eases around curves at fifteen—on the wrong side of the road. If these could be taught that the road is there to move traffic and that nowadays the driver need think like a railroader!

The GUILT of BENEDICT ARNOLD

By
RANDOLPH
G.
ADAMS



Major General Benedict Arnold (after an engraving by H. B. Hall).

WHY did he do it? Why did the bravest and most dashing general of the American Army in the Revolution suddenly turn traitor, sell out to the enemy, attempt to betray his post, flee to the British lines and accept a commission under George III? What can be said in explanation of his action, what ought to be said, not merely to soften the judgment of history upon Arnold, but to make clear what the world is constantly doing to make more Arnolds.

In the numerous biographies of the traitor there has been placed considerable emphasis upon the high moral and religious character of his mother and upon the fact that he was brought up in a thoroughly Christian and thoroughly respectable atmosphere. Historians and biographers alike have asked the question, 'How could such a mother have such a son?' Yet it is probably in this very fact that we find the beginnings of the evil which wrecked a great career and all but lost the American Revolution.

If there is one thing that our Puritan forefathers have quite frankly said about themselves, it is that they often overdid religion. This is to be seen in New England itself. Both Rhode Island and Connecticut were founded by brave and intelligent men and women who simply could not tolerate the extreme and narrow piety of Massachusetts. The kind of courageous, self-reliant and adventurous man who has done the most to advance civilization has all too often had to fight against the efforts of society to keep him from doing the very things the world needs to have done. Benedict Arnold's mother wrote to her son about his 'precious soul.' One can imagine the kind of violent rebellion such a thing created in such a boy.

When Arnold was fifteen he ran away and joined the Colonial troops preparing for the French and Indian War. At the intercession of his mother, he was discharged and brought back. Posterity has thought of the fortunate Mrs. Arnold who thus saved her boy from death on the field of battle. Should we not think of the high-spirited boy, who has outgrown his mother's apron strings, yet who is humiliated beyond words by being caught and brought back home, like a small child who has been surprised with a jam pot? Might it not have been better if Mrs. Arnold had let her boy go, instead of outraging his dignity and hurting his pride by dragging him back to be laughed at? Moreover, when Arnold got tired of the army, he went 'absent without leave,' and came home. For this he should have been punished, but the influence of his mother got him off.

We know very little about Arnold's childhood, that most important period of life. But what we do know points to two things: his mother provoked in him the spirit of revolt, and she enabled him to think he could 'get away with' wrongdoing.

When the Revolution broke out, Arnold was among the first to volunteer. Although in Connecticut, he and his troop reached the scene of war within ten days of the Battles of Lexington and Concord. He immediately volunteered for the dangerous duty of getting guns and ammunition from old Fort Ticonderoga. He captured the fort and its garrison. For this he was rewarded by being 'investigated,' superseded in command by a man who had done no fighting, and was allowed to go home without having been reimbursed by the State of Massachusetts for the large amount of money he had spent in the patriot cause. Incidentally there was no justification for the conduct of the civil authorities responsible.

ARNOLD swallowed the insult and went to Cambridge, where Washington had now taken command of the army. The new commander in chief saw at once the sterling qualities of Arnold and sent him on a hazardous expedition to Quebec. With an army half-starved and decimated by disease Arnold struggled through the icy woods of Maine and attacked Quebec, which held a larger garrison than his attacking force. Of course he failed, and was wounded. But his heroism in this expedition is unparalleled in American military history. Outnumbered ten times, he withdrew his army from Canada and was again superseded in command. Yet the new commander intrusted him with the task of keeping the British out of the United States at the north in 1776.

With astonishing ingenuity and skill, he built a fleet on Lake Champlain, hurled it in the face of a great British armament, with troops which outnumbered him ten to one. Although his fleet was entirely wiped out, he saved his army. The great British force was so badly battered that instead of continuing its way to New York, it retreated in haste to Canada.

At this time Benedict Arnold was the senior brigadier general. To reward him for his conduct the politicians in the Continental Congress promptly promoted over his head five junior brigadiers to major general and did nothing for the fighting general. Arnold's rage was shared by Washington—but Congress would do nothing. Arnold threatened to resign, but at Washington's earnest personal request he stayed with the colors. One should not think less of Arnold for this, for it is worth knowing that at this same time a French general appeared in America, magnificently offering his services to Congress. The politicians were thinking of making him a major general and chief of artillery. When this news got around, three of Washington's bravest generals, Nathaniel Greene, John Sullivan and Henry Knox, all wrote Congress that if the Frenchman was appointed they would resign. Moreover, one disgruntled brigadier, who had been passed over, did resign.

ARNOLD received permission to go home in the winter of 1777, but was rudely interrupted on his holiday by an invasion of Connecticut itself. Hastily gathering a force of militia he threw his little army directly across the British line of march. In a terrific fight at Ridgefield, Connecticut, he opposed an enemy force four times his strength. Naturally he was defeated, and this time his horse fell under him struck by nine bullets. He extricated himself and drew off his forces, secured reinforcements and flung himself once more on the British troops who were now retreating toward New York. Only by the most desperate fighting did the British force, still much superior in numbers, succeed in escaping from the clutches of the tireless Arnold.

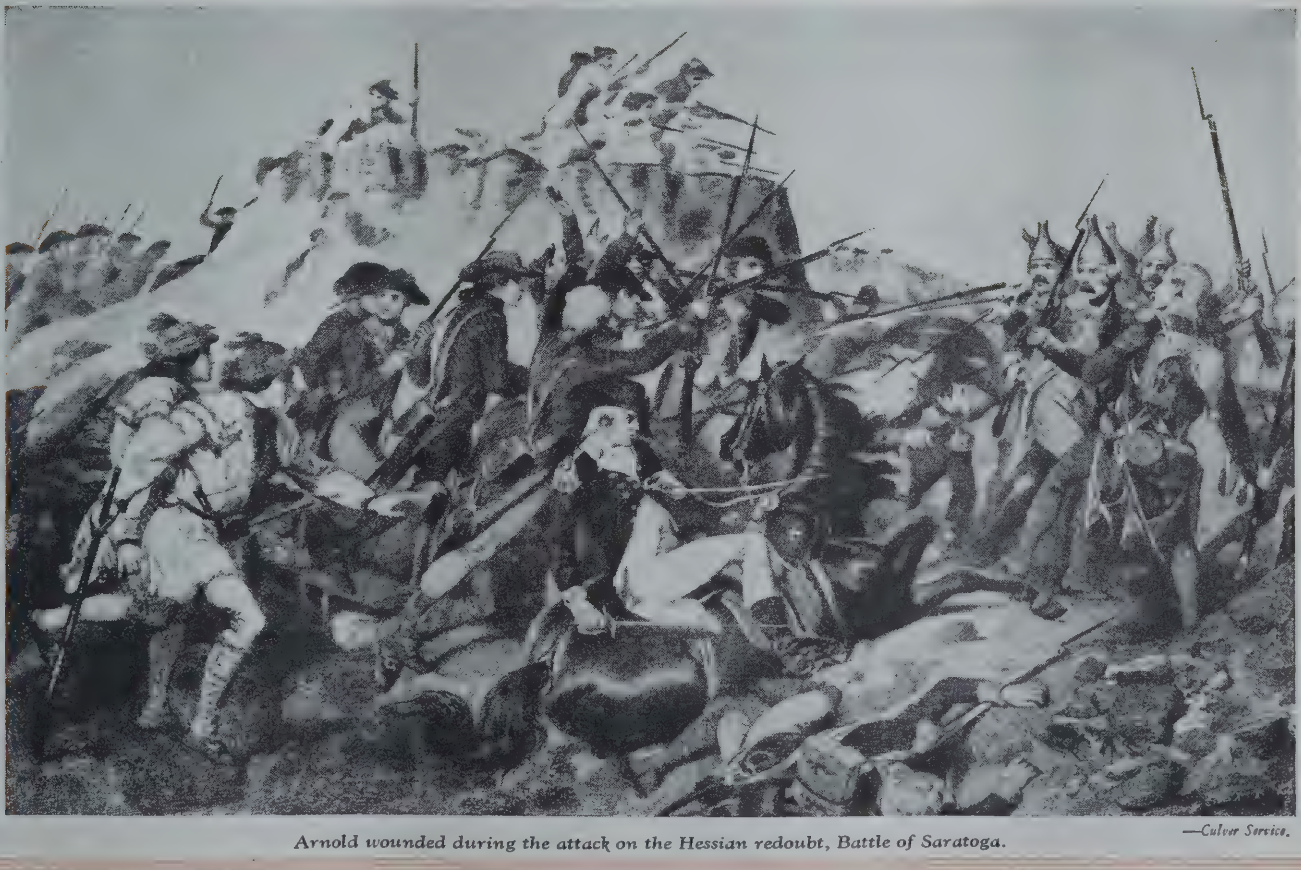
For this Congress did finally make him a major general—but with characteristic ill grace, it refused to restore his rank above the other five generals. To a soldier this kind of promotion is insulting. Arnold went to Philadelphia to Congress, and found a number of charges had been trumped up against him, in connection with his accounts in the Quebec expedition. He defended himself ably and the charges were demonstrated groundless. Still Congress did not restore his rank.

In exasperation Arnold presented his resignation, but on the same day came the news from Washington that the British general, Burgoyne, had started south from Canada again, and that Arnold must be sent to help check him. Again at the request of the commander in chief he swallowed his resentment and left for the northern headquarters. When he arrived he was sent off to relieve the beleaguered garrison at Fort Stanwix. Although again outnumbered by the British, yet by a combination of audacity and skill, he soon had that particular British army in full flight. He turned his army and rushed back to the Hudson to join the main northern army now opposing the British army under Burgoyne.

HERE in September and October of 1777, although Arnold was a subordinate commander, he displayed a resourcefulness and energy in leading the American troops in person which had much to do with the final American victory. The American commander, Gates, was scarcely on the field of battle at all, while Arnold was badly wounded in the final battle of October 7 which sealed the fate of the British army at Saratoga.

In the Saratoga campaign Gates had not taken pains to be as careful of Arnold's feelings as had Washington, and there had been friction between the two. When to this Arnold felt the added insult of Gates' reports slighting the work of his division in the campaign, another factor was added to make Arnold resentful and angry.

He was carried home to convalesce in the winter of 1778, and joined Washington again in the spring at Valley Forge. As the British evacuated Philadelphia, (Continued on page 23)



Arnold wounded during the attack on the Hessian redoubt, Battle of Saratoga.

A WOMAN EDUCATOR

By JULIAN HAWTHORNE

ALL women are educators of their men pupils, more out of school than in, and their teaching is wisdom. But my aunt, Elizabeth Palmer Peabody, born in the first decade of the 19th Century, and, living in it nearly eighty years, was an educator born; she might have taught her own mother how to rear her. At least she must have received illumination early, and being the eldest daughter and child of good Dr. Peabody and his wife (née Palmer), she naturally began their education, and that of her brothers and sisters as they successively appeared.

She had never said to herself, 'I will teach'; she was Teaching incarnate. One would feel his education proceeding as soon as she came into the room, and even if she sat silent (which in my experience she never did), the atmosphere was full of lessons.

DR. PEABODY was a 'regular' physician, which, at a period when the tenets of Hahnemann were becoming the rage in New England, showed courage on his part; but Elizabeth, who perched always on the crest of the wave of progress, was innately homeopathic; if Hahnemann hadn't said, '*Similia similibus curantur*,' she would have anannounced the principle as soon as she could articulate. And whenever I see a bust of the German sage in the window of a homeopathic druggist's shop, I feel that hers ought to stand beside it.

But nobody ever made a bust or painted a portrait of her, or hardly so much as took a daguerreotype, carte de visite, or tintype of her benign and beloved physiognomy; and when, the other day, I glanced through an anthology, her name was absent; though the angel of goodness and mercy who keeps the immortal anthologies has not omitted it; and she would have valued no other fame, and would be much embarrassed to find herself renowned even in Paradise. She thought of many things, but there is no evidence that she ever spent a thought on herself; she lived to give help and good counsel to her fellow creatures; and how she found time to equip herself with the encyclopedic knowledge and culture which she possessed, in the scant intervals when she was not imparting it, is one of those things which, as the late Lord Dundreary used to declare, no fellow can find out.

My earliest recollection of Aunt Elizabeth was when I turned upon her suddenly and planted a hearty kick in her stomach: as soon as she had recovered her breath she turned to my mother and exclaimed anxiously, 'Sophy, the child is going to be ill!' Luckily for my moral reputation, I was down with the scarlet fever that same night. I had been standing on a chair looking out of the window of our house in Mall Street, Salem, and she had been standing behind lest I fall off, I being only six years old. So the kick must have got her in the abdominal nerve center, to be made famous fifty years later by Bob Fitzsimmons. She trotted round late that night to fetch the great local homeopathic Doctor Wesselhoeft, who came, saw and cured me promptly.

The other thing that I recall of my aunt at this period was when she sat down comfortably in the broad-bottomed easy-chair, which just fitted her, and began to converse, though the family cat was all the while pulling at her skirts, as if to call her attention to some subject of feline interest; but Aunt Lizzie, beyond half-stooping once in a while to caress the animal, continued to discourse, and we to give ear, for her way was always captivating, even if she were discussing celestial mechanics or ontology.

But after twenty minutes, when my father happened to come into the room, she got up to greet him, and it was then revealed that she had been sitting on the six kittens, which had come into the world the day before, only to leave it again so soon, in a manner so egregious. The cat had placed them there unobserved for comfort and security, and their darksome color on the dark upholstery of the chair, in the rather dusky room, had prevented their presence from being known. They went without a mew, and probably without pain, like Keats in his 'Ode to a Nightingale'; and I dare say that my aunt suffered more from the fatality than did the mother cat, for she was most tender toward all dumb beasts.

IT IS time to say that she was the eldest of three sisters and three brothers; two of the brothers had died in their young manhood; the other lived to a good age, but not happily; he was a maker and vender of the purest homeopathic globules obtainable, a praiseworthy calling, but not remunerative; he was also an admirable draftsman, but not for commercial ends; he married and had two daughters; the family was good but not beautiful. Poor little Uncle Nat was sad, dim and unhopeful; his speech had the thinness and intonation of a mew; he was very fond of cats. He was extremely conscientious in all his little affairs, which never for a moment prospered; his faith in Providence dwindled year by year; he became pessimistic and feebly rebellious, but lacked energy to make oppression bitter. His relatives did all they could for him; when my father took his family to Europe, he handed over the Wayside to him rent-free, and he abided there during the seven years of our absence, but his mew when we came home was as melancholy as when we went away. His head was tall and narrow, with a fine forehead, but his body was so small that I used to wonder how he could be an uncle.

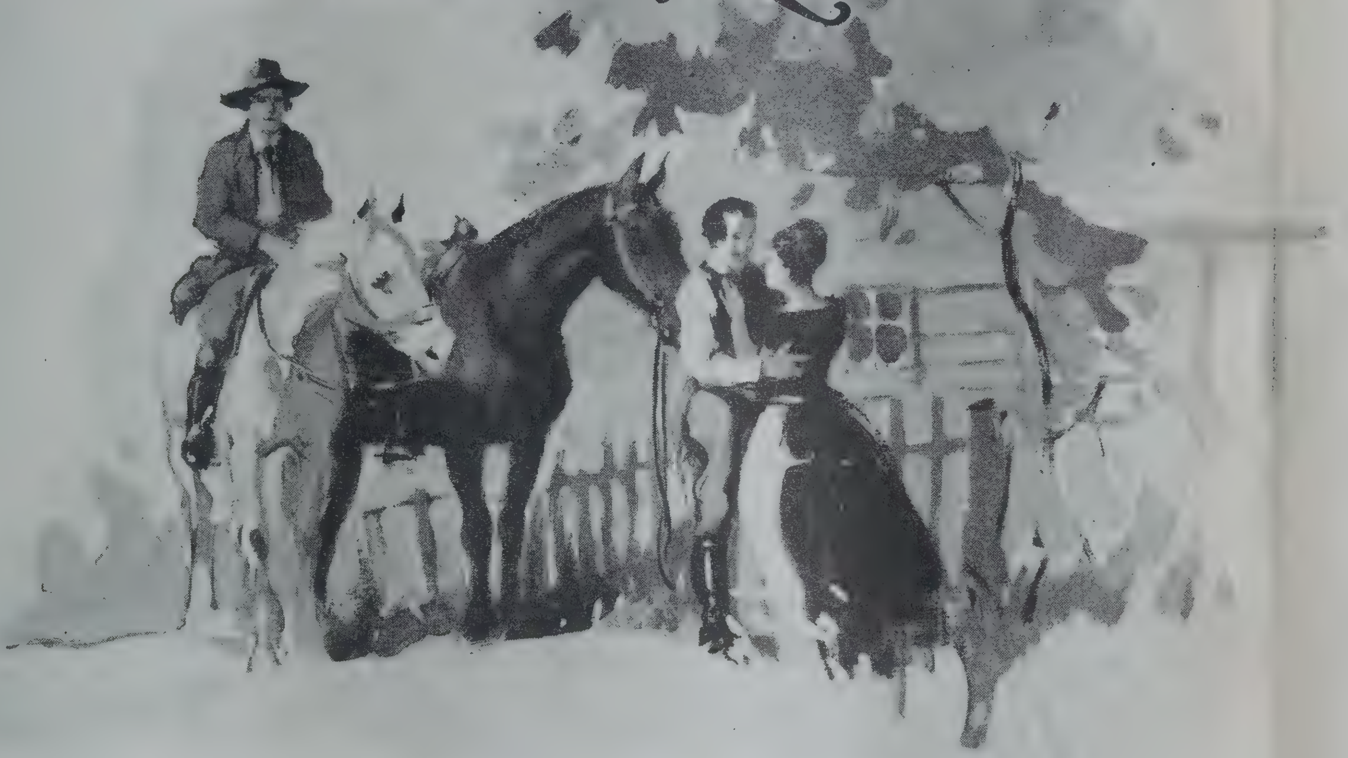
AUNT MARY, the second daughter, married Horace Mann, and was exalted forever after. My mother, Sophia Amelia, was the youngest. For many years, until her marriage at the age of two and thirty, she was an invalid, suffering from terrific headaches; but she was always happy and the cause of happiness in others; witty, humorous, wise and learned. She was an artist, a painter and sculptor, and she made exquisite tracings and copies of Flaxman's classic outlines, which were the esthetic nourishment of my childhood.

It had been early determined that she must never marry, and she herself was almost vowed to the life of a vestal; George Peabody, a cousin, fell in love with her, but had to content himself with making a great fortune in London and achieving renown as a philanthropist; Russell Sturgis was another suitor; he afterward became the most powerful figure in the London banking house of Baring Brothers. But she passed on, in maiden meditation, fancy free, till she met the young Nathaniel Hawthorne, the Salem hermit, and then began another story.

And that meeting was due to Elizabeth. Elizabeth not only brought the meeting about, but it was she who discovered the young author. He had been writing short tales for years, but signing fanciful names to them, never his own; they had been printed sporadically in periodicals of the day, but had never been collected, or assigned to their true origin. But Elizabeth, reading them all, now here, now there, was convinced by internal evidence that they were from one hand, and was only in doubt whether that hand was a man's or a woman's. Finally, when 'The Gentle Boy' appeared, and chance had brought her acquainted with Hawthorne's two sisters, the truth transpired, and she wrote him a letter redolent with enthusiasm and with sensitive and penetrating criticism. It led to a meeting; he was as shy as a wild stag, having for

(Continued on page 28)

NANCY HANKS, the Mother of LINCOLN



One of the men was Nancy's brother. The other was Tom Lincoln.

By WILLIAM E. BARTON

Illustrated by GERALD VAN DER HEYDEN

NANCY HANKS was not quite nine years old when her grandfather Joseph Hanks died. She had had an important place in the history of the Hanks family since her first arrival, but most of it the neighbors did not know or bother about. She was born back in Virginia and came to Rolling Fork as a baby, and had been accepted as a member of the family without any necessity for much explanation. But she was undeniably there, and when the group of relatives and neighbors assembled round the open grave of Joseph Hanks that day in late winter of 1793, there was no other child present. It was a group of grown folk, or of folk nearly grown, and little Nancy.

Little Nancy was quite distinct from her young aunt Nancy, who was still in her early teens. The family had two Nancys and one Nannie, for by that pet name Old Man Joe Hanks called his aged wife Ann.

The death of her grandfather wrought no immediate change in the daily life of little Nancy Hanks. Spring came, and the flowers were fragrant up and down the shores of Rolling Fork; they bloomed abundantly also along Pottinger's Creek which flowed in on the Hanks side, and up the steeper shores of Knob Creek, which flowed out of the knobs on the opposite side. Nancy's childhood life was not one of hardship. She had her daily tasks to perform, but the heavy work was cared for by her uncles and aunts. Her Uncle Joe and Aunt Nancy were not too old to play with her, and the others were considerate. Whatever the faults of the Hanks family, its members were loyal to one another. Except for one thing, the year that followed her grandfather's death might have been rather a cheerful one. Her grandmother became despondent, and very homesick for Virginia.

It was not the more recent Virginia home on Patterson's Creek she longed for; that had never seemed like home to her. She wanted to be back in the old North Farnham parish where she had been born, and where her old friends still lived. Day by day, for a whole year, she moaned and sorrowed about it, and then the children held a council, and arranged to send her back, and young Joe was to go with her.

William and his wife, Elizabeth Hall, stood ready to buy the farm, which under the will of the deceased Joseph was to belong to the widow during her life, and then to the youngest son. Joseph and his mother, Ann, assigned their rights to William, and a suitable financial arrangement was reached. The old home was still to be home for the other members of the family until their separate plans should carry them away to homes of their own. This would not be long for some of them. Mary was about to marry Jesse Friend, and the older sons were approaching matrimonial arrangements with young women of the neighborhood. Elizabeth was old enough to earn her own way and look out for herself. The daughter Nancy would be cared for by her sisters and by William's wife.

Little Nancy was the only problem. William's wife, Elizabeth, was assuming as many motherly functions as a bride might fairly be asked to undertake. Grandmother Hanks did not think it wise to take so small a child as Nancy back across the mountains with her to Virginia where she herself might have so short a time to live and care for the little girl. It was decided that Nancy should go to her own mother, Lucy Hanks Sparrow.

If Grandmother Ann Hanks had decided that she needed little Nancy as a staff for her old age, and that the little girl must accompany her back to Virginia, the history of the United States would have been seriously modified.

The home of Henry and Lucy Sparrow was in Mercer County, a rather long day's ride on horseback from the Rolling Fork home of Grandfather Joseph Hanks, but it was a cheerful ride. The time was spring, a year and more after her grandfather's death, and the road had no rough hills or dangerous fords. The Sparrow home was a comfortable one, and little Nancy had a suitable place in it.

Yet there was something of constraint in the welcome, and Nancy did not wholly understand it. She did not quite belong there, and if the fault was hers, she did not know it.

HERE she was no longer 'Little Nancy.' There was no big Nancy from whom she needed to be distinguished. There was no one else who was older than herself, except only her mother and her stepfather. On the other hand, there were two small children, and Nancy was their nursemaid. She had suddenly grown up.

Her very name was changed. The neighbors soon forgot the necessity of distinguishing between Mrs. Sparrow's younger and older children, and the little girl who had been Nancy Hanks became the big girl, Nancy Sparrow.

Another baby was coming, and did come, to Lucy Sparrow, and her sister Elizabeth Hanks came over from Nelson County to remain with her a few weeks. This sister attracted the attention of Thomas Sparrow, Henry's brother. Elizabeth did not return to the old Nelson County home, but married Thomas Sparrow and remained in Mercer.

This marriage brought another change to Nancy Hanks, and she went to live with her aunt and new uncle, Elizabeth and Thomas Sparrow. The only explanation made to her was that her Aunt Elizabeth wanted company, but Nancy understood in some vague way that her mother, though loving her, was glad to have her in the other home, and not in her own.

The name Hanks fell further away from her. Whether with her mother or her aunt, she was called Nancy Sparrow. The neighbors fell easily into this habit, and her relatives were quite willing that it should be so.

AND now occurred a strange shifting of relationships. Gradually Nancy's mother became her aunt, and her aunt became her mother.

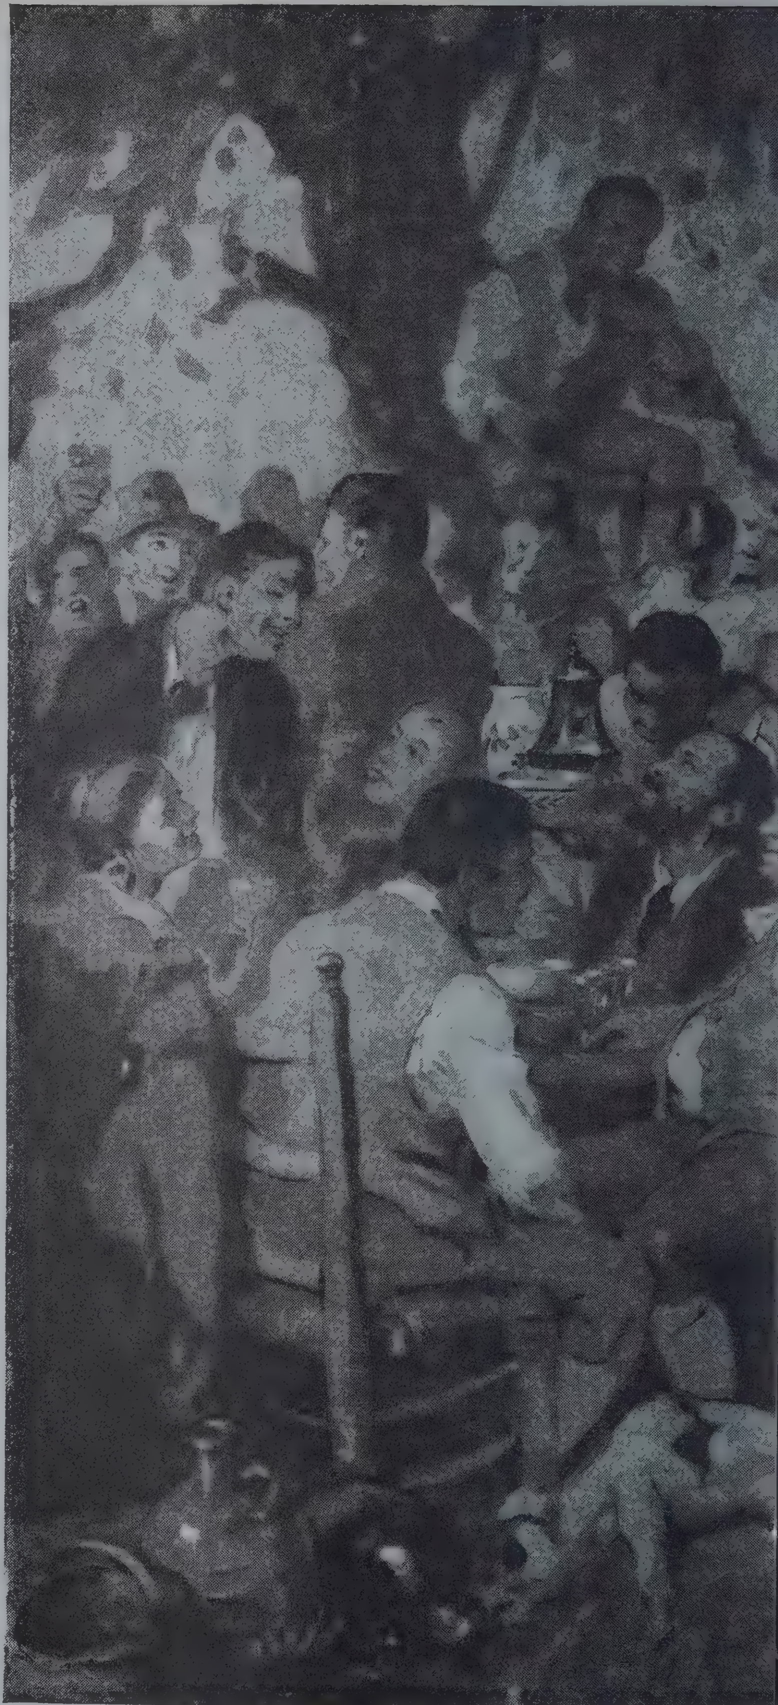
So Nancy Hanks, or Nancy Sparrow, as they more frequently called her, blossomed into young womanhood, and she did not look back on her youth as a time of either poverty or disgrace. She knew, of course, long before she became of age, the whole story of her birth, and at times it cast a shadow over her mind. But her mother, Lucy, was held in increasing respect in Mercer County, and her foster mother, Elizabeth, was respected everywhere.

Nancy's services were in frequent demand, especially in Mercer and Washington counties, which were older and richer than Hardin, and when she was not thus employed, she had a comfortable and cheerful home with her foster parents, Thomas and Elizabeth Sparrow.

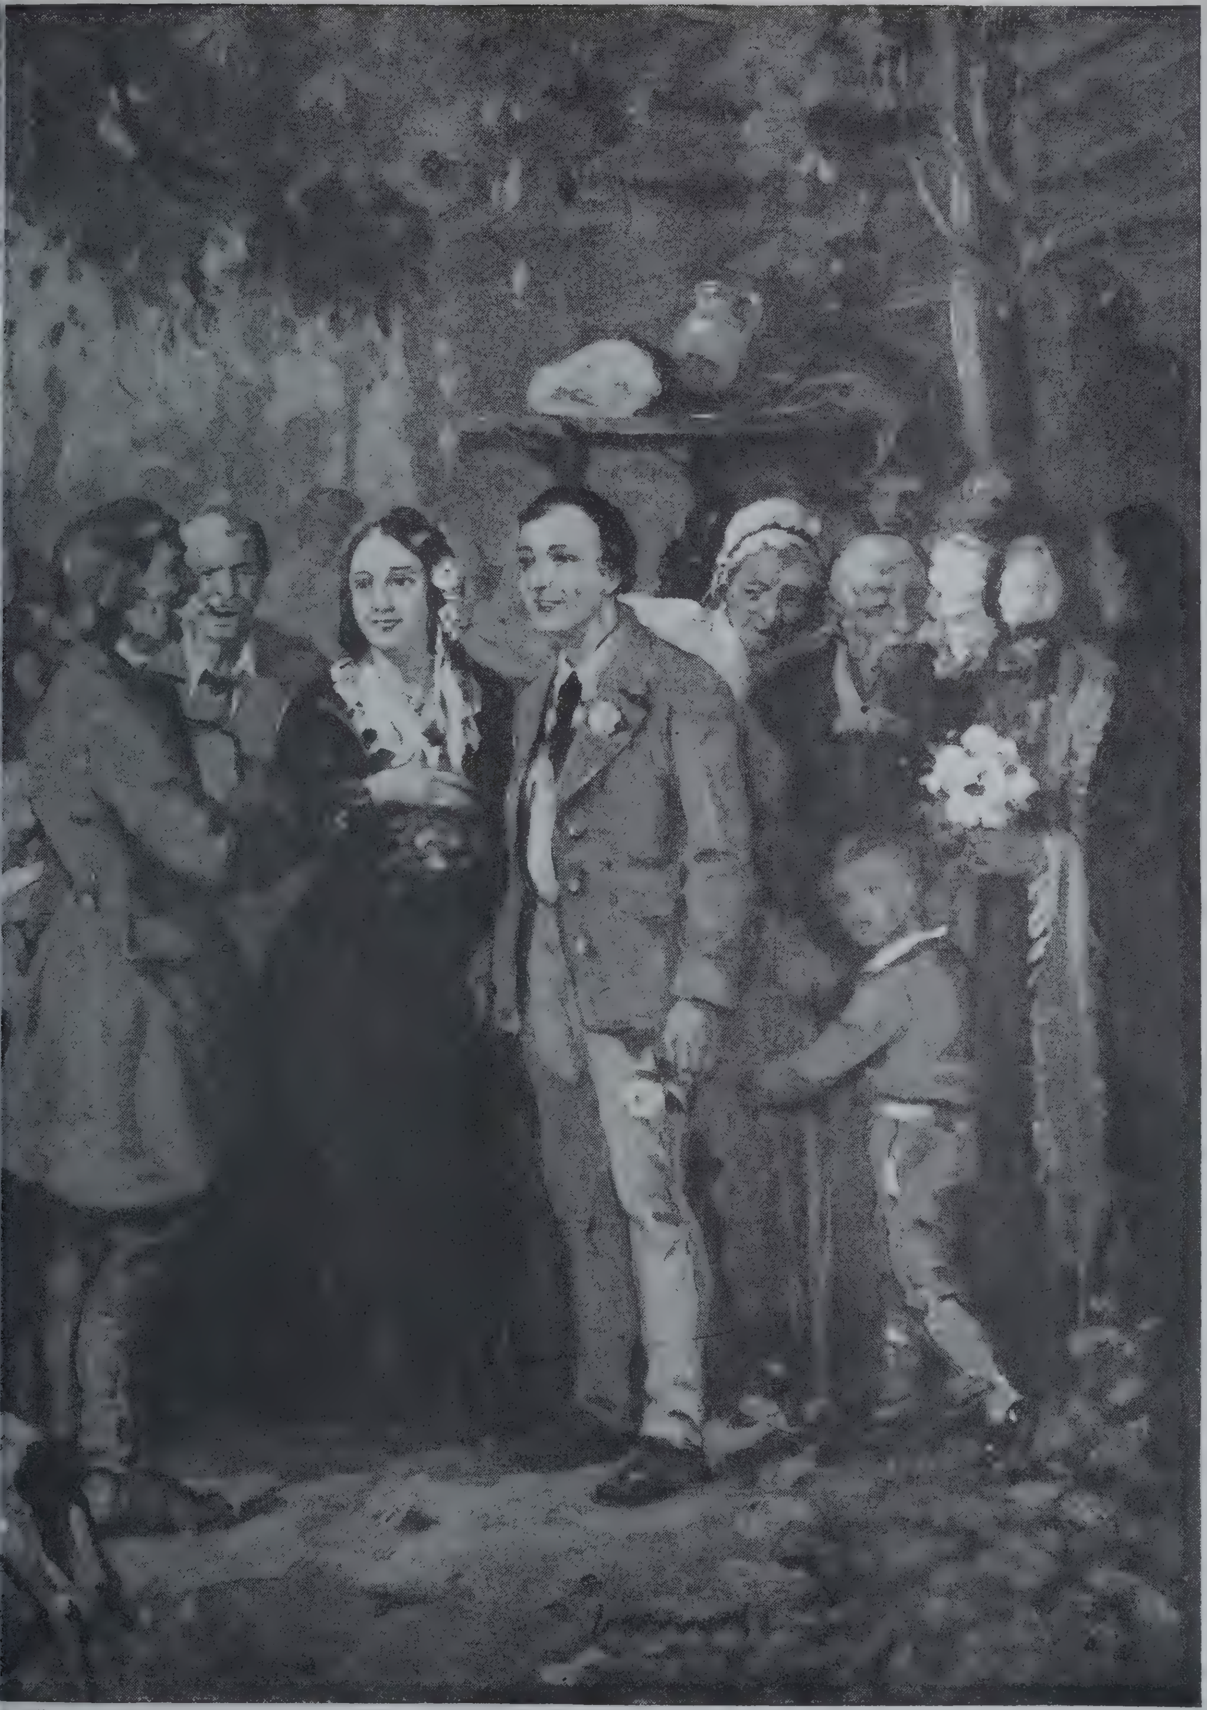
The level afternoon sun was sifting its rays through the golden shade of the beech trees and lighting up the shed-room where Betsy Sparrow had set up her loom. Nancy was on the porch, spinning. The dogs barked, and two men rode up to the fence and called. Betsy looked out of the door and hurried to the fence. One of the men was her brother Joseph Hanks. The other was introduced as Joe's friend, Tom Lincoln.

Thomas Sparrow appeared, welcomed Joe, and was introduced to Tom, and the three men went to the barn and stabled the horses. Then they went to the house and greeted Nancy.

Uncle Joe expressed amazement at the way little Nancy had grown to womanhood, and remembered that when he left with his mother for Virginia she had not been more than knee-high to a toad, which was not very accurate, for she had been tall even as a little girl, but that was the accredited measure for such cases. And in due time, Mr. Tom Lincoln was properly presented to Joe Hanks' niece, Miss Nancy Hanks. That evening, after little Dennis had been put to bed, the five grown people sat around the fire and told each other many things.



Joe had remained in Virginia till hi mother died. She had been glad to be back but not so glad as she expected to be Things had changed, even in old Virginia Her old friends had died off, and he relatives, while bidding her welcome, ha families of their own and thought her ow children were the ones who should hav cared for her.



The wedding of Nancy Hanks and Tom Lincoln—backwoods . . . great assemblies of sundered friends . . . kettles boiling . . . ovens reeking . . . a good, average June wedding of the period.

Her own children did care for her. Joe stayed with her in Virginia, as long as she lived, and then returned to Kentucky, still unmarried. No one could say he had failed to care for his mother. But Virginia was no such place as Kentucky for a man who had his own way to make.

He had picked up carpentry as a trade, and was hewing timbers for mills, and doing such work as was called for in his vocation. It was that particularly which had brought him into friendly relations with Tom Lincoln. Tom owned a farm over on Mill Creek, about forty miles away, and he had a mother and a married sister living there. But he had found, after trial, that farming was lonely business, so he was working as a carpenter in Elizabethtown, the county seat. Now and then he earned a little money from the sheriff, serving as guard at the jail.

The most important words that were spoken by the fire that night were not those of Joe, relating his adventures to his sister and her husband, nor yet anything that Mr. and Mrs. Thomas Sparrow had to tell him, but were those certain unrecorded words, and acts more eloquent than words, that passed between Tom Lincoln and Nancy Hanks.

They made no undue haste about their approach but they took a good look at each other. He was twenty-six, of medium height, solidly built, with hair so darkly brown it was almost black, hair cut around straight on a level with the bottom of his ears and not shingled up the back, and eyes that were gray, and now and then kindled with the love of fun. She was twenty-two, tall, well-proportioned, with dark skin and eyes. She had a high forehead, and possessed a good command of language. Her hands were skilled, and she had a good voice and could sing the old ballads.

Tom and Nancy did not say much, but they looked at each other, and neither was blind. Joe interrupted their observation now and then to ask Tom to confirm some statement about Joe's horse. But if anyone had had money with which to gamble that night, there was a safer wager possible than any that depended even upon the horsemanship of Joe Hanks. Tom Lincoln was riding to win. And in due time he won.

No formal invitations were issued to the wedding of Thomas Lincoln and Nancy Hanks. Someone who was riding from Springfield to Elizabethtown conveyed a message to Joseph Hanks, and so to Thomas Sparrow and William Hanks, and Grandmother Bathsheba Lincoln, and there were ways enough of sending word to friends in Mercer and Nelson counties.

We do not know just who were present of the relatives of Thomas and Nancy.

His brothers and their families lived nearby. It would have been a long ride for his mother and the daughter and son-in-law with whom she lived, but in that season it was not an impossible ride. Certainly Thomas and Betsy Sparrow and Jesse and Polly Friend, and Levi Hall and his wife, Nancy Hanks, the aunt of the bride, were within a comfortable day's ride. Weddings in the backwoods were more than weddings. They were great assemblies of sundered friends who hungered for social relationship.

WE CAN picture the scene on the day of the wedding. The Berry house, a double, hewn-log structure, fronted the road a short distance from the ford of Beech Fork. A few houses were near, and the neighborhood was sometimes called Beechland and at other times Poortown. No reasonable explanation has been offered for the latter name, for the farmers were rather more than ordinarily prosperous. It may be that some of them were tenants of the Berrys, and that their cabins were small as compared with the two double log houses of Richard and Frank Berry. Below the Dick Berry House and near the road was, and still is, an excellent spring where each arrival refreshed himself, and the men made their outdoor toilet after their ride.

People were arriving nearly all day, and preparations were going forward on an extensive scale. The wedding feast was no matter of light refreshments, but a barbecue. Kettles were boiling and ovens were reeking the whole day long. A 'snack' was provided for the guests who arrived before noon, and it did not minish the provision for evening. The Berrys were well-to-do, and food was cheap. There was no market for surplus perishable food, and the actual cost of what people were to eat was hardly a matter to be considered.

There was no lack of help. The Berrys owned slaves, and so did the more prosperous of their neighbors, not even excepting the preacher, Jesse Head, whom modern authors have credited with the antislavery sentiments of the Lincoln family. There was help enough inside the house and out.

There is no occasion to exalt the wedding of Thomas Lincoln and Nancy Hanks into a social event of high rank. Neither have we any reason to think of it as less than the ordinary wedding of the period in its appeal to the friends of the bride and groom and to those who arranged for the marriage. It was just a good, average June wedding, and we know what such weddings were.

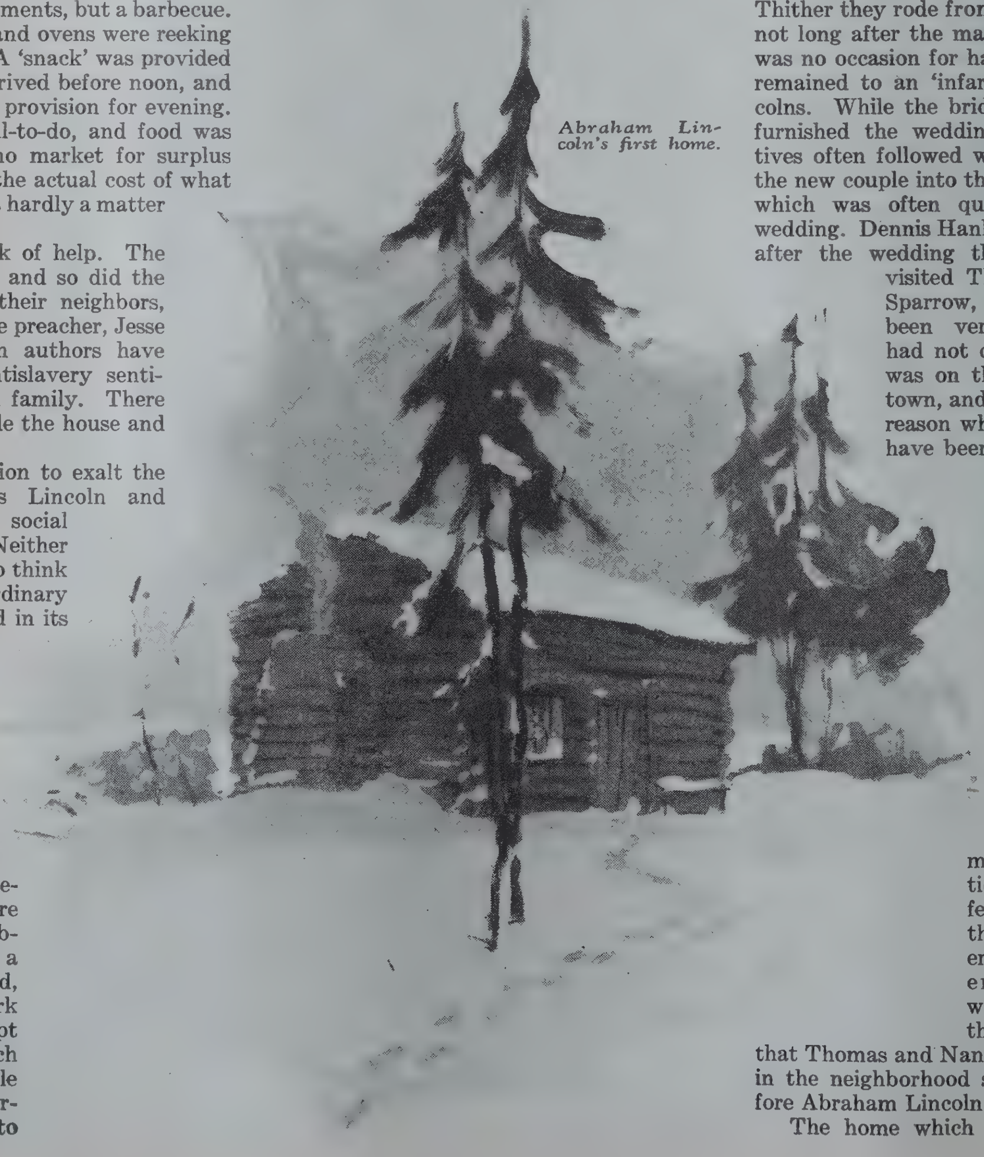
Not, certainly, because any of them were of his church, but probably because he was a neighbor and friend, and because his work as cabinetmaker kept him within easy reach of the courthouse, while preachers who rode circuits were not always to be depended upon, the minister selected for the occasion was the Reverend Jesse Head.

Rather late in the afternoon, he rode up. We know the color of the mare on which he rode; she was gray. Later, by natural increase and some swapping, he owned, at times, as many as three horses, but at this time he paid taxes on one gray mare, and three slaves, the slaves being a mother and two children. He did not own the husband of Mrs. Jane Head's cook; that colored man belonged to a neighbor. Jesse Head was later custodian and guardian of certain free Negro children, and so a trusted friend of their interests, but he was no abolitionist. He edited a paper which did not hesitate to advertise rewards for runaway slaves. On that subject he was neither ahead of his time nor behind it. But most of the preachers opposed slavery, and he did not.

He was recognized as he approached, for his gray mare and her rider were well known. Willing hands would have taken the bridle rein from him as he dismounted, but he personally saw to the removal of the saddle. It was summer, and a horse's back might easily scald, and a sore-backed horse is no asset to a backwoods preacher.

Thanks to a ribald jingle then current, we know how he looked:

His nose is long and his hair is red,
And he goes by the name of Jesse Head.



Abraham Lincoln's first home.

He was no saintly, mealy-mouthed man, this Jesse Head. He was a fighter of the devil and of desperadoes and of Calvinists and later of Whigs. He could eject a rowdy from a service, and thrash a bully till he cried for mercy, and then kneel with him, and with tears streaming from his eyes, pray that God would save the bully's miserable soul. He had a good library for his time, and he was something of a lover of books. Not everyone loved him. He made many enemies. But everyone respected him. Well might that company assembled on Beech Fork rise up and pay reverent regard to Jesse Head. Dogmatic, controversial, censorious, he was; but mightily in earnest, desperately sincere, and utterly without fear of Whigs, Calvinists, Baptists, rowdies or the devil. He did his own worthy share in saving the wilderness from godlessness and savagery.

THE wedding was at sunset and the feast and the dance followed. There were the good old tunes, 'Vilikins and his Dinah,' 'Turkey in the Straw,' 'The White Cockade,' 'Moneymusk,' and 'Hey, Betty Martin, Tiptoe, Tiptoe.' The fiddler rosined his bow and drew it lovingly across the eager catgut. There was enough to eat and more than enough to drink. It was a gay and festive night.

The first home of Thomas and Nancy Lincoln after their marriage was in Elizabethtown, county seat of Hardin County. Thither they rode from Washington County not long after the marriage service. There was no occasion for haste. They may have remained to an 'infare' given by the Lincolns. While the bride's family or friends furnished the wedding, the groom's relatives often followed with that reception of the new couple into their clan by an 'infare' which was often quite as noisy as the wedding. Dennis Hanks related that shortly after the wedding the bride and groom visited Thomas and Elizabeth Sparrow, and it would have been very strange if they had not done so. Their home was on the way to Elizabethtown, and there was every good reason why such a visit should have been made.

Some time in 1808 Thomas and Nancy moved from Elizabethtown, and on December 12, 1808, he bought from Isaac Bush two hundred acres of land, including the Sinking Spring, and the cabin which just two months later was to become famous. But when the purchasers of the Lincoln farm, a century later, made their investigation prior to the transfer of that property to the United States Government, they discovered evidence, not wholly certain, but to them highly probable, that Thomas and Nancy were already living in the neighborhood some ten months before Abraham Lincoln was born.

The home which for one single crop-season they are believed to have occupied was located in the 'Plum Orchard.' The cabin in the Plum Orchard was a temporary home. Tom Lincoln was tired of lawsuits, and of the kind of work that led to litigation, and Nancy wanted a home nearer to her foster parents, Thomas and Elizabeth Sparrow. And so, until possession of the home at Sinking Spring could be obtained, they lived for a few months in the Plum Orchard.

Thomas was not yet through with his lawsuits, and had to make rather frequent trips back to Elizabethtown, but usually he was gone only for the day, and Nancy awaited his return with glad anticipation.

Here, in May, 1808, while the wild crab apples were in their glory, and the air was full of their fragrance, Nancy felt the thrill of a new expectancy. She whispered her secret to her husband, and to Elizabeth Sparrow, and they all were glad, and the crab apples blushed happily. This time, Nancy hoped she would bear a son.

THERE was a neighborhood picnic in the woods of the Richard Creel place, in the summer of 1861, and the lunch baskets were assembled at the Sinking Spring. During the luncheon there was discussion about the cabin that had once stood there, and which had been removed, and whose logs some people present believed were still in the walls of a barn in the vicinage. The occupants of the cabin, Thomas Lincoln and his wife, had owned this very spring, and used its water; and it was here that their boy, Abraham Lincoln, was born.

It seemed a very remarkable fact that the man who was at that minute sitting in the White House and directing the great war, in which Kentucky was likely to be involved on the one side or the other, should have been born in this very spot, in a cabin, almost exactly where they were sitting, and that he and his parents should have drunk of and bathed in the water of this very spring.

Some one present said he had heard that when the Lincolns lived in that place, they were a 'no 'count' family, and perhaps not even married.

Aunt Peggy Walters answered the imputation with vigor.

'Mis' Lincoln was a fine woman,' she said. 'I knew her well. We lived just three-quarters of a mile over here, and I was here right often. She was a good woman, and nobody ever spoke a word against her while they lived here, nor against her husband, either.'

Aunt Peggy Walters was a woman of character, related to half the people present, and her word had weight.

'Weren't you here when he was born, Aunt Peggy?' asked one of the younger women.

'I most certainly was,' replied Aunt Peggy, 'and I remember it just as well as if it had been yesterday.'

Plied with questions, Aunt Peggy rose and hobbled about for a few steps, for she had a broken hip and had to use a crutch; it wearied her to sit long in one position. If she was to tell a long story, she must make herself more nearly comfortable.

She seated herself again, laid down her crutch, and told in her own language, which in the main was correct language, this story of the birth of Nancy Lincoln's baby:

'I was twenty years old, then, and helping to bring a baby into the world was more of an event to me than it became afterward. But I was married young, had a baby of my own, and I had helped mother, who, as you know, was quite famous as a granny-woman, and I had gone several times to help when I was sent for.

'It was Saturday afternoon, I remember, when Tom Lincoln sent over and asked me to come, and I got up behind the boy that rode across to fetch me, and I rode across to the cabin that then stood here. It was a short ride, less than a mile. It was winter, but it was mild weather, and I don't think there was any snow. If there was any then, it wasn't much, and no snow fell that night. It was a clear night. I was here all night. They sent for me quite as soon as there was any need, for when I got there nothing much was happening. They sent for her two aunts, Mis' Sparrow and Mis' Friend, and these both came, but they lived about two miles away, so I was there before them, and we all had quite a spell to wait, and we got everything ready that we could.

'They were poor folks, but so were most of their neighbors, and they didn't lack anything they needed. Nancy had a good feather bed under her; it wasn't a goose-feather bed; hardly anyone had that kind then, but good hen feathers. And she had blankets enough. There was a little girl there, two years old. Her name was Sarah. She went to sleep before much of anything happened.

'Well, there isn't much that a body can tell about things of that kind. Nancy had about as hard a time as most women, I reckon, easier than some and maybe harder than a few. It all came along kind of slow, but everything was regular and all right. The baby was born just about sunup, on Sunday morning. Nancy's two aunts took the baby and washed him and dressed him, and I looked after Nancy. That's about all there is to tell. I remember it better than I do some cases that came later because I was young, and hadn't had so much experience as I had afterward. But I remember it all right well.

'Oh, yes, and I remember one other thing. After the baby was born, Tom came and stood beside the bed and looked down at Nancy, lying there, so pale and so tired, and he stood there with that sort of a hang-dog look that a man has, sort of guilty like, and he says to me, "Are you sure she's all right, Mis' Walters?" And Nancy kind of stuck out her hand and reached for his, and said, "Yes, Tom, I'm all right." And then she said, "You're glad it's a boy, Tom, aren't you? So am I." '

OF THE actual naming of the child we have no account. None is needed. When Thomas Lincoln was a lad of six he saw his father, Captain Abraham Lincoln, shot down by an Indian. He wanted to perpetuate that name and did so. The name did not quite fit the first child, and for her the name Sarah appeared the best available substitute; the reserved name was ready for the next baby. They called the child Abraham Lincoln.

Several years later Tom Lincoln erected a new house, eighteen feet square, and with a loft high enough to provide room for beds, one of which was occupied by Abraham, now a lad of eight years. In that cabin he was to spend the remaining years of his boyhood.

The half-faced camp did not remain unoccupied. Thomas and Betsy Sparrow came on to be near their foster daughter, and made their home near the Lincolns. Scarcely had this couple moved out of the hillside place than Levi and Nancy Hanks Hall came on, and they in turn occupied the camp until they had provided themselves a permanent home. The rude shack sheltered in succession three families known to us, and quite possibly several others afterward.

For two years Nancy Hanks Lincoln dwelt in Indiana, and saw some approach to comfort in the conditions of her home. Gradually the cleared area of land and 'deadening' around the cabin widened, and the acreage of corn increased. The stock of poultry and of bacon grew, and the 'pinching times,' while not far pushed back into the woods, were not at the door as they were at the beginning. Conditions appeared to promise a reasonably comfortable future for the family.

The autumn of 1818 brought to southern Indiana a terrible sickness, afflicting both man and beast. The cattle were first to suffer from it, and as it was found to have been their milk that carried it to their human owners, it was called the 'milk-sickness.' A number of people in the neighborhood where the Lincolns lived contracted the disease and died. Levi and Nancy Hall died, and so did Thomas and Betsy Sparrow. Two uncles and aunts, one couple being her foster parents, were swept away as with a flood. Then Nancy herself contracted the disease. There was no physician within thirty-five miles. We have the testimony of a neighbor who was an eyewitness that Abraham and his sister were faithful in waiting on their mother, doing what they could for her. 'She struggled on,' says this neighbor, 'a good Christian woman, and died on the seventh day after she was taken sick.' The mother knew that she was going to die. She was very weak, and the children leaned over her while she gave her last messages.

Placing her feeble hand on Abe's head, she told him to be kind and good to his father and sister. To both she said, 'Be good to one another,' expressing a hope that they might live, as they had been taught by her, 'to love their kindred and worship God.' Thus, at the age of thirty-five, on October 5, 1818, died this madonna of the backwoods, the mother of Abraham Lincoln.

Mathematics *and* Reason

LINCOLN once remarked after reading a geometry book, 'Now I know what a proof is.' And Lincoln walked many miles to borrow that geometry.

Is there any other way to learn what a proof is? Is there any other method of arriving at confidence in reasoning power? The mathematician would be the first to admit that there is. But the other way is long and tedious and is attainable by only a few who through years of drill in engineering or in business problems arrive at certainty and confidence.

For young people no other subject of the curriculum can replace mathematics in the grasp which it gives of the universe controlled by law.

In mathematics as in no other school discipline, compulsion to think is placed upon the pupil. Mathematics will continue in the future as it has in the past the backbone of the material used for instructing the youth of the land.

Your Mirrors of the World

(*Continued from page 7*)

importance from offices employing one or two persons in sparsely populated districts, to an office in Washington which employs two or three dozen highly skilled reporters.

From a black dot on a trunk line, lighter black lines will zigzag about in a crazy fashion over the map of a state, and this will mark a state wire circuit—in other words a leased telegraph wire from which operators, sitting in newspaper offices in towns that may vary from 20,000 to 250,000 in population, copy 14,000 to 16,000 words of news in an eight-hour period.

Third, on this map you will see fine lines radiating from bureau cities in every direction, like rays of a pictured sunrise. These mark the telephone 'ponies.' The 'rays' represent phone wires leading from a capital city (either legislative or industrial) which will be used for verbal dictation of a briefed news report for smaller towns at fixed hours each day.

AS THE layman looks at all this complicated system he may say to himself that this is some sort of madhouse. There will be an element of truth in his conclusion. Let us take the lid off this madhouse and see what happens inside, taking a fairly simple incident for our text.

You live in Chillicothe, Ohio, let us say. Mussolini rises in the Chamber at Rome and makes some startling statement. A process then starts which might very well be described by a now familiar radio term: 'selectivity.' An American press association correspondent selects out of a dramatic parliamentary session such facts as he thinks necessary to make a story. He sends this to his London office, because experience has shown this the best thing to do. (Had an attempt been made to assassinate Mussolini, he would have filed that to his London and Paris offices, and by at least two direct-to-New York routes, at 'urgent' rates.)

The London editor may select only a part of the Mussolini message for relay to New York, or he may see it in better perspective and reach into the body of the message for a direct quotation with which to open the cable story. He may, if necessary, add to the cable other information from one of the three British news agencies, being careful to state the source of this addition. The cable editor in New York knows more of the American perspective on Italian news than the London correspondent can know, so it is possible he may select still another set of facts to bring to the front of the story he writes. The cable arrives in condensed form, because the fastest cable service costs twenty-five cents a word from London, and must be rewritten and expanded on this side. The finished story then goes to an editor who passes on all copy—the active executive in charge of the service—who considers it from many points of view. Is it accurate? Are the right facts emphasized in the lead? Is it too long, or too short? What is its importance as related to other news now in sight? And so on.

This editor may issue some instructions regarding the story. It goes then to a man called a filing editor. This man decides what shall be sent on the double trunk lines leading from New York to Chicago, which story shall be moved quickest, and in how great volume. He may send 300 words, we will say, on the Italian dictator. But double wires through Cleveland will carry 30,000 words, or thereabout, while less than 15,000 words can be carried by the single-wire state circuit. Moreover, that state circuit is there because those who live in Ohio are more interested in nearby Ohio news than in far-away events. So perhaps a third of the stories carried on that state wire are Ohio stories. Less than a third of the national and international news stories available in the Cleveland office can go downstate. Mussolini will be lucky, perhaps, if he gets 125 words.

Then, you will remember, from Columbus radiate the thin lines that mean telephone 'pony' circuits. Your editor in Chillicothe may get a 'thirty minute report'—as much newspaper copy as can be dictated and copied down accurately in a half-hour. The Columbus correspondent, to use the A. P. title (or bureau manager, if you use the phrase common to both other associations), must provide your editor with a representative selection of the day's news, in brief form. The final selective process may give you sixty words on Mussolini.

There, and I have let it run into some detail, you have the great mass of daily drudgery of the American press association business. This is far from spectacular, but it is necessary, and nowhere else in the world is such an amount of what is sometimes called public intelligence made available to newspapers. We are the best informed people in the world, in spite of our indifference.

Suppose that a brief fifty-word 'take' of that story had been written, topped by the word 'Bulletin.' Then when copies of it have been distributed to the filing editor he tosses it across the desk to a telegraph operator who breaks whatever story he is sending at the end of a sentence, sends the bulletin, then continues sending the earlier copy. At each 'relay point' a similar procedure is followed, so that news of importance travels across the country to San Diego in a few minutes. It has right of way, like an express train, and lesser traffic is shunted on to side tracks. News is traveling both ways on these wires, at the order of the filing editor, who is the train dispatcher immediately controlling traffic.

But let us do some more supposing: this time the cable reads, 'Flash Rome Pope Died 1635 Official.'

As the word 'Flash' ticks out over the cable wire, an operator calls the editor-in-charge.

THIS editor reads the message, turns, and brings the entire organization, coast to coast, to instant attention with the shout of 'Flash,' which instantly is sent on the wires by operators, to be followed perhaps by 'Rome Pope Dead,' dictated by the editor. At each relay point through all the vast network of wires, that flash is repeated by word of mouth, re-sent almost instantly, and in a few seconds it is stopping great presses, bringing stereotyping squads to attention for another try at a speed record, sending cuts and 'obit' (life history) material to the composing rooms, and setting editors to planning the make-up of extra editions in every town of any size in the country. The flash is a signal. It has caused a press association employe in Columbus to put through a rush phone call for your editor in Chillicothe, for one thing.

But before that rush call is through, the press association wires are carrying a 'Bulletin Sub Flash' telling that the Holy Father died at 4:35 p. m. (the 1635 of the twenty-four-hour clock) and that the announcement was official from the Vatican. After which 'adds' follow each other in rapid succession.

When one pictures the network of competing press association wires which cross and crisscross this country, the speed with which news is delivered, the fight for accuracy, the honesty of intent that is general, and the elimination of bias from news; and when one then turns for a look at Europe, the contrast is striking.

Over all of Europe there lies a network of 'semi-official' news agencies, the chief of which are Reuter, in England; Wolff, in Germany; and Havas, in France. These have a distinct edge on government news. The American correspondent soon learns that they have certain preferential standing. Occasionally an official will explain smilingly that he must favor these agencies, as they perform certain services for the Government. They are subsidized, in various not-too-apparent ways. Reuter, I believe, is paid for transmission of certain news to the colonies, and so on down the line.

The American correspondent, if he be unwary, can trip nicely over the ambiguities and mysteries of this situation.

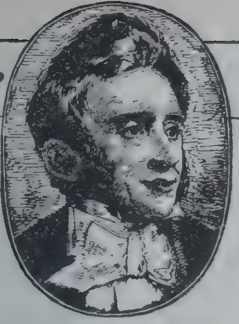
Hunters' Rewards

IN QUOTING a publication entitled 'The Parish,' *Notes and Queries* tells of a standing committee in every parish whose duty it was to destroy all 'noyfull fowles and vermyn.' The practice still exists in some rural parishes.

Rewards for the destruction of vermin taken within the parish were as follows:

For every three heads of old Crows, Choughs, Pyes, or Rooks, 1d.; for every six heads of young birds of the same kinds, 1d.; for every six eggs unbroken of any of them, 1d.; for every twelve heads of Stares (starlings), 1d.; for every head of Martin, Hawkes, Fursekite, Moldite, Buzzard, Shag, Cormorant, or Ringtail, 2d.; for every two eggs of them, 1d.; for every Iron (Hebron) or Osprey's head, 4d.; for the head of every Woodwall, Pye, Jay, Raven, or Kite, 1d.; for the head of every bird called the King's-fisher, 1d.; for the head of every Bullfinch, or other bird that devoureth the blowth (bloom) of fruit, 1d.; for the head of every Fox, or Gray, 12d.; for the head of every Fitchewe, Polecat, Weasel, Stote, Fayre-bad, (fare-bad, i. e., badgoer, Badger), Wildcat, 1d.; for the head of every otter, or Hedgehog, 2d.; for the heads of every three Rats, or twelve Mice, 1d.; for the head of every Moldewarpe or Want (Mole), ½d.

The Greatest Name in Rubber



Charles Goodyear, from a contemporary portrait

He walked the streets in downpouring rain in a strange garment of rubberized cloth.
He met the jeers of the world with a faith that neither disaster nor seeming disgrace could conquer.
He laid upon the altar of his work all the dear things of life—health, family, friends, fortune, happiness.
He was cast into prison for debt.
He felt himself "appointed of God."
He discovered the vulcanization of rubber.
His name was Charles Goodyear.

IN the immense and farflung industrial structure that is Goodyear today, an army of workers labors to enlarge Charles Goodyear's discovery.

In cities that he never saw—quite possibly of which he could not even dream—and in an enterprise he did not found, his spirit abides where his name finds greatest honor.

With every passing year, the name of Goodyear rises higher, clearer.

Deservedly the greatest name in rubber in the beginning, through the work of the man, it is today no less deservedly the greatest name in rubber through the work of the institution which followed the path he pioneered.

The name Goodyear is greatest in invention.

Look through the annals of the rubber industry's achievements, and on every important page for a quarter-century you will find record of Goodyear the institution's contribution to the art.

Goodyear invented the present straight-side tire. Goodyear perfected the principle of cord tire construction underlying the high-mileage performance of automobile tires today.

Goodyear ingenuity fashioned the machines necessary to the production of this new construction.

Goodyear devised the All-Weather Tread, for maximum safety, traction, wear.

Goodyear pioneered the successful pneumatic cord truck tire.

Goodyear originated the Plant Analysis Plan of specifying rubber mechanical goods to the uses of industry.

Goodyear provided the indispensable rubber equipment for aeronautics in America, and itself established record after record in air navigation.

Goodyear developed SUPERTWIST, the extra-elastic, extra-durable cord fabric essential to the modern low-pressure tire.

Goodyear has just now announced the tractive, slow-wearing new Goodyear balloon tire with the new-type All-Weather Tread.

The name Goodyear is greatest in sales.

The measure of value in rubber may accurately be gauged by volume of sales, sustained public demand being the evidence of merit.

More people ride on Goodyear Tires than on any other kind.

More people walk on Goodyear rubber heels than on any other kind.

More Goodyear rubber conveyor belting is used in industry than any other kind.

More Goodyear rubber equipment is supplied to commercial aviation and for national aeronautical defense than any other kind.

More Goodyear Tires—many millions more—have been made and placed in the service of motorists than any other kind.

More rubber is used by Goodyear—nearly one-seventh of all the crude rubber produced annually on the earth, almost 50% more than is used by any other manufacturer.

The name Goodyear is greatest in service.

There is in the Goodyear business method a fixed principle of the greatest service to the greatest number.

With the same care that it builds into its products the greatest possible value, Goodyear has provided the means to help users get all that value out.

It has covered the world with a network of branches, depots and dealer service stations for the prompt supply and expert servicing of Goodyear wares.

It has pledged its selected retail outlets to give the skilled assistance to owners that results in the enjoyment of the last ounce of usefulness built into the Goodyear product.

The name Goodyear is greatest in usefulness.

It is a fair statement to say that none of Goodyear's success has come to Goodyear unearned.

This is a young company—eager, alert, forward-looking—one of the youngest although it is the greatest rubber company of the world.

It has come along no royal road in its march to decisive leadership, but often through trial and travail like that which Charles Goodyear himself endured.

But it has had his conquering spirit in its heart.

And it has had the devoted service of thousands on thousands of loyal men who respond to that spirit.

And it has had the trust and good-will of the millions of people who have tested its work and word and found them worthy.

It will keep all these, because it knows whereof they spring.

In the beginning, by force of discovery, Goodyear was the greatest name in rubber.

By force of usefulness, to its own and to all people, Goodyear is the greatest name in rubber today.

GOODYEAR

Copyright 1927, by The Goodyear Tire & Rubber Co., Inc.

The Novelist

(Continued from page 6)

spent any time and thought over his work, and even Mr. Edgar Wallace with his half-dozen novels a year gives them, one must suppose, some care and consideration, must have a personal tender regard for his creation. It is in all probability bound up in his mind with much personal history; if the work is a novel he has lived for many months with these people; they have yielded to him their intimacy even though he is not able to convey that contact to others.

BUT the critic has to consider some dozen novels a week or twenty little slim volumes of verse or a little colony of eager reminiscences; he, in these days at least, is forced to consider horrible limits of time and space; how can he pause to meditate upon the author's personal anxieties?

The creator on the other hand, after some years of experience, discovers that the criticisms of his work fall always into one or other of two divisions. He names them to himself hostile or friendly and it is his complaint always that the colour of the feeling about his work in general will always be much stronger than the abstract critical value. He sees that he belongs inevitably to a certain world, that try as he may, he will never escape from this, and that it is well that he should not because that is his personality, the figure in his carpet, the thing that makes him, even in a small degree, unique and separate. But to the critic the things that comprise his world may seem of themselves false and sentimental or indecent and cynical.

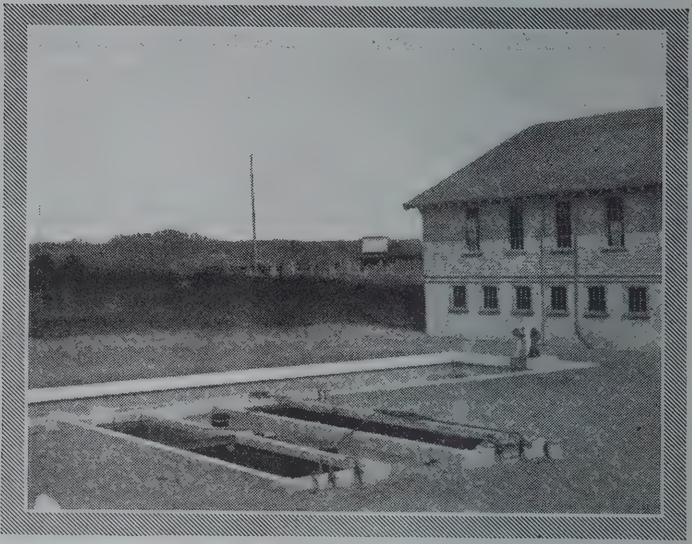
As creator I may see life as an adventure in which the new scientific attitude to sex is the most important thing that has ever happened; as critic this attitude may seem to me absurdly unimportant or so desperately important that it must be fought with every weapon in one's power. How then in this can critic and creator ever meet each other fairly?

THE creator discovers at last that he is working for certain others who see life in the main as he does himself. Not that they of necessity agree with him. And the critic too must inevitably move in his own world. How surprising it is to find, as one does constantly, that someone considers Conrad a vastly overrated writer, that Hardy is no poet, that Kipling told his tale long ago (and this after 'The Bull' and 'The Janeites' in the last volume). It is the same again with the great men of the past: to one Keats is a sugary and affected poet, to another Shelley is coloured wind and water, to another Jane Austen, a tepid chronicler of the smallest beer.

And so the creator finds his great consolation in his application to the work itself. He has no other business, he discovers at the last, but to do it as well as he can; he must listen to no other voices, be betrayed by no hopes of popular short cuts. And the critic on his side continues to wonder that the rest of the world refuses to see things as he does, but he has his abiding satisfaction, if he is honest and refuses to be swayed too far by personal feeling, that he is clearing the ground and that at the end he has brought the fine things to wider attention and is encouraging beauty and truth to flourish in a dusty soil.

The FISH COURSE *at the* University *of* Washington

By N. NORRIS DAVIS



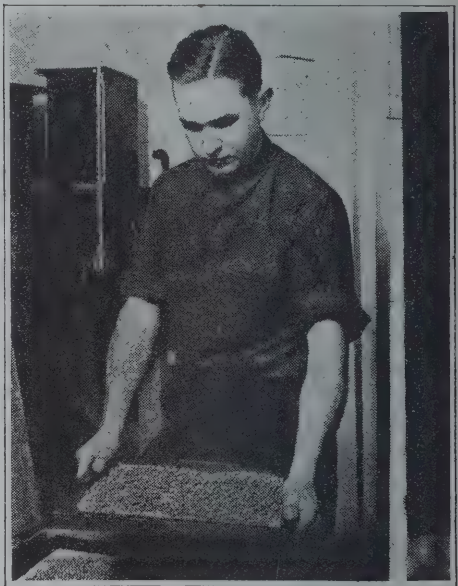
Right—*Cement ponds for rearing fish, kept in operation all year.* Below—*Student dressing fish.*

THE College of Fisheries of the University of Washington was founded in February, 1919.

Scattered throughout the country and notably on the Pacific Coast, are numerous ponds, lakes, small streams and marshy spots, which under present conditions are a liability, but which may be an asset if used for 'water farming.' The function of the College of Fisheries is to instruct in the principles and practices of fishery.

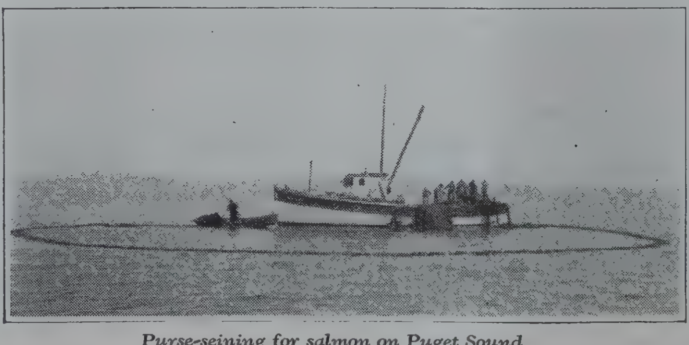
Its campus is located on the shores of Lakes Washington and Union, and these two bodies of water are connected by canals with each other and with Puget Sound. As a result, the largest fishing vessels are enabled to tie up alongside the Lake Union dock of the university, and this dock is only about a thousand feet from the fisheries school. At Friday Harbor, on Puget Sound, the university owns, and has operated for some years, one of the best situated marine biological laboratories in the world.

The course in the College of Fisheries includes the history and methods of the fisheries and subsidiary industries. Students receive training in the construction, operation and preservation of all forms of fishery apparatus; the best methods of handling the catch; modern methods of business management, and some knowledge of fishery business and admiralty law.



Student handling a trough of trout eggs.

One very important part of the course is the teaching of the latest methods of canning, salting, smoking, spicing, and otherwise preparing fishery products for market, and in order to do this a laboratory has been established, in which are installed washing and brining tanks, retorts, steam boxes, oil fryers, dryers, double seamers, smokehouse, salting tanks, et cetera, and a barrel-making outfit, codfish cutting blocks, codfish brick machine, et cetera.



Purse-seining for salmon on Puget Sound.

The Other Fellow

(*Continued from page 5*)

days, when, even upon British soil, the letters of the British and their allies were officially opened, and frequently suppressed.

In Damascus, Jerusalem, in Cairo and Alexandria even, where the trail of the tourist has destroyed much of the simplicity of manners, one has frequently seen a tradesman, called away from business, simply tilt a chair in front of his open shop door to signify that he is out, the contents being left entirely without protection for hours at a time. If a neighbor sees a chance of doing a bit of business on his behalf, he will invite a customer to enter, sell him the object in question, replace the chair, and faithfully hand over the cash at the return of the proprietor.

But here again we have the difference of standard. A peasant woman of my acquaintance, a Christian, was rebuked by her priest for not remonstrating with a relative for picking and stealing, especially at night when he would prowl about and carry off hens, or eggs, or wood, or linen left to dry. 'He is no thief,' she said indignantly. 'He is like a lion which goes out and brings home something for the children, instead of being idle and sleeping all night. Times are hard and the little ones must live. That is not *haram* (forbidden)!'

The small courtesies of life are much insisted upon by both religion and custom, and their absence strikes one as strange on return to Western surroundings. It is said that the social duties of a pious Moslem are five: Accepting invitations, answering a *salaam* (greeting), visiting the sick, walking behind a bier, and if a person sneezes and says 'Praise be to God!' to answer 'God have mercy upon thee.' As with us, a sneeze is regarded as a possible precursor of ailment, and even of the plague, which the pilgrims sometimes bring with them from Egypt. Walking behind a bier is an act of respect for humanity which must never be omitted, be it only for a few steps.

SILENCE is no impoliteness in the East. When people have no more to say there is no obligation to 'keep up conversation.' A low voice as well as kindly speech is recommended. 'God has given me two ears and only one tongue,' said a follower of the Prophet, when reproached with silence.

On the subject of cleanliness the point of view between East and West often reveals again differences of standard. I once sat with a Turkish friend in the hall of a great hotel in Constantinople. A lady present, observing the growing habit among Orientals of discarding the fez indoors, which was formerly regarded as a disrespect, remarked that it was now impossible to know Christian from Moslem. 'Nothing easier,' replied the Turk, 'the Moslems will go through that door opposite to wash their hands before eating.'

Some of us may have felt rebuked, though it is a part of good manners never intentionally to convey criticism. They quote, 'Jesus—blessed be He—said, "Use not wisdom with the unwise to their annoyance."'

Lord Palmerston's celebrated definition of dirt, that it is 'matter in the wrong place,' leaves the question open as to which is the right place. Possibly, because the heat of the sun quickly destroys all deleterious organisms, the Oriental seems to think that anything may be thrown out of doors. You cross a filthy court to enter a spotless house. An oriental crowd, except for that branch of it which delights in garlic, forbidden by the Prophet, is less unpleasant to the nostrils than a crowd elsewhere, perhaps because the poor wear less woolen clothing. Moreover, they delight in baths, and an oriental bath is not a mere dip, but a ceremony which lasts for hours.

I once met, in the train, a group of fathers going to visit a mission school in order to take their sons to the bath. They were anxious they said that the boys should not forget the habits of cleanliness in which they had been brought up, yet doubtless the excellent missionaries supposed themselves to be initiating barbarians in the paths of hygiene!

Thomas Lake Harris

(*Continued from page 9*)

death on March 23, 1906. Two years after Harris left California he made a legal disposition of Fountain Grove to this effect: That his interest in it should go to Nagasawa and that the remaining interest should finally go to the last survivor. He also arranged for the accumulation of a cash fund to take care of his disciples when they should become too old to work.

A few years later, the number of survivors had been reduced to three—Nagasawa and two others. The other two later opened negotiations to take the cash fund that had accumulated and let Nagasawa have Fountain Grove. Prohibition had in the meantime come and it looked as if Fountain Grove would not be worth much.

Nagasawa asked George F. King to go East and conduct the negotiations, at the same time giving him power of attorney to conclude whatever arrangements might seem to him to be best. King learned that the cash fund for the support of the old people had grown to $120,000. This seemed to him to be quite a sum of money to give up in return for the sole ownership of Fountain Grove, the value of which under prohibition was still problematical. But King, who is a very shrewd business man, evidently sensed what later came about—that the price of grapes might advance. As a matter of fact, grapes that used to sell for $15 a ton, now bring from $75 to $100. At any rate, King gave them the $120,000 in cash and took Fountain Grove for Nagasawa.

We now come to a very peculiar and a very interesting situation. When Harris gave Nagasawa a vested interest in Fountain Grove it was lawful for native-born Japanese to own land in California. This has been changed by California law. It is still lawful for Nagasawa to own Fountain Grove, because the Constitution of the United States prohibits California and every other state from enacting *ex post facto* laws—laws that are retroactive. But the law prohibits Nagasawa even from bequeathing Fountain Grove to a native Japanese.

Here trips upon the stage of this story the future master of Fountain Grove—a lad of seven who is still called 'Coo-Coo' because when he was a baby this was as near as he could come to his Japanese name which is 'Kosuke'—Kosuke Ijichi, pronounced 'Ajish.' This lad, who is the grandson of Nagasawa's sister, was born at Fountain Grove and is therefore a 'native son of the Golden West' and as much a Californian as Hiram Johnson.

'Coo-Coo' is evidently the child in image of whom Japanese dolls were fashioned. His black hair and eyes contrast beautifully with his pink-and-white complexion. He plays with great vigor and makes friends with caution. Not many who go to Fountain Grove can get beyond the barrier of his reserve. And yet it isn't reserve. He's just got his fences up against familiarity, that's all.

Benedict Arnold

(*Continued from page 13*)

Arnold was given the important post of commander of the garrison in the capital city. Here he stayed in the summer of 1778 and the winter of 1779. His wounded leg made service in the field impossible. The civil and municipal authorities of Philadelphia did a great deal to make trouble for him, and the necessary and inevitable conflicts between the military and civil jurisdictions added more fuel to the fire of his wrath against Congress. Finally charges were made against him which resulted in his court-martial in December of 1779 for exceeding his authority. The court-martial in the main exonerated him, but found him guilty of imprudence.

This friction with the Pennsylvania authorities was the last straw which broke the camel's back. He entered into treasonable correspondence with the British commander in chief, which ended in his effort to betray West Point and the death of the unfortunate Major André. Besides this, as commander at Philadelphia, he was expected to keep up social appearances beyond his means. This was difficult for a general who had already sacrificed a great deal of his personal money in the patriot cause, and whose generosity to the unfortunate family of General Warren had caused him serious losses.

One other element played in causing him to desert the American cause. As a veteran of the French and Indian War he resented bitterly the idea of the alliance between France and the United States which was effected in the winter of 1778. He felt that France had no really disinterested motives. As a New Englander he had been taught to regard the French with horror, for had not these same French been responsible for a hundred years of savage border warfare in New England, in which villages had been burned and men, women and children scalped and burned to death? An alliance with France seemed to him the final surrender of hopes for American independence. He preferred British to French domination and so went over to the British side.

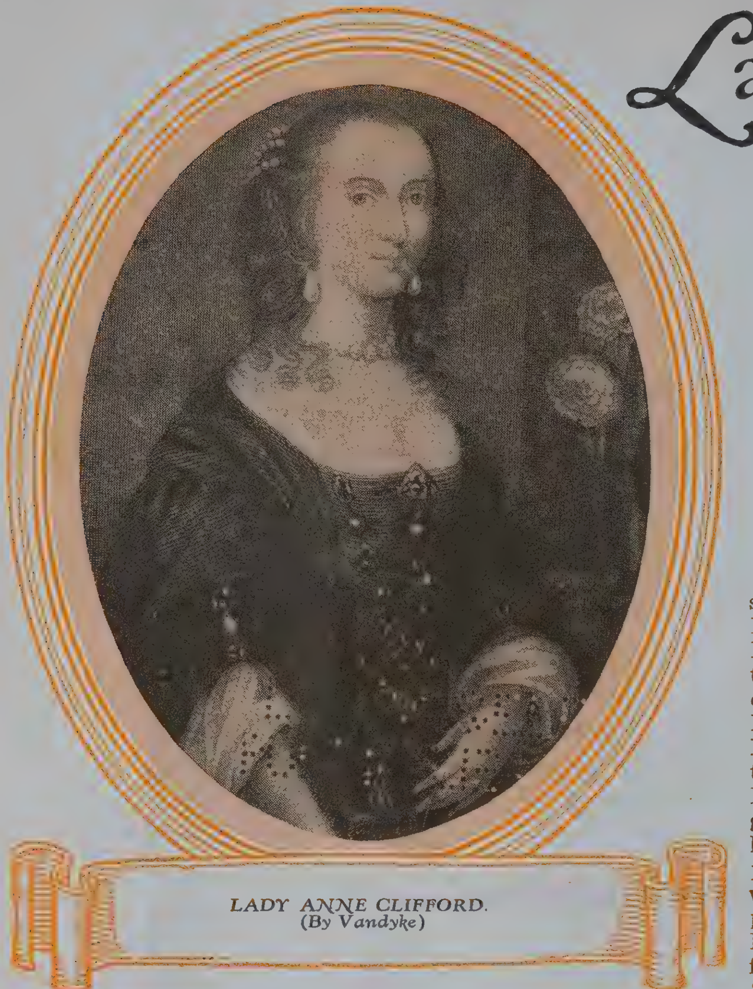
Lady ANNE CLIFFORD, Countess *of* Dorset *and* Pembroke

By
FRANCES
HOLBROOK
PFEIFFER



LADY ANNE CLIFFORD.
(By Vandyke)

YOU have met those mild, little women, soft-spoken, gentle, yielding—usually they have blue eyes—you have seen them give way, sacrifice their own desires in nearly everything. Then one day you have seen them take a stand for a principle—have known them to become resolute, immovable, adamantine; and it has been all the more surprising because they were so meek.

There were just such meek and immovable little women three hundred years ago. One, conspicuous long after her day, who for thirty years held steadfastly to her purpose against the opposition, coercion, threats and contumely of friends, husband, relatives, prelates and even the king himself; who never swerved nor gave up, and who finally won, was Lady Anne Clifford. But *her* eyes were black!

Lady Anne Clifford was the only surviving child of George, the third Earl of Cumberland—of the great Cliffords of north England—and his wife, Margaret Russell, a daughter of the Earl of Bedford. Lady Anne, herself, born in the winter of 1590, had the characteristics of both parents—she was a gentle little battler.

George Clifford, large, handsome, dashing and dominating, grew restless in the quiet of English country life; he was surfeited with the glamour and cajolery of the court. He was Elizabeth's official champion in all jousting and tilting, but he sought more stirring adventure, and during the reign of Elizabeth—and with that adventurous Queen's approval—he fitted out fleets at his own expense, and set gaily out on eleven different expeditions; . . . 'he exchanged his country pleasures with new thoughts of greater worlds,' his gentle lady said. Off to the River Plate, Costa Rica, the Canaries, the Azores, to the coasts of Spain and Portugal he sailed. In these voyages 'for the service of Queen Elizabeth, for the good of England and his own person,' he plundered as he went, a sort of superior buccaneer. Elizabeth, having a fondness for men of 'roguish condition,' closed her eyes to his piracy and kept them wide open for her share of the plunder Clifford brought back—gold, silver, precious stones, spices, bales of silk, and so on.

Lady Anne's mother was gentle, courteous, religious, of a sharp wit, withal, high-spirited and loyal, never yielding to opposition. Lady Cumberland's happy years were those early ones of her marriage before the earl had a taste of the sea.

Lady Anne held, always, a proud and high regard for her splendid father and worshiped her mother, in whose care she was reared. Her education was directed by Samuel Daniel the poet, and from him she acquired a taste for reading and a desire for literary composition. Lady Anne was a writer. Because of her high position and her century, she wrote mostly 'for her own closet,' recording many personal and trifling matters, largely about her own life. Now, three hundred years afterward, they interest us—these little pictures of a lady's life in the long ago. She wrote with a brevity, a grace and purity, and with direct sincerity, seeing she lived in an age of ceremony and long, involved sentences.

When Lady Anne Clifford was only fifteen her gallant father made port from his last voyage and passed away. For an unaccountable reason he willed his vast properties in the north, not to his only child, but to his brother Sir Francis Clifford, with the proviso that they were to revert to Lady Anne in the failure of male heirs. Cumberland thus ignored the fact that his estates were entailed upon his heir, regardless of sex. Therefore, this enormous property justly belonged to his daughter, and both Lady Anne and her mother were determined to possess it. Then began a famously protracted litigation—Clifford vs. Clifford—little Lady Anne Clifford vs. the unjust laws and traditions of England.

At nineteen Lady Anne was married to Richard Sackville, third Earl of Dorset, and became the Countess of Dorset. He was twenty, 'a man of lively parts and a licentious life, and probably a polite and negligent husband.' Where Lady Anne's swashbuckling father poured out his fortune in fitting out galleons, her husband squandered his estates in fine clothes, sports, hospitality and riotous living. Dorset's high-handed expenditures caused battle royal between him and his lady, over her inheritance in the Border country. His lands and London estates had been sold; and he had nearly lost Knole, the ancient seat of the Sackvilles in Kent, and needing more and more money, he tried to force Lady Anne to compromise with her uncle, whereby she would renounce her rights for certain sums of money—for Dorset to squander. But right there Dorset came up against the Rock of Gibraltar!

All through Lady Anne's diary—which, unfortunately, covers only a few years of this period of her life—there runs the refrain, *'I will never part with Westmoreland upon any condition whatsoever!'*

DORSET writes to her, beginning his letter 'Sweet Heart' and refers to her, 'whom in all things I love and hold a sober woman, your land only excepted, which transports you beyond yourself, and makes you devoid of all reason.' And Lady Anne writes to her mother: 'In everything will I commend him, save only in thus business of my land, wherein I think some evil spirit works, for in this he is violent as possible.'

Nor did Dorset fight her single-handed. He called in his friends, the great lords of the realm, his powerful relatives, and even the king himself. The diary records, simply, how this quiet woman withstood all their attacks, practically alone. There are indications, however, that Lady Anne's friends, the great ladies and even the queen, sympathized with her and sustained her as much as they dared. May not the seeds have been planted, in this protracted struggle of one woman against the leaders of the nation, which produced, in a later century, more equitable laws and greater liberty for English women?

Her little daughter, Lady Margaret Sackville, was not a robust little girl, living in such a contentious family. Lady Anne writes her mother:

> 'It is a miracle to me that the Child should prosper so well. She is but a little one, I confess, but a livlier and a merrier thing was there never yet seen.'

Lady Anne was devoted to the 'Child,' and while she writes calmly about Dorset's unkindest coercive move, her mother-heart must have been fearful and heavy:

'Upon the 3rd. (May) Baskett came down from London and brought me a letter from my Lord by which I might see it was his pleasure that the Child should go the next day to London, which at the first was somewhat grievous to me, but when I considered that it would both make my Lord more angry with me and be worse for the Child, I resolved to let her go, after I had sent for Mr. Legge and talked with him about that and other matters and wept bitterly. The 4th. being Saturday, between 10 and 11, the Child went into the litter to go to London . . . In the afternoon came a man called Hilton . . . from my Lady Willoughby to see me, which I took as a great argument of her love, being in the midst of all my misery.'

The child was only two years old and we are glad to say that she was not kept many months from her mother.

'All this time my Lord was in London where he had all and infinite and great resort coming to him. He went about Cocking, to Bowling Alleys, to Plays and Horse Races and commended by all the world. I stayed in the country, having many times a sorrowful and heavy heart, being condemned by most folks, because I would not consent to the agreements, so as I may truly say, I am like an owl in the desert.'

Her best friend, her mother, passed away. Dorset brought more pressure to force her to make over her Westmoreland lands to him and the child, and upon her refusal, he dispatched her, with only an hour's notice, from London to Knole. Two days later Dorset sent down a conveyance 'which Mr. Walter had drawn and persuaded me to go and set my hand to it, which I refused because my Lord had sent me down so suddenly 2 days before.'

She went north to Brougham Castle to settle her mother's affairs and matters became more peaceful between her and Dorset —'my Lord persuaded me to consent to his business and assured me how kind and good a husband he would be to me.'

Notwithstanding the spirit she showed about 'the business,' she dared not go to London without permission from her lord. In answer to an earnest letter urging him to allow her to visit London, she records:

'The 21st. was the first day I put on my black silk grogram gown. Upon the same day Rivers came down to Brougham and brought me word that I could not go up to London this winter.'

Wives certainly submitted themselves to their husbands in those days in England! There was a great house party at Penhurst, the home of the Sidneys, of which Lady Anne writes in August, 1617:

'The 4th. in the morning my Lord went to Penhurst but would not suffer me to go with him, although my Lord and Lady Lisle [Sidneys] sent a man on purpose to desire me to come. He hunted and lay there that night, there being my Lord of Montgomery, my Lord Hay, my Lady Lucy and a great deal of other company, yet my Lord and I parted reasonable friends, he leaving me his grandmother's ring.'

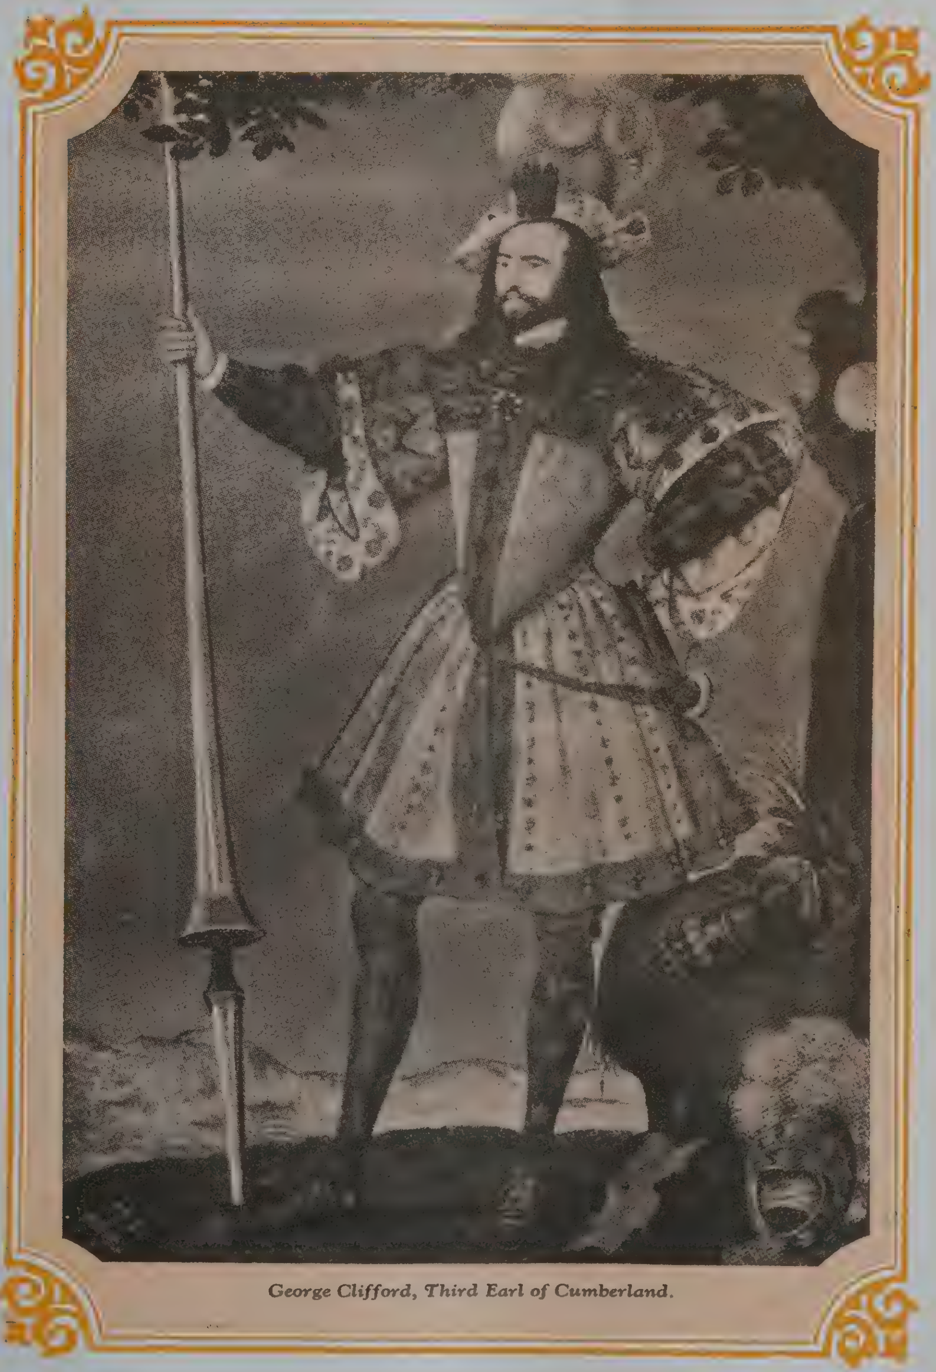
Small solace for missing the party! While she is still in Brougham Castle she makes these records:

'I rose by times in the morning and went to the Pagan Tower to my prayers and saw the sun rise . . . I did string the pearls and diamonds my Mother left me into a necklace . . . Prince Charles was created Prince of Wales in the great Hall of Whitehall . . . Not long after this Lord Chancellor was created Viscount Brackley, Lady Derby's husband.'

In passing it is interesting to recall that Viscount Brackley, Baron Ellesmere, was the founder of the famous Bridgwater Library, now a part of the Henry E. Huntington Library, in San Marino, California. Finally in December, 1616, she comes up to London where she is met at Islington by a number of great ladies—'so that we were in all 10 or 11 coaches and so I came to Dorset House where the Child met me in the Gallery. The house was well dressed up against I came . . . All this time of my being in London I was much sent to, and visited by many, being unexpected that ever matters should have gone so well with me and my Lord, everybody persuading me to hear and make an end, since the King had taken the matter in hand so as now.'

Then comes the hardest experience of all for poor little Lady Anne:

'The 17th. when I came up my Lord told me I must resolve to go to see the King the next day. The 18th. I went to see the Queen in the Drawing Chamber where my Lady Derby told the Queen how my business stood, and so she promised me she would do all the good in it she could. When I had stayed a little while I was sent for, my Lord and I going through my Lord Buckingham's chamber who brought us to the King . . . He put all out that were there and my Lord and I kneeled by his chair sides when he persuaded us both to peace and to put the whole matter wholly in his hands, which my Lord consented to do, but I beseeched His Majestie to pardon me, *for that I would never part with Westmoreland while I lived upon any condition whatsoever.* Sometimes he used fair means and persuasions and sometimes foul means, but I was resolved before as nothing would move me. From the King we went to the Queen's side. The Queen gave me warning not to trust my matters absolutely to the King lest he should deceive me. At this



George Clifford, Third Earl of Cumberland.

time I was much bound to my Lord for he was kinder to me in all these businesses than I expected, and was very unwilling that the King should do me any public disgrace.'

Two days later she was again dragged before James:

'I stayed in my Lady Ruthven's chamber till towards 8 o'clock about which time I was sent for to the King into the Drawing Chamber where the door was locked and nobody suffered to stay there but my Lord and I, my Uncle Cumberland and my Coz. Clifford [the usurpers of her inheritance], my Lords Arundel, Pembroke, Montgomery, Sir John Digby . . .'

The lawyers she names and continues:

'The King asked us all if we would submit to his judgment in this case. My Uncle Cumberland, my Coz. Clifford and my Lord answered they would, but I would never agree to it without Westmoreland at which the King grew in a great chaff. My Lord Pembroke and the King's solicitors speaking much against me; at last when they saw there was no remedy, my Lord fearing the King would do me some public disgrace, desired Sir John Digby would open the door, who went out with me and persuaded me much to yield to the King. Presently, after my Lord came from the King when it was resolved if I would not come to an agreement, there should be an agreement made without me . . . I may say I was led miraculously by God's Providence, and next to that I trust all my good to the worth and nobleness of my Lord's disposition, for neither I nor anyone else thought that I should have passed over this day as well as I have done.'

Magnificent estate of the Pembrokes, begun during the reign of Queen Elizabeth.

How like a woman, when she receives kindness in the midst of stress, to forget that that very one is causing her trouble! And how like a woman in any age to write just this way:

'. . . Mr. Smith went up in coach to London to my Lord to whom I wrote a letter to let him know in what case the Child was, and to give him humble thanks for his noble usage towards me in London.

'Mr. Amherst, the Preacher, came hither to see me with whom I had much talk. He told me now they began to think at London that I had done well in not referring this business to the King and that everybody said God had a hand in it.'

So the contest goes on. When the Cliffords and Dorset had signed papers and Lady Anne thought everything was lost, some technicality prevented them, and we read this record:

'I did strive to give him much comfort and assurance of my love as I could possibly, and yet I told him *I would never part with Westmoreland upon any condition whatsoever.*'

She never did part with Westmoreland! Her life goes on with records of little happenings; she reads and is read to by her 'folks':

'I spent the evening in working and going down to my Lord's Closet where I sat and read much in the Turkish History and Chaucer; wandering over the great house; I spent most of my time in working and going up and down to see the Child . . . I wore a plain green flannel gown . . . and my yellow taffety waistcoat. Rivers used to read to me in Montaigne's Plays and Moll Neville in the Fairy Queen . . . I made an end of my cushion of Irish stitch . . . it being my chief help to pass away the time at work . . . I made pancakes with my women in the great Chamber . . . Came Sir John Taylor with whom I had some 2 hours talk of ancient times and my Father in the north . . . Now I had a great desire to have my Father's sea-voyages written, so did set Jones to inquire about these matters. My Lord and Sir Henry Vane played at Bowles. This night my Lady Margaret (the Child) was 5 years old and so my Lord caused her health to be drank throughout the house . . . After supper I went with the Child who rode the piebald nag that came out of Westmoreland . . . The Child put on her white coats and left many things from her head, the weather growing extreme hot . . .' and so on.

The Earl of Dorset goes on living his gay life until it came prematurely to an end in 1624, when some degree of peace entered into the life of his widow. However, six years later she unwisely married again, this time to 'the greatest Lord in all England,' Philip Herbert, the Earl of Pembroke, whereupon her last state was worse than her first. Let her tell it:

'These two Lords of mine . . . were in their several kinds worthy noblemen as any there are in the kingdom; yet it was my misfortune to have contradictions and crosses with them both. With my first Lord about the desire he had to make me sell my rights in the lands of mine ancient inheritance . . . which I never did; . . . and with my second Lord because my younger daughter, the Lady Isabella Sackville, would not be brought to marry one of his younger sons . . . So as, in both their lifetimes the marble pillars of Knole in Kent and Wilton in Wiltshire, were to me oftimes gay arbours of anguish.'

There isn't any doubt that a part of Lady Anne's troubles were caused by a lack of humor! All through the diary nobody laughs nor says a sprightly thing. There is no doubt, and history confirms it, that Lord Pembroke was a bounder, however nicely his lady tries to smooth things over. She was obliged to separate from him.

IN 1649 Lord Pembroke very considerately departed this life, leaving Lady Anne free at last, after an embittered twenty years. And 'about this time' her 'Uncle Cumberland and Coz. Clifford' both passed away, and so Lady Anne, past fifty, came into the possession of Westmoreland!

Lady Anne ruled her wide domain like the queen of a principality; restored and rebuilt her castles; defied Cromwell by telling him that if he pulled them down about her head she would rebuild them again. She cared for and fought her tenants; erected chapels; built bridges and monuments—one to Edmund Spenser in Westminster, another to her old tutor, Samuel Daniel, and reared an obelisk on the spot where she last parted from her mother; endowed homes, pensioned her old retainers; provided for the several natural children of her first husband; she delighted in seventeen grandchildren and nineteen great grandchildren, although only two of her own children, daughters, survived. One of Lady Anne's grandchildren was that Earl of Thanet who, in 1688, became one of the donors of King's Chapel in Boston.

She reveled in her great possessions. She was happy and free, with plenty to occupy her alert and vigorous mentality. Her time was largely spent in those famous progresses back and forth over the roads of Westmoreland, Yorkshire and Cumberland, visiting her great estates, followed by a retinue often of three hundred or more horses, coaches and litters. For thirty years this 'terrible, great old lady' ruled with a strong, just, kind hand, then at eighty-six she laid down her scepter in Brougham Castle in the same room in which her father had been born and in which her mother had passed away.

It was said of her:

'If she had sought fame rather than wisdom possibly she might have been ranked among those wits and learned of her sex of whom Pythagoras or Plutarch, or any of the ancients, have made honourable mention . . . But, with Mary, she sought the better part, of learning the doctrine of Christ.'

Political Issues of the Colorado River

(*Continued from page 2*)

these terms, they propose to submit the whole controversy to the courts of the United States.

California, on the other hand, says that the preponderance of engineering investigation and experience dictates the Boulder Canyon site as the most available and most advantageous place for the dam. With a storage capacity of 26,000,000 acre feet, it is asserted that all danger of floods will be passed and the people of the Imperial Valley saved from possible destruction. They maintain that with this amount of water stored, they can build new canals all within American territory and not only reclaim 385,000 acres of land, but also prevent the shortage that is threatened each year on the lands that are now irrigated. They insist that the dam should be placed at a point where the power when created will have a market and that the only market at the present time for 200,000 electric horsepower is the cities of southern California. To back up their assertion of the availability from both a power and reclamation angle, and to demonstrate their good faith, they state that they are willing that they shall be bound by law to submit contracts for the purchase of water and of power which would pay for the entire construction of the dam, the power plant, and the All-American Canal within a certain number of years.

California joins issue with Arizona's claim to the right to tax the power on the ground that Arizona when admitted as a state, both in her constitution and in accepting the law whereby Congress recognized her as a state, waived her right to the control of power sites located on the river within the border of the state. Californians take the offensive against the Arizona scheme by saying that, in the event of the creation of a power plant where the State of Arizona desires it, there will be practically no market for the same because of its distance from cities and manufacturing areas. They ridicule the idea of drilling a tunnel seventy miles through solid rock in order to get water out upon the 3,000,000 acres of Arizona's land. They add that water stored in the Boulder Canyon Reservoir will give Arizona sufficient water to reclaim all that it is feasible to irrigate of its arid lands.

California crystallized its position in legislation known as the 'Swing-Johnson bill,' a bill proposed by Congressman Phil D. Swing and Senator Hiram Johnson. This bill focused the attention of all the parties interested in the Colorado River problem in the United States Senate at the last session. It probably would have passed the Senate had it not been for a filibuster during the closing days of the session. Briefly, it calls for the building of a storage reservoir of a capacity of not less than 20,000,000 acre feet in the Colorado River at Black Canyon or Boulder Canyon. A diversion dam some miles below as a part of a canal project would carry water to the Imperial and Coachella valleys in California. It also calls for the construction of a power plant which would supply electrical energy for raising water up above the canyon so that it could be carried to the cities of southern California to supply electrical power, the entire project not to exceed a cost of $125,000,000, and no money to be appropriated for construction work until contracts have been executed which would provide revenue to cover operation and maintenance and the cost of completing the project within a certain period of years.

The proposed law is also based on the condition that the Colorado River compact shall be accepted by six states and that all agreements under this proposed law shall be subject to the terms of the compact.

In addition to the refusal of Arizona to agree to the compact and California's withdrawal and conditional terms upon which she would reënter the compact, Utah has also withdrawn from the compact, on the ground that the states in the northern basin are doing a futile and dangerous thing in agreeing to the compact, when Arizona may acquire prior rights on the river by applying the water to a beneficial use, and power interests might possibly, through the Federal Power Commission, do likewise by obtaining a license to construct power reservoirs on the stream.

In the background stands Mexico, which claims the right to the use of the water of the Colorado running through her territory as it flows toward the Gulf of California. Already there is great energy being shown on the Mexican side of the border in the reclaiming of lands that are close to the Imperial Valley. It is said that most of the money invested in this project is American money. In answer to those disposed to keep as much of the water as possible in the United States by carrying it through the American canals for American lands, the canal to be constructed entirely in the United States, those in Mexico say that there are international obligations that must be settled by treaty between the two governments. They suggest that in the event that the plan of some of the Americans is approved, that is, giving as little as possible to Mexico, that the reverse situation prevails on the Rio Grande, and that, if reprisals are in order, the Mexicans can apply the same rule on the Rio Grande and endanger the reclamation of areas in Texas which are irrigated from that stream.

Behind all of the turmoil and struggle that went on in Congress over the Swing-Johnson bill, there was the assertion made, both covertly and openly, that the great power interests of the United States were intent on agitating the situation, so that there could be no legislation or agreement among the states. It was charged that the reason for this was that the power companies had already parceled among themselves the division of the electrical power that could be created on the river, that they were willing and able to build the power plants and the distribution lines, that they intended to see to it that the matter was so stirred up that an agreement could not be reached, and that at some point in the proceedings the power companies would break through, get their licenses and eventually have a strangle hold on the development and sale of power throughout the southwest part of our country.

Finally, such an engineer as F. H. Newell, former director of the Reclamation Service, who spent a number of years investigating the conditions of the Colorado River, maintains that the great question on the river is the handling of the hundreds of thousands of acre feet of silt each year; that no scheme of development should be considered that would not take care of this great problem; that the amount of silt is so great that in two generations it would fill up any dam that would be built; that therefore a series of dams down the river should be contemplated in the plan, and that until the Government had more complete and accurate knowledge of the engineering features, no work should begin. In the meantime, the people of the Imperial Valley should be protected as much as possible from the great floods of the river by the excavation of a channel leading to the Gulf of California.

In reply to Mr. Newell's position Government engineers who have made a very thorough study of the Boulder Dam site declare that a 550-foot dam would allow for the taking care of the silt for at least fifty years.

It must be obvious to the reader that the Colorado River is, as was said at the beginning of this article, in politics; that it will never get out until fact is severed from fancy, and the contestants are put in a position where public opinion can register its views upon facts that are actually determined.

(*This is the second of a series of three articles by the writer. In the third article he will attempt to show the various steps that should be taken at this time.*)

Exploration *by* Airplane

MORE than one student of the North is asking whether it will ever be possible to find land between Alaska and the North Pole—if it exists—by using aviation methods.

The dense fog which helped bring on failure again this season is said to hover almost constantly over the western Arctic, so that visibility is a serious problem. Possibility of a forced landing on an ice field furnishes another handicap, since the pack is usually a chaotic mass of blocks piled as high as an ordinary summer cottage. It is difficult for the pilot to detect the difference between rough and smooth ice.

There are certain favorable factors, however. During a part of the flying season, there are twenty-one hours of daylight and three hours of twilight each day for a period of two weeks. The winds are constant, being northeasterly; and the open water is comparatively smooth because of the presence of the extensive ice fields.

Expert geographers and students of tidal phenomena agree that in all likelihood land does exist in this unexplored area. In addition to scientific reasons, there are many others, such as the yearly flight of millions of ducks and geese from the north coast of Alaska and the annual northward cruise of the bowhead whale. A whale must feed in shallow water; and even ducks and geese do not make their nests on drifting ice.

A Woman Educator

(*Continued from page 14*)

twelve years previous seen nothing of society, and not too much even of his own mother and sisters.

But nobody could resist the transparent goodness of Elizabeth, her understanding, her sympathy; and she at length prevailed upon him to come to the Peabody house. There was a fortunate intermission in Sophia's headaches, and downstairs she must come, declared Elizabeth, to meet the handsomest and most wonderful man in Salem, or perhaps in the world, and the rarest of geniuses to boot. Sophia was amused by her sister's superlatives, but at last consented to take a peep at the new marvel; and she walked quietly into the room, in her white frock, with a blue ribbon in her brown hair.

It was love at first sight for both of them, and after a courtship unavoidably prolonged, the happiest marriage, the truest and completest union of two human beings that mortal annals can afford. From that time, Sophia's headaches and invalidism ceased, and she entered into a long period of health and vigor . . . But this was to be the story of my Aunt Lizzie. But no small part of that story was the happiness of her beloved sister, due, under God, to her, and which had for her the added beauty of pathos. For the dear woman could not help falling in love with Hawthorne herself; and when she realized manifest destiny, she was silent, and did all in her power silently to promote the felicity of the two beings she dearly loved.

She did not repine, or lessen the joy of others by personal regrets, but mastered herself heroically, and carried on. When children came, she loved them as her own, and smoothed and brightened the way by all loving attentions and forethought. It was the supreme chapter of her life, into which she allowed no revelation of herself to appear. She did not permit herself to imagine that she could ever have won the man preordained for another. But she was able to see that her sister was endowed with a nature and qualities which could make him happier than she could have done, and she had the magnanimity to find her joy in theirs.

SHE wrote and printed a first reader for children. It was based upon one of the new theories then current among the elect that letters of the alphabet should not bear names—Gee, Aitch, Doubleyou, and so forth, but should be designated simply by their actual sounds in speech. Thereby the child, in learning to read words, would not be perplexed by being told that Doubleyou-Eye-Gee, for instance, spelt Wig. The little book was printed in large, broad-faced type, and began with one-syllabled words, thus:

O Mamma. O Papa. Best Mamma. Best Papa. Mamma's velvet dress fits well. Papa's velvet vest fits well. And so on by degrees and beautifully more, so that one knew how to read almost overnight. After that, as I recall, we were given a broad view of ancient history. On a wall of the nursery was tacked up a long strip of cotton cloth, which Uncle Nat had neatly divided into serried arrays of small squares, which were again to be subdivided diagonally as occasion required, and painted in bright colors, blue signifying Persia; yellow, Greece; red, Rome; purple, Assyria.

A person not cognizant of how we got that way would have been impressed by hearing infant lips reel off ancient events and dates as trippingly as nursery rhymes. Teaching by eye as well as by ear has been revived somewhat of late years, but Aunt Lizzie began it seventy or eighty years ago. I won't say that the earliest germs of the idea didn't come from Germany, which was at that time a peaceful and benevolent nation, favorably known to children as the native land of Grimm's fairy tales, and Nuremburg toys. Aunt Lizzie was profoundly versed in Teutonic legend, history, philosophy and literature, and foresaw nothing of the sinister transformation which succeeded their smiling innocence, long after she was safe in Paradise.

It must have been after she had passed threescore and ten years that the unlooked-for opportunity came to her to visit Europe. Europe had been in her mind since girlhood, its history, its great figures, the character of its peoples, its famous cities, its rivers, plains and mountains, its architecture and its literature. She had dreamed of it, she loved to speak of it, but never had she expected to see it with her eyes. Then came the glorious bolt out of the blue!

BUT she was old and infirm; she had never had robust health: and if she went, she must go alone. Not for an instant did such considerations halt her. Her friends earnestly advised her against it; but she laughed and feared nothing.

Another obstacle was that she had never had practice in speaking Continental languages; she had read German, French, Italian, but to read and to speak and to hear are different. No matter; she bought two or three little pocket dictionaries, English on one page, foreign on the other, and took ship and voyaged to the lands of her heart's desire.

We awaited the result with anxiety, perhaps not unmingled with amusement; it was so like Aunt Lizzie, and yet so perilous. A poor little old woman, always belonging more to the spiritual than to the actual world, tottering about strange lands, at the mercy of accident and heedless and uncomprehending mobs; moreover, the strictest fitting of means to objects was indispensable, and she had no such training. Few letters came from her and they were briefer than her wont, but brimming with joy and wonder.

The time allowed her was but about six months, and in that little space what immensities were to be seen and done! But week after week passed with no news of disaster or even of disappointment, and we began to hope against common sense that all would go well to the end.

And so it did! Within the time appointed the beloved figure reappeared among us, and day after day we gathered about her to listen to her tale. It might be summarized as a continuity of special providences, and Aunt Lizzie wasn't a bit tired, but happy, animated, active, and full of bright and humorous accounts of her adventures, which, could they have been collected, would have made a travel book to delight the world. But the world must do without it; she didn't have the time for it herself; of what value to others could her trivial haps and mishaps be? and there was no stenographer to take it down as she talked. And so the charming story went into the air and was lost—if loss can be predicated of the vicissitudes of loving and lovely spirits. I remember one little episode; her arriving at the foot of a remote little hill in Italy, unknown to ordinary tourists, and therefore unprepared for such an advent. On its upper levels was a wonderful little town, with crooked streets and queer, tall little houses, and out of it poured down a queer, curious population, eager to examine and question the visitor, in her odd little bonnet and travel-worn waist and petticoat, with her wisps of gray hair floating out beside her broad, smiling, innocent, good-humored face, and in her hand a little black book.

THEY surrounded her, peering over one another's shoulders, clamoring and interrogative; and she spoke to them in amiable but unfamiliar tones, now and then referring to her little book and repeating from it, over and over again, some word, which at last the quickest-witted among them recognized and said over again in their own pronunciation, and understood that it referred to something connected with their own village, and understood that the stranger had come from afar to explore and admire. Whereupon they formed a triumphant procession, and almost carried her up the steep places and showed her their homes and treasures, the bare-legged children stringing along behind with shouts and laughter, and the old lady continuing to find words in her book, and so penetrating to the ancient little church, where the good priest met them at the portal, and took the visitor in and showed her its wondrous and sacred things. Never since the 15th Century had there been an occasion so joyful and memorable: and not one ragamuffin in the entire crowd remembered to beg a copper of her, or exhibited for her compassion a crooked leg or a sore arm. Smiling she came, and smiling and grateful for her entertainment did she depart, and their children's children would tell the tale, adding many miraculous features from their Italian imaginations.

This much I recall; but not the name of the mountain village, and probably no other tourist than my Aunt Lizzie has rediscovered it since then or ever will.

After these Sindbad wanderings she resumed the interrupted threads of her New England life, and one of the last wrongs which she felt inspired to set right was the treatment of the North American Indians by the Government Bureau in Washington. She was very old then, near the end of her earthly pilgrimage in fact, but as alive as ever with purpose and confidence, and, when I went to see her on what was to prove my final visit to her in this world, she was eloquent in her exposition of the injustice and error which it should be her function to set right.

CHATS WITH OFFICE CALLERS

'The camel of the Arabian desert,' said the ***Tourist,*** 'is not treated with the respect he deserves. He is a laborer of the most degraded type. The natives have a way of saying: "The horse is a gentleman; the camel is a boor."

'The Arabs have no appreciation of the camel. He is rarely in sympathy with his masters, though born in the family. He does not become one of the household as do the goat, the donkey and the lamb which, if there be space in the one-room hut, share it. The natives resent the aloofness of the camel, and consequently punish him for it. He is peaceable until his rights are trampled on, and then his long brown teeth become weapons. Every hospital in lands in which he abounds has patients doctoring for camel bites, and there is seldom a day in the larger Egyptian and African towns that one does not see policemen carrying an unruly camel, generally muzzled, to a depot, where he is examined to see if a bodily ailment caused the fretfulness.'

'Stretching from the muddy waters of the Missouri more than two thousand miles straight into the setting sun, an automobile highway marks the trail over which passed, three-quarters of a century ago, the greatest migration white men have ever made. It is the Old Oregon Trail, which began in Independence, Kansas, and ended at Seaside, Oregon,' said the ***Motorist from the West.***

'This trail was blazed in 1742, was followed by Lewis and Clark, became the highway of the Mormons, and the path of that great American migration which began in the early fifties, and did not end until the ultimate West became the sunset frontier of the United States.

'The Old Oregon Trail begins at the town of Independence, on the Missouri, though, in the old days, St. Louis was its real terminus. The trail ran along the Little Blue River, until it entered the valley of the Platte, reaching the river some twenty miles below what is now Grand Island. Then the trail turned up the Platte to its forks, some 485 miles. The trail, 513 miles from its starting point, turned abruptly to the North Fork, and thence rolled on 667 miles to Fort Laramie. This fort was the last post on the eastern side of the towering Rockies.

'From Fort Laramie the Old Oregon Trail wiggled along the course of the Platte until it reached a point 807 miles from Independence. It then abandoned the Platte, and swung over into the valley of the Sweetwater. One of the famous features of the trail, then and now, is Independence Rock, 838 miles from the starting point. This rock is a sort of crude register, on whose face may still be traced, carved deep in the stone, the names of numbers of the pioneers, guides, adventurers and scouts who passed that way.

'Up the Sweetwater, the pioneers passed the foot of the Bighorn Mountains and the Devil's Gate, and thence through South Pass, discovered by Etienne Provost. There, 947 miles from the Missouri River's western bank, they started down the Pacific slope of the Great Divide. They crossed the Green River and rested at Fort Bridger, almost exactly halfway between the Missouri and the Pacific.

'Following the Bear River, the migrants dropped down to Soda Springs on the big bend, 1,206 miles from their starting point, and then crossed the Height of Land between the Bear and the Port Neuf rivers, the latter flowing into the Columbia. At 1,288 miles from Independence, they reached Fort Hall, established by Nathaniel Wyeth, on the Snake River, important because here the wandering pioneers could follow that great arm of the Columbia.

'At the Raft River, 1,334 miles from Independence, the trail to California turned aside to the southward. The Old Oregon Trail continued on to the base of the Blue Mountains. It then dipped into the Umatilla Valley, now one of the most beautiful and most fertile farming and fruit-growing sections of the Northwest. Within a few miles the trail debouched to the banks of a roaring river, and the pioneers knew they had reached the Columbia, the Father of Waters of the West.'

'The problem of the education of women,' explained the ***President of a Women's College,*** 'might be termed a study of differences. There is an endless variety of possibilities in any group of women, and to give to each type the proper equipment and training is a stupendous task. For it should be borne in mind that education is more than for the immediate need. The situation was aptly expressed when a recent writer said: "My mind to me a kingdom is," and it is for the enriching of this kingdom that education should serve. True, it is difficult to find moments for yourself, but after you do find them the test comes: Can you enjoy such moments? Is your mind so filled that moments of leisure and contemplation are a pleasure? Self-cultivation may become very selfish, but it is not necessarily nor generally so.'

PASS TH' ICE WATER!

* * *

'Alaska embraces nearly 600,000 square miles of territory, less than two per cent of which is owned by private persons,' the ***Old Sourdough*** stated. 'The far interior near the Arctic Circle is hundreds of miles nearer to Michigan than to the homes of fellow residents of Alaska. General opinion conceives of Alaska as extending only northerly. In fact its western reaches are bathed by a setting sun which is simultaneously viewed as the rising sun on the New England coast.

'Alaska has but three industries of more than negligible consequence: fishing, mining and fur production. Commercial fishing, which is conducted almost exclusively by outside corporations, employs outside labor.

'Mining, also largely owned by outside capital, is operated by Alaska labor.

'Fur production—including trapping and fur farming—chiefly owned and conducted by Alaskans—is a poor third in the list of industries.

'The reindeer industry should perhaps be mentioned because of the great publicity it has recently received. A reindeer is simply a domesticated caribou. Herding is the only cost involved in its maintenance, as it fends for itself unaided and feeds exclusively upon moss. The flesh is of excellent flavor but possesses little nutriment. Some persons maintain the contrary, but I know from personal experience and observation that men cannot long perform hard labor on a reindeer diet, and that dogs which will work satisfactorily on a dried salmon a day quickly lose their vigor if fed on reindeer meat.

'Coal, oil, timber, livestock, and agricultural industries receive much publicity but are in fact almost wholly theoretical. We can and do produce a small proportion—probably twenty per cent—of our total consumption of potatoes and hardy vegetables; and in southeastern Alaska some fine strawberries are produced. In the Tanana Valley of the interior, wheat, oats and barley have been matured during favorable seasons, but whether these products can ever be grown in commercial quantities on a soil perpetually frozen a few inches beneath the surface is a problem still in the lap of the gods.'

CAN YOU TELL ME?

Question. When did the year of the Athenians and the Romans begin? Any others?

Answer. The Athenians began the year in June, the Macedonians in September, the Romans first in March and afterward in January, the Persians on August 11, the ancient Mexicans on February 23, the Mohammedans in July. The Chinese year, which begins late in January or early in February, is similar to the Mohammedan in having tweve months of twenty-nine and thirty days alternately; but in every nineteen years there are seven years which have thirteen months. This is not quite correct, and the Chinese have therefore formed a cycle of sixty years, in which period twenty-two intercalary months occur.

Q. What possessions has France in French West Africa and how are they governed?

A. The French possessions in French West Africa include Senegal, French Guinea, the Ivory Coast, Dahomey, Upper Senegal-Niger, also called French Sudan, Upper Volta, Mauretania and the Territory of the Niger. The total area of these possessions is 1,384,845 square miles and the approximate population in 1924 was 12,579,931. There is a governor-general over the whole of French West Africa who maintains his seat at Dakar. Each colony has a lieutenant governor at the head of its immediate administration.

* * *

Q. When did the United States start to use our present time system?

A. The United States adopted Standard Time in 1883, on the initiative of the American Railway Association, and at noon of November 18, 1883, the telegraphic time signals sent out daily from the Naval Observatory at Washington were changed to the new system, according to which the meridians of 75°, 90°, 105° and 120° west from Greenwich became the time meridians of Eastern, Central, Mountain and Pacific Standard Time respectively. By Act of Congress, approved March 19, 1918, Standard Time is made the legal time throughout the United States.

* * *

Q. What is meant by absolute zero; absolute temperature?

A. The zero points on the Fahrenheit, Centigrade, and Reaumur thermometer scales are simply arbitrary. Absolute zero—the point at which bodies on the earth are entirely devoid of heat—exists at 459.4 degrees below Fahrenheit and 273.1 degrees below Centigrade zero points. This is the beginning of what is known in dynamic meteorology as absolute temperature, as determined by observations of the contraction of gases when cooled, and from thermodynamical considerations.

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

Q. What is the total cost of state governments in the United States?

A. Expenditures in all the states for the fiscal period ending January 31, 1926, were $1,614,562,230, as compared with $1,513,628,021 for 1924 and $517,503,220 for 1917. The outlays for permanent improvements alone in the fiscal year 1925, ended January 31, for all 48 of the states was more then $500,000,000, principally for highways which ate up more than four-fifths of that amount. The revenues of the states were $129,319,990 less than expenditures, and in only seven of the states was there sufficient revenue to meet all payments during the year. The payments in excess of revenue receipts were met from the proceeds of debt obligations. The average per capita tax imposed by state governments in 1925 was $13.19 or more than double that of 10 years ago. Payments for maintenance and operation of the general departments of the state governments of the 48 states amounted to $10,305,478,035, or $9.20 per capita. This included $256,060,528 apportionment for education to the minor civil divisions of the states and $55,884,578 payments of soldiers' bonus in 21 states. In 1924 the comparative per capita for maintenance and operation of general department was $9 and in 1917 $4.19. The net indebtedness—funded or fixed debt less sinking fund assets—continued to increase, and in 1925 was $1,251,702,639, or $11.12 per capita. In 1924 the per capita net debt was $10.64 and in 1917 $4.93. Twenty-six states decreased their indebtedness, but the aggregate increase in the net debt of the states was $118,683,000.

* * *

Q. How many islands are there in the Philippine Archipelago?

A. There are more than 7,000 islands in the Philippine Archipelago of which but 2,440 are named.

* * *

Q. When was the first newspaper published in America?

A. On September 25, 1690, Richard Pierce of Boston issued the first number of what was to have been a periodical publication but it was promptly suppressed by the authorities due to the fact that in his salutatory he stated that as there were many false rumors being circulated in the town of Boston which were constantly doing a great deal of harm, he requested his readers to furnish him with a list of those persons who were starting such stories that he might advertise them in the succeeding issues of his paper. This journal, of which only one issue appeared, was to have borne the name of 'Public Occurrences, both Foreign and Domestic.' The next periodical to appear was *The Boston News-Letter* which was published by John Campbell, a Scotsman, and the postmaster of Boston. The first number of this was dated April 24, 1704. It was not till fifteen years later, in the latter part of 1719, that another paper, called *The Gazette* was started in Boston.

* * *

Q. What is the law against threatening the President?

A. The following federal law, inspired by the assassination of President McKinley, makes it specifically a crime to threaten to kill or harm the Chief Executive of the Nation.

Chapter 64—United States Statutes—An act to punish persons who make threats against the President of the United States.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that any person who knowingly or wilfully deposits or causes to be deposited for conveyance in the mail or for delivery from any post office or by any letter carrier any letter, paper, writing, print, missive, or document containing any threat to take the life or to inflict bodily harm upon the President of the United States, or who knowingly or wilfully otherwise makes any such threat against the President, shall upon conviction be fined not exceeding $1,000 or imprisoned not exceeding five years or both. Approved, February 14, 1917.

THESE DAYS!

BRIEFLY TOLD

According to Burmese superstition marriage between two persons born on the same day of the week is sure to bring misfortune. To prevent these unfortunate marriages, all children are called by a name which begins with the letter associated with the day of the week upon which they were born.

It has been estimated that there are 2,300 different kinds of snakes throughout the world.

Reports of an insurance company show that during 1926 more men were injured in fishing, golf, tennis, gymnasium exercising and squash racquets than in football.

There are 1,677,000 more women than men in England.

Nairobi, East African Protectorate, is planning to erect a hotel with all modern conveniences, including electric elevators and its own bakery.

Paper money was reported by Marco Polo to be in use in China in the 13th Century.

A pipe organ presented to old Trinity Church in New York by Queen Anne of England in the 17th Century and later placed in Trinity Church at Utica, New York, then in Trinity Church at Geneva, New York, is now in the possession of the St. John's Episcopal Church at Clyde, New York.

A hotel for children only has been erected by the juvenile welfare organization of Berlin to accommodate recreation-bound youngsters making a stop-over in the city. Ten cents is the price of a night's lodging; breakfast is three and one-half cents and lunch or supper seven cents.

A 1,400-pound leatherback sea turtle, eight feet long, was the prize recently landed by Henry Bordzik of Beach Haven, New Jersey. Being a rare specimen, the New York City Aquarium at once arranged to purchase it, paying $2,000.

A chapel built in the center of the ship and extending two decks high is one of the features of a new French Atlantic liner. Although the chapel seats eighty persons and is equipped with an organ, it has no permanent clergyman, inasmuch as there are usually several among its passengers.

One out of every thirty-three persons in the world is always on the sick list.

Men are more vain than women, members of the Photographers' Association of America declare. The vainest men, they say, are clergymen, with actors a close second while the meek and lowly genius displays the least vanity of all.

According to recent tests, loss of sleep gives the mind slightly higher power at the expense of a heavier drain on the physical condition.

There is approximately one physician to every 753 persons in the United States; one to every 1,087 in Great Britain; one to every 1,290 in Switzerland; one to every 1,359 in Japan; one to every 1,940 in Germany; one to every 2,120 in Austria; and one to every 3,500 in Sweden.

Among the trophies of the ancients brought to London by C. Leonard Woolley in his finds at Ur of the Chaldees is a gambling board incrusted with shell plaques inlaid with lapis lazuli and red stones. It is thought to be at least 6,000 years old.

The use of light in the treatment of sick persons was advocated by a physician early in the 18th Century after noting that sick animals always lie in the sun.

A test performed by Professor F. M. Gregg, of Nebraska Wesleyan University, indicates that night-prowling animals are color-blind.

To prevent college pranksters from firing it in the middle of the night and annoying townsfolk, a Spanish War cannon in the courthouse park at Galesburg, Illinois, is to be filled with cement.

Figures compiled by the Washington, D. C., traffic bureau show that five per cent of that city's automobile casualties are caused by persons walking into the sides of moving motor vehicles.

WHY PREDICT AN AGE OF INSECTS TEN MILLION YEARS FROM NOW?

In the Polytechnic Institute of Zurich, Switzerland, is a clock which does not need to be wound. Its running power is provided by a mechanism set in motion each time there is a change in temperature of two degrees.

Out of 83,019 enlisted men discharged from the Regular Army during the past three years, 48,125, or 57.8 per cent, re-enlisted within the succeeding three months.

A Maltese cat which recently 'adopted' a Davenport, Iowa, hardware store as her home, and a few days later presented the employes with a family of six kittens, combines rare mother love with hiking ability. Cat and kittens were given to a farmer ten miles from town. The next day the cat started moving her family, one at a time, back to the store. At the end of three days she had made the necessary six trips, walking a total of 120 miles.

More pupils in United States high schools study Latin than all other foreign languages combined, reports the American Classical League.

Bread treated with ultra-violet rays, made and sold by a Welsh baker, is being fed, with favorable results, to children suffering from rickets.

Cuba now has forty-two radio broadcasting stations, sixteen of them located at Havana. Calls are based upon a numerical system—2AB, 2BB, and so on.

Postage stamps as home decorations are becoming increasingly popular in England. Papering his wife's boudoir with unused stamps cost a wealthy financier nearly $50,000, but he was so pleased with the effect that he had his main hall floor covered in the same way, using ten different shades of stamps to form a colorful mosaic.

Approximately 30,198,000 gallons of gasoline are being consumed daily in the United States this year. During 1926 the average daily consumption was appreciably lower—27,174,000 gallons.

The Oxford University dictionary of the English language, largest and most exhaustive dictionary ever published, is nearing completion. Slightly more than 425,000 words are defined, including every word established in the English language since Anglo-Saxon days, with many American and colonial colloquialisms. Sixty years' labor and a sum of $6,000,000 have been expended upon the work.

Andrew Jukoff, 113-year-old Siberian citizen, recently arrived in Moscow to prove to bureaucrats his eligibility for an old-age pension. He is the father, he says, of 54 children, the oldest now 80 years of age.
